Subject: **Geotechnical Design and Materials Report (GDMR)**
U.S. 101 Auxiliary Lane
Palo Alto and Mountain View, California

Dear Mr. Mai:

URS has completed the accompanying GDMR for the Santa Clara Valley Transportation Authority (VTA) for the proposed modifications to U.S. 101 in Palo Alto and Mountain View, California. The accompanying report has been prepared in accordance with Caltrans Guidelines for preparing Geotechnical Design Reports, dated December 2006.

The report presents our engineering opinions and recommendations regarding the geotechnical factors influencing the design and construction of the proposed roadways and overhead sign structures. The opinions and recommendations have been based upon the results of our field investigation, laboratory testing, engineering judgment and local experience. Mr. Madhu Thummaluru, P.E. Staff Engineer, performed engineering calculations and assisted in preparation of this report. Mr. Mark Schmoll, Certified Engineering Geologist, contributed to the seismic source characterization and the evaluation of geologic conditions along the project alignment. Mr. Michael Larson, G.E. provided consultation and technical guidance to the URS project team over the course of this investigation. Mr. Jose Landazuri provided independent technical review of this report in accordance with URS Corporation Quality Management System. Mr. Christopher Lillie, URS Deputy Project Manager, supervised the incorporation of geotechnical and pavement materials recommendations in various design aspects of the project.

The discussion and analysis used in preparation of this report are based on June 2010 Submittal Plans and subsequent updated plans. Since our report dated February 1, 2010 was issued, we received review comments from Caltrans dated February 26, March 1, June 16, October 20, and November 2, 2010. These comments have been incorporated into this report.

If any questions should arise, or if we can be of further service, please contact the undersigned at (408) 297-9585.

Sincerely,

S. Stephen Huang
Geotechnical Task Leader, G.E. 2150

1.1 DESCRIPTION OF PROJECT

1.1.1 General

The proposed project is located on U.S. 101 in the cities of Mountain View and Palo Alto, Santa Clara County, California. The project limits extend from State Route (SR) 85 on the south to Embarcadero Road on the north (PM 48.7/51.9), a distance of approximately 3.2 miles (Figure 1-1). Within project limits, the U.S. 101 has three mixed-flow lanes and one high occupancy vehicle (HOV) lane in each traffic direction. Full-access interchanges are located at SR 85, Shoreline Boulevard, Rengstorff Avenue/Amphitheatre Parkway, Oregon Expressway, and Embarcadero Road. Partial access interchanges are located at Old Middlefield Way, Charleston Road, and San Antonio Road. There is also a direct HOV connector ramp to and from northbound US 101 and SR 85.

The purpose of the overall project is to relieve existing and future traffic congestion on weaving sections and at ramp termini, and provide for improved local access over this segment of the U.S. 101 corridor.

The project will construct an auxiliary lane on U.S.101 in each direction between SR 85 and Embarcadero Road. The exception will be between San Antonio Road and Rengstorff Avenue in the southbound direction, where no auxiliary lane is proposed because it would create weaving conflicts with traffic entering the freeway from Charleston Road. The new auxiliary lanes will be constructed adjacent to the existing outside lanes. On-ramps at a few interchanges will be widened for the purpose of increasing storage capacity. At most locations, there is sufficient room within the existing Caltrans right-of-way to accommodate the construction of the auxiliary lanes. There are areas where minor amounts of additional right-of-way would be required.

The auxiliary lanes will require the widening (1) of the existing U.S.101 bridges over Adobe Creek and Matadero Creek and (2) of the existing U.S.101 box culvert at Permanente Creek. The existing 12 feet by 12 feet box culvert at Permanente Creek will be extended approximately 2 feet on the upstream end and 20 feet on the downstream end. The proposed improvement of Adobe Creek Bridge and Matadero Creek on U.S. 101 will include widening both sides of the structure in both directions, closing the gaps between the U.S. 101 bridges and the adjacent frontage road bridges. The station locations are shown in Key Map K-1 in Appendix A.

1.1.2 Other Features

In accordance with regulations that require projects to include feasible measures to treat storm water runoff prior to discharge into creeks, the project will include construction of biofiltration swales within the freeway right-of-way. Based on preliminary design information, the treatment areas will total approximately 22 acres in size.

Construction of the project is scheduled to begin in mid 2011 and be completed by the end of 2013.

1.1.3 Retaining Walls

A retaining wall is planned along the south side of U.S. 101 at Old Middlefield Way overcrossing between stations 198+00 and 198+44. This wall is 44 feet long and the maximum design height would be about 12 feet. For more details, including recommendations, please refer to Section 6.8 "Retaining Wall".

1.1.4 Soundwalls

Soundwalls currently are not planned for this project.

1.2 EXISTING STRUCTURES

Figures 1-2 through 1-7 present the layout of the existing bridge structures. Based on as-built plans, the pile and spread footing foundation loadings are summarized as follows:

Table 1-1 Existing Structures

Bridge Number	Name	Abutment / Bent / Foundation Type	Pile [(1)] Loading (tons)
37-149	Oregon Expressway Overcrossing	Abutments (piles)	45
		Bents (piles)	45
37-0174	Adobe Creek Bridge (Widen)	Abutments (piles)	45
37-0040	Matadero Creek Bridge (Widen)	Abutments (piles)	45
		Bent (piles)	45
37-0416	San Antonio Road Overcrossing	Abutments (piles)	45
		Bents (piles)	45
37-449	Rengstorff Avenue Overcrossing	Abutments (piles)	70
		Bents (piles)	70
37-154	Old Middlefield Road Overcrossing	Abutments (piles)	45
		Bent (piles)	45
37-153	Shoreline Boulevard Overcrossing	Abutments (piles)	70
		Bents (piles)	70

(1) All loads including wind and seismic

Permanente Creek crosses U.S.101 at approximate Station 187+50. A 216 feet long and 12 feet by 12 feet box culvert is located at this crossing.

1.3 PHYSICAL SETTING

1.3.1 Climate

Climatologically, the area is classified as Mediterranean with dry summers and mild winters. The following discussion includes records at the Palo Alto weather station (Western Regional

Climate Center). The mean annual temperature is 59.2° F. Extremes of temperatures expected range from an average daily maximum of 78.8° F in July to average daily lows of 33.0° F in December. The highest and lowest temperatures on record in Palo Alto are 107° F and 15° F. Freezing temperatures should only be expected to occur an average of 16 days per year, so freeze-thaw conditions should not be a factor.

Precipitation in Palo Alto averages 15.24 inches per year, primarily confined to the months of October through May. November through March usually have the most precipitation accumulation, averaging 1.78, 2.73, 3.25, 2.87, and 2.23 inches per month, respectively. Thunderstorms are rare.

1.3.2 Terrain

U. S. 101 follows the southwestern margins of San Francisco Bay and the topography along the existing roadway is relatively flat, ranging in elevation from approximately 20 feet at the southeast end near Permanente Creek to a low of about 5 feet near the Oregon Expressway overcrossing at the northwest end (USGS Mountain View Quadrangle). The channelized Matadero Creek and Adobe Creek are at or near sea level and are subject to tidal inundation.

Development along the project area is extensive, consisting of residential housing, mostly on the southwest side, commercial retail and office business buildings, and tidal wetlands fronting the northeast section of the freeway between about Oregon Expressway and Adobe Creek.

1.3.3 Surface Drainage

Watershed

Major streams within or in the vicinity of the project include, from north to south (Wreco, 2006):

- Matadero Creek (crossed by project)
- Adobe Creek/Barron Creek (crossed by project)
- Permanente Creek (crossed by project)

Matadero Creek crosses U.S. 101 approximately 3,200 feet southeast of the Oregon Expressway Interchange. The creek originates near the town of Los Altos Hills and Palo Alto Hills, flowing northeast through unincorporated areas of Santa Clara County and the City of Palo Alto. The watershed area of Matadero Creek is approximately 13.6 square miles. Eleven square miles are within mountainous areas, and three square miles are in gently sloping terrain. Within the City of Palo Alto, the watershed is almost fully urbanized for residential, commercial, industrial, and institutional use. There is open space in the foothills, which covers approximately 24 percent of the watershed area. Forty to sixty percent of the fully urbanized area near the project site is impervious.

Adobe Creek crosses U.S.101 between the Matadero Creek crossing and the San Antonio Road Interchange. Adobe Creek confluences with Barron Creek at the upstream face of the U.S.101 crossing. Adobe Creek originates in the highlands of the unincorporated areas of Santa Clara County and Palo Alto Hills. The watershed area of Adobe Creek is approximately 13.5 square miles; 10.4 square miles from Adobe Creek and 3.1 square miles from Barron Creek (FEMA,

1999a). Land use within the City of Palo Alto and City of Los Altos is fully urbanized. Open space is limited to the area in the foothills of the upstream watershed. Approximately 70 percent of the watershed area is urbanized and 30 percent is open space. Currently, the area surrounding the project site is 40 to 60 percent impervious.

Permanente Creek crosses U.S.101 between Rengstorff Avenue (approximately 2,200 feet northwest of the creek crossing) and Old Middlefield Way (approximately 900 feet southeast of the creek crossing). The creek originates in the Santa Cruz mountains, travels 19 miles north to the San Francisco Bay, and passes through unincorporated areas of Santa Clara county as well as the City of Cupertino, Town of Los Altos Hills, City of Los Altos, and City of Mountain View. At the downstream end of the project site, Permanente Creek passes through a twin Reinforced Concrete Box Culvert at Charleston Road, and a bridge at Amphitheatre Parkway, to discharge to Mountain View Slough; the creek eventually outfalls to the San Francisco Bay. The watershed area of Permanente Creek is approximately 15.8 square miles at the U.S.101 crossing. The Cities of Mountain View and Los Altos is fully developed and covers approximately 55 percent of the watershed area. In addition to the urbanized area, approximately 8 percent of the area is used as non-urbanized development, such as golf course and a mine. The remaining 37 percent is open space, predominantly located in the ridge foothills.

Floodplain Information/Historic flooding

The FEMA Floodplain Insurance Rate Maps (FIRMs) for the City of Palo Alto and the City of Mountain View illustrate the 100-year floodplain at the project site. The FIRMs indicate large floodplains cover U.S.101 and the surrounding area within the project limits.

Historically, U.S.101 have been flooded in this area due to capacity issues of San Francisquito Creek. The historic flooding event was recorded in February 1998, which was reported to closely resemble the floodplain areas delineated in the FEMA FIRM. The overtopping flow from San Francisquito Creek flooded the U.S.101 travel way and ponded at the low point near the Oregon Expressway/U.S.101 Interchange. Pursuant to Caltrans' record, the southbound lanes were closed during the flood event. Matadero and Adobe/Barron Creeks did not experience overtopping during this flood event. This project does not modify San Francisquito Creek, which is outside of the project limits. However, the San Francisquito Creek U.S.101 bridge will be replaced as part of the San Mateo County auxiliary lane project to eliminate the flow restrictions at the existing San Francisquito Bridge.

1.3.4 Regional Geology

The project site is located about 1¼ to 2 miles southwest of the edge of San Francisco Bay within the northern portion of Santa Clara Valley, an alluvial basin located between the Santa Cruz Mountains to the southwest and the Diablo Range to the northeast. The Santa Clara Valley is within the central portion of the Coast Ranges geomorphic province of California. Northwest-southeast-trending valleys and ridges characterize the regional morphology of the Coast Ranges province. These topographic features are controlled by folds and faults that resulted from the collision of the Farallon and North American plates and subsequent predominantly strike-slip faulting along the San Andreas fault system between the Pacific and North American plates.

Regional geologic mapping shows the project alignment to be underlain by Holocene fine-grained alluvium deposits extending from the southern end at Permanente Creek northward to about the San Antonio Road overcrossing (Helley and LaJoie, 1979). North of this point to the end of the project at Oregon Expressway the roadway is mapped as being underlain by Holocene bay mud. This section of the project extends northeast of the original 1850 shoreline of the bay (Helley and LaJoie, 1979). The fine-grained alluvium deposits are described as plastic, poorly sorted organic silt and clay that interfingers with the bay mud. The bay mud is described as water-saturated estuarine organic clay and silty clay with a few lenses of well-sorted sand, and shelly and peaty layers. More recent mapping by Witter and others (2006) show similar conditions, however the fine-grained alluvium deposits are referred to as Holocene alluvial fan deposits – fine grained facies. Witter also shows the bay mud as being overlain by artificial fill along the roadway alignment north of about the San Antonio Road overcrossing. The nearest bedrock consists of Tertiary sedimentarty rocks and volcanic basalt mapped about three miles southwest of the site in the Los Altos Hills.

1.4 PREVIOUS INVESTIGATIONS NEAR SITE

The existing Foundation and Geotechnical Design Investigation references provided by Caltrans include the following:

Table 1-2 Previous Investigations

Bridge Number	Name	Report Description	Date

1.5 REVIEW COMMENTS

URS initially submitted a Geotechnical Design and Materials Report (GDR/MR) dated August 10, 2009 for the proposed U.S. 101/Auxiliary Lanes Project. Subsequently, Caltrans reviewed

our report and later reports and provided their comments in correspondence dated September 16, 2009, March 1, 2010, February 26, 2010 and June 16, 2010. The most recent GDR/MR submitted was dated June 11, 2010. Copies of Caltrans' review comments are attached in Appendix L. We have incorporated these review comments in this report.

2.1 ORIGINAL CONSTRUCTION

Existing structural pavement sections are shown on As-built (exist) Typical Cross Section Drawings in Appendix B. The pavement thicknesses are summarized in Tables 2-1a, 2-1b, and 2-1c.

Consistent with Caltrans terminology, for the remainder of this report, the following definitions, abbreviations, and acronyms are used:

- Asphalt concrete is AC
- Asphalt concrete, Type A is AC(A)
- Asphalt treated permeable base is ATPB
- Aggregate base is AB
- Aggregate subbase is AS
- Cement treated subbase is CTS
- Class 3 aggregate base is Cl. 3 AB
- Class 4 aggregate subbase is Cl. 4 AS
- Lean concrete base is LCB
- Portland cement concrete is PCC
- Rubberized hot mix asphalt, gap graded is RHMA-G
- Hot mix asphalt is HMA
- Impermeable subbase is IS
- Untreated base is UTB

2.2 U.S. 101

According to Typical Cross Sections drawings X-1 through X-32 presented in Appendix B and in Table 2-1a, 2-1b, and 2-1c, the existing pavement sections for U.S. 101 mainline, shoulders, and ramps consist of the following structural elements:

Table 2-1a Existing Typical Structural Sections in SB direction

Station	Distance from "C" line			Shoulder Section (feet)
	0 to 22 feet*	22 to 34 feet	34 to 58 feet

2.3 STRUCTURAL PAVEMENT SECTION

The existing pavement structural sections were measured where our boring locations encountered existing pavement. Approximate measurements of the existing section were made in exploratory boreholes at the time of drilling and are summarized in the following table.

Table 2-2 Borings on Shoulders

Boring Number	AC Thickness		AB/LCB/AS Thickness	
	(inches)	(feet)	(inches)	(feet)

3.1 FIELD EXPLORATION

The locations of all borings for the entire U.S.101 project are presented in Figures 3-1 through 3-17. The locations of selected borings used for this report are presented on Boring Records, in Appendix C.

The selected borings for this GDMR include A-09-101 through A-09-105, A-09-107 through A-09-148, A-09-150, A-09-155 through A-09-160, A-09-162, A-09-163, A-09-165, A-09-166, A-09-168, A-09-170, and A-09-172 through A-09-174. These borings were drilled primarily for determination of the roadway subgrade; depths were generally in the range of 9 to 11.5 feet, and typically about 10 feet; except borings A-09-136 and A-09-156 which were terminated due to refusal at depths of 0.8 foot and 2 feet, respectively. These borings were drilled with a hollow stem auger. Furthermore, the selected borings also include other multipurpose borings drilled for retaining wall, overhead sign structures as well as determination of roadway subgrade. These borings and CPTs include A-09-149, A-09-152 through 154, A-09-161, A-09-164, A-09-167, A-09-169, A-09-171, A-09-175, A-09-177 through A-09-185, CPT-09-106, CPT-09-151, and CPT-09-176. Depths of these borings and CPTs ranged from 35 to 45 feet. A is an abbreviation for auger boring, CPT is an abbreviation for Cone Penetration Test and 09 represents that the borings are drilled in the year 2009.

Furthermore, deep borings were drilled for the bridge/box culvert widening along the project alignment. These deeper borings include R-09-001, R-09-004, R-09-005, CPT-09-002, CPT-09-003, and CPT-09-006. Depths of these borings ranged from 51½ to 101½ feet. These borings were drilled by either the rotary wash method or by the cone penetration test. R is an abbreviation for rotary wash method.

The field investigation was conducted during the period of March 22 through 27, 29 through 31, 2009, April 1, 2, and 12 through 14, 2009.

During drilling, visual classifications of the soils encountered were made from cuttings and soil samples. Typically, drive samples were collected just below the ground surface or under the pavement structural section to a depth of approximately 6 feet and at intervals thereafter of about 2 to 5 feet. Bulk samples of the subgrade materials were also collected for R-value testing. After the borings were completed, the approximate locations were measured from known landmarks. The approximate ground surface elevation at boring locations was determined by interpolation from available topographic maps.

A representative of URS supervised the drilling operations and soil sampling. The soil samples collected were labeled and sealed immediately to preserve their natural moisture content. At completion of the exploration, samples were delivered to the laboratory for further examination and testing. Descriptions of individual laboratory tests and results are presented in Appendix D, "Laboratory Tests," and on the Boring Records in Appendix C. A summary of laboratory test results is presented in Table 3-1.

Comprehensive descriptions of the soils encountered at each boring, together with field and laboratory test data are presented on the Boring Records.

3.2 SUBSURFACE CONDITIONS

3.2.1 General

All explorations (auger, rotary wash borings, and CPT's) were located in the paved shoulder, in the future traveled way, within bridge areas (existing or replace), or near future retaining walls. The pavement sections encountered in these explorations are presented previously in Section 2 "Existing Structural Pavement Sections".

3.2.2 Subsurface Conditions

Alluvium was encountered in all of the borings either beginning at the ground surface or underlying the road base and fill materials. An existing pavement section typically consisting of asphalt concrete overlying aggregate base material was encountered in a number of borings; this information is summarized in Section 2.3 "Structural Pavement Section". Borings at creek crossings (R-09-001, R-09-004, and R-09-005) encountered fill that ranges from about 3 feet thick to as much as 9½ feet in thickness. Eight feet of fill was encountered in Boring R-09-001 on the southern bridge abutment at Matadero Creek, 9.5 feet of fill was encountered in Boring R-09-004 on the northern bridge abutment at Adobe Creek, and 3 feet of fill was encountered in Boring R-09-005 on the southern end of box culvert at Permenente Creek. The fill consisted of locally derived clay and sand with gravel.

The alluvium consists of complexly interbedded lean and fat clay, clayey, silty sand, and well-graded sand with silt. In general, the clay alluvium is soft to very stiff and the sand interbeds are medium dense to dense. Fine grained soils encountered at shallow depths (less than 10 feet) from southern end of Permanente Creek northward to about San Antonio Road Overcrossing are generally classified as lean clay. Fine grained soils encountered north of San Antonio Road overcrossing to the end of project at Oregon Expressway at shallow depths are mainly classified as fat clay. North of San Antonio Road overcrossing fine grained soils encountered at shallow depths are generally soft to stiff in consistency. Fine grained soils south of San Antonio Road overcrossing are generally medium to very stiff in consistency. Fine grained soils encountered between depths of 10 to 50 feet are generally classified as medium stiff to stiff lean clay and soils below depths of 50 feet are alternating layers of medium stiff to very stiff lean and fat clay.

3.2.3 Groundwater

Groundwater was encountered in 28 out of 91 explorations (borings and CPTs) performed. The groundwater depths encountered in 28 explorations are summarized in the following table.

Table 3-2 Groundwater Measurements

Boring Number	Water Depth (feet)	Total Boring Depth (feet)	Drilling Method	Comments
A-09-103	9	10.0	Hollow Stem Auger	
CPT-09-106	13.2	45	Cone Penetration Test	Groundwater depth calculated from dissipation test results
A-09-185	11	35.0	Hollow Stem Auger	
A-09-184	12	35.0	Hollow Stem Auger	
R-09-001	Not Measured	101.5	Rotary Wash	Dry to 7.5 feet
A-09-183	13.5	36.5	Hollow Stem Auger	
A-09-182	8	35.0	Hollow Stem Auger

A-09-161	10	36.5	Hollow Stem Auger	
A-09-162	8	10.0	Hollow Stem Auger	
A-09-164	8	36.5	Hollow Stem Auger	
R-09-005	Not Measured	51.5	Rotary Wash	Dry to 8.5 feet
A-09-169	10	35.0	Hollow Stem Auger	
A-09-170	7.5	10	Hollow Stem Auger	
A-09-171	10.5	40	Hollow Stem Auger	
A-09-174	10	11.5	Hollow Stem Auger	
A-09-175	8	36.5	Hollow Stem Auger	

All of the deeper exploratory borings completed at the creek crossings were drilled with rotary wash drilling methods and immediately backfilled with a mixture of cement and bentonite grout at completion of drilling; therefore, reliable groundwater depths could not be measured in these borings.

A profile of groundwater depth (of the above listed A, R, and CPT series borings) versus stationing is shown in Figure 3-18; it should be understood that water depths at many locations were not available due to the shallow depth of the borings (10 to 11.5 feet).

Several of the exploratory borings completed by Klienfelder (2000) were drilled using hollow-stem auger drilling methods, which allowed for the groundwater level to be measured at time of drilling. The depth to groundwater ranged from about 10 to 25 feet below ground surface (bgs), or about Elevation 10 to 20 feet. Several of these borings were completed in clayey soils and the groundwater level measurements at time of drilling were likely not stabilized. Groundwater levels encountered in the Klienfelder borings are also shown in Figure 3-18.

From Figure 3-18, we can infer that in the northern section of the project where ground surface elevations are lower, the groundwater level is expected to be around Elevation 2 to 4 feet, similar to the surface water level in Matadero and Adobe Creeks. Furthermore, on the upgrade south of Station 150+00 depth of groundwater varies considerably from about Elevation 4 to 15 feet. The groundwater level is probably subject to some influence of tidal fluctuation. No groundwater springs or seeps were observed on or near the project alignment. Groundwater levels may vary considerably in the area with seasonal rainfall or with tidal cycles.

4.1 REGIONAL TECTONIC SETTING AND SEISMICITY

The Santa Clara Valley is located between the active San Andreas fault to the west, and the Hayward and Calaveras faults to the east as shown in Figure 4-1 of this report. Each of these faults has produced damaging earthquakes during historic time. The valley margins are marked by belts of active thrust faults; the Foothills fault system to the southwest and the East Valley thrusts to the northeast (Fenton and Hitchcock, 2002).

The Foothills fault system is a series of southwest-dipping thrust faults located along the range front of the Santa Cruz Mountains (Bürgmann et al., 1994). The Monte Vista-Shannon, Cascade and Sargent faults are the main active faults in the Foothills thrust system. The Monte Vista-Shannon fault zone is approximately 27 miles long and dips at a moderate angle to the southwest, merging with the San Andreas fault at depth. The Cascade fault is approximately 22 miles long. The Sargent fault is approximately 35 miles long and merges with the San Andreas fault near Loma Prieta.

The East Valley thrusts are a series of northeast-dipping thrust faults that mark the junction between the southern end of the Hayward fault and the southern and central segments of the Calaveras fault. These faults, which include the Quimby, Piercy, Evergreen, Silver Creek, Coyote Creek, Berryessa, Crosley, and Warm Springs faults, are relatively short, less than 19 miles long, and appear to merge with the Calaveras faults at relatively shallow depths (Jones et al., 1994). Recent geologic and geomorphic investigations along both the Foothills and East Valley thrust systems indicate that they are active and may be capable of generating damaging earthquakes (Hitchcock and Kelson, 1999; Fenton and Hitchcock, 2002).

The closest active faults to the project alignment are the Cascade, Monte Vista-Shannon, Silver Creek, San Andreas and Hayward faults (Caltrans Deterministic PGA Map, 2007). The Caltrans Seismic Map (Mualchin, 1996) divides the Monte Vista fault into west and east branches. In the 2007 Caltrans Deterministic PGA Map the Monte Vista East fault has been renamed as Cascade fault. The California Geological Survey (2000) has produced maps showing Alquist-Priolo Earthquake Fault Zones along faults with known Holocene activity that pose a potential surface faulting hazard. The San Andreas and Hayward faults are included as Alquist-Priolo (A-P) zoned faults, however the Monte Vista-Shannon and Cascade faults are not.

The closest fault to the site is the Cascade fault, located about 2.7 miles southwest of the southern end of the project site. The Monte Vista-Shannon fault is located about 4 miles at its closest point at the southern end of the project. Silver Creek fault generally parallels U.S.101 in the project areas and is located about 6 miles northeast of the site. The San Andreas fault generally parallels U.S. 101 and is located about 7.5 miles southwest of the site. The Hayward fault also generally parallels the road alignment and is located about 10.8 miles northeast of the site. Figure 4-1 shows active faults within the site region relative to the project.

The following paragraphs are brief descriptions of the nearby active faults.

4.1.1 Foothills Thrust Belt (Monte Vista-Shannon and Cascade Faults)

The southwestern margin of the Santa Clara Valley is bounded by the rugged, young southern Santa Cruz Mountains. Late Cenozoic uplift of the mountains has occurred, in part, along a series of northwest-striking reverse faults, known as either the Loma Prieta domain (Aydin and

Page, 1984) or Foothills thrust belt (Bürgmann *et al.*, 1994), bordering the northeastern margin of the range front. Bounded by the main trace of the San Andreas fault to the west, this sequence of southwest-dipping thrusts, associated with a restraining left bend in the San Andreas fault, has been responsible for the uplift of the Santa Cruz Mountains (Bürgmann *et al.*, 1994). These faults offset the Pliocene and Pleistocene Santa Clara Formation, and locally offset and deform overlying Quaternary sediments and geomorphic surfaces within the range-front communities of Palo Alto, Los Altos Hills, Cupertino, Saratoga, and Los Gatos, located along the southwestern margin of the Santa Clara Valley (Hitchcock and Kelson 1999; Hitchcock *et al.* 1994). The up-dip projection of the blind Loma Prieta fault, which is interpreted to have been the source of the 1989 **M** 6.9 Loma Prieta earthquake (Bürgmann *et al.*, 1994), coincides with the Foothills thrust belt.

The Monte Vista-Shannon fault is one of the primary range-front faults and probably the most extensively studied fault in the Foothills thrust belt. The exposed fault strikes northwest and places Franciscan, Miocene, Santa Clara Formation, and Pleistocene alluvium over Pleistocene and older strata. To the south, the fault merges with the Shannon fault, while at its northern end it intersects the San Andreas, via the Hermit fault, between Woodside and Redwood City. Limited exploratory trenching indicates that the Monte Vista-Shannon fault has had late Quaternary and possibly Holocene displacement. Recent geomorphic mapping by Hitchcock *et al.* (1994) shows that late Pleistocene fluvial terraces flanking Stevens Creek are deformed. The style of late Quaternary deformation affecting these terrace surfaces is consistent with reverse faulting on the Monte Vista faults. Hitchcock and Kelson (1999) estimated an average late Pleistocene slip rate of 0.0067 ± 0.0035 in/yr for the Monte Vista-Shannon fault.

The Cascade fault traverses the coalescent alluvial-fan complex underlying the Santa Clara Valley approximately 1 to 4 miles northeast of the Santa Cruz Mountains range front. Hitchcock et al. (1994) show a strong correlation between the mapped trace of the Cascade fault and fault-related geomorphic features, including vegetation lineaments, closed depressions, linear drainages, stream profile convexities, and high-sinuosity stream reaches. These features are developed in late Pleistocene (and possibly Holocene) displacement along the Cascade fault. Between Los Altos Hills and Los Gatos, most of the major streams show longitudinal profile convexities where they cross mapped trace of the Cascade fault. In general, the crests of the convexities coincide with the zone of lineaments. These relations indicate late Pleistocene uplift along this section of the Cascade fault (Hitchcock et al., 1994). Although this provides little or no information on the sense of slip and the amount and direction of the fault dip, it is likely that the Cascade fault is a southwest dipping, northeast vergent reverse fault similar to, but perhaps having a shallower dip in the near surface than the Monte Vista-Shannon fault (Fenton and Hitchcock, 2001).

4.1.2 Silver Creek Fault Zone

The Silver Creek fault is mapped as steep, east dipping oblique reverse fault with an exposed well documented southern fault section and an inferred northern section buried beneath late Quatenary sediments of Santa Clara Valley. The southern section extends approximately 19 miles from the Anderson Reservoir, northeast of Morgan Hill, where it splays from the Coyote Creek fault to the mouth of the Silver Creek Valley, southwest of the town of Evergreen. Northern section is approximately 25 miles long beneath Santa Clara Valley, extending from Silver Creek Valley to Alameda Creek in Fremont (Fenton and Hitchcock, 2001).

4.1.3 San Andreas Fault Zone

The dominant active fault structure in this region is the San Andreas fault. The fault extends from the Gulf of California, Mexico, to Point Delgada on the Mendocino Coast in northern California, a total distance of 746 miles. The San Andreas fault accommodates the majority of the motion between the Pacific and North American plates. This fault is the largest active fault in California and is responsible for the largest known earthquake in Northern California, the 1906 **M** 7.9 San Francisco earthquake (Wallace, 1990). Movement on the San Andreas fault is right-lateral strike-slip, with a total offset of some 348 miles (Irwin, 1990). In northern California, the San Andreas fault is clearly delineated, striking northwest, approximately parallel to the vector of plate motion between the Pacific and North American plates. Over most of its length, the San Andreas fault is a relatively simple, linear fault trace. Immediately south of the Bay, however, the fault splits into a number of branch faults or splays, including the Calaveras and Hayward faults. In the Bay Area, the main trace of the San Andreas fault forms a linear depression along the Peninsula, occupied by the Crystal Springs and San Andreas Lake reservoirs. Geomorphic evidence for Holocene faulting includes fault scarps in Holocene deposits, right-laterally offset streams, shutter ridges, and closed linear depressions (Wallace, 1990). The 1906 earthquake resulted from rupture of the fault from San Juan Bautista north to Point Delgada, a distance of approximately 295 miles. The average amount of slip on the fault during this earthquake was 16.7 feet in the area to the north of the Golden Gate and 8.2 feet in the Santa Cruz Mountains (WGNCEP, 1996).

Based on differences in geomorphic expression, fault geometry, paleoseismic chronology, slip rate, seismicity, and historic fault ruptures, the San Andreas fault is divided into a number of fault segments. Each of these segments is capable of rupturing either independently or in conjunction with adjacent segments. In the Bay Area, these segments include the Santa Cruz Mountains, the Peninsula, and the North Coast segments. These fault segments have calculated maximum earthquakes of **M** 7.2, 7.3, and 7.7, respectively. The North Coast segment may also be subdivided into two shorter segments with a boundary at Point Arena. These northern and southern North Coast segments are capable of generating earthquakes of **M** 7.5 and 7.7, respectively.

South of the Golden Gate, the fault slip rate is 0.67 ± 0.27 in/yr (Hall *et al.*, 1999). North of the Golden Gate, the slip rate increases to 0.94 ± 0.20 in/yr (Niemi and Hall, 1992). WGCEP (1999) assigns a recurrence interval of 361 years to a **M** 8.0 1906-type event on the San Andreas fault, with a 21 percent probability of a **M** 6.7 or larger earthquake on the San Andreas in northern California in the time period 2000 to 2030. Recent investigations indicate that the repeat time for large earthquakes on the North Coast segment may be less than 250 years.

4.1.4 Hayward Fault

The Hayward fault extends for 62 miles from the area of Mount Misery, east of San Jose, to Point Pinole on San Pablo Bay. At Point Pinole, the Hayward fault runs into San Pablo Bay. The northern continuation of this fault system is the Rodgers Creek fault. The two faults are separated by a 3.1 mile wide right step beneath San Pablo Bay. Systematic right-lateral geomorphic offsets and creep offset of cultural features have been well documented along the entire length of the fault (Lienkaemper, 1992). The last major earthquake on the Hayward fault, in October 1868, occurred along the southern segment of the fault. This **M** 6.8 event caused

toppling of buildings in Hayward and other localities within about 3.1 miles of the fault. The surface rupture associated with this earthquake is thought to have extended for approximately 18.6 miles, from Warm Springs to San Leandro, with a maximum reported displacement of 3.3 feet. The Hayward fault is considered the most likely source of the next major earthquake in the Bay Area (WGCEP, 1999). As well as undergoing displacement earthquake ruptures, the Hayward fault also moves by a seismic creep. Measurements along the fault over the last two decades show that the creep rate is 0.2 to 0.35 in/yr (Lienkaemper and Galehouse, 1997).

4.2 PEAK BEDROCK ACCELERATION

The active faults close to the U.S.101 Materdero Creek Bridge are the Hayward, Cascade, and San Andreas faults. The Hayward, Cascade, and San Andreas faults are designated with Maximum Credible Earthquake (MCE) magnitudes of 7.5, 6.9, and 8.0, respectively, on the 2007 Caltrans fault database. The Cascade and San Andreas faults are expected to contribute the same level of ground shaking at the site (0.5g) while the Hayward fault should produce lower shaking (0.4g). The MCE, therefore, is the earthquake on the San Andreas Fault since it potentially releases the highest energy (**M**=8.0) and result in the strongest shaking at the site. The distance from the project site to the San Andreas fault is approximately 7.5 miles.

Table 4-1 Seismic Source Parameters

Fault	Type	MCE	Distance (miles)	Near Field Effects ?
Cascade	Reverse	6.9	2.7	N
San Andreas	strike-slip	8.0	7.5	Y
Hayward	strike-slip	7.5	10.7	Y

4.3 POTENTIAL GEOLOGIC HAZARDS

4.3.1 Surface Fault Displacement and Ground Shaking

The project alignment does not cross any known active faults or mapped Alquist-Priolo (A-P) zoned faults. The Santa Clara County geologic hazard maps (2002) do not show the road alignment crossing any fault hazard rupture zones. Surface rupture due to faulting along the alignment, therefore, is not expected to occur. However, the short distance to the Cascade, San Andreas and Hayward faults does create a high risk for ground shaking from fault movement. The intensity of the ground shaking is dependent upon the size of the earthquake, the distance of the epicenter from the site, the direction that the earthquake propagates along the fault, and the site geologic conditions. Section 4.2 “Peak Bedrock Acceleration” discusses the anticipated seismic shaking from these faults.

4.3.2 Landslides

U.S 101 is on relatively flat ground along the project alignment and is not subject to landsliding. The project site is not within a landslide hazard zone on hazard maps published by Santa Clara

County (2002), or on the CGS Earthquake-Induced Landslide hazard zone map (2001). Landsliding is not a potential hazard.

4.3.3 Liquefaction

Liquefaction is a phenomenon whereby sediments temporarily lose shear strength and collapse. This condition is caused by cyclic loading during earthquake shaking that generates high pore water pressures within the sediments. The soil type most susceptible to liquefaction is loose, cohesionless, granular soil below the water table and within about 50 feet of the ground surface. Liquefaction can result in loss of foundation support and settlement of overlying structures, ground subsidence and translation due to lateral spreading, lurch cracking, and differential settlement of affected deposits. Lateral spreading occurs when a layer liquefies at depth and causes horizontal movement or displacement of the overburden mass toward a free face such as a stream bank or excavation, or toward an open body of water.

Several liquefaction hazard maps have been prepared for the project area including: Santa Clara County Liquefaction Hazard Zone maps (2002), the California Geological Survey Liquefaction hazard zone map for Mountain View Quadrangle (CGS, 2001), and the liquefaction hazard map for Palo Alto/Stanford, Scenario:1906 San Francisco Earthquake (ABAG, 2001). All of these maps show the U.S. 101 alignment to be within a liquefaction hazard zone ranging from "moderate" to "very high" susceptibility. In a regional study of the nine-county San Francisco Bay region for the U.S. Geological Survey, Witter et al. (2006) mapped the liquefaction susceptibility of the site soils along the project alignment related primarily to the mapped geologic units. The alluvial fan deposits – fine grained facies, mapped from the south end of the project at Permanente Creek to about Adobe Creek, are shown as having "moderate" liquefaction susceptibility. The artificial fill over the Bay Mud soils between about Adobe Creek and the north end of the project are shown as having "very high" liquefaction susceptibility. Several historic ground failures from both the Loma Prieta earthquake and the 1906 San Francisco earthquake have been recorded in the Bay Mud tidal flats between the freeway and the San Francisco Bay margin including disturbed water wells, ground settlement and miscellaneous effects (Knudsen, et al, 2000).

For design, we estimated the potential post-liquefaction settlement at a number of borings and CPTs using the computer program LIQUEFY PRO[1] for peak ground acceleration of 0.5g and design earthquake moment magnitude, **M**, of 8.0. The results of these studies are presented in Appendix E. A summary of our findings is presented in Tables 4-2 and 4-3, including factors of safety (FOS). FOS is defined as the ratio of cyclic resistance ratio (CRR)[the cyclic stress ratio required to induce liquefaction for a cohesionless soil stratum at a given depth] to the earthquake-induced cyclic stress ratio (CSR) at that depth from a specified design earthquake

[1] LIQUEFY PRO is a software program that evaluates liquefaction potential and calculates settlement of a soil deposit due to seismic loads. The program is based on methods recommended in the 2001 NCEER Workshop and 2008 Edition of SP117 Implementation. The seismic load is estimated with Seed's simplified method (Seed, 1971), which gives a Cyclic Stress Ratio (CSR) that is compared with the Cyclic Resistance Ratio (CRR) of the soil. The CRR calculation is based upon input data from common in-situ tests such as SPT and CPT. Because the BPT-test is more appropriate for gravel type soils the user can also use BPT data as input for the liquefaction analysis. The program finally makes an estimate of the earthquake-induced settlements using the results from the liquefaction evaluation. The software was developed by CivilTech Software, located in the Seattle-Bellevue area.

(defined by a peak ground surface acceleration and an associated earthquake moment magnitude).

Based on results of exploratory borings, the FOS for each granular layer is summarized in Table 4-2. As shown, the FOS for liquefaction prone layers (LPL) ranges from about 0.3 to 0.7 (rounded off to the nearest 0.1).

For CPTs, readings are taken at smaller vertical intervals (than for exploratory borings) of 0.164 feet (0.05 m); FOS for CPTs are tabulated in Table 4-3. As shown, the FOS for LPL ranges from about 0.2 to 0.9.

Based on our analyses, we estimate that post-liquefaction settlement in these borings and CPTs could be on the order of less than ¼ to 2¾ inches.

4.3.4 Subsidence and Settlement

Subsidence typically occurs as a result of subsurface fluid extraction (e.g. groundwater, petroleum) or compression of soft, geologically young sediments such as the bay mud soils. Settlement can occur quickly when soil is loaded by a structure or by the placement of fill on top of soil, or it can also occur gradually when soil pore pressures, increased by vertical loading, gradually dissipate over time. This second type is termed consolidation settlement. The soft, young Bay Mud soils underlying the northern portion of the project are susceptible to subsidence and consolidation settlement.

Compaction settlement, or seismic densification, occurs when loose granular soils above the water table increase in density as a result of earthquake shaking. The soil densification can result in differential settlement because of variations in soil composition, thickness, and initial density. As discussed in Section 3.2 “Subsurface Conditions”, occasional layers of medium dense granular soils were encountered at few locations along the project alignment. These granular layers may be subject to cyclic densification during strong ground shaking.

For design, we estimated the potential post-earthquake settlement at all CPT locations ranging in depth from 45 to 100 feet and using the computer program LIQUEFY PRO. In our analyses we used a peak ground acceleration of 0.5g and design earthquake moment magnitude of 8.0. The results of these studies are presented in Appendix E. Based on our analyses, we estimate compaction settlement of less than ¼ inch.

4.3.5 Flooding

The project alignment south of the North Rengstorff Avenue overcrossing is located outside of the 100-year flood zone as shown on the FEMA Flood Insurance Rate Maps (FEMA, 2009). The alignment north of the North Rengstorff Avenue overcrossing is within the 100-year flood zone.

4.4 SCOUR

The closest creek is located approximately 1,000 feet from the retaining wall structure beginning at Station 198+09; therefore scour is not an issue for retaining wall foundation design. Scour issues at Adobe Creek Bridge, Matadero Creek Bridge, and Permanante Creek box culvert are discussed in the following paragraphs.

Caltrans February 2006 Bridge Inspection Report describes the Adobe Creek Channel as trapezoidal with concrete lined side slopes and an earth bottom. The report also states that no scour problems are suspected. Based on the project hydraulic analysis (WRECO, 2009), we understand that a total scour depth of 2.5 feet is expected at the Adobe Creek bottom.

Caltrans February 2006 Bridge Inspection Report describes the Matadero Creek Channel as trapezoidal with concrete lined side slopes and an earth bottom. However, an as-built plan for a fish channel construction by the Santa Clara Valley Water District, dated April 1990, indicates that concrete lining was constructed along the channel bottom. Since the channel is concrete-lined, the potential of scour related issues at the foundations are unlikely.

Based on a review of Permanente Creek as-built drawings and a field visit, it is our understanding that the channel bed and side slopes are lined with concrete to a distance of approximately 100 feet on both upstream and downstream ends of the channel. No scour issues are anticipated at the Permanente Creek crossing.

5.1 STRUCTURAL SECTION DESIGN PARAMETERS

Structural section designs described in the following paragraphs follow in general the Caltrans Highway Design Manual dated July 24, 2009, Chapters 600-670 "Pavement Engineering", and in particular Chapter 630 "Flexible Pavement".

Acronyms used in this section are defined in Section 2.1 "Original Construction".

We also followed these guidelines in developing the new structural pavement sections:

- Total overlay thickness is 0.15 foot, as discussed in Section 5.4 "Pavement Overlay". Overlay includes RHMA-G (0.15 foot thick) on top of existing structural section.
- For Northbound lanes, the improvement will include grinding and overlay, whereas for the Southbound lanes, it will be overlay only.

5.1.1 Traffic Data

The projected traffic loading for the U.S.101 Auxiliary Lane design is given in terms of traffic indices (TI). The TI for a 40-year design life for the mainline segment and 20-year design life for the ramps was determined by URS in agreement with Caltrans. Accordingly, a TI of 14.5 applies for all mainline lanes and TI of 10 applies for all ramps.

5.2 SUBGRADE CONDITIONS

5.2.1 Untreated Subgrade

The subgrade conditions beneath the areas of the proposed roadway and ramp modifications were revealed by the exploratory borings listed previously in Section 3.1 entitled "Field Exploration." Sixteen bulk samples were retrieved from the borings along U.S. 101, and all were submitted to R-value testing; the test results are summarized in the table below and in Appendix F.

Table 5-1 R-Value Test Results

Boring	R-Value	Plasticity Index	Soil Description	Depth Interval (feet)	Control Line/ Stationing (feet)	Offset (feet) (1)	Traffic Direction (2)

O-09-197	61		SM	1-3	"C" 216+00	Rt 250	Ramp

1. Lt = Left, Rt = Right
2. NB = Northbound, SB = Southbound

Caltrans defines an "expansive subgrade" as soil with a plasticity index (PI) greater than 12 and California R-value less than 10. On this basis the samples from A-09-107, A-09-140 and A-09-161 fall in this category or are close to this category. According to Caltrans Highway Design Manual (HDM) Section 614.4 "Expansive Soils" require special engineering or

construction considerations. One of the common options is to remove the expansive soils to a depth where seasonal moisture content is relatively constant. Shallow (less than 10 feet bgs) fat clay was encountered throughout the project alignment; in most cases the top of fat clay was observed at depths ranging from 3 to 8 feet. Based on our engineering experience, depth of seasonal moisture change in soils occurs within the upper 3 feet. Therefore, the majority of borings reveal that the soils should not experience seasonal fluctuation of moisture content in fat clays and no remedial treatment of fat clays below 3 feet is anticipated. As presented in subsequent Section 5.3 "New Structural Pavement Sections" for mainline travelway, the total structural pavement thickness ranges from 2.85 to 3.10 feet and will consist of non-expansive import material which extends to a depth of about 3 feet bgs. No borings drilled in the ramp locations encountered potentially expansive soils (CH) except a hand-auger sample, O-09-194, located near the U.S. 101 SB off ramp at Rengstorff Avenue. Consequently, swelling and shrinkage is not anticipated within and below the new pavement section, except that at U.S. 101 Southbound (SB) on and off ramps at Rengstorff Avenue. For the SB Rengstorff Avenue on-ramp and off-ramp, the planned AS layer of the structural section should be thickened to achieve a total pavement thickness of at least 3 feet in order to minimize expansive potential of the subgrade.

R-value tests were performed on bulk samples obtained from the subgrade directly under the existing asphalt concrete and aggregate base structural pavement (shoulder) or on fill or native soil in the unpaved shoulder area at depths in the upper 2 to 5 feet. As shown in the above table, the results of the tests range from an R-value of 4 to 63 for the sixteen soil samples. However, in order to assign design R-values we plotted the numerical distribution of R-values in Figure 5-1 and the distribution of R-values along the alignment in Figure 5-2. As shown on Figure 5-1, R-values fall in a wide range of 4 to 63. The geographical distribution of R-values is shown in Figure 5-2.

Twelve R-value tests were performed by Kleinfelder as part of the Route 85/U.S.101 Interchange project, that ranged from less than 5 to 38. R-value tests performed as part of the above mentioned project by Kleinfelder that are within the current project limits are also shown on Figure 5-2. We reviewed the Profile Grade sheets, which show minimal cut or fill below present grade (generally 0 to 4 feet). On this basis, the selected R-values of the anticipated subgrade soils are summarized in the following table.

Table 5-2 Subgrade Design R-values

Northbound/ Southbound	Approximate "A-1" Line Station Limits (feet)		Segment Length (feet)	Design R-value	Boring Number
	From	To			
NB	51+62	129+00	7,738	10	A-09-104, A-09-111, A-09-125, A-09-134, A-09-138
NB	129+00	214+00	8,500	5	A-09-140, A-09-161, A-09-172
SB	47+29	53+00	571	5	A-09-107
SB	53+00	215+00	16,200	10	A-09-116, A-09-131, A-09-143, A-09-145, A-09-153, A-09-166, A-09-175

As shown in Table 5-2, the selected design R-values range from 5 to 10. According to HDM Section 614.5, Subgrade Enhancement Geotextile (SEG), locations that may require placement of SEG include areas with "low undrained shear strength (equivalent to California R-value < 20). Although individual R-value tests indicate certain portions of the project alignment could be higher than 20, it will be prudent to include SEG for all new pavement sections to facilitate ease of construction and to minimize questions from the Contractor during construction.

5.2.2 Lime Treated Subgrade

Soil (subgrade) stabilization (or treatment) implies improvement of subgrade soil so that it can be used as subbase for flexible pavement. In addition, the R-value of the subgrade can be increased with a stabilizing agent such as lime. According to Caltrans Highway Design Manual Section 614.4 "Expansive Soils" require special engineering or construction considerations. Based on these criteria, review of Table 5-2 and subsurface data, we conducted a laboratory subgrade stabilization testing program on soil samples where the design R-value is 5. Based on a review of available subsurface data, expansive soils were encountered at shallow depths in northbound between Stations 125+00 to 137+00, 169+00 to 182+00 and southbound between Stations 49+00 and 53+00. The purpose of the laboratory testing program is to evaluate whether subgrade improvements can be achieved. Quicklime (or lime) is often used with lean clays or fat clays to reduce plasticity and swelling potential, as well as increase the workability and R-value.

Based on the distribution of R-values (without additives) shown on Figure 5-2, we undertook a stabilization program using Quicklime as summarized in Table 5-3.

Table 5-3 Lime Treated Bulk Samples Summary

Batch No.	Combine Bulk Samples from Borings	Station Limits of Bulk Samples		Trial Additive Contents (%)
		From	To	Quicklime
1	A-09-139, A-09-140, and A-09-146	128+69	137+16	3, 5, 7
2	A-09-161, A-09-163, and A-09-165	172+63	182+06	3, 5, 7

These tests were performed in accordance with California Test 373, "Unconfined Compressive Strength of Lime Treated Soils and Aggregates", to determine the optimum percentage of the additive. For each batch, laboratory tests were performed on bulk samples (before Quicklime was added) to include gradation, plasticity index and R-value. The details of the laboratory tests are presented in Appendix D. The laboratory test results are summarized in the following table.

Table 5-4 Bulk Sample Test Results/California Test 373 Results

Batch No.	Without Agent				% Agent where Qu ≥ 300 psi
	Soil Type	LL	PI	R-value	
1	CH	64	46	14	3 (447 psi) 5 (492 psi) 7 (459 psi)
2	SC	38	20	19	3 (332 psi) 5 (349 psi)
3*	SC	38	24	17	N/A

* Batch 3 consists of bulk samples from borings A-09-102, A-09-105 and A-09-107

The laboratory tests performed on soil samples and lime were consistent with Caltrans approved testing guidelines. Two bulk samples of subgrade one each between northbound Stations 172+63 and 182+06 (Batch 2) and southbound Stations 47+29 and 53+00 (Batch 3) were each classified as clayey sand (SC). California Test 373 was not performed on Batch 3 as the mixture was classified as clayey sand (SC). However, lime treatment is mainly applicable to clay subgrade soils. Although the bulk samples between the above mentioned stations were classified as clayey sand (SC), based on a review of subsurface data, we believe a majority of the subgrade in northbound between Stations 169+00 to 182+00 and southbound between Stations 49+00 to 53+00 is expansive material. Furthermore, the subgrade bulk sample between northbound Stations 129+00 to 137+00 (Batch 1) was classified as fat clay (CH).

Based on exploratory data and the batch testing results, we believe the following segments of the proposed widening could benefit from lime treatment of subgrade:

- Southbound, "C" Station 49+00 to 53+00
- Northbound. "C" Station 125+00 to 137+00

- Northbound, "C" Station 169+00 to 182+00

Based on the above test results, for cost estimating purposes we preliminarily recommend that 5 percent Quicklime be used throughout the alignment where subgrade treatment is proposed. If lime treated subgrade was substituted for aggregate subbase in flexible (HMA) pavement design, the actual thickness should be obtained by dividing the gravel equivalent (GE) by the appropriate gravel factor (G_f) determined as follows, based on the unconfined compressive strength (UCS) in units of psi.

$$G_f = 0.9 + \frac{UCS}{1000}$$

Since the proposed design UCS is 400 psi (Batch1),

$$G_f = 0.9 + \frac{400}{1000} = 0.9 + 0.4 = 1.30$$

The above mentioned lime treatment tests and recommendations are intended to provide a basis for evaluating the feasibility of lime treatment of subgrade soils, in the event if the Contractor proposes a CRIP for lime treatment of subgrade in lieu of aggregate subbase. It is recommended that more tests be performed on the fat clays by the Contractor if he proposes a CRIP for lime treated subbase. No lime treated subbase layers are proposed for the PS&E package at this time.

5.3 NEW STRUCTURAL PAVEMENT SECTIONS

5.3.1 Background

Where Portland Cement Concrete (PCC) is part of the existing mainline pavement section, along southbound U.S.101, the PCC section will be overlayed with RHMA. Where new pavement is required adjacent to existing PCC, the new pavement will consist of a AC/LCB/AS structural section. We have analyzed structural pavement design, numbered Structural Pavement Cross Sections (SPCS) 1 through 4 for mainline and shoulders. Based on our analysis for the design considerations discussed above, we recommend the following minimum structural sections.

5.3.2 RHMA Considerations

Consideration was given to Rubberized Hot Mix Asphalt Concrete (RHMA) as a structural course. RHMA is formulated by mixing granulated (crumb) rubber with hot asphalt to form an elastic binder with less susceptibility to temperature changes. The rubberized asphalt is substituted for the regular asphalt as the binder for the flexible pavement. RHMA is generally specified to retard reflection cracking, resist thermal stresses created by wide temperature variations and add flexibility to a structural overlay. Caltrans uses gap-graded (RHMA-G) and open-graded (RHMA-O) rubberized asphalt. The difference between the two is in the gradation of the aggregate. RHMA-O is used only as a non-structural wearing course. RHMA-G can be used as either a surface course or a non-structural wearing course. The minimum thickness for RHMA (any type) should be 0.10 foot for new construction and rehabilitation. For pavement preservation, RHMA may be placed as thin as 0.08 foot provided compaction requirements can be met. The maximum thickness for RHMA-G is 0.20 foot. The maximum thickness for

RHMA-O is 0.15 foot. It is undesirable to place RHMA-G or RHMA-O in areas that will not allow surface water to drain. As an example, a surface that is milled only on the traveled way and not on the shoulder forms a "bathtub" section that can trap water beneath the surface of the traveled way. To prevent this effect, RHMA-G should be placed over the whole cross section of the road (traveled way and shoulders). For this project RHMA-G is selected.

According to Section 39 of the 2006 Caltrans Standard Specifications, Hot Mix Asphalt (HMA) shall be placed only when the atmospheric temperature is above the following values:

Table 5-5 Hot Mix Asphalt Placement Temperatures

Type of Hot Mixed Asphalt	Specified Atmospheric Temperature ^{o}F
Type A	45 – 55
RHMA-G	55

We compared the specified placement temperatures to the recorded atmospheric temperatures at the Palo Alto weather station. The latter graph is presented in Figure 5-3 and shows the (1) average of all daily maximum temperatures recorded between 1971 and 2000, (2) average of all daily minimum (MINADT) temperatures recorded between 1971 and 2000, and (3) average of all daily average temperatures recorded between 1971 and 2000. We then superimposed the specific atmospheric temperatures for Type A (45°F) and RHMA (55°F) on Figure 5-3. Assuming the average of all daily average temperatures is the appropriate temperature criteria, we conclude, based on Figure 5-3, that RHMA should be placed no lower than atmospheric temperature of 55°F. In Palo Alto, the expected placement period is between about March 1 and November 1, which is a relatively large window of time.

In summary, the seasonal window of time for placement of Type A as well as RHMA is relatively large.

5.3.3 Recommended Northbound Mainline and Shoulder Sections from "C" Line Station 51+62 to 129+00 (SPCS 1)

Design Factors are TI = 14.5, R-value = 10, GE (required) = 4.18

Section Component	Thickness (feet)	Gravel Equivalent (feet)
RHMA-G	0.15	1.34
HMA (Type A)	0.65	
LCB*	0.90	1.71
Class 4 AS	1.15	1.15
SEG	--	--
Total		4.20

*It is understood that Caltrans recommends using lean concrete base for TI > 12.

5.3.4 Recommended Northbound Mainline and Shoulder Sections from "C" Line Station 129+00 to 214+00 (SPCS 2)

Design Factors are TI = 14.5, R-value = 5, GE (required) = 4.41

Section Component	Thickness (feet)	Gravel Equivalent (feet)
RHMA-G	0.15	1.34
HMA (Type A)	0.65	
LCB*	0.90	1.71
Class 4 AS	1.40	1.40
SEG	--	--
Total		4.45

*It is understood that Caltrans recommends using lean concrete base for TI > 12.

5.3.5 Recommended Southbound Mainline and Shoulder Sections from "C" Line Station 47+29 to 53+00 (SPCS 3)

Design Factors are TI = 14.5, R-value = 5, GE (required) = 4.41

Section Component	Thickness (feet)	Gravel Equivalent (feet)
RHMA-G	0.15	1.34
HMA (Type A)	0.65	
LCB*	0.90	1.71
Class 4 AS	1.40	1.40
SEG	--	--
Total		4.45

*It is understood that Caltrans recommends using lean concrete base for TI > 12.

5.3.6 Recommended Southbound Mainline and Shoulder Sections from "C" Line Station 53+00 to 215+00 (SPCS 4)

Design Factors are TI = 14.5, R-value = 10, GE (required) = 4.18

Section Component	Thickness (feet)	Gravel Equivalent (feet)
RHMA-G	0.15	1.34
HMA (Type A)	0.65	
LCB*	0.90	1.71
Class 4 AS	1.15	1.15
SEG	--	--
Total		4.20

*It is understood that Caltrans recommends using lean concrete base for TI > 12.

5.3.7 Recommended Ramp Sections (SPCS 5 - Excluding SB U.S. 101 On-/Off-Ramps at Rengstorff)

Design Factors are TI = 10, R-value = 5, GE (required) = 3.04

Section Component	Thickness (feet)	Gravel Equivalent (feet)
HMA (Type A)	0.50	0.90
Class 3 AB	1.15	1.26
Class 4 AS*	0.90	0.90
SEG	--	--
Total		3.06

*As discussed in Section 5.2.1 potentially expansive soils (CH) were not encountered in the upper 3 feet of borings drilled along on and off ramps, excluding SB U.S. 101 ramps at Rengstorff Avenue. Therefore, for SPCS 5 the AS layer is not thickened to achieve a total pavement section thickness of 3 feet.

Although, the existing structural section at NB U.S. 101 off-ramp at Amphitheatre Parkway consists of an ATPB component, the planned improvement of this off-ramp will be on the up-gradient of the super-elevated ramp. Therefore, an ATPB component is not required in the new structural section.

5.3.8 Recommended Ramp Section for SB On-/Off-Ramps at Rengstorff (SPCS 6 – Down Gradient of Existing Ramp Section)

Design Factors are TI = 10, R-value = 5, GE (required) = 3.04

Section Component	Thickness (feet)	Gravel Equivalent (feet)
HMA (Type A)	0.50	0.90
ATPB	0.25	0.35
Class 3 AB	0.50	0.55
Class 4 AS*	1.75	1.75
SEG	--	--
Total		3.55

*AS is thickened to 1.75 feet to achieve a minimum total pavement section thickness of 3 feet.

5.3.9 Recommended Ramp Sections for SB On-/Off-Ramps at Rengstorff (SPCS 7 –Up Gradient of Existing Ramp Section)

Design Factors are TI = 10, R-value = 5, GE (required) = 3.04

Section Component	Thickness (feet)	Gravel Equivalent (feet)
HMA (Type A)	0.50	0.90
Class 3 AB	1.15	1.26
Class 4 AS*	1.35	0.90
SEG	--	--
Total		3.06

*AS is thickened to 1.35 feet to achieve a minimum total pavement section thickness of 3 feet.

5.3.10 Full Depth HMA Option for Sliver Widening Sections for Mainline and Shoulder

Design Factors are TI = 14.5, R-value = 5, GE (required) = 4.41

Section Component	Thickness (feet)	Gravel Equivalent (feet)
RHMA-G	0.15	5.10
HMA (Type A)	2.00	
Class 3 AB*	0.50	0.55
SEG	--	--
Total		5.65

*At locations where this full depth HMA option are proposed, potentially expansive soils are not anticipated at the subgrade based on nearby borings. Therefore, the AB layer is not thickened to achieve a total pavement section thickness of 3 feet.

This full depth HMA option is recommended only for sliver widening or for relatively small, non-regular shaped areas of roadway improvements. The estimates of gravel equivalent for the RHMA-G and HMA layers are based on the procedure for full depth HMA outlined in HDM Chapter 630. In addition to the full depth HMA, we recommend an additional 0.5 foot of AB to provide a working table for ease of placement of the HMA section. Furthermore, the SEG layer below the AB should facilitate subgrade preparation in relatively tight or narrow working areas. We understand that Caltrans recommends using lean concrete base (LCB) where TI is greater than 12. Because of the built-in safety factor of the full depth HMA, it is our opinion that using 0.5 foot of LCB in lieu of the proposed AB for a full depth HMA option is not necessary.

5.4 PAVEMENT OVERLAY

As shown on typical cross section sheets X-1 through X-32 in Appendix B, 0.15 foot of RHMA-G overlay is planned on the southbound, whereas cold plane (0.1 foot) and RHMA-G overlay (0.15 foot) are planned on the northbound mainline segment. Also variable depth (0.10 to 0.35 foot) HMA (Type A) underlying the 0.15 foot of RHMA-G is planned on both northbound and southbound mainline segments for cross slope correction. In this manner, the finished cross slope grade of 2 percent can be achieved.

5.5 PAVEMENT CONDITION SURVEY

A pavement condition survey was conducted by URS on June 22 through 25, June 28, June 29 and July 6, 2010 in accordance with Caltrans Slab Replacement Guidelines, January 2004 with the intent of determining the need for rigid slab replacements. This survey was only limited to southbound lanes 2, 3 and 4 with Portland cement concrete (PCC) pavements. The findings of this survey are presented in a technical memorandum entitled "Pavement Condition Survey" dated July 15, 2010.

Based on results of the Pavement Condition Survey, the repair of existing PCC pavements falls into 2 main categories. These are referred to as "isolated partial depth concrete repair" (IPDR) and "full depth concrete repair" (FDR) in accordance with the Maintenance Technical Advisory Guide, Volume II, Rigid Pavement Preservation, Second Edition, dated March 7, 2008, The quantity of repair is estimated to be approximately 4,560 square feet of IPDR and about 430 cubic yards of FDR; this represents less than 1 percent of the existing roadway surface for the IPDR and less than 3 percent of the existing roadway surface for the FDR. Caltrans most often uses Rapid Strength Concrete (RSC) for IPDR. For FDR, Caltrans uses 3 types of RSC mixes as outlined in Caltrans Slab Replacement Guidelines, dated January 2004. The type of RSC selected for the FDR should be in conformance with Caltrans SSP No. 40-020.

6.1 SUBGRADE TREATMENT

6.1.1 Clearing and Grubbing

Before any grading begins, all locations to be filled should be cleared of existing improvements (rails, posts, curbs, pavements, etc.), all debris, vegetation, and any soils containing roots or other vegetative matter in accordance with Section 16 of Caltrans Standard Specifications. A stripping depth of 4 to 6 inches is estimated. The entire root ball of large shrubs should be removed, including all roots greater than 1 inch in diameter.

6.1.2 Subgrade Preparation

Immediately after existing guardrail posts have been removed, the resulting voids should be backfilled with slurry cement up to present ground surface in accordance with Caltrans Standard Specifications Section 19-3.062 "Slurry Cement Backfill".

All subgrade should be prepared in accordance with Caltrans Standard Specifications Section 25-1.03 "Subgrade". After the areas to receive fill have been cleared and stripped, the exposed subgrade soil should be scarified, moisture conditioned to near the optimum moisture content, and compacted to the requirements of fill to a minimum depth of 6 inches. When the subgrade has been compacted and approved by the Engineer, fill can be placed to provide the desired finished grades.

6.1.3 Fill Material

In general, materials intended for use as fill materials should be a soil or soil/rock mixture that is free of organic matter and other deleterious substances in accordance with Section 19 of Caltrans Standard Specifications. In addition, these materials should have an R-value greater than 10 to be consistent with the design R-value used in pavement structural design. All import material and onsite material reused as fill should meet these requirements and should be approved by the Engineer prior to construction. Asphalt concrete and aggregate base that are pulverized to meet the size requirements for fill material detailed above, could be reused as fill.

6.1.4 Fill Placement

All fill should be constructed in accordance with Caltrans Standard Specifications Section 19, entitled "Earthwork." Relative compaction of not less than 90 percent should be achieved in all fill materials, except where 95 percent is required.

6.1.5 Soil Reuse and Disposal

URS has prepared under separate cover a Site Investigation Report, dated May 19, 2010. The following statement is quoted from the Executive Summary, "Soil Reuse/Disposal" of that report.

With the exception of aerially-deposited lead (ADL), no constituent was detected at a concentration limiting soil reuse or requiring disposal of soil as a hazardous waste. However, the

detected concentrations of aerially-deposited lead have resulted in restrictions on the reuse and/or disposal of soil within the project limits. The following table summarizes the reuse restrictions and disposal requirements of the project soil.

Table 6-1 - Soil Reuse/Disposal Requirements

Group	Northern Limit Station	Southern Limit Station	Depth*	Reuse Restriction	Disposal Requirement
Southbound					
1A	Northern end of project	113+00	0-1 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
1B	Northern end of project	113+00	1-3 ft	None	Non-Hazardous
2A	113+00	Southern project limit	0-0.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
2B	113+00	Southern project limit	0.5-3 ft	None	Non-Hazardous
Northbound					
3A	Northern end of project	105+00	0-1.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
3B	Northern end of project	105+00	1.5-3 ft	None	Cal-Hazardous, or out-of-state
4A	105+00	159+00	0-1.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
4B	105+00	159+00	1.5-3 ft	None	Non-Hazardous
5A	159+00	Southern project limit	0-1 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
5B	159+00	Southern project limit	1-3 ft	None	Non-Hazardous

*Samples typically collected at 0.5, 1.0, 1.5, 2.0, and 3.0 feet below ground surface

Significant project costs may result due to the volume of soil with reuse restrictions or requiring disposal as a hazardous waste, and the presence of a shallow groundwater table. Steps to reduce these costs by minimizing disposal of soil as a hazardous waste, or finding locations to properly reuse the restricted soil, may be necessary. Additionally, the lead-impacted soil may be reused as a component of lime-treated subbase, if any. For more details, refer to the Site Investigation Report.

6.2 ESTIMATED SETTLEMENT

Most new fill depths along the shoulders range from about 1 to 3 feet. Some sliver fill depths are 3 feet or less. The long term consolidation settlement due to the new fill loads is estimated to be less than ½ inch.

6.2.1 Surcharge and Monitoring

The immediate settlement estimated above is expected to occur during placement of fill, as a result of elastic compression of granular and cohesive soils. Long term consolidation settlement of clay soils is anticipated to be completed within a month upon completion of construction. Considering that the minor amounts of fill are placed and estimated settlements are relatively small, we see no need for (1) surcharging the fills and (2) monitoring the settlement of fills with settlement monitoring devices.

6.3 DRAINAGE SYSTEM

New and realigned storm drains are planned as shown in Drainage Plan drawings D-1 through D-17 in Appendix G. The new alignment will be beyond the edge of pavement. No underdrain systems are required since lowering of profile grade is not planned, i.e. no cuts.

As shown on the as-built drawings dated January 28, 1986, edge drain consisting of a 2-inch perforated plastic pipe (edge drain) was installed next to the existing southbound travel lane and underneath the paved shoulder. The edge drain was constructed by excavating a 6-inch wide trench with the perforated plastic pipe at the bottom and filter fabric placed along the sides. This edge drain will be removed during construction and the new pavement will not include any edge drains.

For the NB off-ramp at Amphitheatre Parkway and the SB on-ramp and off-ramp at Rengstorff Avenue, the existing ATPB layer will be extended in the planned widening of the ramps. In this case, the existing edge drain will be removed, and new edge drains will be installed to drain the ATPB layer.

6.4 UTILITY CROSSINGS

6.4.1 General

As shown on Utility Plan Sheets U-1 through U-20 (Appendix H) there are several existing and planned buried utilities that cross the roadway. In general, we estimate that buried utilities subject to loading from new fill will have negligible long term consolidation settlement, except in fill areas described in Section 6.2 “Estimated Settlement” where we estimate settlement of less than ½ inch.

6.5 ROADWAY EXCAVATIONS

In most ramp and median areas, relatively shallow excavations (less than 4 feet) are currently planned for placement of new pavement sections, retaining wall foundations and bridge footings.

Shallow excavations will be completed entirely in the existing pavement structural sections and into the embankment fill or native materials underlying the existing pavements. No cobbles were encountered at boring locations within the anticipated excavation depths.

In our opinion, materials excavated from the existing pavement structural sections can be reused as fill materials in the new or raised embankments provided the asphalt concrete is pulverized to

meet the size requirements for fill. However, the existing fill materials underlying the pavement structure should be reviewed and tested by the Geotechnical Engineer at the time of construction to verify they meet the requirements for fill.

Based on the Boring Records, potentially expansive fat clay (CH) was primarily encountered throughout the project alignment at shallow depths ranging from about 0 to 10 feet bgs (with typical depths on the order of 5 feet).

In our opinion these soils, if excavated, should not be reused as engineered fill due to their expansive nature, i.e. potential to shrink and swell with moisture changes. If used in embankments, CH soils will slough with seasonal moisture changes. Furthermore, the moisture content of these soils generally ranges from about 30 to 40 percent and is wet of optimum moisture content. Therefore, these CH soils would have to be dried out, i.e. aerated or treated with lime, before reuse. In our opinion this would require considerable effort by the Contractor.

The explorations were completed during the months of March and April 2009, both of which were relatively dry. No perched water was encountered in the semi-permeable aggregate base component of the pavements. However, it is conceivable that some free water could potentially be encountered in the aggregate base and subbase components of the existing pavements if construction occurs in the winter and spring months.

As stated above, cuts ranging from about 1 to 3 feet are anticipated along the shoulders. Based on the most recent water depths measured in the closest borings, it appears the 2009 groundwater levels are at or slightly below the bottom of most shallow excavations. Some localized groundwater is anticipated in a few excavations, particularly for bridge foundations. If excavations extend below the groundwater level, the Contractor should be prepared to provide standard sumping during construction to remove accumulated seepage at the bottom of excavations.

6.6 BOX CULVERT AT PERMANENTE CREEK

Existing Permanente Creek undercrossing (12 feet x 12 feet box culvert) will be extended approximately 20 feet on the downstream end to accommodate new fill for roadway widening. Two retaining walls (RW#2 and #3) will be constructed on the downstream end of the box culvert. However, the bottom of the extended box culvert will be placed on native soil. For that reason Boring R-09-005 and CPT-09-006 were extended beyond the existing toe of the embankment native soils. Boring R-09-005 and CPT-09-006 were drilled to terminal depths of 51.5 feet and 100 feet, respectively. Two inches of asphalt concrete pavement section was encountered in boring R-09-005. Underlying the pavement section, clayey sand with gravel fill was encountered to a depth of 3 feet bgs. Underlying the fill are alluvial soils which predominantly consists of cohesive deposits of hard fat clay, medium stiff to stiff lean clay, and medium stiff sandy silt to silty clay with granular interbeds below a depth of 8 feet. Granular deposits consist of medium dense to dense silty sand, poorly graded sand with silt, and well graded sand with silt and gravel with thickness of layers ranging from 2 to 6 feet. Boring R-09-005 was advanced to a depth of 8.5 feet using a solid flight auger. No free groundwater was observed at that time. The drilling method then was switched to rotary wash, thereby precluding a reliable groundwater measurement. Groundwater was encountered at depths ranging from 8 to 10 feet bgs (Elevation 11 feet to 11.5 feet) in borings performed approximately 700 feet in either

direction of the creek. However, free groundwater was reportedly encountered at depths ranging from 9 to 13 feet (Elevation 6.5 feet to 10.5 feet) in explorations performed for the Permanente Creek bicycle/pedestrian bridge study performed in June 2005.

In Section 4 entitled "Liquefaction" and Tables 4-2 and 4-3, the post-liquefaction ground surface settlement is estimated to be less than 1.5 inches (CPT-09-006 and R-09-005). This estimate includes the settlement of soils encountered above the invert elevation of box culvert to the ground surface. Post-liquefaction settlement of the box culvert is estimated to be slightly less than 1 inch.

Medium stiff silty clay (Elevation 8 feet to 6 feet) was encountered at the invert elevation in Boring R-09-005 drilled next to paved shoulder. Due to prolonged saturation of soils at channel bottom, we anticipate soils at the channel bottom will be soft and wet. To bridge the soft subgrade, a layer of geotextile bridging fabric such as Mirafi 600X covered with a 2 foot section of ¾ -inch to 6-inch bridging material. Bridging material conforming to the following grading requirements has been successfully used on a number of projects in the South Bay:

Sieve Size (U.S. Standard)	Percentage Passing
6 inches	100
2 inches	0-50
¾ inch	0-10

Durability Index = 40 minimum

Based on our calculations and field observation, we estimate a total settlement of ½ inch for the new box culvert extension. Therefore, we estimate differential settlement of about ½ inch at the connection between the existing and new box culvert. These estimates are based on the assumption that the 2 foot of subgrade will be replaced with fabric and rock as discussed above.

The base of the excavation (about Elevation 8 feet) is expected to be soft and unable to support construction traffic. Disturbances of the subgrade during construction could lead to substantially larger mat settlements than those recommended for design. To minimize disturbance, it is recommended that the last 2 feet of excavation be made by equipment supported above this level. This might be accomplished with a backhoe excavating from locations at least 2 feet above final subgrade or with a dragline from outside the excavation. All dewatering should be installed before the final 2 feet are excavated.

The Geotechnical Engineer should be retained to observe the excavation and mat construction, regardless of the method of stabilization selected. If any undesirable conditions are encountered, additional recommendations could be provided.

This culvert should be designed for the load factors recommended in Caltrans Standard Plans D82. The load factors include earth pressures for 2 conditions: (1) 140 lb/ft^3 vertical with 42 lb/ft^3 horizontal; and (2) 140 lb/ft^3 vertical with 140 lb/ft^3 horizontal. The structure should be designed to resist each earth loading condition, as well as HS 20-44 truck including impact. These load values were developed by Caltrans based on extensive studies including strain gauge measurements on culvert walls and load cells on the soil outside of the culverts. The two conditions represent the range of horizontal pressures, long term as well as immediately after construction.

6.7 EARTHWORK FACTORS

Minor cuts and fills are anticipated. Some cut materials will be generated by removing the existing shoulder and median to allow for placement of the new traveled way pavement structural section.

In general, no apparent distress was observed in median shoulder pavements. Assuming that the existing pavement structural sections were constructed in accordance with Caltrans Standard Specifications, it is likely that the pavement structural sections were well compacted at the time they were constructed. Based on density tests performed in our laboratory on samples recovered from our borings, the subgrade materials appear to exhibit moderate in place density. Based on our field observations, laboratory testing, and our engineering judgment and experience, the following earthwork factors are recommended for the purpose of estimating the volume changes during construction.

1. For existing asphalt concrete and aggregate base materials used for fill material compacted to a relative compaction of 95 percent, use 1.0 for an earthwork factor.
2. For native subgrade materials underlying the existing pavements, used for fill material compacted to a relative compaction of 95 percent, use 0.94 for an earthwork factor (i.e., 6 percent volume decrease).
3. For existing fill materials used for new fill compacted to a relative compaction of 95 percent, use 1.0 for an earthwork factor.

6.8 RETAINING WALL

As discussed previously in Section 1.1.3 “Retaining Wall”, one (1) retaining wall is planned. Foundation design aspects and geotechnical recommendations for this non-standard wall, Retaining Wall No. 1, are summarized in a separate Foundation Investigation Report titled “Foundation Report, Mountain View, California,” dated November 11, 2009.

6.9 SOUNDWALLS

Soundwalls currently are not planned for this project.

6.10 NEW OVERHEAD SIGNS

Thirteen new overhead signs and one changeable message sign (CMS) are planned; the locations and other details are summarized in the following table.

Table 6-2 Overhead Signs Summary

Sign Number	Approximate “C” Station Location	Closest Boring (s)		Post Type
		Number	C Station Location	
SS3-B	58+00 Lt. FNBT*	CPT-09-106	55+05	IX
SS3-C	70+50 Rt FSBT**	A-09-184 R-09-001	70+50	24 NPS

Sign Number	Approximate "C" Station Location	Closest Boring (s)		Post Type
		Number	C Station Location	
SS5-F	87+00 Rt. FSBT	A-09-120 A-09-182	86+23 85+07	IX
SS5-H	95+00 Lt. FNBT	A-09-125 A-09-179	95+09 95+40	VII
SS7-J	120+00 Rt. FSBT	A-09-135 A-09-178	119+69 120+02	IX

SS15-BB	198+20 (Median) FSBT	A-09-171	197+99	IX
SS17-CC	210+19.81 Rt. FSBT	A-09-175	210+05	IX

* FNBT: Facing Northbound Traffic
**FSBT: Facing Southbound Traffic

An overhead sign/CMS with a drilled pier type foundation is planned at each of the above locations (see Appendix I). These plans currently indicate that these signs are to be supported on a single CIDH pile having a diameter of 5 feet. Based on Caltrans Standard Plan S7 (May 2006), foundation design is based on an internal friction angle of 30 degrees and unit weight of 120 pcf.

6.10.1 Subsurface Conditions

At Station 58+00 NB, the subsurface conditions were investigated by advancing a cone penetrometer CPT-09-106 drilled next to the shoulder. This CPT revealed primarily layers of medium stiff clay to silty clay to the terminal depth; loose to medium dense sand to silty sand was encountered between depths of 18 to 21 feet. During the Cone Penetration Test of CPT-09-106, a pore pressure dissipation test was conducted to estimate the groundwater level at the site. The dissipation test result suggests groundwater is at approximately 13 feet bgs (Elevation -4.5 ft).

At Station 70+50 SB, the subsurface conditions were reviewed in nearby borings A-09-184 and R-09-001. Medium stiff to stiff lean to fat clay was encountered to the terminal depth of 35 feet in boring A-09-184 with a 4 foot thick sand interbed at a depth of 29 feet bgs. Boring R-09-001

primarily encountered medium stiff to hard lean to fat clay with thin interbedded layers of clayey sand to a depth of 45 feet bgs. Below this depth is a deposit of dense to very dense sand with silt and gravel to 55 feet bgs. Underlying this deposit are layers of medium stiff to very stiff lean to fat clay. Boring R-09-001 was dry to a depth of 7.5 feet, where the drilling method was changed to rotary wash. Groundwater was encountered at a depth of 12 feet bgs (Elevation -1.5 feet) at time of drilling in boring A-09-184.

At Station 87+00, the subsurface conditions were reviewed in nearby borings A-09-120 and A-09-182. Medium dense clayey to silty sand was found to a depth of 4.5 feet bgs. Below this depth is a deposit of soft to very stiff lean to fat clay to the terminal depth of boring with a 1-foot thick silty sand deposit at 13 feet bgs. Boring A-09-120 was dry at the time of drilling. Groundwater was encountered at a depth 8 feet (Elevation -1 feet) during drilling in Boring A-09-182.

At Station 95+00, the subsurface conditions were reviewed in nearby borings A-09-125 and A-09-179. Soft to medium stiff lean to fat clay was encountered to the terminal depth of the borings; two 5-foot thick sand layers, one each at depths of 20 and 30 feet bgs. Groundwater was encountered at depths of 3 to 9 feet (Elevation 4 feet to -2 feet) bgs at time of drilling.

At Station 120+00, the subsurface conditions were reviewed in nearby borings A-09-135 and A-09-178. Stiff to very stiff lean clay was encountered to a depth of 24 feet bgs. Below this depth is a deposit of silty sand that extends to the terminal depth of boring A-09-178. Boring A-09-135 was dry at the time of drilling. Groundwater was encountered at a depth of 12 feet (Elevation -7 feet) at the time of drilling in Boring A-09-178.

At Station 142+00, the subsurface conditions were reviewed in nearby boring A-09-149. Underlying the 36 inches of aggregate base, stiff to very stiff lean clay, sandy lean clay and fat clay were encountered to a depth of 16 feet bgs. A medium dense sand layer was encountered between depths of 16 to 23.5 feet. Directly below this granular deposit is a deposit of stiff to very stiff lean clay and lean clay with sand to the terminal depth of the boring. No groundwater measurements were taking during drilling of this boring.

At Station 150+00, the nearest explorations are CPT-09-151 and A-09-152. At A-09-152 a 2.5 foot thick surficial layer of clayey sand was underlain by stiff fat and lean clay to a depth of 13.5 feet bgs. Below this depth is a deposit of silty sand with gravel that extends to a depth of 17 feet bgs. This was underlain by stiff to very stiff lean clay to the terminal depth of boring. A 2 foot clayey sand deposit was encountered at a depth of 25 feet bgs. A hand auger was used to penetrate the first 5 feet at CPT-09-151 location to avoid buried utilities. Below 5 feet a medium dense sand layer was encountered to a depth of 12 feet bgs underlain by clay, silty clay, and sandy silt to the terminal depth of CPT with granular interbeds at depths of 14 feet and 23 feet. Groundwater was encountered at a depth of 12 feet (Elevation -2.5 feet) at the time of drilling in Boring A-09-152. No pore pressure dissipation test was performed when advancing CPT-09-151.

At Station 165+50 NB, the nearest boring was A-09-177. Stiff fat clay was found to a depth of 3.5 feet underlain by predominantly medium stiff to very stiff lean clay to the terminal boring depth. Silty sand deposits, 1 to 1.5 feet thick were observed at depths of 15, 21, and 26 feet. Groundwater was encountered at a depth of 15 feet (Elevation -4.5 feet) at the time of drilling.

At Station 173+00 NB, the nearest boring was A-09-161. This boring revealed primarily layers of soft to very stiff lean and fat clay to a depth of approximately 36 feet, underlain by 2.5 inches of clayey sand which extended to terminal depth of boring. Very stiff fat clay was encountered between depths of 1.5 to 4 feet. Groundwater was encountered at a depth of 10 feet (Elevation 3 feet) at the time of drilling.

At Station 178+50 SB, the nearest boring was A-09-164. This boring encountered 30 inches of aggregate base underlain by stiff to very stiff lean clay and fat clay to a depth of 8 feet. Below this depth a deposit of silty and clayey sand was encountered to a depth of approximately 20 feet. This granular deposit was underlain by medium stiff lean clay which extended to the terminal depth of the boring. Groundwater was encountered at a depth of 8 feet (Elevation 9 feet) at the time of drilling.

At Station 187+50 SB, the nearest boring was R-09-005. Underlying the pavement section is a clayey sand fill to a depth of 3 feet bgs. Below this fill native soils consisted of hard fat clay, medium stiff to stiff sandy silt and sandy lean clay to a depth of 28 feet with interbedded granular layers; granular layers were 1.5 to 3 feet in thickness and are classified as silty sand and sand with silt. More granular deposits were encountered between depths of 28 to 34 feet and 35.5 to 39.5 feet and were classified as sand with silt and gravel and silty sand, respectively. Underlying these granular deposits was hard fat clay which extended to a depth of 51.5 feet. Boring R-09-005 was dry to a depth of 8.5 feet, where the drilling method was changed to rotary wash.

At Station 188+00 NB, the nearest explorations are CPT-09-006 and A-09-167. Underlying the pavement section in A-09-167 are mostly layers of medium stiff to hard lean clay, sandy lean, and fat clay to a depth of 36 feet. Underlying the fine grained deposits, a dense clayey sand deposit was encountered to the terminal depth of 36.5 feet in A-09-167. A hand auger was used to penetrate the first 5 feet at CPT-09-006 location to avoid buried utilities. Below 5 feet the CPT revealed primarily layers of clay and silty clay to a depth of 46 feet bgs; sandy silt and clayey silt interbeds were encountered at regular intervals. Granular deposits were encountered at depths of 9 feet and 20 feet. Below 46 feet the CPT revealed primarily layers of sandy silt and clayey silt with interbeds of clay and silty clay which extended to the terminal depth of 100 feet at CPT-09-006. Groundwater was not measured during or upon completion of drilling of A-09-167. No pore pressure dissipation was performed when advancing CPT-09-006.

At Station 198+20 SB, the nearest boring was A-09-171. Poorly graded sand with silt and gravel was encountered to a depth of 2 feet, underlain by predominantly layers of soft to very stiff lean and fat clay to the terminal depth of 40 feet. Medium stiff to very stiff fat clay was encountered between depths of 2 to 7 feet, 17 to 22 feet, and 33.5 to 35 feet. Groundwater was measured at a depth of 10.5 feet (Elevation 13.0 ft) at the completion of drilling and prior to backfilling with grout.

At Station 210+19.81 SB, the nearest boring was A-09-175. Underlying the pavement section are mostly layers of medium stiff to very stiff lean clay, sandy lean clay, and fat clay to the terminal depth of 36.5 feet; a medium dense silty sand deposit was encountered between depths of 31 to 35.5 feet. Groundwater was measured at a depth of 8 feet (Elevation 20.5 feet) at the completion of drilling and prior to backfilling with grout.

The Unified Soil Classification System and the guidelines summarizing soil consistency and relative density are presented on the Log of Test Borings (LOTB) legend, Figure 6-1a and 6-1b. Descriptions of the soils encountered in the borings at each sign structure are presented in a LOTB presented on Figure 6-1c through 6-1o. The logging method used in preparing the LOTB is consistent with Caltrans Soil and Rock Logging, Classification and Presentation Manual, dated June 2007. The logs also illustrate the notation used for the size of the samplers and the methods of advancing them.

6.10.2 Liquefaction Potential

Liquefaction potential was previously discussed in Section 4.3.3 "Liquefaction" for the borings and CPTs along the entire project alignment; a summary of potential post-liquefaction settlement is presented in Tables 4-2 and 4-3 also for the entire project alignment. More specifically at the new overhead signs, we estimate the liquefaction induced settlement to be as summarized in the following table:

Table 6-3 Liquefaction Settlement at Overhead Sign Structures

Sign Number	Approximate "C" Station Location	Closest Borings	Estimated Settlement (inches)
SS3-B	58+00 Lt. FNBT	CPT-09-106	1.0
SS3-C	70+50 Rt. FSBT	A-09-184 R-09-001	Nil 0.4
SS5-H	95+00 Rt. FSBT	A-09-179	1.0
SS10-M	142+00 Lt. FNBT	A-09-149	1.0
SS11-N	150+00 Lt. FNBT	CPT-09-151 A-09-152	1.0 nil
SS12-Q	165+50 Lt. FNBT	A-09-177	0.5
SS14-S	178+50 Rt. FSBT	A-09-164	1.0
SS15-X	187+50 Rt. FSBT	R-09-005	1.5
SS15-AA	188+00 Lt. FNBT	CPT-09-006 A-09-167	1.5 nil

Based on our analysis of subsurface information, at or near the proposed overhead signs, we estimate that post-liquefaction settlement to be: nil at signs SS5-F, SS7-J, SS14-V, SS15-BB, and SS17-CC; less than or equal to 0.5 inch at signs SS3-C and SS12-Q; and greater than 0.5 inch at signs SS3-B, SS5-H, SS10-M, SS11-N, SS14-S, SS15-X, and SS15-AA. Although the CPT performed close to sign location SS11-N indicates post-liquefaction settlement of 1.0 inches, analyses of three other nearby borings (A-09-152, A-09-153, and A-09-154) located within a few hundred feet of the proposed sign location SS11-N reveals settlement less than 0.5 inch. In summary therefore the estimated magnitude of post-liquefaction settlement at overhead sign locations SS3-C, SS5-F, SS7-J, SS11-N, SS12-Q, SS14-V, SS15-BB, and SS17-CC will not

result in downdrag on the proposed CIDH piles. Downdrag (where relative settlement exceeds ½ inch) is anticipated at signs SS3-B, SS5-H, SS10-M, SS14-S, SS15-X, and SS15-AA. Caltrans Standard Plan S8 specifies CIDH piles with a diameter of 5 feet and depth of 25 feet are required for post types VIII and IX and 23 feet for post type VII. Caltrans Standard Plan S116 and Reference Sheets (overhead and roadside signs) specifies CIDH piles with a diameter of 5 feet and minimum depth of 22 feet and 21 feet, respectively are required for CMS signs (Model 500). Structural loads anticipated at each sigh structure are summarized in the following Table 6-4:

Table 6-4 Preliminary Structural Load Magnitudes

Sign Number	Approximate "C" Station Location	Axial Compression (kips)	Shear at Base of Sign Post (kips)	Moment at Base of Sign Post (kip-ft)	Estimated Liquefaction Settlement Induced Downdrag (kips)
SS3-B	58+00 Lt. FNBT	23.5	31.0	606	110
SS3-C	70+50 Rt FSBT	18.7	12.2	372	None
SS5-F	87+00 Rt. FSBT	23.5	31.1	603	None
SS5-H	95+00 Lt. FNBT	19.6	21.6	414	None
SS7-J	120+00 Rt. FSBT	23.6	30.8	619	None
SS10-M	142+00 Lt. FNBT	23.5	31.0	610	160
SS11-N	150+00 Lt. FNBT	20.2	21.6	417	None
SS12-Q	165+50 Lt. FNBT	23.2	31.8	569	None

SS15-X	187+50 Rt. FSBT	19.4	19.3	365	180
SS15-AA	188+00 Lt. FNBT	19.6	21.4	452	320
SS15-BB	198+20 (Median) FSBT	23.5	31.0	610	None

Sign Number	Approximate "C" Station Location	Axial Compression (kips)	Shear at Base of Sign Post (kips)	Moment at Base of Sign Post (kip-ft)	Estimated Liquefaction Settlement Induced Downdrag (kips)
SS17-CC	210+19.81 Rt. FSBT	23.4	31.3	595	None

Based on these preliminary loading conditions, we estimate that the design tip of the CIDH piles due to downdrag potential at signs SS3-B, SS10-M, SS15-X, and SS15-AA should be extended to depths greater than those mentioned in Caltrans Standard Plan S8.

6.10.3 Geotechnical Design Parameters

It is our opinion that the design lateral soil pressure estimated for an angle of internal friction of 30 degrees and unit weight of soils of 120 pcf is appropriate for these signs, assuming the ground surface is no steeper than 2:1 (horizontal to vertical). However, due to the shallow groundwater encountered at all sign locations the unit weight is reduced considerably to the submerged unit weight below the groundwater level. Based on our analysis of lateral pile capacities assuming the loading conditions presented in Table 6-4, we estimate that the standard depth for the CIDH piles should be capable to resist the shear and moment at all sign locations except SS3-B, SS5-F, and SS14-S. Based on consideration of lateral demand and liquefaction induced settlement, the recommended pile data of the sign structure foundations are summarized in the Table 6-5.

Table 6-5 Pile Data at Overhead Sign Structures

Sign Number	Pile Data		Remarks	Extend Pile Depth Due to	
	Diameter (ft)	Depth (ft)		Liquefaction Induced Settlement	Lateral Load
SS3-B	5	38	Non-standard length	√	√
SS3-C	5	22			
SS5-F	5	30	Non-standard length		√

SS14-V	5	25			
SS14-S	5	30	Non-standard length	√	√
SS15-X	5	39	Non-standard length	√	
SS15-AA	5	45	Non-standard length	√	
SS15-BB	5	25			
SS17-CC	5	25			

6.10.4 Construction Considerations

The subsurface conditions encountered in the overhead sign borings consists primarily of layers of fat clay and lean clay with granular seams. Groundwater was encountered or anticipated in all the borings at a depth of about 5 to below feet 10 feet below the ground. In cohesive soils as generally encountered a fairly long time would be required for the groundwater to seep into the bore hole and attain an equilibrium position with long-term hydrostatic groundwater table. Thus, the immediate readings obtained may or may not be representative of the actual groundwater table level. Furthermore, seasonal fluctuations in groundwater levels should be anticipated throughout the year. While the cohesive deposits will help keep the holes open during construction, some sloughing and caving can be expected in the cohesionless deposits. Cohesionless deposits that could cause some sloughing and caving during CIDH installation were encountered at borings near overhead sign locations SS3-B, SS5-H, SS7-J, SS10-M, SS11-N, SS12-Q, SS14-S, SS15-X, and SS15-AA. Therefore, it is recommended that the Contractor use temporary casing during installation of CIDH piles at the above mentioned 9 sign locations to minimize the risk of caving. It is also recommended to have casing onsite for sign locations SS3-C, SS5-F, SS14-V, SS15-BB, and SS17-CC, should it be needed to minimize the risk of caving. If casing is used, the casing should be withdrawn from the hole slowly as the concrete is being placed; a minimum head of concrete of 3 feet should be maintained in the casing at all times. All CIDH piles should be installed under the direct observation of the Geotechnical Engineer. Temporary casing should have a diameter at least 8 inches larger than the specified diameter of the CIDH piles; for example, a 68-inch diameter temporary casing should be used for a standard plan (Sheet S7) 60-inch diameter CIDH pile.

6.11 GEOTECHNICAL CALCULATIONS

Calculations of liquefaction potential are presented in Appendix E. In addition, a copy of our geotechnical engineering calculations are presented in Appendix J. These calculations include estimated settlement and bearing capacity, as well as pile lateral load analysis for the CIDH piles.

An assessment of the potential for corrosion of various buried foundation and pipe structures was performed by V&A Consulting Engineers (V&A). The results of their investigation are presented in Appendix K. The following paragraphs include their summary, conclusions, and recommendations.

7.1 SUMMARY

V&A Consulting Engineers was retained by URS Corporation to perform a soil corrosivity Investigation for the proposed U.S. 101 Auxiliary Lanes Project. This project runs from Oregon Expressway in Palo Alto to Shoreline Boulevard (SR 85) in Mountain View, CA. The objective of this investigation is to measure various soil parameters and evaluate the results in order to determine the corrosivity of the soil to the proposed structures associated with the U.S. 101 Auxiliary Lanes Project. Corrosivity was determined for the proposed project structures' materials to depths ranging from 0 to 80 feet below grade.

This report provides recommendations for corrosion control for the Concrete Box Culvert at Station 187+50.

The California Department of Transportation, Division of Engineering Services, Materials Engineering and Testing Services, Corrosion Technology Branch has published Corrosion Guidelines (Guidelines) to define corrosive soil. The Guidelines consider soil to be corrosive to structural elements (steel reinforced concrete) if one or more of the following conditions exist for water or soil samples:

> ***"Chloride concentration is 500 ppm (mg/kg) or greater, sulfate concentration is 2,000 mg/kg or greater or the pH is 5.5 or less."***

A wide variety of soluble salts is typically found in soils. Two soils having the same resistivity may have significantly different corrosion characteristics, depending on the specific ions available. The major constituents that accelerate corrosion are chlorides, sulfates and the acidity (pH) of the soil. Chloride ions tend to break down otherwise protective surface deposits and can result in corrosion of reinforcing steel in concrete structures. Sulfates in soil can be highly aggressive to Portland cement concrete by combining chemically with certain constituents of the concrete, principally tricalcium aluminate. This reaction is accompanied by expansion and the eventual disruption of the concrete matrix. High concentrations of bicarbonates tend to decrease soil resistivities. Although bicarbonates are not aggressive to concrete, lower resistivity environments can promote corrosion activity.

Acidity, as indicated by the pH value, is another important factor of soil. The lower the pH (the more acidic the environment), the higher the corrosivity will be with respect to buried metallic and concrete structures. As pH increases above 7 (the neutral value), conditions become increasingly more alkaline and passive to buried structures.

Evaluation of the in-situ soil environment was made in terms of potential damage due to corrosion. Soil resistivity measurements were conducted in the field during the initial stages of the project. In addition, soil samples, collected by URS during the geotechnical investigation, and water samples, collected by V&A from Matadero Creek and Adobe Creek, were forwarded to Cooper Testing Laboratory in Palo Alto, CA, for chemical analysis. The soil borings were analyzed for minimum resistivity, pH, water soluble chloride ion concentration and water soluble sulfate ion concentration, in accordance with the Guidelines.

The pH of the soil samples analyzed ranged from 8.6 to 10.3, while the pH of the water samples analyzed ranged from 7.6 to 7.7. The water soluble chloride ion concentration of the soil borings analyzed ranged from below the minimum detection level of 2 milligrams per kilogram (mg/kg) to 256 mg/kg, while the water soluble chloride ion concentration of the water samples analyzed ranged from 174 to 187 mg/L.

The water soluble sulfate ion concentration of the soil borings analyzed ranged from below the minimum detection level of 5 mg/kg to 203 mg/kg, while water soluble sulfate ion concentration of the water samples analyzed ranged from 12 to 21 mg/L.

Based on the results of the corrosion analyses, the site is considered *non-corrosive*.

7.2 CONCLUSIONS

- The chloride ion concentration of the soil borings analyzed is less than 500 mg/kg.
- The sulfate ion concentration of the soil borings is less than 2,000 mg/kg.
- The soil pH of the soil borings analyzed is greater than 5.5.
- The site is considered *non-corrosive* in accordance with CALTRANS Guidelines.
- The project site is not located within 1,000 feet of a salt or brackish water source.

7.3 RECOMMENDATIONS

Based on the test data and review of the project requirements, specific recommendations for each material alternative are listed below:

7.3.1 Buried Reinforced Concrete Structures and Cast in Place Piles

Buried concrete structures should be constructed of durable concrete as described in ACI Standards 201.2R and 222R. These recommendations include, but are not limited to, the following:

- The water/cement ratio should not exceed 0.50.
- A concrete cover of a minimum of 2 inches should be applied over all steel reinforcement.
- Sand and water used in concrete mixtures should contain a maximum of 100 ppm of water-soluble chloride ions and water-soluble sulfate ions. They should also have a pH in the range of 6.5 to 8.0. Potable water should be used in concrete mixtures.
- Type I-P (MS) modified or Type II modified cement should be used.

7.3.2 Prestressed Concrete Piles

Prestressed concrete piles should be constructed of durable concrete as described in ACI Standards 201.2R and 222R. These recommendations include, but are not limited to, the following:

- The water/cement ratio should not exceed 0.50.
- A minimum concrete cover of 2 inches should be applied over all steel reinforcement.
- Sand and water used in concrete mixtures should contain a maximum of 100 ppm of water-soluble chloride ions and water-soluble sulfate ions. They should also have a pH in the range of 6.5 to 8.0. Potable water should be used in concrete mixtures.

- Type I-P (MS) modified or Type II modified cement should be used.
- Standard reinforced concrete pipe design should be suitable for this user defined level of chlorides.
- Concrete and RCP mitigation measures for pH Type IP (MS) modified cement or Type II modified cement is the minimum required by Caltrans Standard Specifications 90-1.01.
- For sulfate resistant concrete and RCP type IP (MS) modified cement or Type II modified cement is the minimum required by Caltrans Standard Specifications 90-1.01.

7.3.3 Cast-in-Drilled-Hole (CIDH) Piles

Cast-in-drilled-hole (CIDH) concrete piling shall conform to the provisions in Section 49-4, "Cast-In-Place Concrete Piles," of the Standard Specifications and these special provisions[2].

The concrete used in CIDH piles should be dense and homogeneous throughout the length and cross section of the pile per California Test 233[3].

Concrete deposited under slurry shall have a nominal slump equal to or greater than 7 inches, contain not less than 675 pounds of cementitious material per cubic yard, and be proportioned to prevent excessive bleed water and segregation. The nominal and maximum slump and penetration requirements in Section 90-6.06, "Amount of Water and Penetration," of the Standard Specifications shall not apply.

Concrete shall conform to the requirements in "Corrosion Control for Portland Cement Concrete" of these special provisions[2].

Concrete for portions of CIDH concrete piling to be formed shall contain not less than 675 pounds of cementitious material per cubic yard and shall contain 6.0±1.5 percent air entrainment in the freshly mixed concrete.

Concrete shall conform to the requirements in "Mass Concrete for Cast-in-Place Concrete Piles" of these special provisions[2].

7.3.4 Culvert, Mechanically Stabilized Embankment and Metallic Soil Reinforcement Backfill

Fast setting concrete backfill may need to be used when placing culverts in existing roadways. When using an admixture to decrease concrete curing times, only non-chloride admixtures should be considered.

Culvert materials were selected using the Department of Transportation CULVERT4 Software that calculates Maintenance-Free Service Design Estimates using California Department of Transportation (Caltrans) criteria (See Appendix K).

Non-corrosive backfill for metallic soil reinforcement, such as tie-back anchors or soil nails and reinforced concrete structures, shall meet the following requirements, in accordance with the Guidelines:

- Minimum resistivity greater than 1,500 ohm-cm.

[2] CALTRANS, Specifications, Updates 3-13-2009, CIDH Piles

[3] CALTRANS, California Test 233, November 2005

- Water soluble chloride ion concentration less than 500 mg/kg.
- Water soluble sulfate ion concentration less than 2,000 mg/kg.
- A pH between 5.5 and 10.0.

7.3.5 Alternative Pipe Material Selection

Alternative pipe materials were selected using the Department of Transportation CULVERT4 Software that calculates Maintenance-Free Service Design Estimates using California Department of Transportation (Caltrans) criteria.

Using the harshest soil conditions from the sampled soil borings (R-09-001 with a pH of 10.2 and a minimum resistivity of 421 ohm-cm, Chloride 256 mg/kg and Sulfate 181 mg/kg), the following material recommendations can be made:

- 10 gage galvanized (57g) corrugated steel culverts
- 12 gage galvanized steel culverts with a water-side bitumastic coating
- 14 gage galvanized steel culverts with a bitumastic coating and a paved invert
- 16 gage galvanized steel culverts with a soil-side bitumastic coating
- 18 gage galvanized steel culverts with a polymer sealed 90º invert.
- Plastic pipe is approved for 50 years of service life for corrosive conditions. Abrasion should be evaluated.
- A corrugated aluminum pipe (CAP) should not be used due to corrosive conditions.
- A corrugated aluminized steel pipe (CASP) should not be used due to corrosive conditions.

Materials available for the project construction are summarized below in Table 8-1.

Table 8-1 Materials Available

Source:		Stevens Creek Quarry Cupertino	Harbor Sand and Gravel Inc Redwood City	Granite Rock Redwood City	Cemex Santa Clara	Granite Santa Clara	Maccon Masonry Materials San Francisco

9.1 RECOMMENDATIONS

The specifications for this project shall be Caltrans Standard Specifications dated 2006 and corresponding amendments, or later, as applicable.

9.2 SPECIFICATIONS

9.2.1 Earthwork

Earthwork shall conform to the applicable portions of Section 19 of the Standard Specifications and to current Special Provisions.

Structure Backfill

Structure backfill shall conform to the provisions in Section 19-3 of the Standard Specifications.

Embankment Construction

Embankment material for at least 4 feet below the grading plane shall conform to the requirements noted in the Special Provisions. All imported borrow shall conform to the provisions of Section 19-7.02 of the Standard Specifications and to current Special Provisions.

9.2.2 Structural Pavement Materials

Hot Mix Asphalt (HMA)

Hot mix asphalt shall be Type A, ¾-inch maximum coarse graded and shall conform to the provisions in Section 39 of the Standard Specifications and to the requirements noted in the Standard Special Provisions.

Lean Concrete Base (LCB)

Lean concrete base shall conform to the provisions in Section 28 of the Standard Specifications and to the requirements in the Standard Special Provisions.

Aggregate Base (AB)

Aggregate base shall be Class 3, 1½-inch or ¾-inch maximum grading and shall conform to the provisions in Section 26 of the Standard Specifications and to the requirements noted in the Standard Special Provisions.

Aggregate Subbase (AS)

Aggregate subbase shall be Class 4 and shall conform to the provisions in Section 25 of the Standard Specifications and to the requirements noted in the Standard Special Provisions.

Subgrade Enhancement Geotextile (SEG)

Subgrade enhancement geotextile shall be Class B2 and shall conform to the provisions in Section 88 of the Standard Specifications and to the requirements noted in the Standard Special Provisions.

9.2.3 Standard Special Provisions

Aggregate Base (AB)

Aggregate base shall be Class 3, 1½-inch or ¾-inch maximum grading and shall conform to the provisions in Section 26 of the Standard Specifications and to the following Special Provisions.

The aggregate grading for Class 3 Aggregate Base is revised from the Class 2 Aggregate Base by changing "Percentage Passing" the No. 200 screen to:

Sieve	1½-inch Maximum		¾-inch Maximum	
No. 200	Operating Range	Contract Compliance	Operating Range	Contract Compliance
	2-11	0-14	2-11	0-14

The quality requirements shall conform to the quality requirements shown on the following table.

Tests	California Test Method Number	Requirements	
		Operating Range	Contract Compliance
Sand Equivalent	217	25 Min.	22 Min.
Resistance (R-value)	301	-	78 Min.
Durability Index	229	-	35 Min.

Aggregate Subbase (AS)

Aggregate subbase shall be Class 4 and shall conform to the provisions in Section 25 of the Caltrans Standard Specifications and to the following Special Provisions.

Class 4 aggregate subbase shall be clean and free from vegetable matter and other deleterious substances.

The percentage composition by weight of Class 4 aggregate subbase shall conform to the following grading as determined by California Test Method No. 202.

Sieve Size	Percentage Passing	
	Moving Range	Individual Test Results
2½-inches	100	100
No. 4	30-65	25-70
No. 200	0-15	0-18

Class 4 Aggregate Subbase shall also conform to the quality requirements shown on the following table.

Tests	California Test Method Number	Requirements	
		Moving Average	Individual Test Results
Sand Equivalent	217	21 Min.	18 Min.
Resistance (R-value)	301	--	50 Min.

Cast-in-Drilled-Hole Concrete Piles

Cast-in-drilled-hole (CIDH) concrete piling shall conform to the provisions in Section 49-4, "Cast-In-Place Concrete Piles," of the Standard Specifications and the special provisions presented in Standard Special Provisions 49-310.

Rubberized Hot Mix Asphalt (Gap Graded)

This work includes producing and placing rubberized hot mix asphalt (gap graded) (RHMA-G) using Quality Control/Quality Assurance process, complying with Section 39, “Hot Mix Asphalt,” of the Standard Specifications and the special provisions presented in Standard Special Provisions 39-150 (Amended SSP 39-150 dated September 10, 2010, District 4 blanket nSSP approval till June 30, 2011).

Asphalt Treated Permeable Base

Treated permeable base shall be asphalt treated and shall conform to the provisions in Section 29, “Treated Permeable Base,” of the Standard Specifications and the special provisions presented in Standard Special Provisions 29-010. The type of asphalt binder to be mixed with aggregate for treated permeable base shall be Grade PG 64-10 conforming to the provisions in Section 92, “Asphalt,” of the Standard Specifications.

Subgrade Enhancement Geotextile (SEG)

Subgrade enhancement geotextile shall conform to the provisions in Section 88-1.08, “Separation and Stabilization,” of the Standard Specifications and the special provisions presented in Standard Special Provisions 19-760. SEG shall be Class B2.

9.2.4 Special Provisions

Embankment Construction

The upper 4 feet of embankment fill below the grading plane shall have a minimum R-value of 10.

The opinions, conclusions and recommendations contained in this Geotechnical Design Report and Materials Report are based upon the information obtained from explorations made at widely separated locations, geologic reconnaissance, review of available geologic and topographic information and historic data, and upon local experience and engineering judgment.

The recommendations presented in this report are based on the assumption that the soil and geologic conditions do not deviate substantially from those encountered in the exploratory borings. If any variations are encountered during construction, URS should be consulted so that supplementary recommendations can be made.

If the planned construction is changed from that presently conceived, URS should be retained to review the changes and make modifications to the original recommendations presented in this report in order to meet the project needs.

Geotechnical issues may arise during construction which are not apparent at this time. We should be retained during construction to review the soil conditions encountered and the construction procedures. All testing should be done under the direct observation of a representative of our firm.

The elevations shown on the logs of new borings are based on interpolation from spot and contour elevations shown on available topographic maps.

A specific review related to environmental and hazardous waste issues and an investigation for subsurface environmental contamination is presented in a separate URS document entitled “Draft Hazardous Materials Investigation Report”.

As-built drawings pertinent only to the geotechnical investigation are included.

The recommendations presented in this Geotechnical Design Report and Materials Report were developed with the standard of care commonly used as state of the practice in the profession. No other warranties are included, either express or implied, as to the professional advice presented in this report.

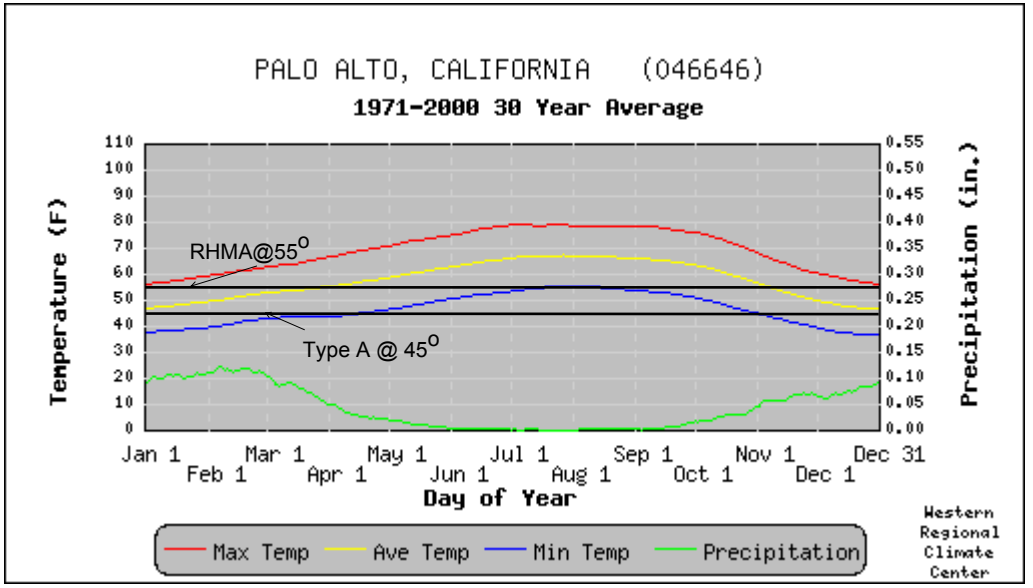
1971 - 2000 Temperature and Precipitation



Data is smoothed using a 29 day running average.

- Max. Temp. is the average of all daily maximum temperatures recorded for the day of the year between the years 1971 and 2000.
- Ave. Temp. is the average of all daily average temperatures recorded for the day of the year between the years 1971 and 2000.
- Min. Temp. is the average of all daily minimum temperatures recorded for the day of the year between the years 1971 and 2000.
- Precipitation is the average of all daily total precipitation recorded for the day of the year between the years 1971 and 2000.

CEMENTATION

Description	Criteria
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

BOREHOLE IDENTIFICATION

Symbol	Hole Type	Description
Size	A	Auger Boring
Size	R P	Rotary drilled boring Rotary percussion boring (air)
Size	R	Rotary drilled diamond core
Size	HD HA	Hand driven (1-inch soil tube) Hand Auger
●	D	Dynamic Cone Penetration Boring
▲	CPT	Cone Penetration Test (ASTM D 5778-95)
⬚	O	Other

Note: Size in inches.

CONSISTENCY OF COHESIVE SOILS

Description	Unconfined Compressive Strength (tsf)	Pocket Penetrometer Measurement (tsf)	Torvane Measurement (tsf)	Field Approximation
Very Soft	< 0.25	< 0.25	< 0.12	Easily penetrated several inches by fist
Soft	0.25 to 0.50	0.25 to 0.50	0.12 to 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 to 1.0	0.50 to 1.0	0.25 to 0.50	Penetrated several inches by thumb with moderate effort
Stiff	1 to 2	1 to 2	0.50 to 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2 to 4	2 to 4	1.0 to 2.0	Readily indented by thumbnail
Hard	> 4.0	> 4.0	> 2.0	Indented by thumbnail with difficulty

PLASTICITY OF FINE-GRAINED SOILS

Description	Criteria
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

APPARENT DENSITY OF COHESIONLESS SOILS

Description	SPT N_{60} (Blows / 12 inches)
Very loose	0 - 4
Loose	5 - 10
Medium Dense	11 - 30
Dense	31 - 50
Very Dense	> 50

MOISTURE

Description	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OR PROPORTION OF SOILS

Description	Criteria
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

PARTICLE SIZE

Description		Size
Boulder		> 12"
Cobble		3" to 12"
Gravel	Coarse	3/4" to 3"
	Fine	No. 4 to 3/4"
Sand	Coarse	No. 10 to No. 4
	Medium	No. 40 to No. 10
	Fine	No. 200 to No. 40

NOTES:

1. DIMENSIONS OF PAVEMENT STRUCTURES (STRUCTURAL SECTIONS) ARE SUBJECT TO TOLERANCES SPECIFIED IN STANDARD SPECIFICATIONS.
2. SUPERELEVATION AS SHOWN OR AS DIRECTED BY THE ENGINEER.
3. FOR CURB & DIKE TRANSITIONS SEE SHEET C-XX.
4. FOR LOCATIONS, TYPES, AND LIMITS OF HMA DIKES, CURBS, FENCES, MBGR, AND BARRIERS, SEE LAYOUT AND SUMMARY OF QUANTITY SHEETS.
5. FOR LIMITS OF REMOVAL OF HMA DIKES, CURBS, FENCES, MBGR AND BARRIERS, SEE LAYOUT AND SUMMARY OF QUANTITY SHEETS.
6. FOR HMA SURFACING CONFORM DETAILS, REFER TO SHEET C-54.
7. FOR MAINTENANCE VEHICLE PULLOUT INFORMATION AND LOCATIONS, SEE SHEET C-67.
8. FOR LIMITS OF CONTRASTING SURFACE TREATMENT, SEE LAYOUT SHEETS.
9. VEGETATION CONTROL IS USED AT ALL MBGR AND THRIE BEAM BARRIER LOCATIONS.
10. SEE SUMMARY OF QUANTITIES FOR LOCATIONS OF PCC SLAB REPLACEMENT & SPALL REPAIR.

The water content, dry density and unconfined compressive strength were determined for selected samples to estimate the strength and compressibility of the underlying soils. The results of these tests, together with the resistance to penetration of the sampler are shown at the corresponding sample location on the Boring Records, Appendix C.

Atterberg limit tests were performed on cohesive samples to determine the plasticity characteristics. The results of these tests are presented in this appendix.

Gradations were performed on granular samples to determine the grain size distributions; the results of these tests are presented in this appendix.

* Note: The equation used to obtain $CRR_{7.5}$ is not valid for corrected $(N_1)_{60}$ higher than 30. According to NCEER 1997, the soil layer with corrected $(N_1)_{60}$ higher than 30 blows per foot is unlikely to be susceptible to liquefaction.

** Note: These values were obtained from a chart for estimation of volumetric strain in saturated sands based on a cyclic stress ratio and standard penetration resistance (Tokimatsu and Seed, 1987).
See figure 9.53 from "Geotechnical Earthquake Engineering" by S. Kramer.

Total Settlement (inch) =	0.34

* Note: The equation used to obtain $CRR_{7.5}$ is not valid for corrected $(N_1)_{60}$ higher than 30. According to NCEER 1997, the soil layer with corrected $(N_1)_{60}$ higher than 30 blows per foot is unlikely to be susceptible to liquefaction.

** Note: These values were obtained from a chart for estimation of volumetric strain in saturated sands based on a cyclic stress ratio and standard penetration resistance (Tokimatsu and Seed, 1987).
See figure 9.53 from "Geotechnical Earthquake Engineering" by S. Kramer.

Total Settlement (inch) =	**1.24**

* Note: The equation used to obtain $CRR_{7.5}$ is not valid for corrected $(N_1)_{60}$ higher than 30. According to NCEER 1997, the soil layer with corrected $(N_1)_{60}$ higher than 30 blows per foot is unlikely to be susceptible to liquefaction.

** Note: These values were obtained from a chart for estimation of volumetric strain in saturated sands based on a cyclic stress ratio and standard penetration resistance (Tokimatsu and Seed, 1987).
See figure 9.53 from "Geotechnical Earthquake Engineering" by S. Kramer.

Job 101 AUX LANE. Project No. 28649951 Sheet ____ of ____

Description BOX CULVERT - PERMANANTE CREEK Computed by MT Date 06/22/09

Checked by MLL Date 07/01/09

Reference

CLOSEST BORINGS ; R-09-005, CPT-09-006.

12'x12' BOX CULERT ; EXTND 20' ON DOWNSTREAM SIDE, 2' ON UPSTRIAM

Groundwater not measured in R-09-005 and no pore pressure dissipation test performed in CPT-09-006.

GW @ EL. 11.5 ft in A-09-169 (600' south of creek)

@ EL 12.9 ft in A-09-170 (1200' south of creek)

@ EL. 9.0 ft in A-09-164 (1000' south of creek).

@ EL. 10.5 ft in B-2, B-7 (parikh consultants, permanante Creek POC)

design Groundwater @ 12.9 ≅ 13 ft.

Bearing capacity :-

S_u = 780 psf Assume $\phi = 0°$

N_c = 5.53 N_q = 1

$q_{ult} = cN_c + \gamma D N_q$ (neglect)

$= (780)(5.53) = 4313$ psf. ✓

From caltrans standard plans (D82) Design bearing pressure for 2' height box culvert w/ 10' of cover = 2.6 ksf.

No cover is planned for the box culvert at permanante creek

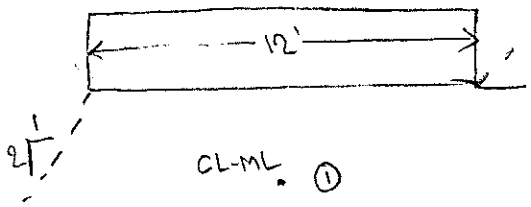
so bearing pressure = $2.6 \text{ ksf} - \frac{(120)(10)}{(1000)} = 1.4$ ksf ✓

EL. 21 ft

$FS = \frac{4,313}{1400} = 3.1$ ✓ ok

EL. 13.0 ft

SETTLEMENT:-



EL 7.7'

CL-ML. ①

EL. 4.0'

SP/SP-SM ②

EL 1.0'

CL. ③

EL -7.0'

SW-SM/SM. ④

EL -18.5'

Ground surface @ 21 ft. Initial pressure due to adjacent soil = (120)(8) + (120-62.4)(5) = 960 + 288 = 1248 psf

(1/2)(120-62.4)(3) = 624 psf

Initial pressure @ ① $P_o = (125-62.4)(1.9) = 120$ psf ✓

@ ② $P_o = (125-62.4)(3.7) + (130-62.4)(1.5) = 333$ psf

@ ③ $P_o = (125-62.4)(3.7) + (130-62.4)(3) + (130-62.4)(4) = 705$ psf ✓

@ ④ $P_o = 705 + (130-62.4)(4) + (130)(6) = 1,755$ psf

Add 624 psf to all layers to final P_o.

change in stress = ΔP

ΔP @ ① $= \frac{(1,400)(12)}{(12+0.925+0.925)} = 1,213$ psf ✓

ΔP @ ② $= \frac{(1,400)(12)}{(12+2.6+2.6)} = 979$ psf

Job 101 ANX LANE Project No. 28641951 Sheet ____ of ____

Description ____ Computed by MTT Date 06/22/09

Checked by MLL Date 07/01/09

Reference

ΔP @ ③ $= \frac{(1{,}400)(12)}{(12+5.35+5.35)} = 740$ psf ✓

ΔP @ ④ $= \frac{(1{,}400)(12)}{(12+10.23+10.23)} = 518$ psf

$C_c = 0.009(LL-10)$ From NAVFAC 7.1-224

LL = 30 - layer ① From nearby boring by Kleinfelder and Parikh

LL = 30 - layer ③

$C_c = 0.009(30-10) = 0.18$ for layer ①

$C_c = 0.009(30-10) = 0.18$ for layer ③

$e_o = \frac{(SG)\gamma_w - \gamma_d}{\gamma_d} = \frac{(2.7)(62.4)-(100)}{(100)} = 0.68$ for layer ①

$= \frac{(2.7)(62.4)-(103)}{(103)} = 0.64$ for layer ③

$\frac{C_c}{1+e_o} = \frac{0.18}{1+0.68} = 0.107$ - layer ① $\frac{C_\delta}{1+e_o} = 0.1 \times 0.177 = 0.0177$ - layer ①

$\frac{C_c}{1+e_o} = \frac{0.18}{1+0.64} = 0.109$ - layer ③ $\frac{C_\delta}{1+e_o} = 0.1 \times 0.187 = 0.0187$ - layer ③

Consolidation settlement $\Delta H = \frac{C_\delta}{1+e_o} H \log\left(\frac{P_o+\Delta P}{P_o}\right)$

$= (0.0177)(3.7)(12)\log\left(\frac{744+1213}{744}\right) = 0.33$ in - layer ① ✓

$\Delta H_2 = (0.0187)(8)(12)\log\left(\frac{1329+740}{1329}\right) = 0.34$ in - layer ③

Immediate settlement of layer ② and ④

$$\Delta H = \frac{49B^2}{K_{VI}(B+1)^2}$$

N = 13 blows/ft - layer ② $\bar{\sigma}_{VO} = (125-62.4)(3.7)+(130-62.4)(1.5) = 333$ PSF $D_r = 75\%$

= 27 blows/ft - layer ④ $\bar{\sigma}_{VO} = 1{,}755$ PSF $D_r = 85\%$, (ATTACHED FIGURE

K_{VI} = 240 TONS/FT^3 - Layer ②

K_{VI} = 280 TONS/FT^3 Layer ④

$$\Delta H_2 = \frac{(4)(0.4885)(17.2)^2}{(240)(17.2+1)^2} = 0.00727' = 0.09 \text{ in}$$

$$\Delta H_4 = \frac{(4)(0.259)(32.5)^2}{(280)(32.5+1)^2} = 0.00348' = 0.04 \text{ in}$$

Total settlement = ① + ② + ③ + ④

= 0.33 + 0.09 + 0.34 + 0.04 = 0.8 in ≅ 3/4"

Although the calculation showed a settlement of 0.8 inches, no signs of settlement were observed in the existing box culvert during site visit by Michael Carlson.

Settlement of 0.5 inches seems appropriate for the box culvert calculation. Recommend to replaced 2' of material below invert with a fabric and 3/4-inch to 6-inch rock.

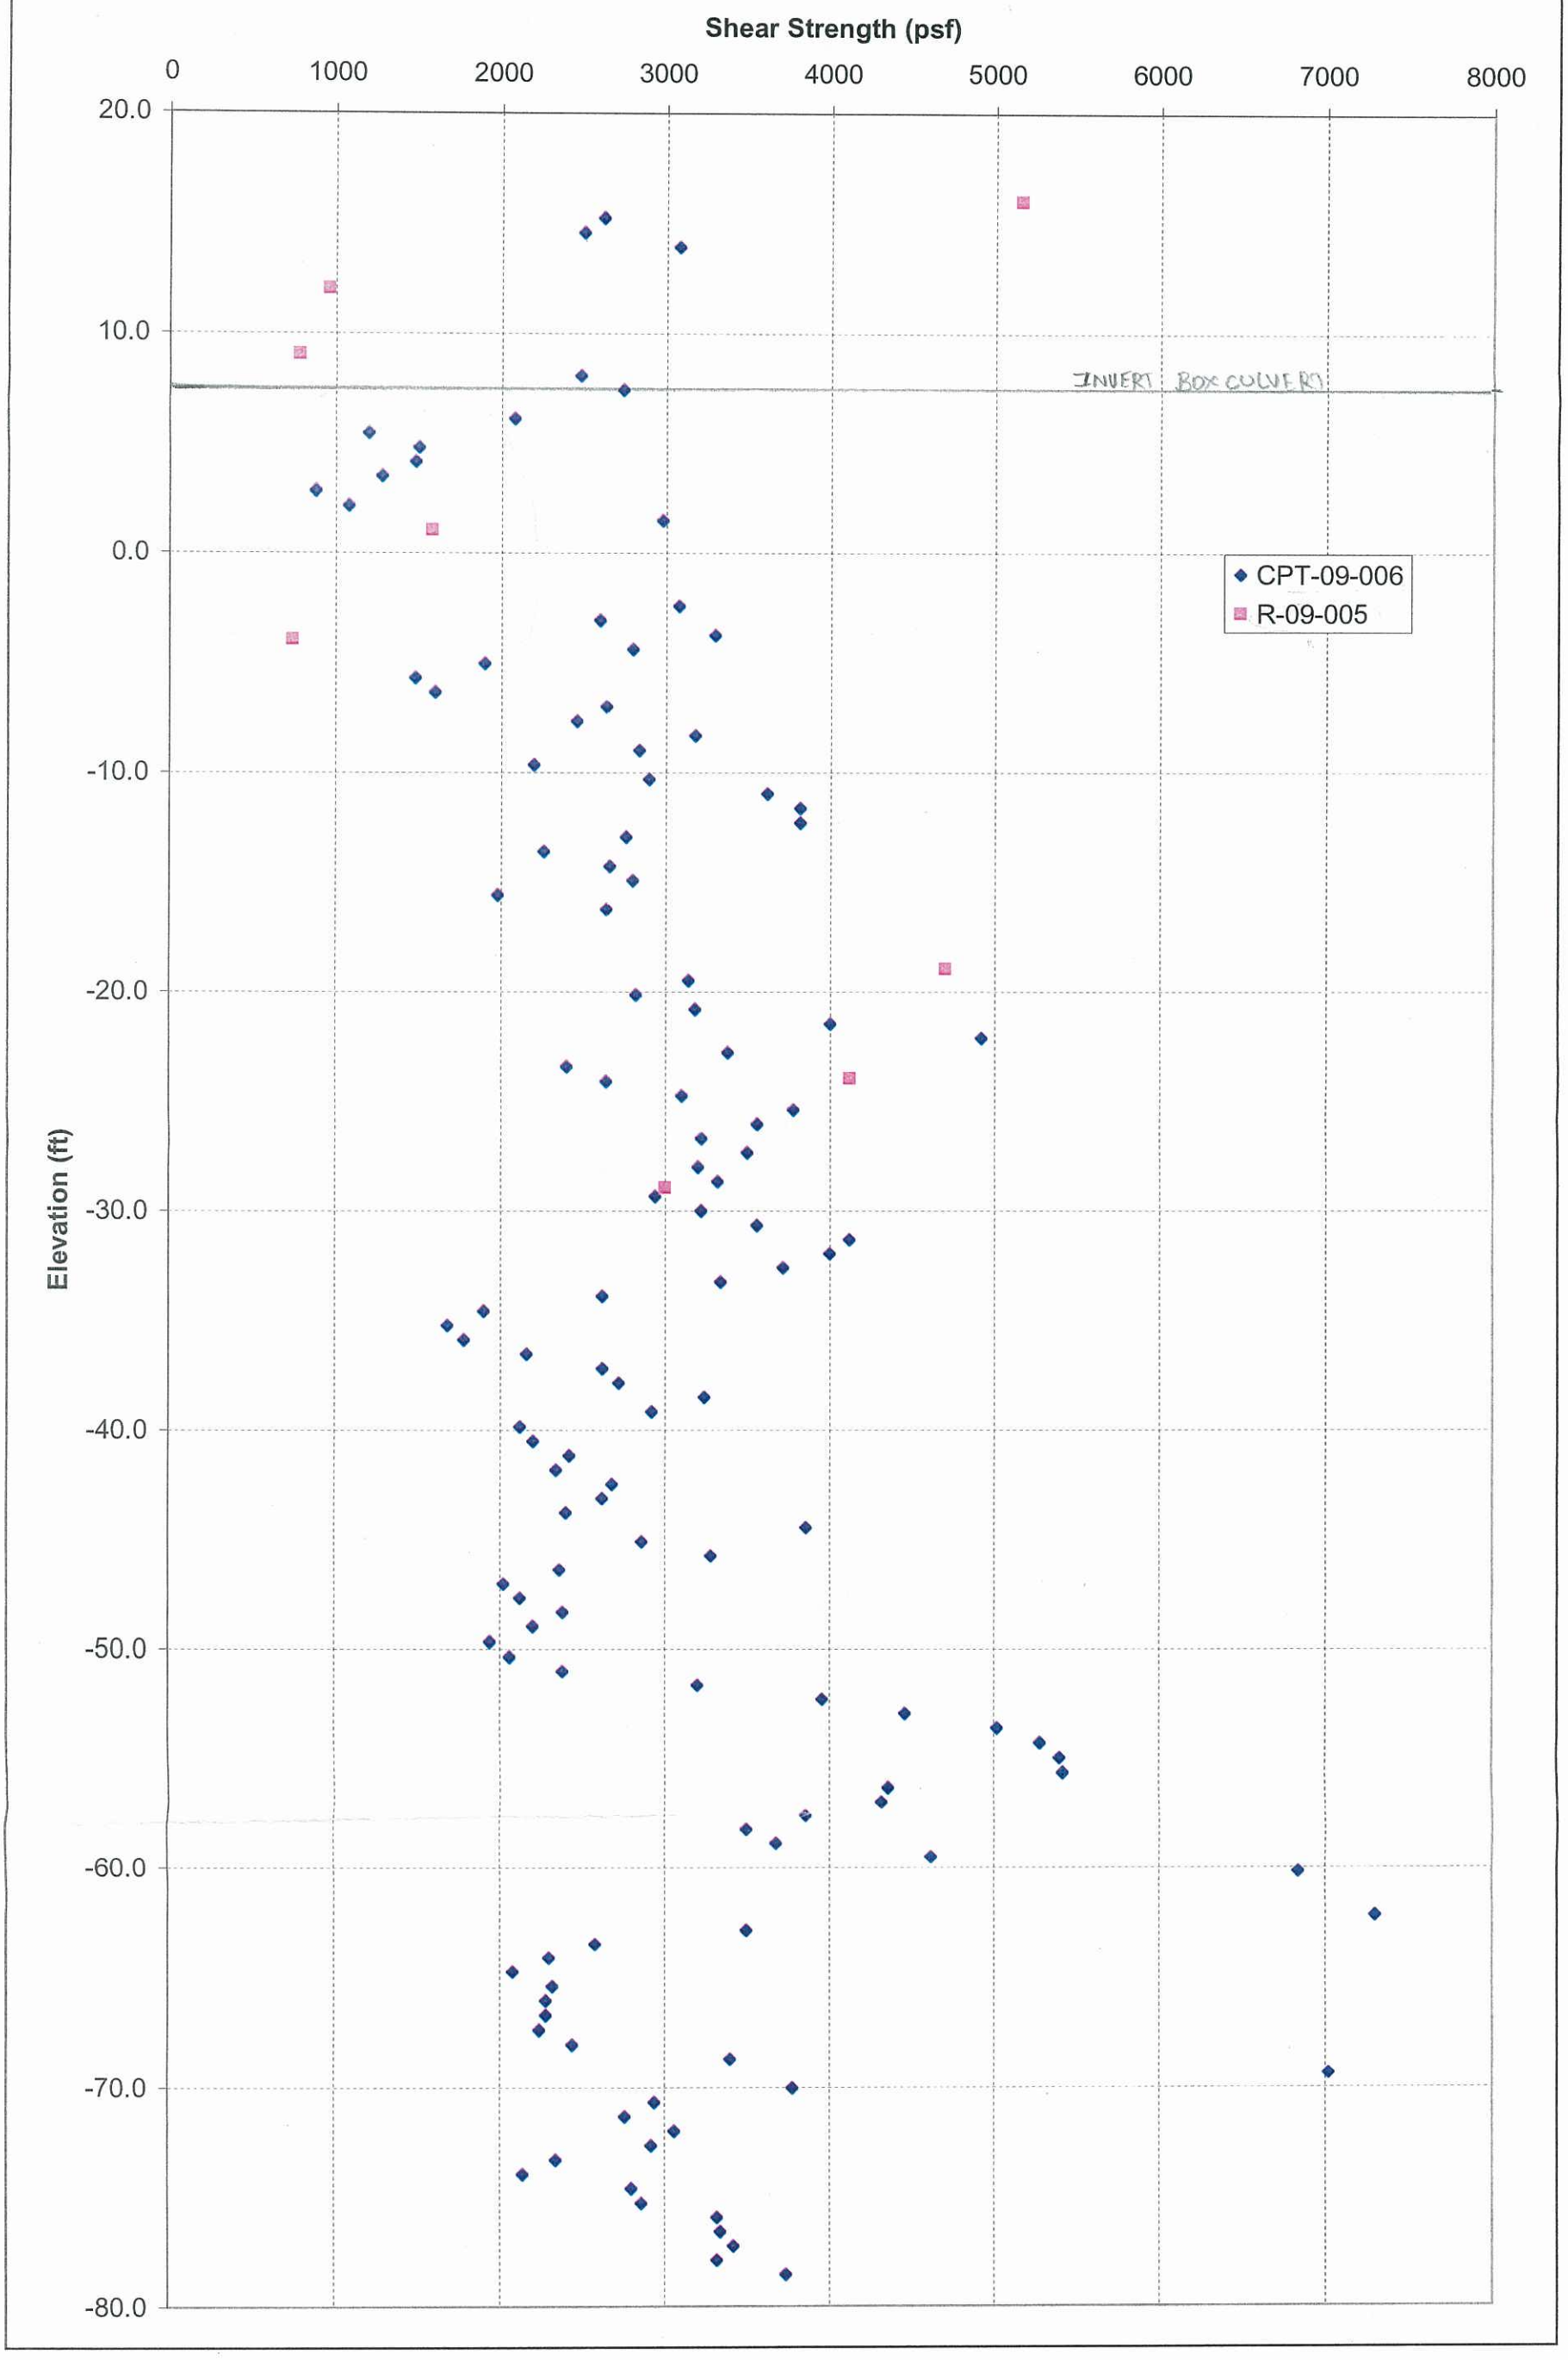
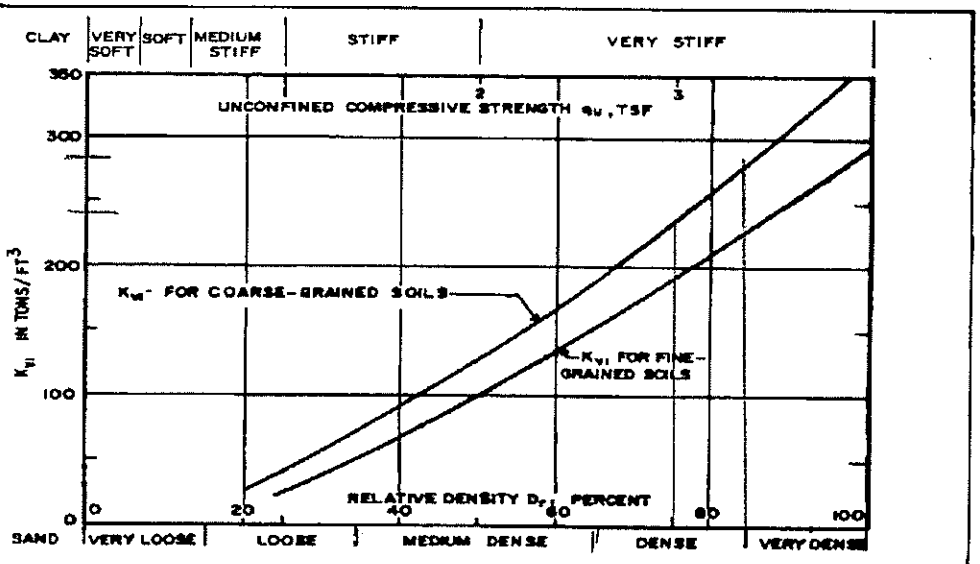
Permanente Creek Box Culvert Extension





DEFINITIONS

ΔH_i = IMMEDIATE SETTLEMENT OF FOOTING
q = FOOTING UNIT LOAD IN tsf
B = FOOTING WIDTH
D = DEPTH OF FOOTING BELOW GROUND SURFACE
K_{vi} = MODULUS OF VERTICAL SUBGRADE REACTION

COARSE-GRAINED SOILS

(MODULUS OF ELASTICITY INCREASING LINEARLY WITH DEPTH)

SHALLOW FOOTINGS $D \leq B$

FOR $B \leq 20$ FT:

$$\Delta H_i = \frac{4\, q\, B^2}{K_{vi}\,(B+1)^2}$$

FOR $B \geq 40$ FT:

$$\Delta H_i = \frac{2\, q\, B^2}{K_{vi}\,(B+1)^2}$$

INTERPOLATE FOR INTERMEDIATE VALUES OF B

DEEP FOUNDATION $D \geq 5B$

FOR $B \leq 20$ FT:

$$\Delta H_i = \frac{2\, q\, B^2}{K_{vi}\,(B+1)^2}$$

NOTES: 1. NONPLASTIC SILT IS ANALYZED AS COARSE-GRAINED SOIL WITH MODULUS OF ELASTICITY INCREASING LINEARLY WITH DEPTH.
2. VALUES OF K_{vi} SHOWN FOR COARSE-GRAINED SOILS APPLY TO DRY OR MOIST MATERIAL WITH THE GROUNDWATER LEVEL AT A DEPTH OF AT LEAST 1.5B BELOW BASE OF FOOTING. IF GROUNDWATER IS AT BASE OF FOOTING, USE $K_{vi}/2$ IN COMPUTING SETTLEMENT
3. FOR CONTINUOUS FOOTINGS MULTIPLY THE SETTLEMENT COMPUTED FOR WIDTH "B" BY 2.

Program Options

Units Used in Computations - US Customary Units, inches, pounds

Basic Program Options:

Analysis Type 1:
- Computation of Lateral Pile Response Using User-specified Constant EI

Computation Options:
- Only internally-generated p-y curves used in analysis
- Analysis does not use p-y multipliers (individual pile or shaft action only)
- Analysis assumes no shear resistance at pile tip
- Analysis includes automatic computation of pile-top deflection vs. pile embedment length

- No computation of foundation stiffness matrix elements
- Output pile response for full length of pile
- Analysis assumes no soil movements acting on pile
- No additional p-y curves to be computed at user-specified depths

Solution Control Parameters:
- Number of pile increments = 50
- Maximum number of iterations allowed = 100
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 1.0000E+02 in

Printing Options:
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (spacing of output points) = 1

Pile Structural Properties and Geometry

Pile Length = 300.00 in
Depth of ground surface below top of pile = .00 in
Slope angle of ground surface = .00 deg.

Structural properties of pile defined using 2 points

Point	Depth X in	Pile Diameter in	Moment of Inertia in**4	Pile Area Sq.in	Modulus of Elasticity lbs/Sq.in
1	0.0000	60.000	636172.5000	2827.4000	3600000.000
2	300.0000	60.000	636172.5000	2827.4000	3600000.000

Soil and Rock Layering Information

The soil profile is modelled using 6 layers

Layer 1 is stiff clay without free water
Distance from top of pile to top of layer = .000 in
Distance from top of pile to bottom of layer = 48.000 in
p-y subgrade modulus k for top of soil layer = 625.000 lbs/in**3
p-y subgrade modulus k for bottom of layer = 625.000 lbs/in**3

Layer 2 is stiff clay without free water
Distance from top of pile to top of layer = 48.000 in
Distance from top of pile to bottom of layer = 120.000 in
p-y subgrade modulus k for top of soil layer = 340.000 lbs/in**3
p-y subgrade modulus k for bottom of layer = 340.000 lbs/in**3

Layer 3 is stiff clay without free water
Distance from top of pile to top of layer = 120.000 in
Distance from top of pile to bottom of layer = 168.000 in
p-y subgrade modulus k for top of soil layer = 100.000 lbs/in**3

p-y subgrade modulus k for bottom of layer = 100.000 lbs/in**3

Layer 4 is stiff clay without free water
Distance from top of pile to top of layer = 168.000 in
Distance from top of pile to bottom of layer = 228.000 in
p-y subgrade modulus k for top of soil layer = 40.000 lbs/in**3
p-y subgrade modulus k for bottom of layer = 40.000 lbs/in**3

Layer 5 is stiff clay without free water
Distance from top of pile to top of layer = 228.000 in
Distance from top of pile to bottom of layer = 360.000 in
p-y subgrade modulus k for top of soil layer = 675.000 lbs/in**3
p-y subgrade modulus k for bottom of layer = 675.000 lbs/in**3

Layer 6 is stiff clay without free water
Distance from top of pile to top of layer = 360.000 in
Distance from top of pile to bottom of layer = 438.000 in
p-y subgrade modulus k for top of soil layer = 180.000 lbs/in**3
p-y subgrade modulus k for bottom of layer = 180.000 lbs/in**3

(Depth of lowest layer extends 138.00 in below pile tip)

Effective Unit Weight of Soil vs. Depth

Distribution of effective unit weight of soil with depth
is defined using 12 points

Point No.	Depth X in	Eff. Unit Weight lbs/in**3
1	.00	.06940
2	48.00	.06940
3	48.00	.07520
4	120.00	.07520
5	120.00	.03620
6	168.00	.03620
7	168.00	.03620
8	228.00	.03620
9	228.00	.03620
10	360.00	.03620
11	360.00	.03910
12	438.00	.03910

Shear Strength of Soils

Distribution of shear strength parameters with depth
defined using 12 points

Point	Depth X	Cohesion c	Angle of Friction	E50 or	RQD

No.	in	lbs/in**2	Deg.	k_rm	%
1	.000	17.36000	.00	.00600	.0
2	48.000	17.36000	.00	.00600	.0
3	48.000	11.11000	.00	.00900	.0
4	120.000	11.11000	.00	.00900	.0
5	120.000	6.94000	.00	.01000	.0
6	168.000	6.94000	.00	.01000	.0
7	168.000	4.51000	.00	.01500	.0
8	228.000	4.51000	.00	.01500	.0
9	228.000	18.75000	.00	.00600	.0
10	360.000	18.75000	.00	.00600	.0
11	360.000	8.33000	.00	.00800	.0
12	438.000	8.33000	.00	.00800	.0

Notes:

(1) Cohesion = uniaxial compressive strength for rock materials.
(2) Values of E50 are reported for clay strata.
(3) Default values will be generated for E50 when input values are 0.
(4) RQD and k_rm are reported only for weak rock strata.

Static loading criteria was used for computation of p-y curves

---

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Case Number 1

Pile-head boundary conditions are Shear and Moment (BC Type 1)
Shear force at pile head = 30994.000 lbs
Bending moment at pile head = 7297227.000 in-lbs
Axial load at pile head = 23500.000 lbs

Non-zero moment at pile head for this load case indicates the pile-head may rotate under the applied pile-head loading, but is not a free-head (zero moment)condition.

Computed Values of Load Distribution and Deflection for Lateral Loading for Load Case Number 1

Pile-head boundary conditions are Shear and Moment (BC Type 1)
Specified shear force at pile head = 30994.000 lbs
Specified bending moment at pile head = 7297227.000 in-lbs
Specified axial load at pile head = 23500.000 lbs

Non-zero moment for this load case indicates the pile-head may rotate under the applied pile-head loading, but is not a free-head (zero moment)condition.

Output Verification:

Computed forces and moments are within specified convergence limits.

Output Summary for Load Case No. 1:

Pile-head deflection	=	.04907366 in
Computed slope at pile head	=	-.00056293
Maximum bending moment	=	7925283.635 lbs-in
Maximum shear force	=	-50273.262 lbs
Depth of maximum bending moment	=	42.000 in
Depth of maximum shear force	=	174.000 in
Number of iterations	=	21
Number of zero deflection points	=	2

Summary of Pile-head Response

Definition of symbols for pile-head boundary conditions:

y = pile-head displacment, in
M = pile-head moment, lbs-in
V = pile-head shear force, lbs
S = pile-head slope, radians
R = rotational stiffness of pile-head, in-lbs/rad

BC Type	Boundary Condition 1	Boundary Condition 2	Axial Load lbs	Pile Head Deflection in	Maximum Moment in-lbs	Maximum Shear lbs

INTRODUCTION

V&A Consulting Engineers was retained by URS Corporation to perform a soil corrosivity Investigation for the proposed US 101 Auxiliary Lanes Project. This project runs from Oregon Expressway in Palo Alto to Shoreline Boulevard (SR 85) in Mountain View, CA. The objective of this investigation is to measure various soil parameters and evaluate the results in order to determine the corrosivity of the soil to the proposed structures associated with the US 101 Auxiliary Lanes Project. Corrosivity was determined for the proposed project structures' materials to depths ranging from 0 to 24.4 meters below grade.

This report provides recommendations for corrosion control for the Concrete Box Culvert at Station 187+50.

The California Department of Transportation, Division of Engineering Services, Materials Engineering and Testing Services, Corrosion Technology Branch has published Corrosion Guidelines (Guidelines) to define corrosive soil. The Guidelines consider soil to be corrosive to structural elements (steel reinforced concrete) if one or more of the following conditions exist for water or soil samples:

> ***"Chloride concentration is 500 ppm (mg/kg) or greater, sulfate concentration is 2,000 mg/kg or greater or the pH is 5.5 or less."***

A wide variety of soluble salts is typically found in soils. Two soils having the same resistivity may have significantly different corrosion characteristics, depending on the specific ions available. The major constituents that accelerate corrosion are chlorides, sulfates and the acidity (pH) of the soil. Chloride ions tend to break down otherwise protective surface deposits and can result in corrosion of reinforcing steel in concrete structures. Sulfates in soil can be highly aggressive to Portland cement concrete by combining chemically with certain constituents of the concrete, principally tricalcium aluminate. This reaction is accompanied by expansion and the eventual disruption of the concrete matrix. High concentrations of bicarbonates tend to decrease soil resistivities. Although bicarbonates are not aggressive to concrete, lower resistivity environments can promote corrosion activity.

Acidity, as indicated by the pH value, is another important factor of soil. The lower the pH (the more acidic the environment), the higher the corrosivity will be with respect to buried metallic and concrete structures. As pH increases above 7 (the neutral value), conditions become increasingly more alkaline and passive to buried structures.

Evaluation of the in-situ soil environment was made in terms of potential damage due to corrosion. Soil resistivity measurements were conducted in the field during the initial stages of the project. In addition, soil samples, collected by URS during the geotechnical investigation, and water samples, collected by V&A from Matadero Creek and Adobe Creek, were forwarded to Cooper Testing Laboratory in Palo Alto, CA, for chemical analysis (Appendix A). The soil borings were analyzed for minimum resistivity, pH, water soluble chloride ion concentration and water soluble sulfate ion concentration, in accordance with the Guidelines.

The pH of the soil samples analyzed ranged from 8.6 to 10.3, while the pH of the water samples analyzed ranged from 7.6 to 7.7. The water soluble chloride ion concentration of the soil borings analyzed ranged from below the minimum detection level of 2 milligrams per kilogram (mg/kg) to 256 mg/kg, while the

water soluble chloride ion concentration of the water samples analyzed ranged from 174 to 187 mg/L. The water soluble sulfate ion concentration of the soil borings analyzed ranged from below the minimum detection level of 5 mg/kg to 203 mg/kg, while water soluble sulfate ion concentration of the water samples analyzed ranged from 12 to 21 mg/L.

Based on the results of the corrosion analyses, the site is considered *non-corrosiv*e.

CONCLUSIONS

- The chloride ion concentration of the soil borings analyzed is less than 500 mg/kg.
- The sulfate ion concentration of the soil borings is less than 2,000 mg/kg.
- The soil pH of the soil borings analyzed is greater than 5.5.
- The site is considered *non-corrosive* in accordance with CALTRANS Guidelines.
- The project site is not located within 300 meters (1,000 feet) of a salt or brackish water source.

RECOMMENDATIONS

Based on the test data and review of the project requirements, specific recommendations for each material alternative are listed below:

Buried Reinforced Concrete Structures and Cast in Place Piles

Buried concrete structures should be constructed of durable concrete as described in ACI Standards 201.2R and 222R. These recommendations include, but are not limited to, the following:

- The water/cement ratio should not exceed 0.50.
- A concrete cover of a minimum of 5.1 centimeters should be applied over all steel reinforcement.
- Sand and water used in concrete mixtures should contain a maximum of 100 ppm of water-soluble chloride ions and water-soluble sulfate ions. They should also have a pH in the range of 6.5 to 8.0. Potable water should be used in concrete mixtures.
- Type I-P (MS) modified or Type II modified cement should be used.
- Standard reinforced concrete pipe design should be suitable for this user defined level of chlorides.
- Concrete and RCP mitigation measures for pH Type IP (MS) modified cement or Type II modified cement is the minimum required by Caltrans Standard Specifications 90-1.01.
- For sulfate resistant concrete and RCP type IP (MS) modified cement or Type II modified cement is the minimum required by Caltrans Standard Specifications 90-1.01

Prestressed Concrete Piles

Prestressed concrete piles should be constructed of durable concrete as described in ACI Standards 201.2R and 222R. These recommendations include, but are not limited to, the following:

- The water/cement ratio should not exceed 0.50.
- A minimum concrete cover of 5.1 centimeters should be applied over all steel reinforcement.
- Sand and water used in concrete mixtures should contain a maximum of 100 ppm of water-soluble chloride ions and water-soluble sulfate ions. They should also have a pH in the range of 6.5 to 8.0. Potable water should be used in concrete mixtures.
- Type I-P (MS) modified or Type II modified cement should be used.

Cast-in-Drilled-Hole (CIDH) Piles

Cast-in-drilled-hole (CIDH) concrete piling shall conform to the provisions in Section 49-4, "Cast-In-Place Concrete Piles," of the Standard Specifications and these special provisions.[1]

The concrete used in CIDH piles should be dense and homogeneous throughout the length and cross section of the pile per California Test 233.[2]

Concrete deposited under slurry shall have a nominal slump equal to or greater than 7 inches, contain not less than 675 pounds of cementitious material per cubic yard, and be proportioned to prevent excessive bleed water and segregation. The nominal and maximum slump and penetration requirements in Section 90-6.06, "Amount of Water and Penetration," of the Standard Specifications shall not apply.[1]

Concrete shall conform to the requirements in "Corrosion Control for Portland Cement Concrete" of these special provisions.[1]

Concrete for portions of CIDH concrete piling to be formed shall contain not less than 675 pounds of cementitious material per cubic yard and shall contain 6.0±1.5 percent air entrainment in the freshly mixed concrete.[1]

Concrete shall conform to the requirements in "Mass Concrete for Cast-in-Place Concrete Piles" of these special provisions.[1]

Culvert, Mechanically Stabilized Embankment and Metallic Soil Reinforcement Backfill

Fast setting concrete backfill may need to be used when placing culverts in existing roadways. When using an admixture to decrease concrete curing times, only non-chloride admixtures should be considered.

Culvert materials were selected using the Department of Transportation CULVERT4 Software that calculates Maintenance-Free Service Design Estimates using California Department of Transportation (Caltrans) criteria (See Appendix B).

Non-corrosive backfill for metallic soil reinforcement, such as tie-back anchors or soil nails and reinforced concrete structures, shall meet the following requirements, in accordance with the Guidelines:

- Minimum resistivity greater than 1,500 ohm-cm.
- Water soluble chloride ion concentration less than 500 mg/kg.
- Water soluble sulfate ion concentration less than 2,000 mg/kg.

- A pH between 5.5 and 10.0.

Alternative Pipe Material Selection

Alternative pipe materials were selected using the Department of Transportation CULVERT4 Software that calculates Maintenance-Free Service Design Estimates using California Department of Transportation (Caltrans) criteria (see Appendix C).

Using the harshest soil conditions from the sampled soil borings (R-09-001 with a pH of 10.2 and a minimum resistivity of 421 ohm-cm, Chloride 256 mg/kg and Sulfate 181 mg/kg), the following material recommendations can be made:

- 10 gage (3.5 mm) galvanized (57g) corrugated steel culverts.
- 12 gage (2.8 mm) galvanized steel culverts with a water-side bitumastic coating.
- 14 gage (2.0 mm) galvanized steel culverts with a bitumastic coating and a paved invert.
- 16 gage (1.6 mm) galvanized steel culverts with a soil-side bitumastic coating.
- 18 gage (1.3 mm) galvanized steel culverts with a polymer sealed 90º invert.
- Plastic pipe is approved for 50 years of service life for corrosive conditions. Abrasion must be evaluated.
- A corrugated aluminum pipe (CAP) should not be used due to corrosive conditions.
- A corrugated aluminized steel pipe (CASP) should not be used due to corrosive conditions.

TEST METHODS

In attempting to predict corrosion problems associated with a particular type of structure prior to installation, it is necessary to investigate the soil conditions the structure will encounter. Since corrosion is an electrochemical process accompanied by current flow, the electrochemical characteristics of a soil are of primary importance when evaluating corrosivity. Test methods utilized during this investigation reflect the most practical methods of evaluating corrosivity.

In-Situ Soil Resistivity

Resistivity of the soil was measured at 24 locations on the project alignment. Figure 1 shows the overall project vicinity map and Figure 2 shows the field soil resistivity testing locations and soil boring locations.

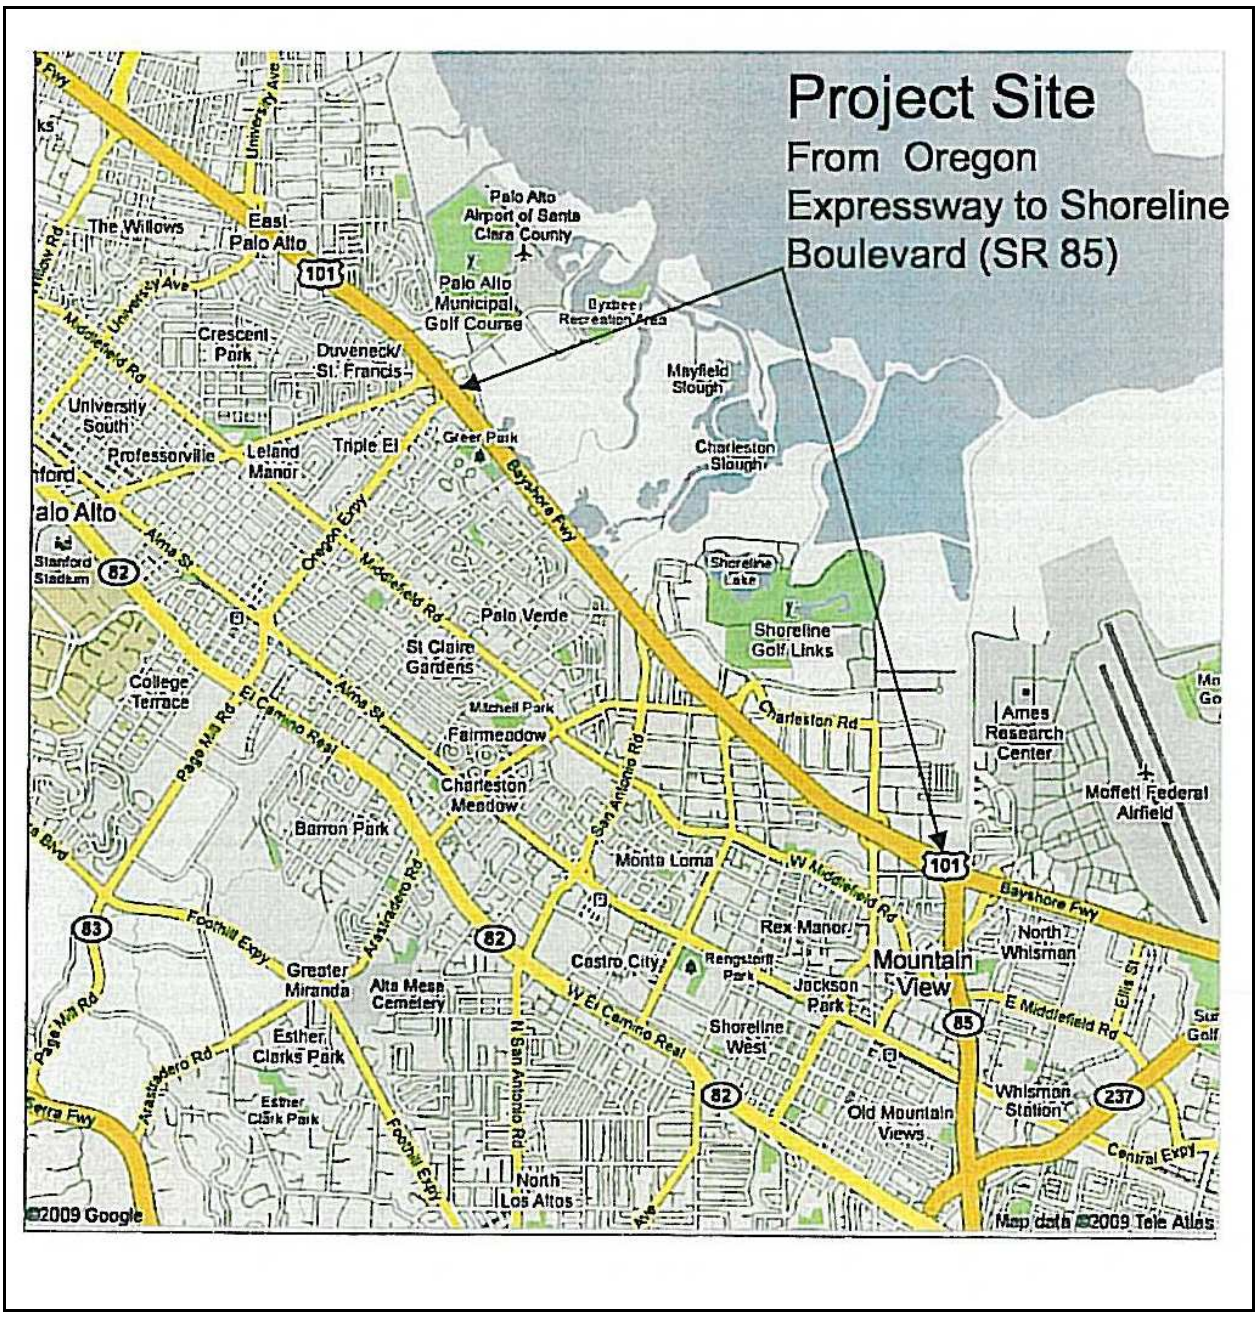

Figure 1 - Vicinity and Project Site Map[1]

[1] Maps courtesy of the Google

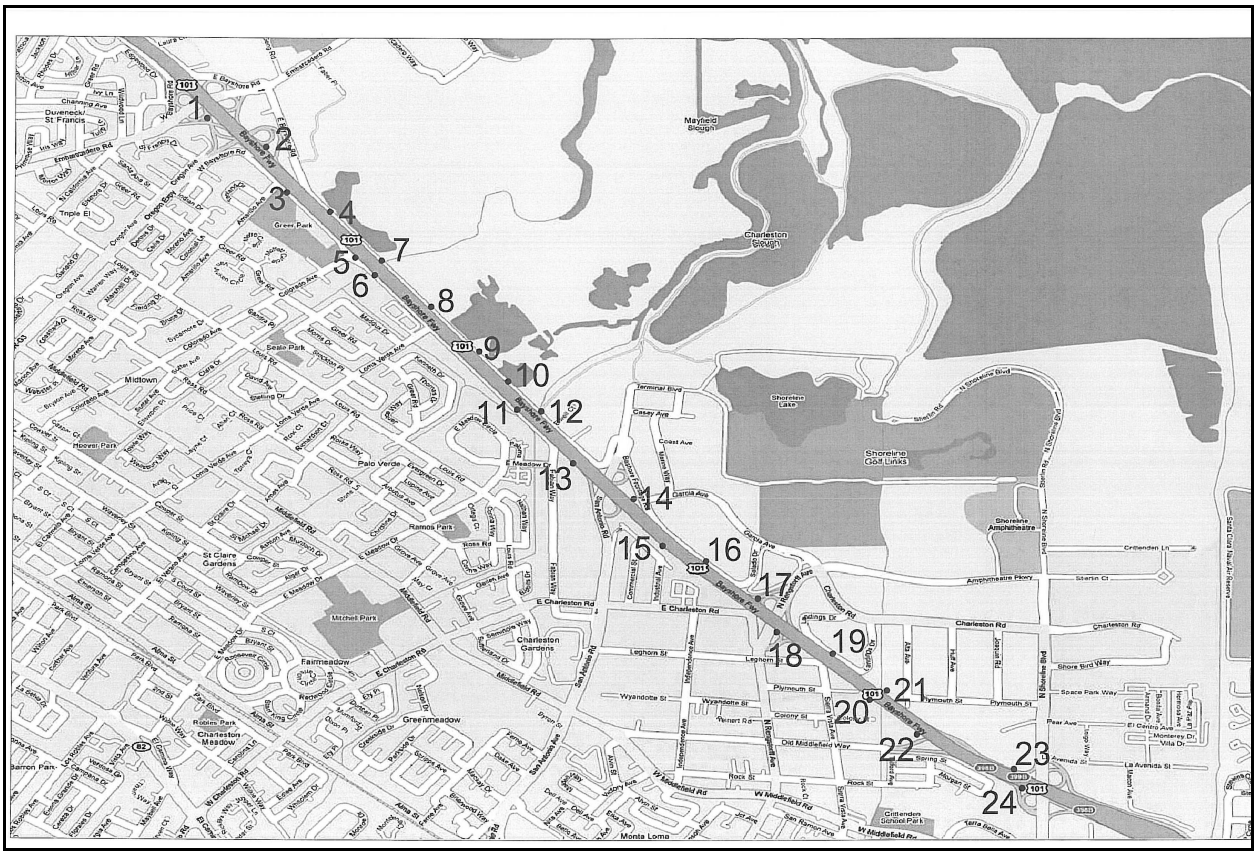

Figure 2 – In-Situ Resistivity Testing Locations

In-situ soil resistivity was measured using the Wenner 4-Electrode (Wenner) Method, with a DIGITAL GROUND RESISTANCE TESTER, Model 4500, manufactured by AEMC Instruments as shown in Figure 4. The Wenner Method involves the use of four metal probes or electrodes, driven into the ground along a straight line, equidistant from each other, as shown in Figure 3.

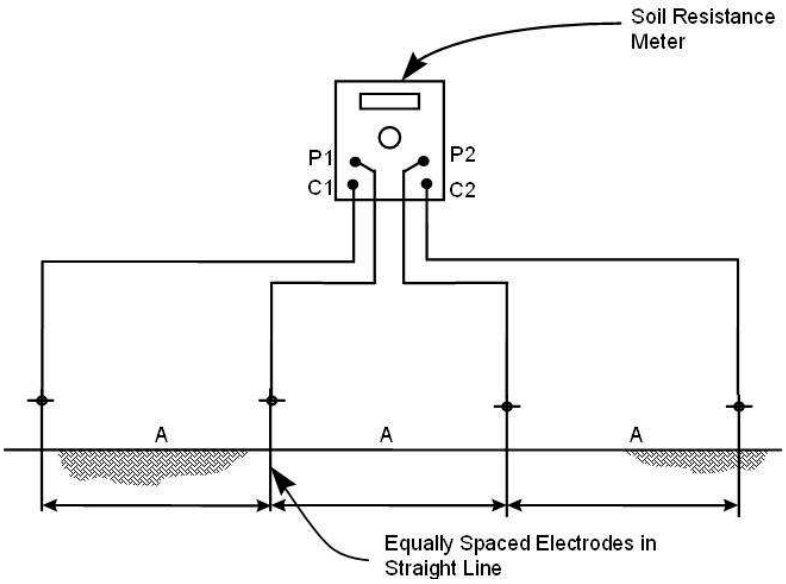

Figure 3 – In-Situ Soil Resistivity Measurement

An alternating current from the Soil Resistance Meter causes a current to flow through the soil between the outside electrodes, C1 and C2. Due to the resistance of the soil, the current creates a voltage gradient, which is proportional to the average resistance of the soil mass to a depth equal to the distance between probes. The voltage drop is then measured across electrodes P1 and P2. Resistivity of the soil is computed from the instrument reading according to the following formula:

$$\rho = 2 \cdot \pi \cdot A \cdot R$$

Where:	ρ	=	soil resistivity (ohm-cm)
	A	=	distance between electrodes (cm)
	R	=	soil resistance, instrument reading (ohms)
	π	=	3.14 (approx.)

Soil resistance was measured with electrodes spaced 0.8, 1.5, 2.3, 3, 4.6, 9.1, 13.7, 18.3 and 24.4 meters apart (2.5, 5, 7.5, 10, 15, 30, 45, 60 and 80 feet). The resistivity values obtained represent the average resistivity of the soil to a depth equal to the electrode spacing. An additional method of calculating the soil resistivity using the data from the Wenner Method is the Barnes-Layer resistivity calculation. The Barnes Layer calculation is used to determine the resistivity of the soil for each soil layer. While the Wenner Method at 3 meters will consider all 3 meters of soil below the surface, the Barnes-Layer method will consider the resistivity of only the layer of soil between 1.5m and 3m below the surface. This method assumes the soil layers are a uniform thickness and parallel to the surface, which may not always be true.

$\rho_{b-a} = KR_{b-a}$ and $\frac{1}{R_{b-a}} = \frac{1}{R_a} - \frac{1}{R_b}$

Where:

ρ_{b-a}	=	Soil resistivity of layer depth b-a (ohm-cm)
a	=	Soil depth to top of layer (cm)
b	=	Soil depth to bottom of layer (cm)
R_a	=	Soil resistance read at depth a (ohms)
R_b	=	Soil resistance read at depth b (ohms)
R_{b-a}	=	Resistance of soil layer from a to b (cm)
K	=	2 π (b-a)

Barnes Layer resistivity is calculated for layers 0 to 0.8, 0.8 to 1.5, 1.5 to 2.3, 2.3 to 3, 3 to 4.6, 4.6 to 9.1, 9.1 to 13.7, 13.7 to 18.3, and 18.3 to 24.4 meters (0 to 2.5, 2.5 to 5, 5 to 10, 10 to 15, 15 to 30, 30 to 45, 45 to 60 and 60 to 80 feet) below grade.

Laboratory Analysis of Soil and Water

To supplement the resistivity data obtained during field testing, soil samples from the project site were obtained from URS. The soil samples, along with water samples collected by V&A, were forwarded to Cooper Testing Laboratory in Palo Alto, CA, for testing. The samples were tested for pH, minimum resistivity and water soluble chloride and sulfate ion concentrations.

TEST RESULTS AND DISCUSSION

Data obtained during this investigation has been summarized in tabular form for analysis and presentation. Table 1 lists the results of the field soil resistivity measurements conducted at the site. Table 2 lists the minimum soil resistivity for each sample collected as well as the chemical analysis of the samples.

In-Situ Soil Resistivity

Since corrosion is a natural electrochemical process accompanied by the flow of electrical current, it is important to understand how easily current will travel through the soil surrounding steel or steel reinforced concrete structure. Resistivity is a measure of the ability of a soil to conduct an electric current. Soil resistivity is primarily dependent on the chemical and moisture content of the soil. As the concentrations of chemical constituents increases, the soil resistivity will decrease. Additional moisture generally decreases the soil resistivity up to the point where the maximum solubility for the dissolved ionic chemicals is achieved. Beyond the maximum solubility, an increase in moisture generally increases the resistivity as

the chemicals become more and more diluted. Since corrosion rate depends on current flow through the soil to and from the metal, soil corrosivity normally increases as soil resistivity decreases.

Laboratory Analysis of Soil and Water Samples

Table 2 lists the minimum soil resistivity for each sample collected, as well as the chemical analysis of the samples.

Based on the corrosion analyses, the soil is classified as *non-corrosive* to *corrosive* in accordance with the Corrosion Guidelines.

Table 2 – Minimum Resistivity and Chemical Data

Item No.	Boring No.	Station	Sample No.	Depth (meters)	Minimum Resistivity (ohm-cm)	Chemical Data		
						pH	Sulfate (mg/kg)	Chloride (mg/kg)
1	Water	72+00	1	N/A	916	7.7	21 mg/L	187 mg/L
2	Water	109+50	1	N/A	1,133	7.6	12 mg/L	174 mg/L
3	R-09-001	72+60	4	4.6	421	10.2	181	256
4	R-09-004	109+32	4	4.6	527	10.3	203	235
5	R-09-005	188+53	2	2.4 – 3	3,850	8.6	<5	6

Subject: 5th Review Comments for Geotechnical Design and Materials Report (GDMR)

This memorandum is in response to your 5th review request of Geotechnical Design and Materials Report (GDMR) dated October 25, 2010. The purpose of the project is to relieve existing and future traffic congestion on weaving section and at ramp termini, and provide for improved local access over this segment of this segment of the U.S. 101 corridor. The proposed project is located on U.S. 101 in the Cities of Mountain View and Palo Alto in Santa Clara County with project limits extending from State Route (SR) 85 on the south to Embarcadero Road on the north (PM 48.97 / 52.17).

Having reviewed the GDMR, we have the following comments:

A. Section 5.3.7 Recommended Ramp Sections (SPCS 5 - Excluding SB U.S. 101 On-/Off-Ramps at Rengtorff)

Why the AS section did not thickened to achieve a minimum total pavement thickness of 3 feet as Section 5.3.8 and Section 5.3.9 ? Please make the appropriate changes of the proposed Structural Sections to Appendix B "Typical Cross Sections".

B. Appendix B - Typical Cross Sections

Please provide calculation and design factors for "proposed structural sections #12" to Section 5.3 New Structural Pavement Sections. (If TI > 12, please comment why LCB was not use at this section.) How will this structural sections achieve a minimum total pavement thickness of 3 feet as Section 5.3.8 and Section 5.3.9 ?

* * * * * *

If you have any questions, please contact Kan Wong at (510) 622-8814.

CT	Kan Wong	1		A. <u>Section 5.3.7 Recommended Ramp Sections (SpeS 5 - Excluding SB U.S. 101 On-/Off Ramps at Rengtorff)</u> Why the AS section did not thickened to achieve a minimum total pavement thickness of 3 feet as Section 5.3.8 and Section 5.3.9? Please make the appropriate changes of the proposed Structural Sections to Appendix B "Typical Cross Sections".	The samples and explorations that form the basis for Structural Pavement Section (SPCS) 5 for on and off ramps did not encounter potentially expansive soils (fat clays). Therefore, the AS component of SPCS 5 is not thickened to make the overall pavement thickness exceed 3 feet. A hand augered sample at the south bound off ramp at Rengstorff Avenue revealed fat clay and formed the basis for thickened AS components for SPCS 6 and 7. Will include a footnote in Section 5.3.7 as reference.	SH	E		E

Subject: 4th Review Comments for Geotechnical Design and Materials Report (GDMR)

This memorandum is in response to your 4th review request of Geotechnical Design and Materials Report (GDMR) dated October 6, 2010 and excerpt of the GDMR Section 5.2 by email dated October 19, 2010. The purpose of the project is to relieve existing and future traffic congestion on weaving section and at ramp termini, and provide for improved local access over this segment of this segment of the U.S. 101 corridor. The proposed project is located on U.S. 101 in the Cities of Mountain View and Palo Alto in Santa Clara County with project limits extending from State Route (SR) 85 on the south to Embarcadero Road on the north (PM 48.97 / 52.17).

Having reviewed the GDMR, we have the following comments:

A. Section 5.1 Structural Section Design Parameters

The total overlay thickness should comply with Section 5.4 "Pavement Overlay" of 0.15' RHMA(G).

B. Section 5.2.1 Untreated Subgrade

Please comment why compensate for expansive soils and or Subgrade Enhancement Geotextile did not apply to Section 5.3.7 and Section 5.3.8.

C. Section 5.3.3, Section 5.3.4, Section 5.3.5, Section 5.3.6, Section 5.3.7 & Section 5.3.8
Please make the appropriate changes of the proposed Structural Sections to Appendix B "Typical Cross Sections".

D. Section 9.2.2 Structural Pavement Materials

Add Subgrade Enhancement Geotextile if applicable.

E. Section 9.2.3 Standard Special Provisions

Rubberized Hot Mix Asphalt (Gap Graded)

- Please edited the attached nSSP 39-150 to replace SSP 39-150.

F. Appendix B - Typical Cross Sections

1. Please revise the project typical cross section sheets in accordance with Section 5.3 New Structural Pavement Sections and Section 5.4 Pavement Overlay of the Final GDMR.

2. Please request the relevant Office to review the Typical Cross Sections of "Matadero Creek Bridge" on Plan Sheet X-4 and "Adobe Creek Bridge" on Plan Sheet X-6 in Appendix B.

* * * * * *

If you have any questions, please contact Kan Wong at (510) 622-8814.

Subject: 3rd Review Comments for Geotechnical Design and Materials Report (GDMR)

This memorandum is in response to your 3rd review request of Geotechnical Design and Materials Report (GDMR) dated June 11, 2010. The purpose of the project is to relieve existing and future traffic congestion on weaving section and at ramp termini, and provide for improved local access over this segment of this segment of the U.S. 101 corridor. The proposed project is located on U.S. 101 in the Cities of Mountain View and Palo Alto in Santa Clara County with project limits extending from State Route (SR) 85 on the south to Embarcadero Road on the north (PM 48.97 / 52.17).

Having reviewed the GDMR, we have the following comments:

A. Section 5.2.2 Lime Treated Subgrade

The report indicated "lime treated subgrade" will be a viable option on Northbound from station 129+00 to station 173+00 (Batch 1).

There are two conflicts with the above statement:

1. On your response (Appendix L) to our 2nd GDMR Review Comment (dated February 26, 2010), item 2, item 10 and item 12, you indicated there will be no "lime treated subbase" for this project.
2. Option #2 and Option #3 under Section 5.3.4 indicated the usage of "lime treated subgrade" at Northbound from Station 49+00 to Station 56+00, and from Station 125+00 to Station 135+00.

B. Section 5.2.3 Station Intervals of Lime Treatment

The report indicated the following three segments would benefit from lime treatment of subgrade:

1. Southbound, "C" Station 49+00 to 53+00.
2. Northbound, "C" Station 125+00 to 135+00.
3. Northbound, "C" Station 169+00 to 182+00.

Section 5.2.2, however, states that "lime treated subgrade" will be required on Northbound from Station 129+00 to Station 173+00 (Batch 1). Please clarify.

C. Section 5.3.2 RHMA Considerations

Please eliminate the option of using HMA (Type B).

D. Section 5.3.3, Section 5.3.4, Section 5.3.5, Section 5.3.6

Please recalculate and use 0.15' RHMA-G as the last layer to match the adjacent project. Apply this information to Section 5.4 and "Typical Cross Sections" (Appendix B) accordingly.

E. Section 5.3.9 Recommended Full Depth HMA Alternative for Mainline

On your response (Appendix L) to our 2nd GDMR Review Comment (dated February 26, 2010), item 6, you indicated "no full depth HMA sections are proposed" for this project. However, this section still shows a full HMA option. Please clarify.

F. Section 5.4 Pavement Overlay

In order to match the adjacent project and maximize the usage of RHMA-G, please do the following:

1. On Southbound, overlay with 0.15' RHMA-G.
2. On Northbound, cold plane 0.10' existing OGAC and overlay with 0.15' of RHMA-G.
3. Apply the above information to the "Typical Cross Sections" accordingly.

G. Section 9.2.2 Structural Pavement Sections

1. Please revise the section heading to read "Structural Pavement Materials".
2. Add the item Lime Treat Subbase if applicable.

H. Appendix B - Typical Cross Sections

Please revise the project typical cross section sheets in accordance with Section 5.3 New Structural Pavement Sections and Section 5.4 Pavement Overlay of the Final GDMR.

* * * * * *

If you have any questions, please contact Kan Wong at (510) 622-8814.

CT	Kan Wong	1		A. Section 5.2.2 Lime Treated Subgrade The report indicated "lime treated subgrade" will be a viable option on Northbound from station 129+00 to station 173+00 (Batch 1). There are two conflicts with the above statement: 1. On your response (Appendix L) to our 2nd GDMR Review Comment (dated February 26, 2010), item 2, item 10 and item 12, you indicated there will be no "lime treated subbase" for this proj ect. 2. Option #2 and Option #3 under Section 5.3.4 indicated the usage of "lime treated subgrade" at Northbound from Station 49+00 to Station 56+00, and from Station 125+00 to Station 135+00.	It is the project intent to provide a basis for evaluating feasibilityof lime treatment of subgrade soils, in the event if the Contractor proposes a CRIP for lime treated subbase (subgrade improvement) in lieu of aggregate subbase. As recommended in the report more tests should be performed by the Contractor on the fat clays if the Contractor proposes a CRIP for subgrade improvement. Lime treated subbase (LTS) section (options #2 and #3) from Section 5.3.4 will be deleted as it is not planned for the PS&E package at this time. The recommendations for a lime treated subbase section will be added as a separate section for future use in the event a CRIP of LTS is submitted by the Contractor.		A		
CT	KW	2		B. Section 5.2.3 Station Intervals of Lime Treatment The report indicated the following three segments would benefit from lime treatment of subgrade: 1. Southbound, "C" Station 49+00 to 53+00. 2. Northbound, "C" Station 125+00 to 135+00.	Section 5.2.2 will be revised to clarify the segments that could benefit from lime treatment of subgrade.		A

Subject: 2nd Review Comments for Geotechnical Design and Materials Report (GDMR) and Life Cycle Cost Analysis (LCCA)

This memorandum is in response to your email dated February 10, 2010 requesting our review of Geotechnical Design and Materials Report (GDMR) and Life Cycle Cost Analysis (LCCA). The purpose of the project is to relieve existing and future traffic congestion on weaving section and at ramp termini, and provide for improved local access over this segment of this segment of the U.S. 101 corridor. The proposed project is located on U.S. 101 in the cities of Mountain View and Palo Alto in Santa Clara County with project limits extend from State Route (SR) 85 on the south to Embarcadero Road on the north (PM 48.97 / 52.17).

Having reviewed the GDMR and LCCA, we have the following comments:

I. Geotechnical Design and Materials Report

A. Section 3.2.3 Groundwater

Does the pavement require the installation of "underdrain" ?

B. Section 5.2.2 Lime Treated Subgrade

Table 5-3 indicated combined bulk samples from different boring locations were used for lime treat testing. The lime treat testing results shown in Table 5-4 might not be the true lime treat testing results.

C. Section 5.3.9 Recommended Full Depth HMA Alternative for Mainline

1. If this is a full depth HMA, why uses Class 3 AB as base ?
2. If base is needed, please consider LCB.
3. Where do you apply this sections ?
4. Full Depth HMA is not recommended to be use on mainline with high TI and low soil R-value.

D. Section 5.3.7 Recommended Ramp Sections

The pavement sections of each ramp should be design with its R-value accordingly.

E. Section 9.2.2 Structural Pavement Sections

1. Add SSP for RHMA-G.
2. Add SSP for ATPB.
3. Add SSP for Lime Treat Subbase if applicable.

F. Appendix B - Typical Cross Sections

1. Please double check; the "proposed structural sections" are not shown in accordance with Section 5 Structural Pavement of the GDMR.
2. Is there any pavement structural sections use "lime treated subbase" in this project ?
3. Please show design factors and support calculation for structural section #8 and #9.

II. Life Cycle Cost Analysis

No comment.

Subject : Review GDR

We have reviewed the submitted Geotechnical Design and Materials Report for the above referenced project and we have the following comments:

- Page 6-10 - The magnitude of the downdrag due to liquefaction, should be specified.
- A sample of the computer program output (Comp 624, etc.) resulting the design length of the piles for the proposed overhead sign structures should be included in the Appendix.

If you have any questions or need additional information, please call me at 510-286-4831 or Hooshmand Nikoui, Branch Chief at 510-286-4811.

Subject: Review Comments for Draft Geotechnical Design and Materials Report (GDMR)

This memorandum is in response to URS's email dated August 14, 2009 requesting our review of Draft Geotechnical Design and Materials Report (GDMR). The purpose of the project is to relieve existing and future traffic congestion on weaving section and at ramp termini, and provide for improved local access over this segment of this segment of the U.S. 101 corridor. The proposed project is located on U.S. 101 in the cities of Mountain View and Palo Alto in Santa Clara County with project limits extend from State Route (SR) 85 on the south to Embarcadero Road on the north (PM 48.97 / 52.17).

Having reviewed the Draft GDMR, we have the following comments:

I. Draft Geotechnical Design and Materials Report

A. Section 5.2.1 Untreated Subgrade

1. Table 5-1 R-Value Test Results
   a. Have any soil samples been taken for ramp modifications?
   b. What are the design R-values for each ramp?
   c. Please show the R-value boring locations (mainline & ramps) on a plan sheet.

2. Table 5-2 Subgrade Design R-Value
   The design R-value of 5 does not agree with the R-values shown in Table 5-4 Bulk Sample Test Results.

B. Section 5.2.2 Lime Treated Subgrade

- Table 5-4 indicated the R-values for Batch #1, #2 and #3 as 14, 19 and 17 respectively which are greater than 10. Is batch #1 still a viable option for "lime treatment"?
- Samples should be taken from one location for each Lime Treat Testing. Combined bulk samples from different borings may not produce a true representative sample for lime testing.
- According to the latest Caltrans Highway Design Manual, the proposed design UCS is 300 psi. Please double check the formula for calculating G_f and modify the design as necessary.

C. Section 5.3.4 Recommended Northbound Mainline and Shoulder Sections from "C" Line Station 129+00 to 214+00 (SPCS 2)

Please redesign the pavement structural sections for Option #2 and #3 using LCB as base for T.I. greater than 12.

D. Section 5.3.7 Recommended Ramp Sections

Do all ramps have an R-value of 5? If not, please show the R-values of each ramp and redesign the pavement sections accordingly.

E. Section 5.4 Pavement Overlay

Please identify the cold plane thickness, overlay material and thickness for the northbound segment.

F. Section 6.1.5 Soil Reuse and Disposal

1. Please consult Caltran's Office of Environmental Engineering for regulation/policy prohibiting the reuse of lead contaminated soil as a component of lime-treated subbase.
2. Has any "lime treated" tests been performed on the lead-impacted soil to verify its usage?

G. Section 7.3.5 Alternative Pipe Material Selection

Please rerun and check by using CULVERT4 Software; whether or not to use Corrugated Aluminum Pipe (CAP) and Corrugated Aluminized Steel Pipe (CASP) due to corrosive conditions. Our analysis shows that these should not be used.

II. Appendix B - Typical Cross Sections

The "proposed structural sections" should be shown in accordance with Section 5 Structural Pavement of the GDMR.

Draft Geotechnical Design and Materials Report								
CT	KW	1	Table 5-1 R-Value Test Results	**Section 5.2.1 Untreated Subgrade** a. Have any soil samples been taken for ramp modifications? b. What are the design R-values for each ramp? c. Please show the R-value boring locations (mainline & ramps) on a plan sheet.	a. Yes. b. Will include description in Table 5-1. c. Will comply.	A		
CT	KW	2	Table 5-2 Subgrade Design R-Value	The design R-value of 5 does not agree with the R-values shown in Table 5-4 Bulk Sample Test Results.	The design R-value considers a reasonable lower bound for each station interval.	C		
CT	KW	3		**Section 5.2.2 Lime Treated Subgrade** Table 5-4 indicated the R-values for Batch #1, #2 and #3 as 14, 19 and 17 respectively which are greater than 10. Is batch #1 still a viable option for "lime treatment"?	Considering the potential expansiveness of Batch #1 (LL=64, PI=46), lime treatment should help minimize the swell/shrink potential of the subgrade and help workability.	C		
CT	KW	4		Samples should be taken from one location for each Lime Treat Testing. Combined bulk samples from different borings may not produce a true representative sample for lime testing.	The bulk samples were constituted using similar soil types based on visual classification.	C		
CT	KW	5		According to the latest Caltrans Highway Design Manual, the proposed design UCS is 300 psi. Please double check the formula for calculating G_f and modify the design as necessary.	Based on HDM Section 6.14.4, "Expansive Soil," the G_f equation is valid for UCS greater than or equal to 300 psi. Therefore, the UCS target of 400 psi we selected remains valid.	C

Dear Mr. Mai:

Attached is a copy of the above referenced report. The conclusions and recommendations present our professional judgments and opinions based upon the findings identified in this report.

The report has been revised since the draft from August 2009, to incorporate the revised results from additional statistical analysis that has been undertaken with respect to lead. The groupings of soil samples used within the statistical analysis were amended to reduce the amount of soil that is subject to reuse restrictions.

The following table shows how the original sample groupings (from the August 2009 analysis and report) were re-grouped for the current statistical analysis and attached report. To avoid confusion, the revised report makes no mention of the original groupings.

Original Group (Aug 2009 Report)	Northern Limit Station	Southern Limit Station	Depth*	Revised Group (as used in attached report)
Southbound				
1	Northern end of project	50+00	0-1 ft	1A
1	Northern end of project	50+00	1-3 ft	1B
2A	50+00	113+00	0-1 ft	1A
2B	50+00	113+00	1-3 ft	1B
3A	113+00	197+00	0-0.5 ft	2A
3B	113+00	197+00	0.5-3 ft	2B

URS Corporation

Fax: 408.297.6962
www.urscorp.com

URS

Original Group (Aug 2009 Report)	Northern Limit Station	Southern Limit Station	Depth*	Revised Group (as used in attached report)
4	197+00	Southern Project Limit	0-0.5 ft	2A
4	197+00	Southern Project Limit	0.5-3 ft	2B
Northbound				
5	Northern Project Limit	70+00	0-1.5 ft	3A
5	Northern Project Limit	70+00	1.5-3 ft	3B
6A	70+00	105+00	0-1.5 ft	3A
6B	70+00	105+00	1.5-3 ft	3B
7A	105+00	159+00	0-1.5 ft	4A
7B	105+00	159+00	1.5-3 ft	4B
8A	159+00	Southern Project Limit	0-1 ft	5A
8B	159+00	Southern Project Limit	1-3 ft	5B

Based on the revised groupings, the following reuse and disposal requirements apply.

Group	Northern Limit Station	Southern Limit Station	Depth*	Reuse Restriction	Disposal Requirement
Southbound					
1A	Northern Project Limit	113+00	0-1 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
1B	Northern Project Limit	113+00	1-3 ft	None	Non-Hazardous
2A	113+00	Southern Project Limit	0-0.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
2B	113+00	Southern Project Limit	0.5-3 ft	None	Non-Hazardous
Northbound					
3A	Northern Project Limit	105+00	0-1.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
3B	Northern Project Limit	105+00	1.5-3 ft	None	Cal-Hazardous, or out-of-state
4A	105+00	159+00	0-1.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
4B	105+00	159+00	1.5-3 ft	None	Non-Hazardous
5A	159+00	Southern Project Limit	0-1 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
5B	159+00	Southern Project Limit	1-3 ft	None	Non-Hazardous

URS

Please note that as discussed in the August 2009 report, selected areas with higher than typical lead known as "hot spots" at 5 locations are to be preliminarily excavated and off-hauled. In addition to those 5 locations, samples associated with a hot spot at boring N-1-4 has also been removed from the sample set as the analytical results would have negatively impacted soil reuse potential. Soil associated with this boring will be separately excavated and managed.

In addition, sampling related to an additional right of way acquisition area identified as the "Peery Property" was performed subsequent to the initial draft; the results of this sampling effort are discussed in this revised report.

Please do not hesitate to contact us if there are any questions or comments.

Sincerely,
URS Corporation

Christopher Lillie, P.E.
Deputy Project Manager

Patrick D. Walz, P.E.
Project Environmental Task Leader

EXECUTIVE SUMMARY

The U. S. 101 Auxiliary Lanes project consists of the segment of U. S. 101 between Embarcadero Road and State Route 85 (S.R. 85) located in the cities of Mountain View and Palo Alto, California. The project limits extend south from Embarcadero Road to S.R. 85, a distance of 3.2 miles (PM 48.97/52.17) and will be referred hereon as "the Site" (Figure 1). The purpose of this Site Investigation Report is to evaluate the soil conditions for on-site use, off-site disposal of site soils, assess the bridges and culverts that will need to be widened for the presence of asbestos or lead-based paint and to assess soil and groundwater to identify work safety issues for construction site workers. The following summarizes URS' conclusions and recommendations.

Soil Reuse/Disposal

With the exception of aerially-deposited lead, no constituent was detected at a concentration limiting soil reuse or requiring disposal of soil as a hazardous waste. However, the detected concentrations of aerially-deposited lead have resulted in restrictions on the reuse and/or disposal of soil within the project limits. The attached Figures 2-18 and the following table summarize the reuse restrictions and disposal requirements of project soil. Please note that selected hotspot removal is assumed as discussed in detail in Section 7.1.2.

Table ES-1 - Soil Reuse/Disposal Requirements

Group	Northern Limit Station	Southern Limit Station	Depth*	Reuse Restriction	Disposal Requirement
Southbound					
1A	Northern Project Limit	113+00	0-1 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
1B	Northern Project Limit	113+00	1-3 ft	None	Non-Hazardous
2A	113+00	Southern Project Limit	0-0.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
2B	113+00	Southern Project Limit	0.5-3 ft	None	Non-Hazardous
Northbound					
3A	Northern Project Limit	105+00	0-1.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
3B	Northern Project Limit	105+00	1.5-3 ft	None	Cal-Hazardous, or out-of-state
4A	105+00	159+00	0-1.5 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
4B	105+00	159+00	1.5-3 ft	None	Non-Hazardous
5A	159+00	Southern Project Limit	0-1 ft	Below pavement, > 5' above the groundwater table	Cal-Hazardous, or out-of-state
5B	159+00	Southern Project Limit	1-3 ft	None	Non-Hazardous

*Samples typically collected at 0.5, 1.0, 1.5, 2.0, and 3.0 feet below ground surface

Significant project costs may result due to the volume of soil with reuse restrictions or requiring disposal as a hazardous waste, and the presence of a shallow groundwater table. Steps to reduce these costs by minimizing disposal of soil as a hazardous waste, or finding locations to properly reuse the restricted soil, may be necessary.

Structures Scheduled for Retrofit or Demolition

Three structures within the project limits are scheduled for retrofit or widening, and this will involve the partial demolition of all or parts of each structure. Accordingly, an asbestos and lead-based paint inspection was conducted for the following structures:

- Adobe Creek Bridge
- Matadero Creek Bridge
- Permanente Creek box culvert

No asbestos containing materials were detected. Lead-based paint was detected at the Adobe Creek Bridge and the Matadero Creek Bridge. Applicable regulations regarding the demolition and disposal of debris from these bridges must be followed.

Potential Right of Way Acquisition Areas

Borings N-1, N-3-5 and N-3-10 were advanced within or adjacent to potential right-of-way acquisition areas, to classify soil in those areas for reuse and to preliminarily screen the sites for other contamination. Boring N-1 exhibited potential contamination of total Chromium; while borings N-3-5 and N-3-10 exhibited contamination of total petroleum hydrocarbons as motor oil (TPH-mo); and boring N-3-10 exhibited contamination of VOCs in groundwater. Additional characterization of these properties would be required to certify that they are free of hazardous contamination.

Impacts from Off-Site Contamination

Several locations at the project site were discussed during the Initial Site Assessment performed by Baseline Environmental Consultants, April 2008, to have likely been impacted by volatile organic compounds (VOCs) or pesticides originating at several properties adjacent to the project area. One groundwater sample and a full-suite of soil analytical data was collected for each of these areas.

These locations include:

- San Antonio Road area (Boring S-2-3)
- Caltrans yard area near Old Middlefield Way (Borings S-3-12 and S-3-13)
- Area south of Amphitheater Parkway (Boring S-3-14)

URS' investigation did not identify evidence that these potential off-Site sources impacted the project corridor.

Groundwater

URS' investigation of groundwater did not reveal the presence of contamination that would require disposal as a hazardous waste. In general, groundwater was detected at depths varying from 8 feet to 15 feet below ground surface. Based on the terms of the Caltrans variance, these shallow depths could reduce the areas at which Aerial Deposited Lead contaminated soil may be reused.

The US 101 Auxiliary Lanes project consists of the segment of US 101 between Embarcadero Road and State Route 85 (S.R. 85) located in the Cities of Mountain View and Palo Alto, in Santa Clara County within District 4 of the State of California Department of Transportation (Caltrans) and within the Santa Clara Valley Transportation Agency (VTA) planning area (See Figure 1 for a Project Location and Vicinity Map). The project limits extend south from Embarcadero Road to State Route 85, a distance of 3.2 miles (PM 48.97/52.17) and will be referred hereon as "the Site".

The purpose of this project is to relieve existing and future traffic congestion at freeway on-ramp and off-ramp connections, improve safety along the US 101 corridor, and provide for improved local access over this segment of the US 101 corridor. This project proposes to construct auxiliary lanes, extend existing second High Occupancy Vehicle (HOV) lanes, and undertake associated ramp improvements including ramp widening and installing/activating ramp metering in both directions. The proposed improvements include widening of creek crossings and relocation of sign structures, storm drainage and other utilities. As a result of these proposed improvements soil will be excavated along US 101, at interchanges, and at creek crossings.

The purpose of the Hazardous Materials Investigation was to evaluate the soil conditions for on-site use, off-site disposal of site soils, assess the bridges and culverts scheduled for retrofit for the presence of asbestos or lead-based paint and assess soil and groundwater to identify work safety issues for construction site workers. URS submitted the Hazardous Materials investigation workplan to VTA and Caltrans on March 16, 2009. Sampling and resulting laboratory analysis activities were performed between March 22 and April 13, 2009.

This Report has been prepared in accordance with the most recently issued Caltrans District 4 lead-impacted soil handling variance by DTSC. This variance describes reuse restrictions and disposal requirements for soils impacted by lead at various concentrations. These criteria and the corresponding regulatory restrictions are described in Section 3.1.

Soil samples were collected at a total of 91 locations, as described in the workplan included as Appendix A. Soil samples were collected at locations perpendicular from the edge of the roadway. Approximately one-third of samples were collected each at outer pavement edge, at the edge of the proposed widening area, or in the midpoint of the proposed widening area. Of the 91 locations, 47 were from adjacent to the northbound direction mainline or ramp lanes and 44 from adjacent to the southbound direction mainline or ramp lanes. A secondary, duplicate boring was advanced at six of the locations. Samples were generally collected at 0.5, 1.0, 1.5, 2.0, and 3.0 feet below ground surface (bgs), though isolated samples were collected to deeper depths where excavation was expected to be deeper than 3 feet, or where groundwater samples were to be collected. A total of 475 soil samples were collected.

Groundwater samples were collected from the first encountered groundwater zone, typically about 8-15 feet below ground surface (bgs). A total of 9 groundwater samples were collected. Groundwater samples were collected where deeper excavation is planned – at bridge and culvert construction areas and at a retaining wall location. Additionally, groundwater samples were collected at areas identified in the project Initial Site Assessment (ISA) as being potentially impacted by VOCs.

A total of 48 samples of potentially-asbestos containing materials, and 7 samples of potential lead-based paint, were collected from these structures requiring modification or widening. This Report provides analytical data of these materials for the following existing structures:

- Adobe Creek Bridge, 37-0174
- Matadero Creek Bridge, 37-0040
- Permanente Creek box culvert extension

Several locations at the project site were discussed during the Initial Site Assessment performed by Baseline Environmental Consultants, April 2008, to have likely been impacted by VOCs or pesticide use originating at several properties adjacent to the project area. One groundwater sample and a full-suite of soil analytical data was collected for each of these areas.

These locations include:

- San Antonio Road area
- Caltrans yard area near Old Middlefield Way, and
- Area south of Amphitheater Parkway.

2.1 DESCRIPTION OF SAMPLING AND ANALYSIS ACTIVITIES

This section describes the sampling and resulting laboratory analysis activities performed between March 22 and April 13, 2009.

2.1.1 Project Limits

The US 101 Auxiliary Lanes project consists of the segment of US 101 between Embarcadero Road and State Route 85 (SR 85) located in the Cities of Mountain View and Palo Alto, in Santa Clara County within District 4 of the State of California Department of Transportation and within the VTA planning area (See Figure 1 for a Project Location and Vicinity Map). The project limits extend south from Embarcadero Road to SR 85, a distance of 3.2 miles (PM 48.97/52.17) and will be referred hereon as "the Site". General project results are discussed separately for the northbound and southbound directions. Smaller groups were created for statistical evaluation, as discussed in the Data Evaluation section.

2.1.2 Sampling Locations

Figure 1 shows the location of the site. Figures 2 through 18 shows the sampling locations. Sampling locations were surveyed using a Trimble ProXH Global Positioning System (GPS) instrument. Soil samples were collected at a total of 91 locations. Approximately ⅓ of samples were collected each at outer pavement edge, at the outer edge of the proposed widening area, or in the midpoint of the proposed widening area. A secondary, duplicate boring was advanced at six of the locations. A total of 475 soil and 9 groundwater samples were collected, and all samples were analyzed for one or more constituents as described in Table 1.

Three of the sampling locations were performed within or immediately adjacent to areas which are expected to be acquired to construct the proposed project. These samples were associated with borings N-1, N-3-5, and N-3-10.

2.1.3 Sampling Depths

Samples were generally collected at 0.5, 1.0, 1.5, 2.0, and 3.0 feet below ground surface (bgs), though isolated samples were collected to deeper depths where excavation was expected to be deeper than 3 feet, or where groundwater samples were to be collected.

2.1.4 Pre-Field Activities

2.1.4.1 Permits

URS used the existing encroachment permit for access to the Caltrans ROW. A copy of this permit is shown in Appendix B. Due to the shallow nature of the environmental borings, no additional permits were required for the environmental investigation.

2.1.4.2 Health and Safety Plan

A Site specific Health and Safety Plan was prepared for the project's field activities and was implemented by personnel working on-Site. Daily tailgate safety meetings were held before initiation of fieldwork with field personnel and subcontractors to discuss each day's activities and related safety precautions. Additionally, a URS Health and Safety representative performed a field visit to monitor implementation of the HASP.

2.1.4.3 Utility Clearance

URS reviewed utility records to place borings away from known utility lines. URS also reviewed ongoing potholing operations results to further determine optimal boring locations. Additionally, utility clearance at each sampling location was conducted through notification of Underground Services Alert (USA) and with the assistance of a private underground utility locator. In several cases, sample locations were moved slightly in the field to avoid utilities.

2.1.4.4 Traffic Control

Cal-Safety Inc., a Caltrans-certified traffic control subcontractor was retained to divert traffic away from the field crew and sampling rig when working along roadways. All work was performed between the hours of 9 PM to 5 AM, at which time URS was permitted to close the outermost lane of traffic.

2.1.5 Sample Collection Methods

A direct push (DPT) geoprobe soil sampling system operated by ECA, Inc. of Aptos, California (State of California Drilling Contractor License No. C57-695970) was used to collect soil cores for logging purposes and collect soil samples at discrete depths from geoprobe borings. In each of the DPT borings, samples were collected by driving an approximately 4-foot long, 2-inch diameter sample barrel equipped with clean plastic liners. Due to access issues or proximity to potential utilities, samples were collected at some locations using a hand auger. All geoprobe borings were logged by a geologist or environmental engineer familiar with soil sampling procedures. Geoprobe boring logs are included in Appendix C.

Sections of the plastic liner containing soil intervals intended for possible laboratory analysis were cut from the 4-foot long soil core, sealed with Teflon® tape, plastic end caps and masking tape, labeled with Site specific designations, and placed on ice in an ice-chest pending transport to Torrent Analytical Laboratory in Milpitas, California, a State of California certified laboratory, under URS Chain-of-Custody procedures.

Sampling equipment was cleaned after each use. Before leaving each sampling location, boring locations were filled to the surface grade with a mixture of Portland cement and bentonite grout. The limited cuttings related to the environmental investigation filled less than one drum, and were consolidated with cuttings resulting from the concurrent geotechnical investigation. These drums were stored beneath the SR 85 to SR 101 HOV ramp, at the southern end of the Site. These investigation-derived soils were sampled, characterized, and are scheduled to be disposed

of off-Site in accordance with applicable regulations. Limited volumes of decontamination water were generated and handled by the drilling contractor.

2.1.6 Changes to the Field Program

Minor modifications were made to the Field Program during the course of the investigation. These changes fall into one of the following categories:

- One boring was advanced to 2.5 feet, instead of 3.0 feet, due to drilling refusal. .
- Approximately 10% of sample locations were moved slightly because the original locations were at an inaccessible point or soil was not exposed in this area. The total number of sample locations was not reduced, and sample locations remained spaced approximately every 300-350 feet.

2.1.7 Soil Laboratory Analysis

Table 1 provides details of the soil analytical program, including soil sampling intervals and soil analyses conducted at each sampling location. Thirty of the soil samples were duplicated in the field for quality control purposes.

All the soil samples included in the analytical program were analyzed for total lead by EPA Method 6010B. Approximately 5-20% of samples collected at various intervals were analyzed for additional soil analytes. The number of soil samples analyzed for each analyte for the Site follows:

- 429 soil samples were analyzed for lead (Pb) by EPA 6010B
- 50 soil samples were analyzed for California Assessment Metals (CAM 17 metals) which includes lead, by EPA Methods 6010B and 7471
- 48 soil samples were analyzed for pH by EPA Method 9045C
- 14 soil samples were analyzed for total petroleum hydrocarbons (TPH) as diesel and motor oil (TPH-d/mo) by EPA Method 8015B
- 12 soil samples were analyzed for organochlorine pesticides (OCPs) and polychlorinated biphenyls (PCBs) by EPA Method 8081A
- 41 soil samples collected at intervals below the top 6 inches were analyzed for TPH as gasoline (TPH-g) by GC-MS
- 45 soil samples collected at intervals below the top 6 inches were analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX), using EPA Method 8260B
- 45 soil samples collected at intervals below the top 6 inches were analyzed for MTBE, TAME, t-Butanol, ETBE, and DIPE (5 Gas Oxygenates) using EPA Method 8260B
- 86 soil samples were collected and analyzed for asbestos using the Polarized Light Microscopy (PLM) method

Additionally, nine soil samples, specifically selected based on the recommendations of the ISA, or in potential right-of-way acquisition areas, were analyzed for VOCs by EPA Method 8260B.

The PLM method of asbestos analysis reveals the presence or absence of asbestos. The results of 5 of the 86 soil samples analyzed for asbestos indicated the presence of asbestos. These samples were subsequently analyzed for asbestos using the Carb 435 Level A (0.25% level of detection) method (Point Count Method).

When total concentration of any metal exceeded ten times its respective Soluble Threshold Limit Concentration (STLC) a sample was extracted with the Standard Water Waste Extraction Tests (WET) and, if the metal was lead, was extracted with the De-ionized Water Waste Extraction Test (DI-WET) and the extracts were analyzed for that metal. The WET test results were used for comparison with California hazardous waste criteria and the DI-WET test results were used to evaluate soils for on-Site use based on the DTSC variance governing soil reuse (a copy of this variance and its subsequent revisions are included as Appendix D). Samples in which the total concentration of any metal exceeded 20 times the STLC criteria were extracted using the (federal) Toxicity Characteristic Leaching Procedure (TCLP) and analyzed for the metal of concern, for further comparison with federal hazardous waste criteria.

Due to limited sample volume, two soil samples exceeding 50 mg/Kg could not be analyzed for DI-WET and five samples exceeding 100 mg/Kg could not be analyzed for TCLP lead. In URS' opinion, a sufficient number of samples have been analyzed using leachate procedures to accurately characterize soil for reuse and disposal.

The number of soil samples analyzed for various metals using WET, DI-WET, and TCLP methods for each project area are as follows:

Lead

- 165 soil samples tested using WET
- 163 soil samples tested using DI WET
- 120 soil samples tested using TCLP

Chromium:

- 21 soil samples tested using WET
- 1 soil samples tested using TCLP

Additionally, four samples were tested for Chromium VI speciation.

Nickel:

- 1 soil sample tested using WET

A complete set of the analytical results, including Chain of Custody forms, are presented in electronic format in Appendix E.

The following analytical quality control procedures were used to comply with Caltrans procedures. Thirty samples were duplicated in the field for quality control purposes. In the laboratory QC, one sample in ten field samples was spiked with lead to ten times the detection limit or at the analyte level. (Approximately one sample in 20 was spiked and a spike duplicate was also run on each spiked sample. This is equivalent to one spike for every ten samples).

A calibration blank sample was run for every ten samples, or per batch, whichever was more frequent.

2.1.8 Groundwater Laboratory Analysis

In the course of this hazardous materials investigation, URS collected groundwater samples near the existing Caltrans maintenance facility adjacent to Old Middlefield Way based on the conclusions of the ISA, in the vicinity of the each bridge or culvert scheduled for replacement due to the possibility of deep excavation and dewatering in those areas, and downgradient or within right of way acquisition areas. Table 1 provides details of the groundwater analytical program. A total of nine groundwater samples were collected. The number of groundwater samples analyzed for each analyte for the Site follows:

- 7 groundwater samples were analyzed for CAM 17 metals by EPA Methods 6010B and 7471
- 6 groundwater samples were analyzed for pH by EPA Method 9045C
- 7 groundwater samples were analyzed for TPH-d and TPH-mo by EPA Method 8015B
- 6 groundwater samples were analyzed for OCPs and PCBs by EPA Method 8081A
- 7 groundwater samples were analyzed for TPH-g by GC-MS
- 10 groundwater samples were analyzed for BTEX, using EPA Method 8260B
- 10 groundwater samples were analyzed for MTBE, TAME, t-Butanol, ETBE, and DIPE (5 Gas Oxygenates) using EPA Method 8260B
- 9 groundwater samples were analyzed for VOCs by EPA Method 8260B

Analyte concentrations in soil are presented in Tables 2 through 6. The analytical results are presented in the following sections, separated into discussions on soil and groundwater, and by analyte. Complete soil and groundwater analytical data are presented in the Analytical Laboratory Reports, attached in electronic format as Appendix E.

3.1 REGULATORY OVERVIEW

Based upon URS' Hazardous Materials Investigation Workplan, and the DTSC Lead Variance for Caltrans, the following soil criteria have been used to evaluate the condition of soil at the Site:

- Soil considered a hazardous waste due to any criteria other than lead may not be reused.
- Soil with total lead <50 mg/kg or extractable lead <5 mg/L with the standard waste extraction test (WET) test, are not considered hazardous waste and are not subject to the reuse restrictions of the Caltrans ADL variance.
- Soil meeting hazardous waste criteria for lead only, with total lead <1411 mg/kg, with <1.5 mg/L extractable lead with the deionized waste extraction test (DI-WET) can be used for fill on-Site as long as it is more than five feet above the water table and must be covered with at least 1.0 foot of non-hazardous cover.
- Soil meeting hazardous waste criteria for lead only, with <3397 mg/kg total lead and >0.5 mg/L and between 1.5 mg/L and 150 mg/L extractable lead with the DI WET can be used within the Right of Way (ROW) on-Site as long as it is more than five feet above the water table and must be covered with a pavement structure which will be maintained by Caltrans.
- Soil with >3397 mg/kg total lead cannot be reused and must be disposed off-Site as a California or Federal Hazardous waste.
- Soil with >5 mg/L extractable lead with TCLP cannot be reused and must be disposed off-Site as a Federal RCRA hazardous waste.
- For soil that must be disposed off-Site if removed from the Caltrans ROW:
    - Soil with <5.0 mg/L extractable lead with the standard WET test is a non-hazardous waste and can be disposed in a non-hazardous waste landfill if removed from the Caltrans ROW.
    - Soil with >5.0 mg/L extractable lead with the standard WET and <5.0 mg/L extractable lead with the TCLP test is a California hazardous waste and must be disposed off-Site in a hazardous waste landfill if removed from the Caltrans ROW, or alternatively can be disposed of out of state, as non-hazardous soil.
    - Soil with >5.0 mg/L extractable lead with the TCLP test is a Federal RCRA waste and must be disposed off-Site in a hazardous waste landfill.

Soil analytical results from the soil samples are discussed below.

3.2 SOIL SAMPLES

3.2.1 Lead

ADL was the primary focus of the soil investigation and the data in Table 2 presents the resulting lead data from the soil samples analyzed for lead as part of this investigation.

Total lead results varied from less than the detection limit of 1 mg/kg in multiple soil samples to 9,700 mg/kg in soil sample S-3-3@0.5 ft.

One-hundred sixty-five of the soil total lead results were above 50 mg/kg. These detections were greater than ten times the STLC criteria of 5 mg/kg (50 mg/kg) for lead, requiring that the WET and DI-WET test be conducted on these samples (limited sample volume prevented DI-WET testing for two of these samples). One-hundred twenty of the total lead results were equal to or greater than 20 times the STLC criteria of 5.0 mg/L (100 mg/kg) for lead. The TCLP test was also conducted on these samples (limited sample volume prevented TCLP testing for five of these samples). Table 3 lists results of all soil samples concentrations using the WET, DI-WET and TCLP tests, if applicable.

3.2.2 CAM 17 Metals

A total of 48 soil samples (including duplicates) were submitted for CAM 17 metals analysis, which includes antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium and zinc. Analytical results for metals and laboratory reporting limits are presented in Table 2.

With the exception of chromium and nickel, no metal was detected at a concentration that requires leachability testing. The results for these metals are discussed in more detail in the following section.

3.2.2.1 Chromium

Chromium concentrations in soil ranged from 18 mg/kg (N-3-5@0.5 ft) to 180 mg/kg (S-1-5@0.5 ft).

Twenty-one of the total soil chromium results were greater than ten times the STLC criteria for total chromium (5 mg/L). The WET test was conducted on these samples, and the concentrations of WET chromium indicate that they did not exceed the criteria for hazardous waste of 5 mg/L. One soil chromium result was greater than 20 times the STLC criteria for chromium. The TCLP test was conducted on this sample, and the concentration of TCLP chromium indicated that it did not exceed the criteria for hazardous waste of 5 mg/L. Four of the 21 soil samples with total chromium detected at concentrations greater than 50 mg/Kg were analyzed for hexavalent chromium (samples N-1@1.0', N-1-4@2.0', S-1-5@0.5', and S-1-14@3.0'). Hexavalent chromium was not detected in any sample above the detection limit of 0.200 mg/Kg. Analytical results for leachate tests and hexavalent chromium are presented in Table 3.

3.2.2.2 Nickel

Nickel concentrations in soil ranged from 25 mg/kg (S-1-5@1.5 ft) to 280 mg/kg (S-1-5@0.5 ft). One total soil nickel result was greater than 10 times the STLC criteria for nickel (20 mg/L). The WET test was conducted on this sample, and the concentration of WET nickel indicated that it did not exceed the criteria for hazardous waste of 1 mg/L. Analytical results for the nickel leachate test is presented in Table 3.

3.2.3 Other Constituents of Concern

Various other chemical analyses were conducted on soil samples collected adjacent to the northbound lanes. These analyses are discussed below. Results and detection limits are tabulated in Table 4.

3.2.3.1 pH

Forty-eight samples were analyzed for pH. Results ranged from 7.63 to 8.86. These pH detections are within the range noted in the DTSC reuse criteria. Therefore, levels of pH are not considered further in this soils evaluation.

3.2.3.2 Organochlorine Pesticides (OCPs)

Twelve samples were analyzed for OCPs. Various OCPs were detected in several samples. The following OCPs were detected in one or more samples at the following maximum concentrations:

4,4-DDD – 11.6 ug/Kg

4,4-DDE – 16.9 ug/Kg

4,4-DDT – 62.1 ug/Kg

Alpha-Chlordane – 18.5 ug/Kg

Dieldrin – 16.9 ug/Kg

Gamma-Chlordane – 18.6 ug/Kg

None of these detection of OCPs exceed the concentration at which leachate testing would be required to determine if the soil qualifies at a hazardous waste. Therefore, OCPs are not considered further in this soils evaluation.

3.2.3.3 Volatile Organic Compounds (VOCs)

Samples collected at three borings advanced within potential Right-of-Way takes, and near the existing Caltrans maintenance facility adjacent to Old Middlefield Way were analyzed for

VOCs. VOCs were not detected at or above the laboratory detection limits, except for sample N-1@1.0', where Methylene Chloride was detected at 12 ug/Kg. Detection limits for analysis of these constituents are included in Appendix E. While the EPA has not established a level at which Methylene Chloride constitutes a hazardous waste, in URS' opinion this concentration does not warrant performance of additional toxicity tests or the analysis of samples collected from deeper intervals. Therefore, VOCs are not considered further in this soils evaluation. However, the presence of VOCs may need to be considered for worker health and safety in the construction contract documents.

3.2.3.4 Polychlorinated Biphenyls (PCBs)

Twelve samples were analyzed for PCBs. PCBs were not detected at or above the laboratory detection limits. Detection limits for analysis of these constituents are included in Appendix E. Therefore, PCBs are not considered further in this soils evaluation.

3.2.3.5 Total Petroleum Hydrocarbon as gasoline (TPH-g)

Forty-one samples were analyzed for TPH-g. TPH-g was not detected at or above the laboratory detection limit of 100 ug/Kg in any soil sample. Therefore, TPH-g is not considered further in this soils evaluation.

3.2.3.6 Benzene/Toleune/Ethylbenzene/Xylenes and 5 Gas Oxygenates

Forty-five samples were analyzed for BTEX and for the constituents, TAME, DIPE, ETBE and t-Butanol (5 Gas Oxygenates). These chemicals were not detected at or above the laboratory detection limit in any soil sample. Therefore, they are not considered further in this soils evaluation. Detection limits for analysis of these constituents are included in Appendix E.

3.2.3.7 Total Petroleum Hydrocarbon as diesel (TPH-d)

Fourteen samples were analyzed for TPH-d. TPH-d was detected in two samples at a maximum concentration of 3.27 mg/kg. While the EPA has not established a level at which TPH-d constitutes a hazardous waste, in URS' opinion these concentrations do not warrant performance of additional toxicity tests or the analysis of samples collected from deeper intervals. Therefore, the presence of TPH-d is not considered further in this soils evaluation.

3.2.3.8 Total Petroleum Hydrocarbon as motor oil (TPH-mo)

Fourteen samples were analyzed for TPH-mo. TPH-mo was detected in all samples at concentrations ranging from 6.7 mg/Kg (N-1@7.0 ft) to 3540 mg/Kg (N-3-10@1.0 ft). While the EPA has not established a level at which TPH-d constitutes a hazardous waste, based on URS' experience these concentrations do not warrant performance of additional toxicity tests or the analysis of samples collected from deeper intervals. Therefore, the presence of TPH-mo is not considered further in this soils evaluation. However, the presence of TPH-mo in soil may need to be considered for health and safety purposes in the construction contract documents.

3.2.3.9 Asbestos in Soil

Eighty-six samples were analyzed for asbestos using the PLM method. The results of this analysis indicated that asbestos was present in 5 samples (see Table 4). For these five samples, the CARB 435 Level A method, which quantifies asbestos with a detection limit of 0.25%. Asbestos was detected at a concentration of <0.25% Chrysotile in four samples, and at 0.50% Chrysotile at sample N-2-11@1.0'. These detections are less than the concentration of asbestos at which the soil would be considered a hazardous waste of 1%, therefore, the presence of asbestos in soil is not considered further in this soils investigation. However, the presence of asbestos in soil may need to be considered for health and safety purposes in the construction contract documents.

3.3 GROUNDWATER

In the course of this hazardous materials investigation, URS collected groundwater samples near the existing Caltrans maintenance facility adjacent to Old Middlefield Way based on the conclusions of the ISA, in the vicinity of the each bridge or culvert scheduled for replacement due to the possibility of deep excavation and dewatering in those areas, and downgradient or within right of way acquisition areas. Analytical results from the groundwater samples are discussed below.

3.3.1 California Assessment Metals (CAM 17 Metals)

A total of 8 groundwater samples were submitted for CAM 17 metals analysis, which includes antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium and zinc. Analytical results for metals and laboratory reporting limits are presented in Table 5. No metal was detected at a concentration exceeding the STLC criteria. Therefore, metals are not considered further in this groundwater evaluation.

3.3.2 Other Constituents of Concern

3.3.2.1 pH

Six samples were analyzed for pH. Results ranged from 7.90 to 8.47. These pH detections do not exceed Title 22 corrosivity levels. Therefore, levels of pH are not considered further in this groundwater evaluation. Analytical results for this constituent are included in Table 6.

3.3.2.2 Organochlorine Pesticides (OCPs)

Six samples were analyzed for OCPs. OCPs were not detected in any sample. Therefore, OCPs are not considered further in this groundwater evaluation. Analytical results for this constituent are included in Table 6.

3.3.2.3 Volatile Organic Compounds (VOCs)

Nine samples were analyzed for VOCs. One or more of the following VOCs were detected in seven samples: 1,1,1-Trichloroethane, 1,1-Dichloroethane, 1,1-Dichloroethene, Chloroform, Tetrachlorethene, cis-1,2-Dichlroethene, trans-1,2-Dichloroethene, Trichloroethene, and Trichlorofluromethane (see Table 6 for these results). No VOC detection exceeded the STLC criteria or were detected at concentrations typically considered a hazardous waste. Therefore, VOCs are not considered further in this groundwater evaluation. However, the presence of VOCs in groundwater may need to be considered for worker health and safety in the construction contract documents. Analytical results for this constituent are included in Table 6.

3.3.2.4 Polychlorinated Biphenyls (PCBs)

Six samples were analyzed for PCBs. PCBs were not detected at or above the laboratory detection limits. Detection limits for analysis of these constituents are included in Appendix E. Therefore, PCBs are not considered further in this groundwater evaluation. Analytical results for this constituent are included in Table 6.

3.3.2.5 Total Petroleum Hydrocarbon as gasoline (TPH-g)

Seven samples were analyzed for TPH-g. TPH-g was detected in three samples at concentrations up to 74 ug/L. While the EPA has not established a level at which TPH-g constitutes a hazardous waste, in URS' opinion these concentrations do not warrant performance of additional toxicity tests or the analysis of samples collected from deeper intervals. Therefore, the presence of TPH-g is not considered further in this groundwater evaluation. Analytical results for this constituent are included in Table 6.

3.3.2.6 Total Petroleum Hydrocarbon as diesel or motor oil (TPH-d/mo)

Seven samples were analyzed for TPH-d/mo. TPH-d/mo was not detected at or above the laboratory detection limits in any sample. Detection limits for analysis of these constituents are included in Appendix E. Therefore, TPH-d/mo is not considered further in this groundwater evaluation. Analytical results for this constituent are included in Table 6.

3.3.3 Groundwater Elevation

Based on URS' geotechnical investigation, which was performed in the summer of 2009, depth to groundwater varied throughout the Site, ranging from approximately 8 feet to 15 feet bgs. Accordingly, reuse of soil may be constrained, because a significant percentage of the soil is restricted to reuse at least five feet above the groundwater table.

This section provides our evaluation of the data presented in previous sections. The evaluation includes statistical analysis and comparisons to various regulation criteria and guidelines. A summary of statistical evaluations for total and leachable quantities of lead for the Site is included as Table 7. The boring logs for the soil borings are presented in Appendix C.

4.1 SOIL

To perform a statistical evaluation of total lead, WET lead, DI-WET lead, and TCLP lead the Site was split into several smaller segments that represent logical divisions within the project area for soil management purposes that correspond to the expected soil management to be implemented as part of the construction project. The concentration data were evaluated separately by depth to evaluate if depth dependence exists.

The smaller segments used in the statistical evaluation are described below.

Southbound

- Group 1: Construction adjacent to southbound lanes from northern project limit to Station 113+00. This group was further split into subgroups 1A and 1B, for soil shallower and deeper than 1-foot bgs, respectively.
- Group 2: Construction adjacent to southbound lanes from Station 113+00 to the southern project limit. This group was further split into subgroups 2A and 2B, for soil shallower and deeper than 6 inches bgs, respectively.

Northbound

- Group 3: Construction adjacent to northbound lanes from northern project limit to Station 105+00. This group was further split into subgroups 3A and 3B, for soil shallower and deeper than 1.5 feet bgs, respectively.
- Group 4: Construction adjacent to northbound lanes from Station 105+00 to Station 159+00. This group was further split into subgroups 4A and 4B, for soil shallower and deeper than 1.5 feet bgs, respectively.
- Group 5: Construction adjacent to northbound lanes from Station 159+00 to the southern project limit. This group was further split into subgroups 5A and 5B, for soil shallower and deeper than 1-foot bgs, respectively.

Statistical Evaluation Methodology

A statistical evaluation of the analytical sample results was conducted to assess whether there is a need for special handling of excavated soils, based on criteria set forth for total lead and leachable lead using WET and DI-WET extraction techniques. To accomplish this, representative soil concentrations were compared to relevant and applicable threshold concentrations. This representative concentration term was estimated by the 95% Upper Confidence Limit of the Mean (95% UCL) of the concentration for materials to be sent off-Site for disposal, and the 95% UCL for soils that may be managed on-Site (for comparison only). The ProUCL software version 4.00.04 was used to calculate the 95% UCL (Singh et al., 2009a).

The use of 95% UCL concurs with USEPA statistical guidance in developing a conservative estimator of the mean concentration of soil constituents or contaminants (USEPA, 2002b). The estimated 95% UCL was used to evaluate whether the soil concentrations of total lead and leachable lead exceeded the appropriate threshold criteria. If non-detects were present, the summary statistics (mean and standard deviation) and the 95% UCL were estimated based on the Kaplan-Meier (KM) method (Singh et al., 2009a) in this analysis. Also, the results of primary and duplicate samples were averaged in order to obtain a single value. Samples collected from various depths of the same boring location were considered to be independent data points in this statistical evaluation.

In general, total lead soil samples in which the respective concentrations did not exceed ten times the STLC criteria (50 mg/kg) were not extracted/analyzed with the WET and DI-WET techniques, and soil samples in which the respective concentrations did not exceed twenty times the STLC criteria (100 mg/kg) were not extracted/analyzed with the TCLP technique. As a result, this greatly reduced the number of data points which could be included in the statistical analysis for leachable lead and would also skew the 95% UCL results high (for WET, DI-WET, and TCLP estimates), as only the samples with high total lead concentrations would be included. Therefore, to estimate WET, DI-WET, and TCLP lead concentrations in locations where the samples were not extracted and analyzed, regression equations were developed between existing total and WET, DI-WET, and TCLP lead results. Using the regression equations, WET, DI-WET, and TCLP lead concentrations for samples which were not analyzed for them were estimated. The 95% UCLs for leachable lead, using these estimated WET, DI-WET, and TCLP lead concentrations, in combination with those analyzed by the laboratory, were then obtained as discussed below.

The Site representative concentrations were evaluated by first performing an exploratory data analysis. The objective of the exploratory data analysis was to discover trends and patterns in the data so that appropriate approaches and limitations in using the datasets could be identified. Both numerical and graphical methods of exploratory data analysis were performed.

For the numerical method, a table of basic summary statistics, including mean, standard deviation, minimum and maximum detected values, for raw data (i.e., no logarithmic transformation) was prepared. For WET and DI-WET lead, the summary statistics were also calculated for the combined dataset including both laboratory-reported values and regression-estimated values. These statistics are presented in Table 7 of this report and can be used to make inferences concerning the population from which the sample data were drawn.

The next step involved a test of distributional assumption for the dataset, and the ProUCL software was used in this process. The purpose of this step was to check whether the data (raw or log-transformed) could be assumed to be normally distributed and/or the data (raw only) could be assumed to follow a gamma distribution. Based on the results of this evaluation, an appropriate probability distribution could be assumed for the data to be used in the calculation of the 95% UCL in the next step.

The Shapiro-Wilk W test was used to test the normality of the dataset at a 5% significance level (i.e., 95% confidence level), as described in the USEPA guidance document titled *Data Quality Assessment: Statistical Methods for Practitioners* (USEPA 2006). The test was first applied to

raw data. If the raw dataset passed the normality test, the raw data were assumed to be normally distributed. If the raw data did not pass the normality test, a gamma distribution goodness-of-fit test (at a 5% significance level) was then applied to the data, and if the dataset passed the gamma distribution goodness-of-fit test, the data were assumed to follow a gamma distribution. Otherwise, the Shapiro-Wilk W test (at a 5% significance level) was applied to the log-transformed data. If the log-transformed data passed the normality test, the data were assumed to be lognormally distributed. If the data failed all three tests, the data were assumed to be non-parametric. In all cases, visual inspection of the shape of histograms and normal probability plots was performed to confirm the distributional assumption. The results of this distributional test are presented under the column heading "Goodness-of-Fit Test" "Distribution" in Table 7.

For datasets without nondetect:

If the data were determined to be normally distributed, the 95% UCL was calculated as follows (USEPA, 2002b):

$$UCL = \bar{x} + t_{1-\alpha,n-1}\frac{s}{\sqrt{n}}$$

where $\bar{x}$ = sample mean

t = the Student t value at α significance level, with n-1 degree of freedom

α = 0.05 (one-tailed)

n = sample size

s = sample standard deviation

Otherwise, if the data were determined to follow a gamma or lognormal distribution, or if non-parametric assumption was used, the 95% UCL was determined based on the recommendation of the ProUCL software, which takes into account sample size and data skewness and ensures adequate coverage of the 95% UCL (Singh et al., 2009b). Depending on the sample statistics, the ProUCL software generally recommended one of the following methods:

- For gamma distribution, Approximate Gamma UCL or Adjusted Gamma UCL.
- For lognormal distribution, Chebyshev Theorem using the minimum variance unbiased estimator (MVUE) of the parameters for a lognormal distribution, or Land's H-statistic.
- For a non-parametric assumption, Chebyshev Theorem using the sample arithmetic mean and standard deviation, or the Hall's bootstrap method.

For datasets with nondetect(s):

For total lead datasets, data were censored at the laboratory reporting limit of <1 mg/kg. For WET and DI-WET lead datasets, because a combined laboratory-reported values and regression-estimated values were used, in addition to the laboratory-reporting censoring <0.1 mg/L, all regression-estimated values fell below 0.1 mg/L were also assigned to be <0.1 mg/L.

If the data were normally distributed and/or if the data were symmetric or approximately symmetric, the KM (*t*) method (i.e., Kaplan-Meier estimates using the Student's *t*-distribution

cutoff value) was used to calculate the 95% UCL. The equation to compute UCL was the same as the one illustrated above, except that the sample mean and sample standard deviation were substituted by KM estimates of mean and standard deviation.

If the data were assessed to follow a gamma or lognormal distribution, or if the data were assumed to be non-parametric with moderate and high skewness, one of the following methods, in general, was recommended by the ProUCL software for the calculation of UCL:

- UCL based upon KM estimates using the Chebyshev inequality.
- UCL based upon KM estimates using the bias-corrected accelerated (BCA) bootstrap method.

The detailed statistical steps of the various methods described above are documented in the ProUCL software technical guide (Singh et al., 2009b). The recommended calculation methods and UCL results, by the ProUCL software, are presented under the column heading "Method of UCL Calculation" and "Assessed 95% UCL" in Table 7.

If all samples were nondetects, or if there was only one single detected result, the UCL was not calculated because of inadequate information on data distribution, and estimates of summary statistics, such as mean and variance, were unreliable. If the recommended UCL was greater than the maximum detected value, an alternative UCL may be selected from the ProUCL report (instead of the recommendation) to better and realistically represent the mean concentration term.

Statistical Evaluation Limitation

Statistical evaluations described below have been prepared for specific areas of the Site. Performing statistical evaluations on a specified segment of the project reduces the negative impacts of isolated areas with high concentrations of lead. If soils are not managed based on the stages and groups described above and analyzed below, or if limited excavation and disposal of soil is performed, the statistical evaluations become invalid and additional statistical evaluation or sampling may be required.

4.1.1 Initial Soil Disposal Assumptions

A total of five samples exceeded the maximum concentration of total lead or DI-STLC lead at which reuse is permitted. The five samples removed from the statistical evaluation are S-1-5@0.5', S-1-6@0.5', S-3-3@0.5', S-3-10@0.5', and N-2-11@1.0' (as a result of this boring, soil at N-2-11@0.5' will also be excavated and off-hauled and has been removed from the sample set). In addition, boring N-1-4 exhibited higher than typical lead concentrations that would have negatively impacted reuse opportunities, and so all results from this boring were removed from the analytical data set. Disposal recommendations for these areas are discussed in Section 7.1.2.

4.1.2 Group 1

The 95% UCLM/Maximum Detection for total lead in this Group's soils are shown in Table 7; in summary the results were as follows:

- 0-1 ft: 687 mg/Kg
- 1-3 ft: 48.0 mg/Kg

The 95% UCLM/Maximum Detection for DI-WET lead in this Group's soils are shown in Table 7; in summary the results were as follows:

- 0-1 ft: 20.3 mg/L
- 1-3 ft: As the 95% UCLM/Maximum Detection for total lead for soils deeper than 1 ft was less than 50 mg/Kg, the DI-WET concentration is not required for the reuse evaluation.

Based on the Caltrans variance, the results for total lead and for DI-WET lead indicate that soils in Group 1 that are shallower than 1 foot bgs may be reused on-Site but restricted to locations more than 5 feet above the water table and must be covered with a pavement structure that will be maintained by Caltrans. Group 1 soils that are at depths greater than 1 foot bgs are not considered hazardous waste due to lead, and are not subject to the reuse restrictions of the Caltrans variance.

It is not known if all soil in this group can be reused on-site. In the event that soils must be disposed of outside the Caltrans ROW, the following statistical analysis applies:

The 95% UCLM/Maximum Detection for WET lead in this Group's soils are shown in Table 7; in summary the result was as follows:

- 0-1 ft: 37.6 mg/L
- 1-3 ft: As the 95% UCLM/Maximum Detection for total lead for soils deeper than 1 foot was less than 50 mg/Kg, the WET concentration is not required for the disposal evaluation.

Statistical analysis of TCLP results was not undertaken, as no individual TCLP lead result was greater than 5 mg/L.

Based on the Caltrans variance, the WET and TCLP lead results indicate that soils from depths shallower than 1 foot in this Group must be disposed of in a California hazardous waste landfill if removed from the Caltrans ROW. Soils at depths deeper than 1 foot, will not be considered California hazardous wastes if removed from the Caltrans ROW.

4.1.3 Group 2

The 95% UCLM/Maximum Detection for total lead in this Group's soils are shown in Table 7; in summary the results were as follows:

- 0-0.5 foot: 583 mg/Kg
- 0.5-3 ft: 84.4 mg/Kg

The 95% UCLM/Maximum Detection for DI-WET lead in this Group's soils are shown in Table 7; in summary the result was as follows:

- 0-0.5 foot: 20.6 mg/L

- 0.5-3 ft: 1.43 mg/L

The 95% UCLM/Maximum Detection for WET lead in this Group's soils are shown in Table 7; in summary the result was as follows:

- 0-0.5 foot: 25.2 mg/L
- 0.5-3 ft: 4.70 mg/L

Based on the Caltrans variance, the results for total lead and for DI-WET lead indicate that soils in the top 0.5 foot of this Group may be reused on-Site but restricted to locations more than 5 feet above the water table and must be covered with a pavement structure that will be maintained by Caltrans. Group 2 soils that are at depths greater than 0.5 foot bgs are not considered hazardous waste due to lead, and are not subject to the reuse restrictions of the Caltrans variance.

Statistical analysis of TCLP results was not undertaken, as only one of 88 soil samples exhibited TCLP lead results greater than 5 mg/L (S-1-7@1.0' with 5.0 mg/L TCLP lead).

Based on the Caltrans variance, the WET and TCLP lead results indicate that soils in this Group from depths shallower than 0.5 foot must be disposed of in a California hazardous waste landfill if removed from the Caltrans ROW. Soils at depths deeper than 0.5 foot, will not be considered California hazardous wastes if removed from the Caltrans ROW.

4.1.4 Group 3

The 95% UCLM/Maximum Detection for total lead in this Group's soils are shown in Table 7; in summary the results were as follows:

- 0-1 ft: 484 mg/Kg
- 1-3 ft: 40.8 mg/Kg

The 95% UCLM/Maximum Detection for DI-WET lead in this Group's soils are shown in Table 7; in summary the results were as follows:

- 0-1 ft: 9.74 mg/Kg
- 1-3 ft: As the 95% UCLM/Maximum Detection for total lead for soils deeper than 1 foot was less than 50 mg/Kg, the DI-WET concentration is not required for the reuse evaluation.

Based on the Caltrans variance, the results for total lead and for DI-WET lead indicate that soils in the top 1 foot of this Group may be reused on-Site but restricted to locations more than 5 feet above the water table and must be covered with a pavement structure that will be maintained by Caltrans. The results for total lead indicate that soils below 1 foot are not subject to the reuse restrictions of the Caltrans variance.

It is not known if all the soil in this Group can be reused on-site. In the event that soils must be disposed of outside the Caltrans ROW, the following statistical analysis applies:

The 95% UCLM/Maximum Detection for WET lead in this Group's soils are shown in Table 7; in summary the results were as follows:

- 0-1 ft: 33.9 mg/L
- 1-3 ft: 8.18 mg/L.

Statistical analysis of TCLP results was not undertaken, as only one of 70 soil samples exhibited TCLP lead results greater than 5 mg/L (N-1-18@0.5' with 6.8 mg/L TCLP lead).

Based on the Caltrans variance, the WET and TCLP lead results indicate that soils in the top 3 foot of this Group must be disposed of in a California hazardous waste landfill if removed from the Caltrans ROW.

4.1.5 Group 4

The 95% UCLM/Maximum Detection for total lead in this Group's soils are shown in Table 7; in summary the results were as follows:

- 0-1.5 foot: 634 mg/Kg
- 1.5- 3 ft: 35.4 mg/Kg

The 95% UCLM/Maximum Detection for DI-WET lead in this Group's soils are shown in Table 7; in summary the result was as follows:

- 0-1.5 foot: 13.0 mg/L
- 1.5-3 ft: As the 95% UCLM/Maximum Detection for total lead for soils deeper than 1 foot was less than 50 mg/Kg, the DI-WET concentration is not required for the reuse evaluation.

Based on the Caltrans variance, the results for total lead and for DI-WET lead indicate that soils in the top 1.5 foot of this Group may be reused on-Site but restricted to locations more than 5 feet above the water table and must be covered with a pavement structure that will be maintained by Caltrans. Soils below 1.5 feet are not subject to reuse restrictions of the Caltrans variance.

It is not known if all the soil in this Group can be reused on-site. In the event that soils must be disposed of outside the Caltrans ROW, the following statistical analysis applies:

The 95% UCLM/Maximum Detection for WET lead in this Group's soils are shown in Table 7; in summary the result was as follows:

- 0-1.5 foot: 13.0 mg/L
- 1.5-3 ft: As the 95% UCLM/Maximum Detection for total lead for soils deeper than 1.5 feet was less than 50 mg/Kg, the WET concentration is not required for the disposal evaluation

Statistical analysis of TCLP results was not undertaken, as no individual TCLP lead result was greater than 5 mg/L.

Based on the Caltrans variance, the WET and TCLP lead results indicate that soils in the top 1.5 foot of this Group must be disposed of in a California hazardous waste landfill if removed from the Caltrans ROW. Soils at depths deeper than 1.5 foot, will not be considered California hazardous wastes if removed from the Caltrans ROW.

4.1.6 Group 5

The 95% UCLM/Maximum Detection for total lead in this Group's soils are shown in Table 7; in summary the results were as follows:

- 0-1 foot: 257 mg/Kg
- 1-3 ft: 23.3 mg/Kg

The 95% UCLM/Maximum Detection for DI-WET lead in this Group's soils are shown in Table 7; in summary the result was as follows:

- 0-1 foot: 19.4 mg/L
- 1-3 ft: As the 95% UCLM/Maximum Detection for total lead for soils deeper than 1 foot was less than 50 mg/Kg, the DI-WET concentration is not required for the reuse evaluation.

Based on the Caltrans variance, the results for total lead and for DI-WET lead indicate that soils in the top 1 foot of this Group may be reused on-Site but restricted to locations more than 5 feet above the water table and must be covered with a pavement structure that will be maintained by Caltrans. The results for total lead indicate that soils below 1 foot are not subject to the reuse restrictions of the Caltrans variance.

Because design of the Site has not been completed, it is not known if all soil in this Group can be reused on-Site. In the event that soils must be disposed of off-Site, the following statistical analysis applies:

The 95% UCLM/Maximum Detection for WET lead in this Group's soils are shown in Table 7; in summary the result was as follows:

- 0-1 foot: 64.1 mg/L
- 1-3 ft: As the 95% UCLM/Maximum Detection for total lead for soils deeper than 1 ft was less than 50 mg/Kg, the WET concentration is not required for the disposal evaluation.

Statistical analysis of TCLP results was not undertaken, as no individual TCLP lead result was greater than 5 mg/L.

Based on the Caltrans variance, the WET and TCLP lead results indicate that soils in the top 1 foot of this Group must be disposed of in a California hazardous waste landfill if removed from the Caltrans ROW. Soils at depths deeper than 1 foot, will not be considered California hazardous wastes if removed from the Caltrans ROW.

The US 101 Auxiliary Lane Project proposes to widen two bridges and one box culvert to add auxiliary lanes in both directions of US 101. An investigation was performed at each of these structures to determine the presence or absence of asbestos or lead-based paint and identify work safety issues for site construction workers.

On April 27 and 28, 2009, Mr. Eduardo Ortega of URS accompanied certified asbestos and lead based paint inspections Mr. Derrik Quach and Mr. Phillip Bradley of Kellco-Macs Labs of Hayward, California, for the collection of potential asbestos containing material (P-ACM) samples and potential lead-based paint (P-LBP) samples at each of the three structures. The results of these investigations are discussed in this section. A copy of the Kellco-Macs Lab laboratory report is included as Appendix F. Analytical results related to the investigations are included as Tables 8, 9, and 10.

5.1 INSPECTED STRUCTURES

The subject structures are scheduled for partial demolition in order to complete the widening improvements. The survey sites consist of the following two bridges and one culvert:

- Adobe Creek Bridge, 37-0174
- Matadero Creek Bridge, 37-0040
- Permanente Creek box culvert extension

The inspection performed was both visual and tactile. Samples were taken of suspect materials located at exterior of the survey area. The inspection was a reasonable attempt to find suspect materials by a competent inspector. If any non-sampled materials are uncovered during demolition, these should be submitted for asbestos and/or lead paint analysis.

5.2 POTENTIAL-ASBESTOS CONTAINING MATERIALS (P-ACM) INSPECTION

The EPA defines Asbestos Containing Material as any material that contains greater than 1% asbestos. Materials containing greater than 1% asbestos must be removed prior to demolition or renovation. Materials containing less than 10% can be submitted for further analysis by the Point Count method as described in Appendix F. If the Point Count method (and only the point count method) determines that the material contains less than 1% asbestos, it can be disposed of as non-hazardous asbestos containing construction waste. If materials containing less than 10% asbestos by Polarized Light Microscopy are not submitted for point counting, they must be presumed to be asbestos containing material and disposed of as hazardous asbestos waste.

5.2.1 Asbestos Inspection Details

URS provided the consulting oversight services related to the inspection and analysis of P-ACM within the Site. Samples of P-ACM were collected from the exterior of the structures as shown in the figures in Appendix F. Each collected sample was stored in a Zip-Loc® bag, with its original location marked and photographed. The number of samples collected was judged sufficient to provide adequate characterization of these materials.

Samples of P-ACM were analyzed by a certified laboratory using Polarized Light Microscopy (PLM), the recommended method of the U.S. Environmental Protection Agency (EPA). A brief description of the analytical procedures is included in Appendix F. A summary of the laboratory analyses of sampled P-ACMs (positive and non-detect results) is included in the attached tables. Detailed analytical results for sampled materials are included in Appendix F. The determination of a material to be an ACM was made either by direct sample testing or by homogeneity with at least one positive sample of the same material. Kellco-Mac's laboratory credentials are included in Appendix F.

In the event that non-sampled P-ACM is uncovered during future renovation/demolition activities, these materials should be sampled and submitted for asbestos analysis.

5.2.2 Asbestos Analytical Quality Control

For every ten field samples, the laboratory performs a Quality Control (QC) duplicate sample. These samples were submitted and analyzed and compared to the original results. The QC analytical results are on file.

5.2.3 Asbestos Analytical Results

P-ACM samples were collected from each structure as follows:

- 15 samples were collected from Adobe Creek Bridge
- 15 samples were collected from Matadero Creek Bridge
- 18 samples were collected from the Permanente Creek box culvert

Figures and pictures displaying the locations of the samples collected and photographs are included in Appendix F. Laboratory analysis indicated that none of these bulk samples were ACM with at least 1% asbestos content. Table 8 list sampled material that tested non-detect, for ACM.

5.3 POTENTIAL-LEAD-BASED PAINT (P-LBP) INSPECTION

The EPA and define LBP as paint or other surface coatings that contain lead greater than 1 milligram per square centimeter (mg/cm2) which is equivalent to 50 parts per million (ppm), or that having a lead content at least 0.5% by weight. The regulations on lead exposure require that a Negative Initial Determination for lead exposure be made for paint that contains greater than 0.06% (600 ppm) of lead, and a worker protection program that incorporates elements such as work practices, training, personal protection equipment and respiratory protection be implemented pursuant to OSHA regulatory requirements. Removal or disturbance of material with any detectable amount of lead paint must be handled in accordance with OSHA regulations. Structural components with intact lead paint and no other hazardous materials can be disposed of as non-hazardous construction waste. Paint chips and debris must be disposed of as lead containing hazardous waste.

5.3.1 P-LBP Inspection Details

URS provided consulting oversight services related to the inspection and analysis of P-LBP within the Site. Samples of P-LBP were collected from the exterior of the structures. Each collected sample was stored in a sealed plastic container, its original location marked and photographed.

Samples of P-LBP were analyzed by a certified laboratory using Atomic Absorption (AA), the recommended method by the EPA. A brief description of the analytical procedures is included in Appendix F. A summary of the laboratory analyses of sampled P-LBP (positive and non-detect results) is included in Tables 8 and 9. A copy of detailed analytical results for sampled materials and Kellco-Mac's laboratory credentials are included in Appendix F.

In the event that non-sampled P-LBP is uncovered during future demolition activities, these materials should be sampled and submitted for lead analysis.

5.3.2 Lead Based Paint Analytical Quality Control

For every ten field samples, the laboratory performs a Quality Control (QC) duplicate sample. These samples were submitted and analyzed and compared to the original results. The QC analytical results are on file.

5.3.3 Lead Based Paint Analytical Results

P-LBP samples were collected from each structure as follows:

- 2 samples were collected from Adobe Creek Bridge
- 2 samples were collected from Matadero Creek Bridge
- 3 samples were collected from the Permanente Creek box culvert

Laboratory analysis indicated that both samples collected from the Adobe Creek Bridge and one sample collected from the Matadero Creek Bridge were LBP having at least 1 mg/cm2 (50 ppm). The highest detected lead concentration at Adobe Creek Bridge was 113 ppm; the highest detected lead concentration at Matadero Creek bridge was 108 ppm. Tables 9 and 10 list sampled materials from the Site that are respectively above or below the regulatory limits for LBP. Figures illustrating the locations of the samples collected and photographs are included in Appendix F; field sample identifications shown on the figures are cross-referenced in Tables 9 and 10. A brief synopsis of LBP found in tested materials at the Adobe Creek and Matadero Creek Bridges follows:

- Adobe Creek Bridge:
    - Grey paint on concrete on NB 101 Adobe Creek Bridge Barrier Wall, near the southern end
    - Orange/grey/black paint on SB 101 southern wall
- Matadero Creek Bridge:

- Gray, flaking paint, on concrete, NE end of wall.

Paint of the same color on the same bridge, as those noted above, should be considered positive unless proven otherwise by direct sampling with results of non-detect (at or above the detection limit of 1.0 mg/Kg). Disposal requirements for materials containing LBP are discussed in Section 7.2.2.

In addition to the general soils investigation performed to determine soil reuse or disposal requirements, primarily due to the presence of ADL, several borings were advanced with soil and/or groundwater samples collected to preliminarily evaluate areas outside the existing right-of-way which may be acquired as part of the project, or to evaluate areas which were identified in the ISA as having been potentially impacted due to off-Site contamination. These areas are discussed in this Section.

6.1 POTENTIAL RIGHT-OF-WAY ACQUISITIONS

Soil and groundwater samples were collected at three potential right-of-way acquisition areas for preliminary evaluation (N-1, N-3-5 and N-3-10). These sampling efforts were primarily intended to determine the reuse and disposal requirements associated with the soil and to preliminarily screen the areas for contamination; the sampling efforts were not intended to provide sufficient information to certify the presence or absence of 'significant contamination' as typically required by Caltrans prior to right-of-way acquisition. The results of these sampling efforts are described below.

6.1.1 Boring N-1

Boring N-1 was advanced adjacent to the on-ramp from southbound Amphitheater Parkway to northbound US 101, adjacent to a property identified as the Peery Property. The boring was advanced to first encountered groundwater. One groundwater sample was collected and soil samples were collected from 1.0 and 7.0 ft bgs. Both soil samples and the groundwater sample were analyzed for Cam 17 Metals, DITPH-g, BTEX, 5 Gas Oxygenates, VOCs, TPH-d, and TPH-mo. In addition, the shallow soil sample was also tested for STLC Chromium and Hexavalent Chromium.

Total Lead was detected in both soil samples at concentrations at detections of 20 and 3.2 mg/Kg respectively. As this sample was collected at a later date than all other samples, and the detected concentrations were less than 50 mg/Kg, the results from this boring were not included in the statistical evaluation. Soil from this area is not subject to the Caltrans Variance.

Total Chromium was detected in sample N-1@1' at 63 mg/Kg, which is above the 10 x STLC level of 50mg/Kg, while sample N-1@7' had Total Chromium just below the 10 x STLC limit (49 mg/Kg). STLC Chromium and Hexavelent Chromium were run on the N-1@1' sample, but were not detected above the regulatory levels.

TPH-mo was detected in the two soil samples at concentrations of 140 and 6.7 mg/Kg respectively, while the VOC Methylene Chloride was detected at a concentration of 12 ug/Kg in sample N-1@7'. In the groundwater sample, the VOCs 1,1-Dichloroethane, 1,1-Dichloroethene, and cis-1,2-Dichloroethene were detected at concentrations of 0.79, 2.4 and 1.1 ug/L respectively. In URS' opinion, these concentrations do not require further testing to determine soil reuse and soil disposal, however they may qualify as contamination subject to further evaluation prior to right-of-way certification. No other constituent was detected at a concentration meriting further discussion.

6.1.2 Boring N-3-5

Boring N-3-5 was advanced at approximately station 175+00, directly adjacent to a potential right-of-way acquisition area that extends from approximately stations 173+00 to 179+00. The boring was advanced to first encountered groundwater. One groundwater sample was collected and soil samples were collected from 0.5, 1.0, 1.5, 2.0, and 3.0 ft bgs. One or more soil samples were analyzed for Cam 17 Metals, DI-WET Lead, WET Lead, TCLP Lead, pH, TPH-g, BTEX, 5 Gas Oxygenates, TPH-d, TPH-mo, PCBs, and OCPs. The groundwater sample was analyzed for the same list of analytes as well as for VOCs.

Total Lead, WET Lead, DI-WET Lead, and TCLP Lead were detected in one or more soil samples at concentrations within the typical range of detections for the project. These results were included in the statistical evaluation and therefore soil from this potential acquisition area is subject to the reuse and disposal recommendations discussed in Section 7. TPH-mo was detected at a concentration of 1,380 mg/Kg in the sample collected from 0.5' bgs. The VOC cis-1,2-Dichloroethene (cis-1,2-DCE) was detected at a concentration of 1.75 ug/L in groundwater. While these concentrations do not require further testing to determine soil reuse and soil and/or groundwater disposal, they may qualify as contamination subject to further evaluation prior to right-of-way certification. No other constituent was detected at a concentration meriting further discussion.

6.1.3 Boring N-3-10

Boring N-3-10 was advanced at approximately station 193+00, within a potential right-of-way acquisition area that extends from approximately stations 192+00 to 196+00. The boring was advanced to first encountered groundwater. One groundwater sample was collected and soil samples were collected from 1.0, 3.0, and 6.0 ft bgs. One or more soil samples were analyzed for Cam 17 Metals, pH, TPH-g, BTEX, 5 Gas Oxygenates, TPH-d, TPH-mo, PCBs, and OCPs. The groundwater sample was analyzed for the same list of analytes as well as for VOCs.

Total Lead was detected in at low concentrations compared to the typical range of detections for the project. These results were included in the statistical evaluation and therefore soil from this potential acquisition area is subject to the reuse and disposal recommendations discussed in Section 7. TPH-mo was detected at a concentration of 3,540 mg/Kg in the sample collected from 1.0 ft bgs; this detection represents the highest detection of TPH-mo within the Site. The VOCs cis-1,2-DCE, trans-1,2-Dichloroehtene (trans-1,2-DCE), and Trichloroethene (TCE) were detected at concentrations of 61.8 ug/L, 5.8 ug/L, and 37.2 ug/L respectively in groundwater. While these concentrations do not require further testing to determine soil reuse and soil and/or groundwater disposal, they may qualify as contamination subject to further evaluation prior to right-of-way certification. No other constituent was detected at a concentration meriting further discussion.

6.2 POTENTIAL IMPACTS DUE TO OFF-SITE CONTAMINATION

Three locations at the project site were discussed during the Initial Site Assessment performed by Baseline Environmental Consultants, April 2008, to have likely been impacted by volatile

organic compounds (VOCs) or pesticides originating at several properties adjacent to the project area. Soil and groundwater samples were collected for each of these areas.

These locations include:

- San Antonio Road area (Boring S-2-3)
- Caltrans maintenance facility area near Old Middlefield Way (Boring S-3-12 and S-3-13)
- Area south of Amphitheater Parkway (Boring S-3-14)

Soil samples were collected from 0.5, 1.0, 1.5, 2.0, and 3.0 feet at each boring, and one groundwater sample was collected from Borings S-2-3, S-3-13, and S-3-14.

Based upon URS' Hazardous Materials Investigation Workplan, and the DTSC Lead Variance for Caltrans, the soil criteria soil criteria discussed in Section 3.1.1 have been used to evaluate the condition of soil at the Site.

7.1 CONCLUSIONS

A total of five samples exceeded the maximum concentration of total lead or DI-STLC lead at which reuse is permitted. The five samples removed from the statistical evaluation are S-1-5@0.5', S-1-6@0.5', S-3-3@0.5', S-3-10@0.5', and N-2-11@1.0' (as a result of this boring, soil at N-2-11@0.5' will also be excavated and off-hauled and has been removed from the sample set). In addition, boring N-1-4 exhibited higher than typical lead concentrations that would have negatively impacted reuse opportunities, and so all results from this boring were removed from the analytical data set. Soil associated with these borings may not be reused, and disposal recommendations for these areas are discussed in Section 7.1.2.

The smaller segments used in the statistical evaluation are described below.

Southbound

- Group 1: Construction adjacent to southbound lanes from the northern project limit to Station 113+00. This group was further split into subgroups 2A and 2B, for soil shallower and deeper than 1 foot bgs, respectively.
- Group 2: Construction adjacent to southbound lanes from Station 113+00 to the southern project limit. This group was further split into subgroups 2A and 2B, for soil shallower and deeper than 6 inches bgs, respectively.

Northbound

- Group 3: Construction adjacent to northbound lanes from northern project limit to Station 105+00. This group was further split into subgroups 3A and 3B, for soil shallower and deeper than 1.5 feet bgs, respectively.
- Group 4: Construction adjacent to northbound lanes from Station 105+00 to Station 159+00. This group was further split into subgroups 4A and 4B, for soil shallower and deeper than 1.5 feet bgs, respectively.
- Group 5: Construction adjacent to northbound lanes from Station 159+00 to the southern project limit. This group was further split into subgroups 8A and 8B, for soil shallower and deeper than 1 foot bgs, respectively.

The following conclusions have been prepared for specific areas of the Site based on analytical results obtained as part of this Site investigation. Performing statistical evaluations on a specified segment of the project reduces the negative impacts of isolated areas with high concentrations of lead. If soils are not managed based on the groups described above and analyzed in Section 4, or if limited excavation and disposal of soil is performed, the statistical evaluations become invalid and additional statistical evaluation and/or sampling may be required.

7.1.1 Lead – Soil Reuse

Soil reuse opportunities were summarized in Table ES-1, and shown on the attached Figures. Per the terms of the Caltrans variance, Caltrans may move lead-contaminated soil from one Caltrans project to another Caltrans project so long as it remains in the same Caltrans corridor, in this case US 101. This movement must comply with the terms of the variance. This Site Investigation Report has not evaluated the potential reuse of soil outside a Caltrans Corridor.

Southbound

Due to high concentrations of total lead and DI-WET lead, soil adjacent to the Southbound lanes from the following areas may be reused on-Site only at locations more than 5 feet above the water table and must be covered with a pavement structure that will be maintained by Caltrans:

- the top 1 ft of soil from the northern project limit to Station 113+00; and
- the top 6 inches of soil from Station 113+00 to the southern project limit

Soil excavated from deeper depths adjacent to the Southbound lanes exhibit lead and other constituents at concentrations which are not considered hazardous and therefore reuse of this soil will not be restricted.

Northbound

Due to high concentrations of total lead and DI-WET lead, soil adjacent to the Northbound lanes from the following areas may be reused on-Site only at locations more than 5 feet above the water table and must be covered with a pavement structure that will be maintained by Caltrans:

- the top 1.5 ft of soil from the northern project limit to Station 159+00; and
- the top 1 ft of soil from Station 159+00 to the southern project limit.

Soil excavated from deeper depths adjacent to the Northbound lanes exhibit lead and other constituents at concentrations which are not considered hazardous and therefore reuse of this soil will not be restricted.

7.1.2 Lead – Soil Disposal

In the event that soils must be disposed of off-Site, the following conclusions apply.

A total of five samples exceeded the maximum concentration of total lead or DI-STLC lead at which reuse is permitted. The five samples removed from the statistical evaluation are S-1-5@0.5', S-1-6@0.5', S-3-3@0.5', S-3-10@0.5', and N-2-11@1.0' (as a result of this boring, soil at N-2-11@0.5' will also be excavated and off-hauled and has been removed from the sample set). In addition, boring N-1-4 exhibited higher than typical lead concentrations that would have negatively impacted reuse opportunities, and so all results from this boring were removed from the analytical data set. Soil in the vicinity of these samples should be excavated and properly managed and disposed, prior to initiating soil reuse. Because these samples will be disposed of separately, they have been removed from the statistical evaluation. For each sample, excavation and disposal should be performed prior to initiating excavation for stockpiling and reuse.

Excavation for disposal should be performed along the entire width of excavation, for each area, and from the sample location to the midpoint between the sample and the nearest lateral samples. Excavation for disposal should be performed to the depth of sample for each area. Soil excavated associated with samples S-1-5@0.5' and S-3-3@0.5', should be managed as a RCRA hazardous waste due to presence of lead, while soil excavated associated with samples N-1-4 at all depths, S-1-6@0.5' S-3-10@0.5' and N-2-11@0.5 and1.0 should be managed as a California hazardous waste due to the presence of lead. Limits of excavation and waste management associated with these locations are shown on the Figures.

Disposal of soil for the remainder of the project will be governed by California and/or RCRA hazardous waste regulations will vary based on excavation location and depth. Per the terms of the Caltrans variance, Caltrans may move lead-contaminated soil from one Caltrans project to another Caltrans project so long as it remains in the same Caltrans corridor, in this case US 101. This movement must comply with the terms of the variance.

Southbound

Due to high concentrations of WET lead, soil excavated at certain depths adjacent to the Southbound lanes, if removed from the Caltrans ROW, must be disposed of as a California hazardous waste, or disposed of out-of-state, due to the presence of lead. The affected areas are as follows:

- the top 1 ft of soil from the northern project limit to Station 113+00; and
- the top 6 inches of soil from Station 113+00 to the southern project limit

Soil excavated from deeper depths adjacent to the Southbound lanes exhibit lead and other constituents at concentrations which are not considered hazardous.

Northbound

Due to high concentrations of WET lead, soil excavated at certain depths adjacent to the Southbound lanes, if removed from the Caltrans ROW, must be disposed of as a California hazardous waste, or disposed of out-of-state, due to the presence of lead. The affected areas are as follows:

- the top 3.0 ft of soil from the northern project limit to Station 105+00
- the top 1.5 ft of soil from Station 105+00 to Station 159+00; and
- the top 1 ft of soil from Station 159+00 to the southern project limit.

Soil excavated from deeper depths adjacent to the Northbound lanes exhibit lead and other constituents at concentrations which are not considered hazardous and therefore reuse of this soil.

7.1.3 Other Contaminants of Concern in Soil

As described in detail in Sections 3.1.3, various numbers of samples were analyzed for pH, asbestos, OCPs, PCBs, TPH-g, TPH-d, TPH-mo, BTEX, VOCs, and for the 5 Gas Oxygenates.

None of these constituents were detected at a value or concentration which exceeded applicable State or Federal hazardous waste criteria, or for constituents for which no specific criteria has been established, require additional testing or evaluation, in the opinion of URS. Therefore, these constituents do not restrict reuse of soil or require disposal of soil as a California or RCRA hazardous waste. Results are included as Table 4, and raw analytical reports are included on CD as Appendix E.

7.1.4 Right-of-Way Acquisition

Limited sampling was performed within or immediately adjacent to areas which are expected to be acquired to construct the proposed project. These samples were associated with borings N-1, N-3-5 and N-3-10. Samples collected in the latter two of these areas were included in the statistical evaluation of soils scheduled for reuse, and the soil is thus subject to the conclusions for soil reuse and disposal based on the presence of lead, discussed in Sections 7.1.1 and 7.1.2. Samples collected from the N-1 boring were not included in the statistical evaluation, however lead was not detected at concentrations above the 10 x STLC limit, and therefore soil from this area is not subject to the Caltrans Variance or the conclusions in Sections 7.1.1 and 7.1.2 of this report.

All three of the above samples were also analyzed for additional constituents, and the results of those analysis indicated that the soil represented by these samples do not constitute a hazardous waste. URS notes that the highest detected concentration of TPH-mo within the Site of 3540 mg/Kg was collected at sample N-3-10@1.0', within a right-of-way acquisition. Several VOCs were detected in groundwater samples N-1-GW and N-3-10-GW, including TCE at a concentration of 37.2 ug/L, and the VOC Methylene Chloride was detected in soil sample N-1@1' at a concentration of 12 ug/Kg. These detections indicate that additional characterization of these areas are necessary to certify the presence or absence of 'significant contamination' as typically required by Caltrans prior to right-of-way acquisition.

7.1.5 Groundwater

During URS' environmental investigation, groundwater was typically encountered at a depth of approximately 10 feet bgs. Based on URS' geotechnical investigation, which was performed in the summer of 2009, depth to groundwater varied throughout the Site, ranging from approximately 8 feet to 12 feet bgs. Accordingly, reuse of soil may be constrained because soil reuse restrictions limit reuse to at least 5 feet above the groundwater table.

Groundwater samples associated with the environmental investigation were collected primarily adjacent or downgradient of properties identified as potentially impacting the Site in the ISA, at properties scheduled for right-of-way acquisition, or at the locations of bridges where the deepest excavations might be expected. As discussed in Section 3.2, no constituent of concern was detected at a concentration which exceed State or Federal hazardous waste criteria, or for constituents for which no specific criteria has been established, require additional testing or evaluation, in the opinion of URS. Therefore, these constituents do not require disposal of groundwater as a California or RCRA hazardous waste.

7.1.6 Asbestos/Lead Based Paint

The following subject structures are scheduled for partial demolition as part of the widening improvements and were surveyed for asbestos and lead-based paint.

- Adobe Creek Bridge
- Matadero Creek Bridge
- Permanente Creek box culvert extension

Asbestos was not detected in any sample, at any bridge. Lead based paint was detected in the following samples:

- Adobe Creek Bridge:
  - Grey paint on concrete on NB 101 Adobe Creek Bridge Barrier Wall, near the southern end
  - Orange/grey/black paint on SB 101 southern wall
- Matadero Creek Bridge:
  - Gray, flaking paint, on concrete, NE end of NB 101 wall.

7.2 RECOMMENDATIONS

URS makes the following recommendations relating to soil, groundwater, and demolition debris handling during construction:

7.2.1 Soil

If soil is to be excavated and removed from the Caltrans ROW, the disposal location should be reviewed and approved by the VTA and Caltrans prior to granting approval for the contractor to move the soil. The investigation data results reported herein are considered sufficient to characterize the soil for reuse or disposal.

If soils of unusual color or odorous soils are encountered during the project excavations or soil management activities, those soils should be stockpiled separately and subjected to additional sampling and analysis to further evaluate potential contamination.

The following recommendations have been prepared for specific areas of the Site. Performing statistical evaluations on specified segments of the project reduces the negative impacts of isolated areas with high concentrations of lead. If soils are not managed based on the groups described above and analyzed in Section 4, or if limited excavation and disposal of soil beyond that specifically described in Section 4.1.1 is performed, the statistical evaluations become invalid and additional statistical evaluation or sampling are required.

Reuse and disposal of soil for the Site is discussed in detail in Sections 7.1.1 and 7.1.2. Based upon reuse recommendations significant volumes of excavated material used for backfill must be placed at least 5 feet above the groundwater table. The lead-impacted soil may be reused as a component of lime-treated subbase. The depth to groundwater varies from approximately 8 to 15 feet.

Because of high concentrations of lead throughout the project site, URS recommends development and implementation of a site-specific health and safety plan to protect workers and the public from exposure risks due to lead. This health and safety plan will likely require workers to receive HAZWOPER 24 or 40 hour training prior to beginning field work. The health and safety plan should consider concentrations of all detected constituents, and in particular the presence of arsenic, nickel, chromium, lead, asbestos, OCPs, and TPH-mo in soil.

7.2.2 Right-of-Way Acquisition Area

A work plan should be developed to evaluate potential right-of-way acquisition areas for contamination due to detected concentration of TPH-mo in boring N-3-5, and TPH-mo and VOCs in borings N-1 and N-3-10.

7.2.3 Groundwater

Based upon reuse recommendations most excavated material used for backfill must be placed at least 5 feet above the groundwater table. The depth to groundwater varies from approximately 8 feet to 15 feet throughout the project corridor.

Based upon URS' groundwater investigation, groundwater at the Site may be disposed of as a non-hazardous waste.

If groundwater observed in excavations or during dewatering exhibit odors or sheet, this groundwater should be stored separately additional sampling and analysis to further evaluate potential contamination, prior to continued worker contact or disposal.

URS recommends development and implementation of a site-specific health and safety plan to protect workers and the public from exposure risks due to contact with groundwater.

7.2.4 Structural Demolition Debris

Asbestos has not been detected in any sample at any of the three bridges scheduled for retrofit and/or widening as part of the Project. Lead based paint has been detected in samples collected from both the Adobe Creek Bridge and the Matadero Creek Bridge. URS recommends that all paint from both bridges be considered lead-containing. One sample of gray paint, collected from the northeast end of the NB 101 wall, was identified as flaking. Any flaking paint identified as lead-containing must be scraped to the concrete substrate and properly managed and disposed as a lead-containing hazardous waste. Provided that the remainder of the paint remains in good condition (no chipping and peeling), it may be disposed of by the disposal contractor with the demolition debris as non-hazardous, construction waste, following all proper waste profiling

procedures, and all proper procedures and disposal regulations for demolition of a structure. Lead removal and demolition activities should be performed in compliance with all federal, state and local regulations under proper engineering control procedures. Abatement supervision, environmental area, and clearance air monitoring should be performed during the lead removal and demolition by a third party environmental firm employed by the property owner or owner's representative. The abatement contractor, per Cal-OSHA requirements, should conduct employee exposure monitoring of individuals working in proximity of the lead containing material during abatement and/or demolition activities.

This report was prepared for the Santa Clara Valley Transportation Agency and any use by third parties is at the third parties sole risk. No investigation is sufficient enough to explore the presence of hazardous material at every location on the site. It is assumed that the samples collected and analyzed in accordance with the agreed scope of work are representative of conditions at the Site at the time of the planned construction. If soil or groundwater conditions are observed that differ from those in this report, URS Corporation should be notified so that additional recommendations can be made.

It would be extremely expensive, and perhaps impossible, to conduct a Site reconnaissance or investigation that would ensure detection of all materials at the subject property that might be considered hazardous now or in the future. URS' failure to discover hazardous materials through a reasonable and mutually agreed-upon limited scope of work does not guarantee that hazardous materials do not exist in an area. Similarly, an area that is unaffected by hazardous materials at the time of our assessment may later, due to natural phenomena or human intervention, become contaminated.

Notes:
EPA = US Environmental Protection Agency
mg/Kg = milligrams per kilogram
STLC = Soluble Threshold Limits Concentrations
TCLP = Toxicity Characteristic Leaching Procedure
NE = Not Established
-- = sample not analyzed for specified analyte

Bold indicates value exceeds 10 x STLC
The symbol "<" (less than) indicates that the analyte was not detected at a concentration above the laboratory detection limit specified.

Notes:
EPA = US Environmental Protection Agency
mg/L = milligrams per liter
mg/Kg = milligrams per kilogram
STLC = Soluble Threshold Limits Concentrations
TCLP = Toxicity Characteristic Leaching Procedure
NE = Not Established
-- = sample not analyzed for specified analyte
Bold indicates value exceeds Criteria
The symbol "<" (less than) indicates that the analyte was not detected at a concentration above the laboratory detection limit specified.
EPA = US Environmental Protection Agency
NE* Due to insufficient sample mass available, no extraction was performed on requested sample.

Notes:
EPA = US Environmental Protection Agency
mg/Kg = milligrams per kilogram
ug/Kg = micrograms per kilogram
STLC = Soluble Threshold Limits Concentrations
TCLP = Toxicity Characteristic Leaching Procedure
NE = Not Established
-- = sample not analyzed for specified analyte
Bold indicates value exceeds 10 x STLC
The symbol "<" (less than) indicates that the analyte was not detected at a concentration above the laboratory detection limit specified.
* Asbestos samples with detections above reporting limits were further tested using EPA Method 600/R-93/116 with CARB 435 Prep (Milling) Level A for 0.25% Target Analyte Sensitivity

Notes:

(1) If duplicates exist, the average of the duplicate results is used as a single data point.

(2) All samples collected at various depths at the same location are considered independent data points.

(3) If the dataset contains nondetects, summary statistics and UCLs are estimated by the Kaplan-Meier (KM) method when possible.

(4) Goodness-of-Fit Test at 5% significance level is used to test for distributional assumption.

(5) The distributional assumption from (4) is used to select the appropriate UCL calculation method. For normal distribution, the UCL is based on the t-statistics. For lognormal distribution, gamma distribution, and non-parametric assumption, the UCL is based on the recommendations from USEPA (2002) and Singh (2007).

U.S. 101 Auxiliary Lanes
Embarcadero Road to State Route 85
EA 04-4A3301

FINAL
Hazardous Waste Materials Investigation

Work Plan

Prepared by

URS Corporation

55 S. Market Street, Suite 1500
San Jose, CA 95113
March 12, 2009

BACKGROUND INFORMATION AND PROJECT DESCRIPTION

The U. S. 101 Auxiliary Lanes project consists of the segment of U. S. 101 between Embarcadero Road and State Route 85 (S.R. 85) located in the Cities of Mountain View and Palo Alto, in Santa Clara County within District 4 of the State of California Department of Transportation and within the VTA planning area (See Figure 1 for a Project Location and Vicinity Map). The project limits extend from Embarcadero Road and State Route 85, a distance of 3.2 miles (PM 48.97/52.17) and will be referred hereon as "the Site".

The purpose of this project is to relieve existing and future traffic congestion at freeway on-ramp and off-ramp connections, improve safety along the US 101 corridor, provide for improved local access over this segment of the U.S. 101 corridor. Auxiliary lanes would improve traffic operations on the freeway by providing more room for traffic entering and exiting the freeway at each interchange to merge and by allowing local traffic that is only going from one interchange to the next to use the freeway without impacting the main through lanes.

This project proposes to construct auxiliary lanes, extend existing second High Occupancy Vehicle (HOV) lanes, and undertake associated ramp improvements including ramp widening and installing/activating ramp metering in both directions. The proposed improvements include widening of creek crossings and relocation of sign structures, storm drainage and other utilities. As a result of these proposed improvements soil will be excavated along U.S. 101, at interchanges, and at creek crossings.

Two creek crossing bridge structures and one box culvert crossing structure are planned to be widened:

- Adobe Creek Bridge, 37-0174 - the proposed improvements will include widening both sides of the Adobe Creek Bridge by approximately 11 feet in the northbound and southbound directions, closing the gaps between the U.S. 101 bridges and the adjacent frontage road bridges. The proposed structure type is a single-span precast, prestressed rectangular girder with a cast-in-place concrete deck.
- Matadero Creek Bridge, 37-0040 - the proposed improvements will include widening on both sides of the structure by approximately 12 feet in the northbound and southbound directions. This will close the gaps between the U.S. 101 bridges and the adjacent frontage road bridges. The proposed structure type is a two-span precast, prestressed concrete voided slab.
- Permanent Creek box culvert crossing – the proposed improvement will likely include either extending the box culvert or building a small bridge structure adjacent to the current culvert.

This Hazardous Waste Materials Investigation Work Plan describes the procedures for completing Task 2.6 "Initial Hazardous Waste Soil Investigation" and Task 2.16 "Asbestos/Lead Based Paint Investigation" included in the US 101 Auxiliary Lanes Project Scope of Work dated January 8, 2009. The overall purposes of Hazardous Waste Materials Investigation are evaluate the soil conditions for on-site use, off-site disposal of

site soils, assess the bridges and culvert scheduled for retrofit for the presence of asbestos or lead-based paint and identify work safety issues for site construction workers.

This hazardous waste materials investigation will provide analytical data of soil materials and bridge materials in locations of the following existing structures requiring modifying and widening, and new structure:

- Adobe Creek Bridge, 37-0174
- Matadero Creek Bridge, 37-0040
- Permanente Creek box culvert extension
- Highway soil materials

Several locations at the project site were discussed during the Initial Site Assessment performed by Baseline Environmental Consultants, April 2008, to have likely been impacted by VOCs originated at several properties adjacent to the project area. These issues are being evaluated in this work plan. Samples will be collected within the existing Caltrans Right of Way at the nearest location to these areas as possible.
These locations include at least:

- San Antonio Road area
- Caltrans yard area near Old Middlefield Way, and
- Area south of Amphitheater Parkway.

A site and project specific Health and Safety Plan for personnel completing field activities has been prepared for the hazardous materials and geotechnical investigations during this project and is attached in Appendix A.

CONTACT INFORMATION

The following table lists VTA's, Caltrans's and URS' contacts for this task.

Contact	Function	Office Phone
Lam Trinh	VTA Project Manager	(408) 952-4217
Paul Mai	Caltrans Project Manager	(510) 622-0754
Ray Boyer	Caltrans Hazardous Waste Manager – Santa Clara County	(510) 286-5668
Joe Morgan	URS Technical Expert	(510) 874-3201
Susie Vedantham	URS Hazardous Materials Manager	(408) 297-9585
Ramsey Hissen	URS Project Manager	(408) 297-9585
Patrick Walz	URS Task Manager	(408) 297-9585
Lisa Griggs	URS Health & Safety Manager	(408) 297-9585
Christopher Lillie	URS Project Engineer	(408) 297-9585
Stephen Huang	URS Geotechnical Task Leader	(408) 297-9585

INITIAL HAZARDOUS WASTE INVESTIGATION

URS will conduct a hazardous waste investigation study on the 3.2-mile U.S. Highway 101 Auxiliary Lanes Project from Embarcadero to State Route 85 (the Site) in the Cities of Mountain View and Palo Alto, in Santa Clara County. The primary focus of the investigation will be Aerial Deposited Lead (ADL) at the top 3 feet soil, historically deposited from leaded gasoline automotive emissions. The investigation will also include testing for other roadway potential contaminants for sites identified in the Initial Site Assessment (ISA) prepared by Baseline Environmental Consultants dated April 2008. These constituents include California Assessment Manual (CAM 17) Metals, Total Petroleum Hydrocarbons as Diesel and Motor oil (TPH-d/mo), TPH as Gasoline (TPH-g), Volatile Organic Compounds (VOCs) and 5 Gasoline Oxygenates, Polychlorinated Biphenyl (PCBs) and Organo-chlorine Pesticides (OCPs), pH, and Asbestos. Additionally, groundwater samples will be collected at select locations and analyzed for the same constituents except asbestos.

Soil excavation will be performed along the highway and sections of associated ramps, at Matadero Creek bridge and Adobe Creek bridge bents locations and at the area of the Permanente Creek box culvert extension. Soil excavation will be performed along the highway and sections of associated ramps, between the edge of the current asphalted pavement (including lanes and outer shoulders) and the limit of excavation and will hereafter referred in this report as "the highway excavation area".

Although it is not known at this time where fill material may be placed, it is anticipated that the U.S. 101 Auxiliary Lines will be a balanced project, assuming that the existing soils to be excavated can be used on the project. If some existing soils cannot be used due to the presence of contaminants or soil compaction characteristics, those soils will require off-site use or disposal at an appropriate landfill in compliance with regulatory requirements, and corresponding amounts of additional clean imported soils will be needed.

URS will collect soil samples to evaluate potential soil uses on the project, disposal options off-site, support Right of Way acquisition processes, and to evaluate potential construction worker exposure to lead impacted dust. The ADL in soil analytical results will be evaluated statistically using Caltrans approved statistical methods. Additionally, URS will collect groundwater samples at selected locations for groundwater quality purposes.

URS reviewed the following documents in developing this Work Plan.

- *Initial Site Assessment – Portions of Route 85/US 101 Interchange Project, Mountain View, Santa Clara County, California*, prepared by Kleinfelder, January 28, 2003.
- *Initial Site Assessment - U.S. 101 Auxiliary Lanes Project (Embarcadero Road to Shoreline Boulevard, Palo Alto and Mountain View, California,* prepared by Baseline Environmental Consultants, April 2008.
- *U.S. 101 Auxiliary Lanes-Oregon Expressway to Shoreline Boulevard 04-4A330, Geotechnical Investigation-Field Work Plan,* prepared by URS, October 15, 2008.

REGULATORY ISSUES

Hazardous Waste Regulatory Criteria

The total concentrations of prescribed elements or compounds are regulated as hazardous waste in California if they exceed the Total Threshold Limit Concentration (TTLC) criteria, which can be found in Title 22 of the California Code of Regulations (CCR).

Leachable elements or compounds are also regulated in California based on the Soluble Threshold Leaching Characteristic (STLC) criteria, which can also be found in Title 22 of the CCR. URS will analyze samples for total suspected contaminant concentrations and subsequently evaluate the leachable components for select samples.

The California Waste Extraction Test (WET) is used to evaluate contaminant leachability from soils and other potential wastes for disposal in landfills. The Standard WET uses a citric acid solution as the extracting medium. The De-ionized (DI) WET version uses DI water as the extraction medium and is used to evaluate soil leachability for reuse on-site. Analytical results of the WET extracts will be analyzed and compared to the California STLC criteria for hazardous waste characterization or potential reuse. Analytical results for the DI-WET extracts will be compared to the Maximum Concentration Limits (MCLs) for evaluation of potential impacts to groundwater, if the soils are left in place. The Toxicity Characteristic Leaching Procedure (TCLP) is the Federal Resource Conservation and Recovery Act (RCRA) leaching procedure and is also used to evaluate contaminant leachability for hazardous waste characterization. The TCLP test is not as stringent as the California WET.

These tests will be run iteratively in the following order: WET, DI-WET, and TCLP based on the total metal concentrations in the samples. Samples with total lead concentrations exceeding 50 mg/kg will be extracted with the WET and the DI-WET and analyzed for lead. Samples with lead concentrations exceeding 100 mg/kg will be extracted with the TCLP and analyzed for lead. Evaluation of other contaminants may also require WET and TCLP leachability testing and evaluation if they exceed 10 or 20 times the STLC or TCLP criteria, respectively.

Lead in soil analytical results will be evaluated against the existing DTSC variance (described below), and California and Federal hazardous waste criteria.

Soils that exceed the TTLC and/or the STLC criteria must be managed, transported, and disposed of off-site as a California hazardous waste, if disposed of in California. Alternatively, California hazardous waste can also be disposed of in other states as non-hazardous. Soils that exceed RCRA criteria must be managed, transported, and disposed of off-site as Federal RCRA waste.

Department of Toxic Substances Control (DTSC) Variance for Aerially Deposited Lead (ADL) in Soil on Caltrans Right of Way

The following paragraphs outline the soil handling requirements in the most recently issued Caltrans District 4 lead-impacted soil handling variance by DTSC. If the soil contaminants exceed the prescribed criteria, the soil must be handled as a hazardous waste.

The following bullet points describe potential lead in soil concentrations and the corresponding regulatory restrictions that apply.

- Soil with total lead <50 mg/kg, are not subject to the reuse restrictions of the Caltrans ADL variance.
- Soil with total lead >50 mg/kg and <1411 mg/kg, with <0.5 mg/L extractable lead with the deionized waste extraction test (DI-WET) can be used for fill on-Site as long as it is more than five feet above the water table and must be covered with at least 1.0 foot of non-hazardous cover.
- Soil with >50 mg/kg and <3397 mg/kg total lead and >0.5 mg/L and <50 mg/L extractable lead with the DI WET can be used on the Right of Way (ROW) on-Site as long as it is more than five feet above the water table and must be covered with a pavement structure which will be maintained by Caltrans.
- Soil with >50 mg/kg and <3397 mg/kg total lead and >50 mg/L extractable lead with the DI WET must be disposed off-Site if removed from the Caltrans ROW.
- Soil with >3397 mg/kg total lead must be disposed off-Site if removed from the Caltrans ROW.
- For soil that must be disposed off-Site if removed from the Caltrans ROW:

– Soil with <5.0 mg/L extractable lead with the standard waste extraction test (WET) is a non-hazardous waste and can be disposed in a non-hazardous waste landfill if removed from the Caltrans ROW.

– Soil with >5.0 mg/L extractable lead with the standard WET and <5.0 mg/L extractable lead with the TCLP test is a California hazardous waste and must be disposed off-Site in a hazardous waste landfill if removed from the Caltrans ROW, or alternatively can be disposed of out of state, as non-hazardous soil.

– Soil with >5.0 mg/L extractable lead with the TCLP test is a Federal RCRA waste and must be disposed off-Site in a hazardous waste landfill, if removed from the Caltrans ROW.

- Soil with pH <5.0 can only be reused on-Site if it is used below a paved surface.
- Soil may not be reused on the Caltrans ROW if it is considered hazardous due to the presence of any material other than lead.

PROPOSED INVESTIGATION

The purpose of our screening level investigation is to conduct sampling, chemical analysis, and evaluation of the chemical characteristics of soils to be excavated from the site and groundwater at select locations at the Site.

The evaluation results for soil will be used for the following identification purposes:

- Soil that is not subject to reuse restrictions to be used on-site or off-site for fill.
- Restricted soil to be used on-site for fill under the Caltrans ADL impacted soil variance, from the DTSC, in force during the construction period.
- Hazardous waste that must be removed from the site for off-site disposal at a hazardous waste landfill.
- Non-hazardous soils to be taken off-site for disposal due to excess soils generated by the project or because the geotechnical report indicates that the soils cannot be used for fill due to their poor compaction characteristics.
- Notification and potential required training of on-site workers, if potential contaminant levels warrant it.
- Guidance for development of follow-up soil investigations, if needed.

Based on the above factors, URS proposes to conduct a soil investigation at the highway excavation area, the Matadero Creek bridge and Adobe Creek bridge bent locations and the Permanente box culvert extension area. Soil will be evaluated for ADL, CAM 17 Metals, TPH-d/mo, TPH-g, VOCs and 5 Gasoline Oxygenates, PCBs and Pesticides (OCPs), pH, and Asbestos.

All the soil samples will be analysis and analyzed for total lead. 10 percent of these samples will also be analyzed for CAM 17 metals. Approximately 20 percent of the samples collected will be analyzed for asbestos using PLM Method, and 10 percent of samples will be analyzed for pH. At approximately 10 percent of sample locations, samples will be analyzed for TPH-D/Mo, TPH-G/BTEX, 5 Gas Oxygenates, PCBs and pesticides. TPH-g/BTEX and Gasoline Oxygenates will not be tested in the upper 6 inches due to the volatility of these components, and PCBs and Pesticides (OCPs) will only be tested in the upper 6 inches. Although the final analytical suite will be randomly determined for each soil sample during field work, analytical suites have been already established for soil samples collected at specific locations at the Site including:

- Two of the soil samples collected in the vicinity of the Caltrans yard will be also analyzed for VOCs.
- Soil samples collected at two Right of Way acquisition areas will be analyzed for the full analytical suite.
- Soil samples collected at the retaining wall area scheduled near Old Middlefield Way will be analyzed for the full analytical suite.

The groundwater investigation will be used to evaluate groundwater quality for the following purposes:

- To confirm potential impact to groundwater at those locations discussed at the ISA. Grab groundwater samples will be collected at these locations and analyzed for VOCs.
- To support acquisition processes at Right of Way areas. Grab groundwater samples will be collected at these areas and analyzed for the full analytical suite.
- To evaluate the suitability of dewatering system designs at the bridge locations and at the retaining wall scheduled near the Old Middlefield Way during the construction process. Grab groundwater samples will be collected at these locations and analyzed for the full analytical suite.

Sample locations are shown in the attached drawings.

HEALTH AND SAFETY PLAN

Safety of our staff is a priority. URS personnel have developed a site and project specific Health & Safety Plan (HASP) for personnel conducting the proposed fieldwork and similar geotechnical fieldwork associated with this project. This plan has been reviewed and signed by an office Health & Safety Officer based in San Jose, California. A copy of this HASP has been included as Appendix A.

PERMITS

Caltrans has granted encroachment permit 0408-NSV0710 to VTA and its consultant URS, allowing entry to the State Right of Way including US 101. This encroachment permit allows along US 101 shoulder closures between the hours of 9 AM and 3 PM, and lane closures along US 101 between the hours of 9 PM and 3 AM on weekdays. This permit specifies additional requirements, including work notification, shoulder and lane closure procedures, and personal protective equipment requirements. A copy of this permit has been included as Appendix B.

URS will mark and conduct utility surveys on all proposed sampling locations before the start of the field sampling efforts. An underground utility location contractor will be retained to evaluate the location of underground utilities at each boring location. Underground Service Alert (USA) will be notified of the planned boring locations so participating public utilities can provide the location of underground utilities in the area of the borings. Additionally, URS will review the results of potholing operations performed to determine the location of known utilities to aid in the project design efforts to ensure that borings to not impact these utilities.

A Caltrans-certified traffic control subcontractor will be retained to divert traffic away from the field crew and sampling rig when working along roadways. Shoulder closures, at minimum, will be required for all work adjacent to the outside lanes of US 101 and all work adjacent to entrance and exit ramps. Lane closures on the number one lane of the highway may be required at times. The attached encroachment permit regulates lane and shoulder closure times.

Sampling locations may be marked and surveyed during sampling operations to limit lane and shoulder closures. Sampling locations shown on the attached figures (Figures 2-18) are approximate and may be moved due to field conditions identified during the utility location fieldwork, accessibility, and crew safety considerations.

SAMPLING

URS will retain a drilling subcontractor to assist in the fieldwork sampling including both direct push and hand auger. URS personnel will supervise all fieldwork conducted under this Work Plan and will collect and ship the samples. URS proposes to use direct push sampling techniques to minimize cuttings collection and disposal. Where the direct push equipment cannot be used due to physical or other constraints, we will use hand auger sampling methods.

Boring locations at the Site will be labeled as follow:

- Between Embarcadero Road and San Antonio Road:, Boring locations will be labeled from west to east as N-1-1 through N-1-20 for the northbound side and S-1-1 through S-1-20 for the southbound side.
- Between San Antonio Road and Amphitheater Pkwy: Boring locations will be labeled from west to east as N-2-1 through N-2-15 for the northbound side and S-2-1 through S-2-10 for the southbound side.
- Between Amphitheater Pkwy and State Route 85: Boring locations will be labeled from west to east as N-3-1 through N-3-12 for the northbound side and S-3-1 through S-3-14 for the southbound side.

Sample Locations

- At highway excavation area: URS will collect representative soil samples of the excavation area at intervals perpendicular to the US 101 mainline and ramps. The location of these soil samples relative to the edge of traveled way will be rotated. Approximately 1/3rd of samples will be collected at each of the following areas: the edge of the pavement, midpoint between edge of pavement and limit of excavation. Soil samples will be collected approximately every 400-500 feet at a total of approximately 85 selected locations, as shown on the attached Drawings. The exact number of sample locations and the actual interval distances may change slightly based on field observations, access issues and available space at each location. These locations also include those at the Caltrans Yard area (S-3-12 and S-3-13), the Right of Way acquisition areas (N-3-5 and N-3-10) and the one located at the retaining wall area scheduled near Old Middlefield Way (S-3-11). A total of six groundwater will be collected in the highway excavation area including three groundwater samples at those locations discussed in the ISA (San Antonio Road area at sample S-2-3, Caltrans yard area near Old Middlefield Way at sample S-3-13, and area between Old Middlefield Way and North Shoreline Blvd at sample S-3-14); two groundwater samples at Right of Way acquisition areas (N-3-5 and N-3-10); and one groundwater sample at the scheduled retaining wall area (S-3-11).
- Bridges: Two bridges and a box culvert located along the US 101 mainline are scheduled for widening associated to the freeway widening. These bridges include

Adobe Creek Bridge, Matadero Creek Bridge and Permanente Creek Box Culvert. Bridge bents are scheduled at Adobe Creek and Matadero Creek bridges, while a box culvert extension is scheduled at Permanente Creek. The bridges are paved at the exact locations of the proposed bents, therefore soil samples will be collected at the closest exposed soil location. Soil samples will be collected at a total of 6 selected locations, two locations at each of the two bridges areas and two at the box culvert area, at northbound and southbound, as shown on the attached Drawings. A total of 3 groundwater samples will be collected including one at each of the bridges areas (N-1-8 and S-1-18) and one at the box culvert area (S-3-8).

Each sampling location will be recorded by GPS. All samples collected will be submitted for laboratory analysis. Analytical suite is discussed in Laboratory Analysis section.

Sampling Depths

Although excavations depths for the construction at the highway excavation area may vary between 2 and 5 feet, most excavation will be between 2 and 3 feet below existing grade. Additionally, it is URS experience that ADL impact are not expected at depths greater than 3 feet below ground surface (bgs). Therefore, borings will be advanced to maximum depth of 3 feet bgs or maximum excavation depth if less than 3 feet. Borings will be advanced to first groundwater found at those locations where groundwater sampling is scheduled. According to previous environmental investigation at the site, groundwater is expected at depths between five to eight feet bgs. Actual depth may change if refusal is encountered or utility locations require a change for safe work to proceeed.

At each sampling location URS will collect soil samples at 0 to 0.5 ft, 0.5 ft to 1 ft, 1.0 ft. to 1.5 ft, 1.5 ft to 2 ft, and 2.5 ft. to 3.0 ft. Therefore approximately 450 soil samples will be collected and all samples will be analyzed for, at minimum, lead, as further discussed below.

Sample Collection Methods

Soil samples will be collected using three different sampling methods:

- Direct-push borings samples will be collected at those locations where no access problems are expected. This sample collection method can be advanced at a high rate and is intended to be the primarily sample collection method. These samples will be collected by driving an approximately 2-inch diameter sampler equipped with clean acrylic tube liners provided by the drilling subcontractor. Drive sampling equipment will be pressure-washed after each use.
- Hand auger samples will be collected at those locations where access problems are found.
- Geotechnical borings including Standard Penetration Test and/or Modified California Penetration Test methods may be used at those locations where geotechnical and environmental representative samples may be collected jointly.

Soil samples will be collected in clean soil sampling tubes and/or laboratory provided bottles, respectively. Each soil sample tube will be sealed with Teflon and plastic end caps. All samples will be labeled with site-specific unique numbers, placed on ice and shipped daily to a State of California certified analytical laboratory under URS chain of custody procedures.

Groundwater samples will be collected from direct-push borings using disposable bailers. Temporary screened PVC wells may be constructed to facilitate sampling at each location. No permanent installation, development, or surveying of the temporary wells are proposed. Temporary screened PVC will be left up to 4 hours to allow for sample collection. If no groundwater is present after that time boring will be closed and groundwater sample not collected.

At the end of each sampling day, the borings will be backfilled to the surface elevation with neat cement grout as per SCVWD requirements. The limited cuttings and decontamination water derived during the investigation activities will be drummed, sampled and analyzed separately for off-site disposal purposes. The investigation-derived waste (IDW) will be properly labeled and stored at a site, on the Right of Way, approved by Caltrans, until it can be analyzed and characterized for disposal. URS has assumes that no more than two drums of IDW will be generated during this phase of work.

Laboratory Analyses and Analytical Methodology

All the soil samples will be submitted for analysis and analyzed for total lead by EPA Method 6010. Up to 10 percent of these will also be analyzed for CAM 17 metals by EPA Method 6010 (which includes lead), and for pH. Up to 10 percent of the samples collected from intervals below 0.5 ft will be analyzed for TPH-d/mo by EPA Test Method 8015B, TPH-G/BTEX by EPA Test Method 8015B, and 5 Gas Oxygenates by EPA method 8260. Up to 10 percent of samples collected from the 0.5 ft interval will be analyzed for PCBs and pesticides by EPA Test Method 8081/8082. Up to 20 percent of the samples collected will be analyzed for asbestos using PLM Method. Two of the subsurface soil samples collected in the vicinity of the Caltrans yard will be also analyzed for VOCs using EPA Test Methods 8082/8260. Soil samples collected at Right of Way acquisition areas will be analyzed for the full analytical suit. Soil samples collected at the retaining wall area will be analyzed for the full analytical suit.

Groundwater samples will be analyzed for CAM 17 metals by EPA Method 6010 (which includes lead), pH, TPH-d/mo by EPA Test Method 8015B, TPH-G/BTEX by EPA Test Method 8015B, 5 Gas Oxygenates by EPA method 8260, PCBs and pesticides by EPA Test Method 8081/8082, and for VOCs using EPA Test Methods 8082/8260.

All TPH-d and TPH-mo sample extracts will be first extracted with silica gel to remove biogenic sources that could result in false positive results when required to obtain reliable analytical data.

Soil samples with a total lead content exceeding 50 mg/kg will be extracted with the Standard and De-ionized Water WET and analyzed for lead. Soils with total lead content over 100 mg/kg will be extracted with the TCLP test and analyzed for lead. According to URS experience in similar projects, it is estimated that up to 40 percent of the samples initially analyzed for lead may have to be analyzed for lead using WET and DI-WET procedures and that up to 20 percent of the samples initially analyzed for lead may have to be analyzed for lead using the TCLP procedure. Other constituents may also need leachability testing. If so, URS will notify VTA and Caltrans of such samples before ordering the additional leachability testing. All samples will be analyzed on standard turn around time (TAT) of 10 business days. Each iteration of leachability testing will add another 5-10 business days to the analytical schedule.

The goal of this analytical program is to obtain representative information of the quality of the soil to be excavated and groundwater. Therefore, the specific initial analytical suite for each sample will be determined during the field work depending on the actual number of samples collected, their distribution and field observations.

Additional sampling, testing, and statistics may be needed to reduce the volume of hazardous waste identified during the proposed round of investigation.

STATISTICAL ANALYSIS

The following analytical quality control procedures will be used to comply with Caltrans procedures. A calibration blank sample will be run for every ten samples or per batch which ever is more frequent. One sample in 15 will be duplicated in the field for quality control purposes. In the laboratory QC, one in ten field samples will be spiked with lead to ten times the detection limit or at the analyte level.

URS personnel trained in laboratory data review will review each data package submitted by the laboratory for data quality control. The data will then be tabulated and evaluated.

The evaluation will include comparison to the Caltrans District 4/DTSC variance, California's Title 22 hazardous waste regulations, Federal Resource Conservation and Recovery Act (RCRA) regulations, EPA Region IX Preliminary Remediation Goals (PRGs) and the San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs). The 90% Upper Confidence Limit for lead in soil concentrations will be calculated for soil left on site for all soils and layers of soils. The 95% Upper Confidence Limit for lead in soil concentrations will be calculated for soils to be taken off-site. An additional statistical iteration will be conducted to evaluate "hotspot" soil removal, if needed. Recommendations will be made on handling the soil to comply with the regulations. Additional statistical iterations, sample analysis, or sample collection, if needed, can be conducted to evaluate other handling methods under a separate Work Plan.

STRUCTURE INVESTIGATION – ASBESTOS/LEAD BASED PAINT

The outside walls of bridges scheduled for demolition to allow for construction of bridge widening will be visually surveyed for potential Asbestos Containing Materials (P-ACMs) . If potential ACMs are identified, samples will be collected and analyzed for asbestos to allow for characterization of these portions of bridges prior to demolition or disposal. Examples of materials that will be included in our visual survey for potential ACMs are abrasion pads between the bridge decks and the support structures and caulking/filler between the intersection of the bridge decks and the adjoining roadway surface. ACM will be initially analyzed by Polarized Light Microscopy (PLM) and 6010B, respectively. Samples with asbestos will be further analyzed by the Point Count Method to refine the asbestos content. URS will subcontract these sample collection and analysis activities to Kellco Macs Laboratory, a State of California certified asbestos analytical laboratory.

The following bridges will be assessed for potential Asbestos Containing Materials: Adobe Creek Bridge, Matadero Creek Bridge and Permanente Creek Culvert.

LIMITATIONS

This Workplan includes soil and groundwater sampling within the proposed Right of Way acquisition areas. This sampling is primarily to evaluate the soil within these areas for reuse and/or disposal. In addition, soil and/or groundwater samples collected within these areas will be screened for additional analytes based upon findings of the ISA document. However, this sampling does not constitute a "Phase II" Environmental Site Investigation for these areas, and it is possible that this sampling will not be sufficient to certify that the property is free from hazardous materials. URS may recommend additional sampling in these areas prior to acquisition, and this additional sampling is not included in this Workplan.

SIGNATURES

This Work Plan was prepared under the contract provisions between Santa Clara Valley Transportation Authority and URS Corporation. It will be done in accordance with the State of California, Department of Transportation guidelines and policies. By signature below, Caltrans and URS hereby approve the Work Plan and attached Health and Safety Plan (Appendix A).

TO: Santa Clara Valley Transportation Authority
3331 North First Street
San Jose, CA 95134

Attn: John Ristow
Phone: (408) 321- 5713 , **PERMITTEE**

and subject to the following, **PERMISSION IS HEREBY GRANTED** to:

Perform field surveys, soil investigation and exploration, hazardous material testing, potholing and environmental traffic data measurements and conduct the required services to preclude nesting and roosting of swallows, swifts, and bats on structures for work under District Agreements No. 4-1869-C and No.4-1794-C, and 04239-EA262000, on State Highways 04-SCL-85,87,101,237,880, 152, 17,9, 25,35, 82, 130,156, 280, and 680, Post Mile Various, in Santa Clara County.

A minimum of one week prior to the start of work under this permit, notice shall be given and advance approval of construction detail, operation, public safety and traffic control shall be obtained from State Representative, J. Wong, 500 Queens Lane, San Jose 95112, (408) 452 7131, weekdays, between 7:30 AM and 4:00 PM .

All permitted work requires the permittee to apply for and obtain a work authorization number prior to the start of work. See the attached "Encroachment Permit Project Work Scheduling Procedures" and the attached "Permit Project Work Scheduling Request Form". Additional time beyond the minimum seven day advanced notice required in the above paragraph may be required for obtaining approval .

The following attachments are also included as part of this permit (*Check applicable*):

☒ Yes	☐ No	General Provisions
☐ Yes	☒ No	Utility Maintenance Provisions
☒ Yes	☐ No	Storm Water Special Previsions
☐ Yes	☒ No	A Cal-OSHA permit required prior to beginning work: # _____

In addition to fee, the permittee will be billed actual costs for:

☐ Yes	☒ No	Review
☒ Yes	☐ No	Inspection
☒ Yes	---------	Field Work

(If any Caltrans effort expended)

☐ Yes ☒ No The information in the environmental documentation has been reviewed and considered prior to approval of this permit.

This permit is void unless the work is completed before May 31, 2010

This permit is to be strictly construed and no other work other than specifically mentioned is hereby authorized.
No project work shall be commenced until all other necessary permits and environmental clearances have been obtained.

APPROVED:

BIJAN SARTIPI, District Director

BY: Michael D. Condie

MICHAEL D. CONDIE, District Permit Engineer

Before any work is begun which will interrupt the normal flow of public traffic, approval shall be obtained from State's representative, and closures shall be in accordance with the appropriate State Standard Plans T-10 through T-14. Where required by the plan, the use of a flashing arrow-board is MANDATORY.

Traffic control is authorized with State's representative permission, between 9:00 A.M. and 3:00 P.M., and between 9:00 P.M. to 3:00 A.M. Monday through Friday, holidays excepted.

For shoulder closures, see Standard Plan Sheet T-10. Parking may be restricted, as needed.

Traffic control on freeways and freeway ramps are restricted to closure of shoulders between 9:00 AM to 3:00 PM, Monday through Friday, holidays excepted.

The site of the work shall be enclosed by suitable barricades, signs and lights, as approved by State's representative, to warn and protect traffic effectively.

When survey operation is being conducted, the permittee shall furnish, place and maintain signs and safety equipment in accordance with the latest edition of the "Manual of Traffic Controls for Construction and Maintenance Work Zones"

Excavation backfill shall be in accordance with the State standards and as directed by the State's representative.

Certain details of work authorized hereby are shown on District Agreements No. 4-1869-C and No.4-1794-C, and 04239-EA262000.

Any damage to the existing State's facilities shall be repaired or replaced immediately

All Permittee's personnel shall wear appropriate personal protective equipment, including hard hats and bright-colored vests, shirts or jackets with retro-reflective material while on State highway right-of-way.

Permittee's Consultants are authorized to perform the works for permittee.

Immediately following completion of the work permitted herein, the permittee shall fill out and mail the notice of completion attached to this permit.

1. **AUTHORITY:** The Department's authority to issue encroachment permits is provided under, Div. 1, Chpt. 3, Art. 1, Sect. 660 to 734 of the Streets and Highways Code.

2. **REVOCATION:** Encroachment permits are revocable on five days notice unless otherwise stated on the permit and except as provided by law for public corporations, franchise holders, and utilities. These General Provisions and the Encroachment Permit Utility Provisions are subject to modification or abrogation at any time. Permittees' joint use agreements, franchise rights, reserved rights or any other agreements for operating purposes in State highway right of way are exceptions to this revocation.

3. **DENIAL FOR NONPAYMENT OF FEES:** Failure to pay permit fees when due can result in rejection of future applications and denial of permits.

4. **ASSIGNMENT:** No party other than the permittee or permittee's authorized agent is allowed to work under this permit.

5. **ACCEPTANCE OF PROVISIONS:** Permittee understands and agrees to accept these General Provisions and all attachments to this permit, for any work to be performed under this permit.

6. **BEGINNING OF WORK:** When traffic is not impacted (see Number 35), the permittee shall notify the Department's representative, two (2) days before the intent to start permitted work. Permittee shall notify the Department's Representative if the work is to be interrupted for a period of five (5) days or more, unless otherwise agreed upon. All work shall be performed on weekdays during regular work hours, excluding holidays, unless otherwise specified in this permit.

7. **STANDARDS OF CONSTRUCTION:** All work performed within highway right of way shall conform to recognized construction standards and current Department Standard Specifications, Department Standard Plans High and Low Risk Facility Specifications, and Utility Special Provisions. Where reference is made to "Contractor and Engineer," these are amended to be read as "Permittee and Department representative."

8. **PLAN CHANGES:** Changes to plans, specifications, and permit provisions are not allowed without prior approval from the State representative.

9. **INSPECTION AND APPROVAL:** All work is subject to monitoring and inspection. Upon completion of work, permittee shall request a final inspection for acceptance and approval by the Department. The local agency permittee shall not give final construction approval to its contractor until final acceptance and approval by the Department is obtained.

10. **PERMIT AT WORKSITE:** Permittee shall keep the permit package or a copy thereof, at the work site and show it upon request to any Department representative or law enforcement officer. If the permit package is not kept and made available at the work site, the work shall be suspended.

11. **CONFLICTING ENCROACHMENTS:** Permittee shall yield start of work to ongoing, prior authorized, work adjacent to or within the limits of the project site. When existing encroachments conflict with new work, the permittee shall bear all cost for rearrangements, (e.g., relocation, alteration, removal, etc.).

12. **PERMITS FROM OTHER AGENCIES:** This permit is invalidated if the permittee has not obtained all permits necessary and required by law, from the Public Utilities Commission of the State of California (PUC), California Occupational Safety and Health Administration (Cal-OSHA), or any other public agency having jurisdiction.

13. **PEDESTRIAN AND BICYCLIST SAFETY:** A safe minimum passageway of 4' shall be maintained through the work area at existing pedestrian or bicycle facilities. At no time shall pedestrians be diverted onto a portion of the street used for vehicular traffic. At locations where safe alternate passageways cannot be provided, appropriate signs and barricades shall be installed at the limits of construction and in advance of the limits of construction at the nearest crosswalk or intersection to detour pedestrians to facilities across the street. Attention is directed to Section 7-1.09 Public Safety of the Department Standard Specifications.

14. **PUBLIC TRAFFIC CONTROL:** As required by law, the permittee shall provide traffic control protection warning signs, lights, safety devices, etc., and take all other measures necessary for traveling public's safety. While providing traffic control, the needs and control of all road users [motorists, bicyclists and pedestrians, including persons with disabilities in accordance with the Americans with Disabilities Act of 1990 (ADA)] shall be an essential part of the work activity.

    Day and night time lane closures shall comply with the California Manual on Uniform Traffic Control Devices (Part 6, Temporary Traffic Control), Standard Plans, and Standard Specifications for traffic control systems. These General Provisions are not intended to impose upon the permittee, by third parties, any duty or standard of care, greater than or different from, as required by law.

15. **MINIMUM INTERFERENCE WITH TRAFFIC:** Permittee shall plan and conduct work so as to create the least possible inconvenience to the traveling public; traffic shall not be unreasonably delayed. On conventional highways, permittee shall place properly attired flagger(s) to stop or warn the traveling public in compliance with the California Manual on Uniform Traffic Control Devices (Chapter 6E, Flagger Control).

16. **STORAGE OF EQUIPMENT AND MATERIALS:** The storage of equipment or materials <u>is not</u> allowed within State highway right-of-way, <u>unless specified</u> within the Special Provisions of this specific encroachment permit. If Encroachment Permit Special Provisions allow for the storage of equipment or materials within the State right of way, the equipment and material storage shall comply with Standard Specifications, Standard Plans, Special Provisions, and the Highway Design Manual. The clear recovery zone widths must be followed and are the minimum desirable for the type of facility indicated below: freeways and expressways - 30', conventional highways (no curbs) - 20', conventional highways (with curbs) – 1.5'. If a fixed object cannot be eliminated, moved outside the clear recovery zone, or modified to be made yielding, it should be shielded by a guardrail or a crash cushion.

17. **CARE OF DRAINAGE:** Permittee shall provide alternate drainage for any work interfering with an existing drainage facility in compliance with the Standard Specifications, Standard Plans and/or as directed by the Department's representative.

18. **RESTORATION AND REPAIRS IN RIGHT OF WAY:** Permittee is responsible for restoration and repair of State highway right of way resulting from permitted work (State Streets and Highways Code, Sections 670 et. seq.).

19. **RIGHT OF WAY CLEAN UP:** Upon completion of work, permittee shall remove and dispose of all scraps, brush, timber, materials, etc. off the right of way. The aesthetics of the highway shall be as it was before work started.

20. **COST OF WORK:** Unless stated in the permit, or a separate written agreement, the permittee shall bear all costs incurred for work within the State right of way and waives all claims for indemnification or contribution from the State.

21. **ACTUAL COST BILLING:** When specified in the permit, the Department will bill the permittee actual costs at the currently set hourly rate for encroachment permits.

22. **AS-BUILT PLANS:** When required, permittee shall submit one (1) set of folded as-built plans within thirty (30) days after completion and approval of work in compliance with requirements listed as follows:

1. Upon completion of the work provided herein, the permittee shall send one vellum or paper set of As-Built plans, to the State representative. Mylar or paper sepia plans are not acceptable.
2. All changes in the work will be shown on the plans, as issued with the permit, including changes approved by Encroachment Permit Rider.
3. The plans are to be stamped or otherwise noted AS-BUILT by the permittee's representative who was responsible for overseeing the work. Any original plan that was approved with a State stamp, or Caltrans representative signature, shall be used for producing the As-Built plans.
4. If As-Built plans include signing or striping, the dates of signing or striping removal, relocation, or installation shall be shown on the plans when required as a condition of the permit. When the construction plans show signing and striping for staged construction on separate sheets, the sheet for each stage shall show the removal, relocation, or installation dates of the appropriate staged striping and signing.
5. As-Built plans shall contain the Permit Number, County, Route, and Post Mile on each sheet.
6. Disclaimer statement of any kind that differ from the obligations and protections provided by Sections 6735 through 6735.6 of the California Business and Professions Code, shall not be included on the As-Built plans. Such statements constitute non-compliance with Encroachment Permit requirements, and may result in the Department of Transportation retaining Performance Bonds or deposits until proper plans are submitted. Failure to comply may also result in denial of future permits, or a provision requiring a public agency to supply additional bonding.

23. **PERMITS FOR RECORD PURPOSES ONLY:** When work in the right of way is within an area under a Joint Use Agreement (JUA) or a Consent to Common Use Agreement (CCUA), a fee exempt permit is issued to the permittee for the purpose of providing a notice and record of work. The Permittee's prior rights shall be preserved without the intention of creating new or different rights or obligations. "Notice and Record Purposes Only" shall be stamped across the face of the permit.

24. **BONDING:** The permittee shall file bond(s), in advance, in the amount set by the Department. Failure to maintain bond(s) in full force and effect will result in the Department stopping of all work and revoking permit(s). Bonds are not required of public corporations or privately owned utilities, unless permittee failed to comply with the provision and conditions under a prior permit. The surety company is responsible for any latent defects as provided in California Code of Civil Procedures, Section 337.15. Local agency permittee shall comply with requirements established as follows: In recognition that project construction work done on State property will not be directly funded and paid by State, for the purpose of protecting stop notice claimants and the interests of State relative to successful project completion, the local agency permittee agrees to require the construction contractor furnish both a payment and performance bond in the local agency's name with both bonds complying with the requirements set forth in Section 3-1.02 of State's current Standard Specifications before performing any project construction work. The local agency permittee shall defend, indemnify, and hold harmless the State, its officers and employees from all project construction related claims by contractors and all stop notice or mechanic's lien claimants. The local agency also agrees to remedy, in a timely manner and to State's satisfaction, any latent defects occurring as a result of the project construction work.

25. **FUTURE MOVING OF INSTALLATIONS:** Permittee understands and agrees to relocate a permitted installation upon notice by the Department. Unless under prior property right or agreement, the permittee shall comply with said notice at his sole expense.

26. **ARCHAEOLOGICAL/HISTORICAL:** If any archaeological or historical resources are revealed in the work vicinity, the permittee shall immediately stop work, notify the Department's representative, retain a qualified archaeologist who shall evaluate the site, and make recommendations to the Department representative regarding the continuance of work.

27. **PREVAILING WAGES:** Work performed by or under a permit may require permittee's contractors and subcontractors to pay appropriate prevailing wages as set by the Department of Industrial Relations. Inquiries or requests for interpretations relative to enforcement of prevailing wage requirements are directed to State of California Department of Industrial Relations, 525 Golden Gate Avenue, San Francisco, California 94102.

28. **RESPONSIBILITY FOR DAMAGE:** The State of California and all officers and employees thereof, including but not limited to the Director of Transportation and the Deputy Director, shall not be answerable or accountable in any manner for injury to or death of any person, including but not limited to the permittee, persons employed by the permittee, persons acting in behalf of the permittee, or for damage to property from any cause. The permittee shall be responsible for any liability imposed by law and for injuries to or death of any person, including but not limited to the permittee, persons employed by the permittee, persons acting in behalf of the permittee, or for damage to property arising out of work, or other activity permitted and done by the permittee under a permit, or arising out of the failure on the permittee's part to perform his obligations under any permit in respect to maintenance or any other obligations, or resulting from defects or obstructions, or from any cause whatsoever during the progress of the work, or other activity or at any subsequent time, work or other activity is being performed under the obligations provided by and contemplated by the permit.

The permittee shall indemnify and save harmless the State of California, all officers, employees, and State's contractors, thereof, including but not limited to the Director of Transportation and the Deputy Director, from all claims, suits or actions of every name, kind and description brought for or on account of injuries to or death of any person, including but not limited to the permittee, persons employed by the permittee, persons acting in behalf of the permittee and the public, or damage to property resulting from the performance of work or other activity under the permit, or arising out of the failure on the permittee's part to perform his obligations under any permit in respect to maintenance or any other obligations, or resulting from defects or obstructions, or from any cause whatsoever during the progress of the work, or other activity or at any subsequent time, work or other activity is being performed under the obligations provided by and contemplated by the permit, except as otherwise provided by statute.

The duty of the permittee to indemnify and save harmless includes the duties to defend as set forth in Section 2778 of the Civil Code. The permittee waives any and all rights to any type of expressed or implied indemnity against the State, its officers, employees, and State contractors. It is the intent of the parties that the permittee will indemnify and hold harmless the State, its officers, employees, and State's contractors, from any and all claims, suits or actions as set forth above regardless of the existence or degree of fault or negligence, whether active or passive, primary or secondary, on the part of the State, the permittee, persons employed by the permittee, or acting on behalf of the permittee.

For the purpose of this section, "State's contractors" shall include contractors and their subcontractors under contract to the State of California performing work within the limits of this permit.

29. **NO PRECEDENT ESTABLISHED:** This permit is issued with the understanding that it does not establish a precedent.

30. **FEDERAL CIVIL RIGHTS REQUIREMENTS FOR PUBLIC ACCOMMODATION:**
A. The permittee, for himself, his personal representative, successors in interest, and assigns as part of the consideration hereof, does hereby covenant and agree that:
1. No person on the grounds of race, color, or national origin shall be excluded from participation in, be denied the benefits of, or be otherwise subjected to discrimination in the use of said facilities.
2. That in connection with the construction of any improvements on said lands and the furnishings of services thereon, no discrimination shall be practiced in the selection and retention of first-tier subcontractors in the selection of second-tier subcontractors.
3. That such discrimination shall not be practiced against the public in their access to and use of the facilities and services provided for public accommodations (such as eating, sleeping, rest, recreation), and operation on, over, or under the space of the right of way.
4. That the permittee shall use the premises in compliance with all other requirements imposed pursuant to Title 15, Code of Federal Regulations, Commerce and Foreign Trade, Subtitle A. Office of the Secretary of Commerce, Part 8 (15 C.F.R. Part 8) and as said Regulations may be amended.
5. That in the event of breach of any of the above nondiscrimination covenants, the State shall have the right to terminate the permit and to re-enter and repossess said land and the land and the facilities thereon, and hold the same as if said permit had never been made or issued.

31. **MAINTENANCE OF HIGHWAYS:** The permittee agrees, by acceptance of a permit, to properly maintain any encroachment. This assurance requires the permittee to provide inspection and repair any damage, at permittee's expense, to State facilities resulting from the encroachment.

32. **SPECIAL EVENTS:** In accordance with subdivision (a) of Streets and Highways Code Section 682.5, the Department of Transportation shall not be responsible for the conduct or operation of the permitted activity, and the applicant agrees to defend, indemnify, and hold harmless the State and the city or county against any and all claims arising out of any activity for which the permit is issued.

Permittee understands and agrees that it will comply with the obligations of Titles II and III of the Americans with Disabilities Act of 1990 in the conduct of the event, and further agrees to indemnify and save harmless the State of California, all officers and employees thereof, including but not limited to the Director of Transportation, from any claims or liability arising out of or by virtue of said Act.

33. **PRIVATE USE OF RIGHT OF WAY:** Highway right of way shall not be used for private purposes without compensation to the State. The gifting of public property use and therefore public funds is prohibited under the California Constitution, Article 16.

34. **FIELD WORK REIMBURSEMENT:** Permittee shall reimburse State for field work performed on permittee's behalf to correct or remedy hazards or damaged facilities, or clear debris not attended to by the permittee.

35. **NOTIFICATION OF DEPARTMENT AND TMC:** The permittee shall notify the Department's representative and the Transportation Management Center (TMC) at least 7 days before initiating a lane closure or conducting an activity that may cause a traffic impact. A confirmation notification should occur 3 days before closure or other potential traffic impacts. In emergency situations when the corrective work or the emergency itself may affect traffic, TMC and the Department's representative shall be notified as soon as possible.

36. **SUSPENSION OF TRAFFIC CONTROL OPERATION:** The permittee, upon notification by the Department's representative, shall immediately suspend all lane closure operations and any operation that impedes the flow of traffic. All costs associated with this suspension shall be borne by the permittee.

37. **UNDERGROUND SERVICE ALERT (USA) NOTIFICATION:** Any excavation requires compliance with the provisions of Government Code Section 4216 et. seq., including, but not limited to notice to a regional notification center, such as Underground Service Alert (USA). The permittee shall provide notification at least 48 hours before performing any excavation work within the right of way.

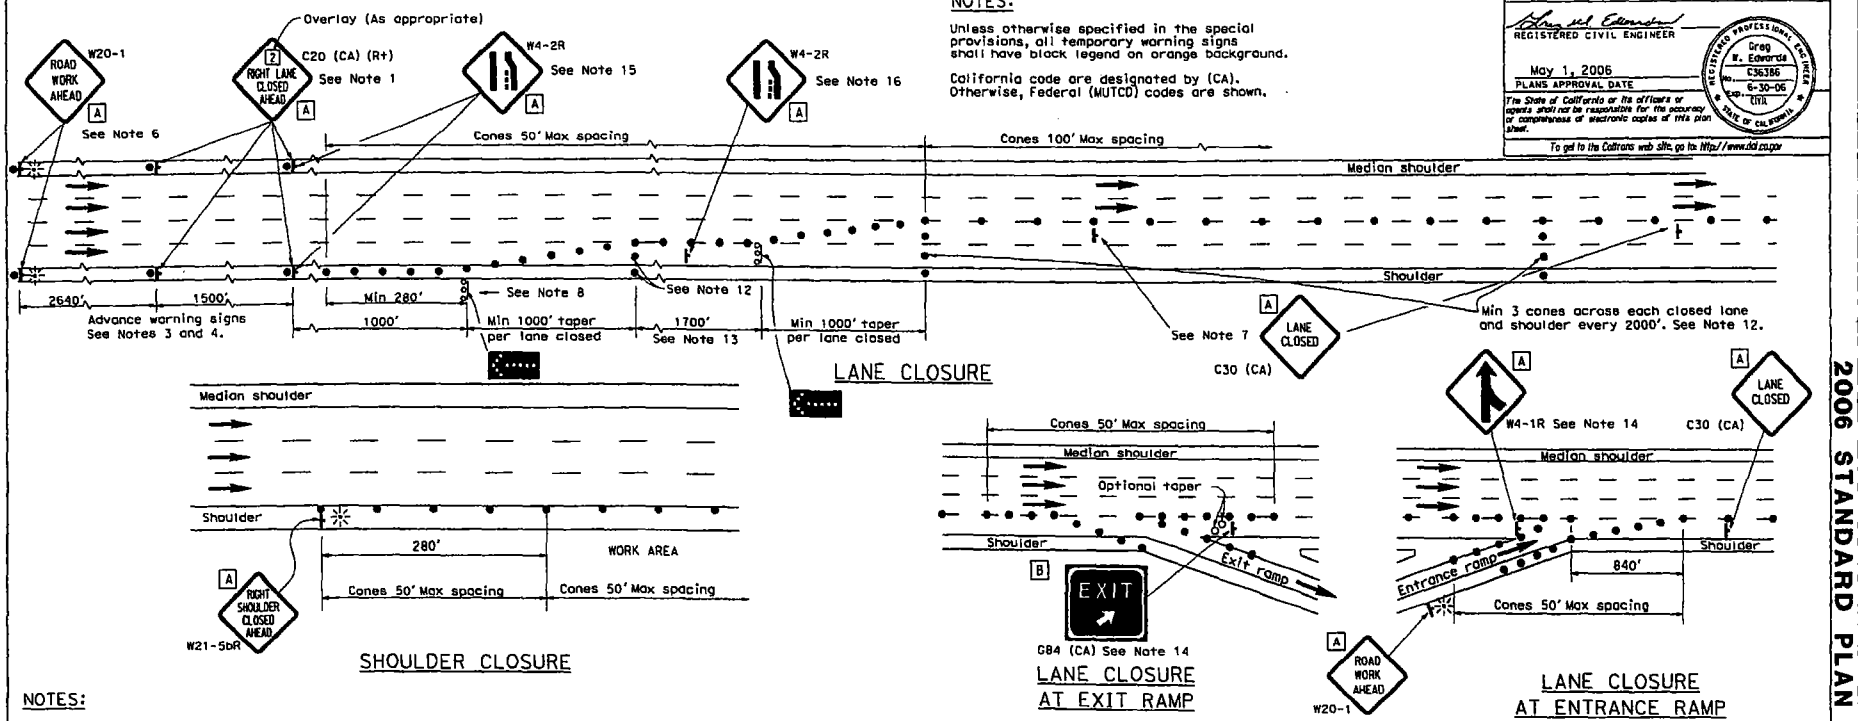
The State of California or its officers or agents shall not be responsible for the accuracy or completeness of electronic copies of this plan sheet.

To get to the Caltrans web site, go to: http://www.dot.ca.gov

NOTES:

Unless otherwise specified in the special provisions, all temporary warning signs shall have black legend on orange background.

California code are designated by (CA). Otherwise, Federal (MUTCD) codes are shown.



NOTES:

1. Median lane closures shall conform to the details for outside lane closures except that C20 (CA) (Lt) signs shall be used.
2. At least one person shall be assigned to provide full time maintenance of traffic control devices for lane closures.
3. Duplicate sign installations are not required:
   a) On opposite shoulder if at least one-half of the available lanes remain open to traffic.
   b) In the median if the width of the median shoulder is less than 8' and the outside lanes are to be closed.
4. Each advance warning sign on each side of the roadway shall be equipped with at least two flags for daytime closure. Each flag shall be at least 16" x 16" in size and shall be orange or fluorescent red-orange in color. Flashing beacons shall be placed at the locations indicated for lane closure during hours of darkness.
5. A C14 (CA) "END ROAD WORK" sign, as appropriate, shall be placed at the end of the lane closure unless the end of work area is obvious or ends within a larger project's limits.
6. If the W20-1 sign would follow within 2000' of a stationary W20-1 or C11 (CA) "ROAD WORK NEXT _____ MILES", use a C20 (CA) sign for the first advance warning sign.
7. Place a C30 (CA) sign every 2000' throughout length of lane closure.
8. One flashing arrow sign for each lane closed. The first flashing arrow sign shall be Type I. All others may be either Type I or Type II.
9. A minimum 1500' of sight distance shall be provided where possible for vehicles approaching the first flashing arrow sign. Lane closures shall not begin at top of crest vertical curve or on a horizontal curve.
10. All cones used for lane closures during the hours of darkness shall be fitted with retroreflective bands (or sleeves) as specified in the specifications.
11. Portable delineators, placed at one-half the spacing indicated for traffic cones may be used instead of cones for daytime closures only.
12. Unless otherwise specified in the special provisions, a minimum of 3 cones shall be placed transversely across each closed lane and shoulder at each location where a taper across a traffic lane ends and every 2000' as shown on the "Lane Closure" detail. Two Type II barricades may be used instead of the 3 cones. The transverse alignment of the cones or barricades on the closed shoulder may be shifted from the transverse alignment to provide access to the work.
13. Unless otherwise specified in the special provisions, the 1700' tangent shown along lane lines shall be used between the 1000' tapers required for each closed traffic lane.
14. Unless otherwise specified in the special provisions, the G84 (CA) and W4-1 signs shall be used as shown.
15. When specified in the special provisions, a W4-2 "LANE ENDS" symbol sign is to be used in place of the C20 (CA) "RIGHT LANE CLOSED AHEAD" sign.
16. The W4-2 "LANE ENDS" symbol sign shown at this location is to be used where the W4-2 sign is used as advance warning as described in Note 15.

TYPICAL LANE CLOSURE

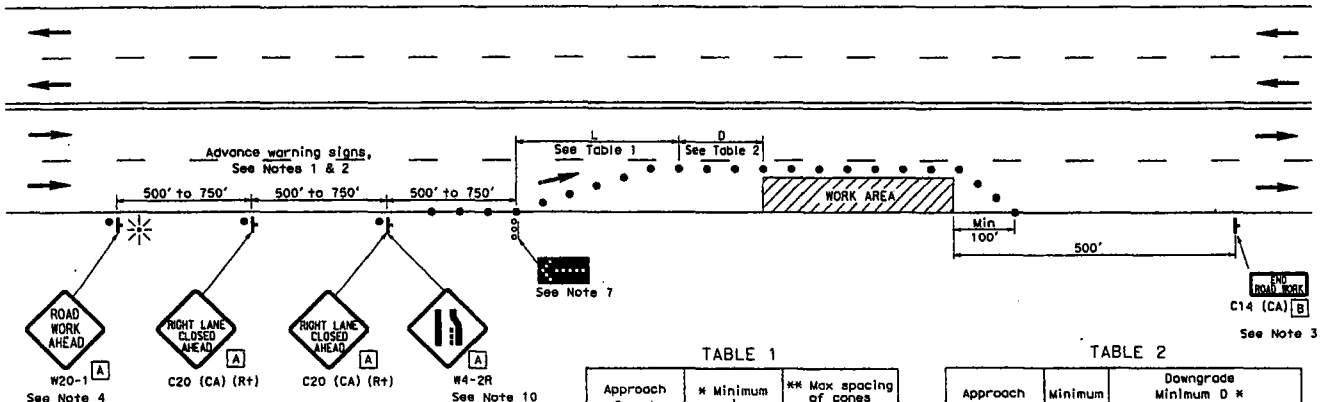

TABLE 1

Approach Speed	* Minimum L	** Max spacing of cones along taper
mph	ft	ft
20 and below	80	20
25	125	25
30	180	30
35	245	35
40	320	40
45	540	45
50	600	50
Over 50	See Note 9	

* Use L for lane widths less than or equal to 12'.
** See Note 8.

TABLE 2

Approach Speed	Minimum D	Downgrade Minimum D *		
		-3%	-6%	-9%
mph	ft	ft	ft	ft
25 and below	155	158	165	173
30	200	205	215	227
35	250	257	271	287
40	305	315	333	354
45	360	378	400	427
50	425	446	474	507
Over 50	See Note 9			

* Use on sustained downgrade steeper than -3 percent and longer than 1 mile.

NOTES:

1. Where approach speeds are low, advance warning signs may be placed at 300' spacing and placed closer in urban areas.
2. Each advance warning sign shall be equipped with at least two flags for daytime closure. Each flag shall be at least 16" x 16" in size and shall be orange or fluorescent red-orange in color. Flashing beacons shall be placed at the locations indicated for lane closure during hours of darkness.
3. A C14 (CA) "END ROAD WORK" sign, as appropriate, shall be placed at the end of the lane closure unless the end of work area is obvious, or ends within a larger project's limits.
4. If the W20-1 sign would follow within 2000' of a stationary W20-1 or C11 (CA) "ROAD WORK NEXT ____ MILES", use a C20 (CA) sign for the first advance warning sign.
5. All cones used for lane closures during the hours of darkness shall be fitted with retroreflective bands (or sleeves) as specified in the specifications.
6. Portable delineators, placed at one-half the spacing indicated for traffic cones, may be used instead of cones for daytime closures only.
7. Flashing arrow sign shall be either Type I or Type II.
8. The maximum spacing between cones along a tangent shall be 50' and along a taper shall be approximately as shown in Table 1.
9. For approach speeds over 50 mph, use the "Traffic Control System for Lane Closure On Freeways And Expressways" plan for lane closure details and requirements.
10. When specified in the special provisions, a W4-2 "LANE ENDS" symbol sign is to be used in place of the C20 (CA) "RIGHT LANE CLOSED AHEAD" sign.

NOTES:

Unless otherwise specified in the special provisions, all temporary warning signs shall have black legend on orange background.

California code are designated by (CA). Otherwise, Federal (MUTCD) codes are shown.

Permittee shall **STATUS** scheduled work **DAILY** via Caltrans 24-Hour Communication Center at **510-286-6359.** Status using Closure ID No(s) at the start of work, **(10-97),** and again when work is finished for the day, **(10-98).** To cancel **(10-22),** phone **510-286-6359** or fax to **510-286-6358** before the scheduled 10-97 time, but no later than 1 hour prior to the scheduled 10-98 time. Any **delay** in picking up your closure must be reported immediately to **510-286-6359** or Permit Inspector. See item 9 on reverse/page 2.

ENCROACHMENT PERMIT WORK SCHEDULING PROCEDURES

1. **INSTRUCTIONS:** Fill in blanks or check appropriate boxes. Attach maps or diagrams, if available. Enter **beginning day** through **ending day of work week** (M-T-W-TH-F-SA-SU). **Month/Day:** Enter month (1-12) and day (1-31) of requested week. **Start & Finish Time:** Use 24 hour clock format. **Read page 2** of your Permit Special Provisions for **hours** & days allowed. Separate lane closure #'s are required for each direction and facility. Use separate line for each. **Lanes are numbered in direction of travel from left to right,** excluding turn pockets; left being #1 or "fast lane". Check boxes under **RESTRICTED LANES** to indicate lanes or parts of highway to be closed. **"VL"(Various Lanes)** may be checked with note in **Comments** Section stating number of lanes to remain open at all times.
2. **ABBREVIATIONS:** **Aux**=auxiliary, **CD**=Center Divide; **Coll**=Collector; **Conn**=Connector; **Contra Flow**=Close 1 direction of traffic and divert to lane(s) in opposite direction or a turn lane. **Day of Week**=(M-T-W-TH-F-SA-SU); **Dir**=Direction (**NB**=North, **SB**=South,**WB**=West, or **EB**=East); **F/L**=fog line; **Lns**=Lanes; **L**=Left; **Med**= Median; **Off/R**=Off-Ramp; **On/R**=On-Ramp; **Park Strip**=Parking area parallel to lane; **Pckt**=Pocket; **Roll**=Rolling (for closure such as sweeping); **R**=Right; **Shldr**=Shoulder; **SR**=State Route; **V/L**=Various Lanes; **V/Loc**=Various Locations.
3. Requests for scheduling shall be submitted on this form via FAX to 510-286-3960, or, via E-Mail to *Permit_Duty_Engineer@dot.ca.gov*, or, through the designated State Representative (page 1 of permit).
4. All permitted work **(with or without traffic control)** is subject to advance scheduling on this form, seven (7)days in advance of the work week requested. Submittals and approvals shall continue on a weekly basis.
5. If work begins weekly on Sunday, the work week shall be Sunday through Saturday. If work week begins on Monday, the work week shall be Monday through Sunday.
6. Incomplete, illegible, or inaccurate requests may be returned for correction. Assistance for completing the request may be obtained from the designated State Representative.
7. Every attempt will be made to return timely requests with closure ID or work authorization numbers, to the Permittee by close of business on Thursday, prior to the scheduled work week. When deemed necessary to ensure public convenience, Caltrans may deny and/or reschedule the request.
8. All requests must include a contingency plan for restoring public traffic (i.e. reopening of a closed lane, ramp and/or shoulder) in the event of (1) CHP or the local authority requires opening due to an unforeseeable incident in the nearby vicinity, or (2) permitted experiences an equipment breakdown, shortage of or lack of production materials or any other failure which would otherwise delay restoring public convenience within the time limits specified in the permit. The contingency plan shall include availability of any proposed standby equipment and stockpiled materials that can be utilized for the immediate opening of closures when ordered by the State representative. Acceptance of the contingency plan by the Engineer shall not relieve the Contractor from the requirement of opening the restricted travel way to accommodate public traffic as specified in the lane closure hour's section of the permit provisions.
9. Caltrans will review and process the request by entering all information into the State-wide Lane-Closure System (LCS). This process generates a work authorization number*. This number will be entered on the request form and returned to Permittee as approval to proceed AND will be used to **"Real-Time Status"** on a daily basis. Permittee shall communicate with Caltrans 24-hour District Communication Center (DCC) via telephone at **510-286-6359** twice daily when working, or once daily if cancelled.
   a. When work begins (first cone down), Permittee shall contact Caltrans DCC and relay: **"(Closure ID #*) is 10-97".**
   b. When work ends (last cone removed), Permittee shall contact Caltrans DCC and relay: **"(Closure ID #*) is 10-98".**
   c. If the work is cancelled on any scheduled day, Permittee shall contact Caltrans DCC and relay; **"(Closure ID #*) is 10-22".** A "10-22" (cancellation) can be phoned at anytime before the scheduled "10-97" time, but no later than 1 hour prior to scheduled "10-98" time. You may be asked to fax confirmation of "10-22" to the **DCC FAX at 510-286-6358.**
   d. During the work, any unexpected occurrences including delayed openings, accidents, etc., shall be communicated to Caltrans DCC @ **510-286-6359,** immediately.

   Avoid possible miscommunication when calling status. Use the **PHONETIC ALPHABET** to state your Closure ID:
   A = Adam, **B** = Boy, **C** = Charles, **D** = David, **E** = Edward, **F** = Frank, **G** = George, **H** = Henry, **I** = Ida, **J** = John, **K** = King, **L** = Lincoln, **M** = Mary, **N** = Nora, **O** = Ocean, **P** = Paul, **Q** = Queen, **R** = Robert, **S** = Sam, **T** = Tom, **U** = Union, **V** = Victor, **W** = William, **X** = X-ray, **Y** = Yellow, **Z** = Zebra. *Example:* P82CA="Paul 82 Charles Adam"
10. The intent of these procedures is to help ensure public convenience by identifying planned closures on the State Highway system, resolving potential conflicts, and disseminating all available **"REAL-TIME"** information, via the traffic media to all motorists, including but not limited to the public, CHP, local police and sheriffs' office, and emergency fire and rescue personnel.

"closure ID number" is the same as "work authorization number"

Appendix D

California Environmental Protection Agency
Department of Toxic Substances Control

VARIANCE

Applicant Names:

State of California
Department of Transportation
(Caltrans)
1120 N Street
Sacramento, California 95814

Variance No. V09HQSCD006

Effective Date: July 1, 2009

Expiration Date: July 1, 2014

Modification History:

Pursuant to California Health and Safety Code, Section 25143, the Department of Toxic Substances Control hereby issues the attached Variance consisting of 9 pages to the Department of Transportation.

Beverly Rikala
Team Leader, Operating Facilities Team
Department of Toxic Substances Control

Date:

1. INTRODUCTION.

a) Pursuant to Health and Safety Code, section 25143, the California Department of Toxic Substances Control (DTSC) grants this variance to the applicant below for waste considered to be hazardous solely because of its lead concentrations and as further specified herein.

b) DTSC hereby grants this variance only from the requirements specified herein and only in accordance with all terms and conditions specified herein.

2. IDENTIFYING INFORMATION.

APPLICANT/OWNER/OPERATOR

State of California
Department of Transportation, (Caltrans)
All Districts

3. TYPE OF VARIANCE.

Generation, Manifest, Transportation, Storage and Disposal.

4. ISSUANCE AND EXPIRATION DATES.

DATE ISSUED: July 1, 2009 EXPIRATION DATE: July 1, 2014

5. APPLICABLE STATUTES AND REGULATIONS. The hazardous waste that is the subject of this variance is fully regulated under Health and Safety Code, section 25100, et seq. and California Code of Regulations, title 22, division 4.5 except as specifically identified in Section 8 of this variance.

6. DEFINITION. For purposes of this variance, "lead-contaminated soil(s)" shall mean soil that meets the criteria for hazardous waste but contains less than 3397 mg/kg total lead and is hazardous primarily because of aerially-deposited lead contamination associated with exhaust emissions from the operation of motor vehicles.

7. FINDINGS/DETERMINATIONS. DTSC has determined that the variance applicant meets the requirements set forth in Health and Safety Code, section 25143 for a variance from specific regulatory requirements as outlined in Section 8 of this variance. The specific determinations and findings made by DTSC are as follows:

a) Caltrans intends to excavate, stockpile, transport, bury and cover large volumes of soil associated with highway construction projects. In the more urbanized highway corridors around the State this soil is contaminated with lead, primarily due to historic emissions from automobile exhausts. In situ sampling and laboratory testing has shown that some of the soil contains concentrations of lead in excess of State

regulatory thresholds, and thus any generated waste from disturbance of the soil would be regulated as hazardous waste. Such soil contains a Total Threshold Limit Concentration (TTLC) of 1000 milligrams per kilogram (mg/kg) or more lead and/or it meets or exceeds the Soluble Threshold Limit Concentration (STLC) for lead of 5 milligrams per liter (mg/l). A Human Health Risk Assessment prepared for this variance concludes that soil contaminated with elevated concentrations of lead can be managed in a way that presents no significant risk to human health.

b) The lead-contaminated soil will be placed only in Caltrans' right-of-way. Depending on concentration levels, the wastes will be covered with a minimum thickness of one (1) foot of non-hazardous soil or asphalt/concrete cover and will always be at least five (5) feet above the highest groundwater elevation. Caltrans will assure that proper health and safety procedures will be followed for workers, including any persons engaged in maintenance work in areas where the waste has been buried and covered.

c) DTSC finds and requires that the lead-contaminated soil excavated, stockpiled, transported, buried and covered pursuant to this variance is a non-RCRA hazardous waste, and that the waste management activity is insignificant as a potential hazard to human health and safety and the environment, when managed in accordance with the conditions, limitations and other requirements specified in this variance.

8. PROVISIONS WAIVED.

Provided Caltrans meets the terms and conditions of this variance, DTSC waives the hazardous waste management requirements of Health and Safety Code, Chapter 6.5 and California Code of Regulations, title 22 for the lead-contaminated soil that Caltrans reuses in projects that would require Caltrans to obtain a permit for a disposal facility and any other generator requirements that concern the transportation, manifesting, storage and land disposal of hazardous waste.

9. SPECIFIC CONDITIONS, LIMITATIONS AND OTHER REQUIREMENTS.

In order for the provisions discussed in section 8 to be waived, lead-contaminated soil must not exceed the contaminant concentrations discussed below and Caltrans management practices must meet all the following conditions:

a) Caltrans implementation of this variance shall comply with all applicable state laws and regulations for water quality control, water quality control plans, waste discharge requirements (including storm water permits), and others issued by the State Water Resources Control Board (SWRCB) and/or a California Regional Water Quality Control Board (RWQCB). Caltrans shall provide written notification to the appropriate RWQCB at least 30 days prior to advertisement for bids of projects that involve invocation of this variance, or as otherwise negotiated with the SWRCB or appropriate RWQCB.

b) The waivers in this variance shall only be applied to lead-contaminated soil that is

not a RCRA hazardous waste and is hazardous primarily because of aerially-deposited lead contamination associated with exhaust emissions from the operation of motor vehicles. The variance is not applicable to any other hazardous waste.

c) Soil containing 1.5 mg/l extractable lead or less (based on a modified waste extraction test using deionized water as the extractant) and 1411 mg/kg or less total lead may be used as fill provided that the lead-contaminated soil is placed a minimum of five (5) feet above the maximum historic water table elevation and covered with at least one (1) foot of nonhazardous soil that will be maintained by Caltrans to prevent future erosion.

d) Soil containing 150 mg/L extractable lead or less (based on a modified waste extraction test using deionized water as the extractant) and 3397 mg/kg or less total lead may be used as fill provided that the lead-contaminated soils are placed a minimum of five (5) feet above the maximum historic water table elevation and protected from infiltration by a pavement structure which will be maintained by Caltrans.

e) Lead-contaminated soil with a pH less than 5.5 but greater than 5.0 shall only be used as fill material under the paved portion of the roadway. Lead-contaminated soil with a pH at or less than 5.0 shall be managed as a hazardous waste.

f) For each project that has the potential to generate waste by disturbing lead-contaminated soil (as defined in 6), Caltrans shall conduct sampling and analysis to adequately characterize the soils containing aerially deposited lead in the areas of planned excavation along the project route. Such sampling and analysis shall include the Toxicity Characteristic Leaching Procedure (TCLP) as prescribed by the United States Environmental Protection Agency to determine whether concentrations of contaminants in soil exceed federal criteria for classification as a hazardous waste.

g) Lead-contaminated soil managed pursuant to this variance shall not be moved outside the designated corridor boundaries (see paragraph t) below. All lead-contaminated soil not buried and covered within the same Caltrans corridor where it originated is not eligible for management under this variance and shall be managed as a hazardous waste.

h) Lead-contaminated soil managed pursuant to this variance shall not be placed in areas where it would become in contact with groundwater or surface water (such as streams and rivers).

i) Lead-contaminated soil managed pursuant to this variance shall be buried and covered only in locations that are protected from erosion that may result from storm water run-on and run-off.

j) The lead-contaminated soil shall be buried and covered in a manner that will prevent accidental or deliberate breach of the asphalt, concrete, and/or cover soil.

k) The presence of lead-contaminated soil shall be incorporated into the projects' as-built drawings. The as-built drawings shall be annotated with the location, representative analytical data, and volume of lead-contaminated soil. The as-built drawings shall also state the depth of the cover. These as-built drawings shall be retained by Caltrans.

l) Caltrans shall ensure that no other hazardous wastes, other than the lead-contaminated hazardous waste soil, are placed in the burial areas.

m) Lead-contaminated soil shall not be buried within ten (10) feet of culverts or locations subject to frequent worker exposure.

n) Excavated lead-contaminated soil not placed into the designated area (fill area, roadbed area) by the end of the working day shall be stockpiled and covered with sheets of polyethylene or at least one foot of non-hazardous soil. The lead-contaminated soil, while stockpiled or under transport, shall be protected from contacting surface water and from being dislodged or transported by wind or storm water. The stockpile covers shall be inspected at least once a week and within 24 hours after rainstorms. If the lead-contaminated soil is stockpiled for more than 4 days from the time of excavation, Caltrans shall restrict public access to the stockpile by using barriers that meet the safety requirements of the construction zone. The lead-contaminated soil shall be stockpiled for no more than 90 days from the time the soil is first excavated. If the contaminated soil is stockpiled beyond the 90 day limit Caltrans shall:

1. notify DTSC in writing of the 90 day exceedance and expected date of removal;
2. perform weekly inspections of the stockpiled material to ensure that there is adequate protection from run-on, runoff, public access, and wind dispersion; and
3. notify DTSC on weekly basis of the stockpile status until the stockpile is removed.

The lead-contaminated soil shall be stockpiled for no more than 180 days from the time the soil is first excavated.

o) Caltrans shall ensure that all stockpiling of lead-contaminated soil remains within the project area of the specified corridor. Stockpiling of lead-contaminated soil within the specified corridor, but outside the project area, is prohibited.

p) Caltrans shall conduct confirmatory sampling of any stockpile area in areas not known or expected to contain lead-contaminated soil after removal of the lead-contaminated soil to ensure that contamination has not been left behind or has not migrated from the stockpiled material to the surrounding soils.

q) Caltrans shall stockpile lead-contaminated soil only on high ground (i.e. no sump

areas or low points) so that stockpiled soil will not come in contact with surface water run-on or run-off.

r) Caltrans shall not stockpile lead-contaminated soil in environmentally and ecologically sensitive areas.

s) Caltrans shall ensure that storm/rain run-off that has come into contact with stockpiled lead-contaminated soil will not flow to storm drains, inlets, or waters of the State.

t) Caltrans may dispose of the lead-contaminated soil only within the operating right-of-way of an existing highway, as defined in Streets and Highways Code, section 23. Caltrans may move lead-contaminated soil from one Caltrans project to another Caltrans project only if the lead-contaminated soil remains within the same designated corridor.

Caltrans shall record any movement of lead-contaminated soil by using a bill of lading. The bill of lading must contain: 1) the US DOT description including shipping name, hazard class and ID number; 2) handling codes; 3) quantity of material; 4) volume of material; 5) date of shipment; 6) origin and destination of shipment; and 7) any specific handling instructions. The bill of lading shall be referenced in and kept on file with the project's as-built drawings. The lead-contaminated soil must be kept covered during transportation.

u) For each specific corridor where this variance is to be implemented, all of the following information shall be submitted in writing to DTSC at least five (5) days before construction of any project begins:

1. plan drawing designating the boundaries of the corridor where lead-contaminated soils will be excavated, stockpiled, buried and covered;

2. a list of the Caltrans projects that the corridor encompasses;

3. a list of Caltrans contractors that will be conducting any phase of work on any project affected by this variance;

4. duration of corridor construction;

5. location where sampling and analytical data used to make lead concentration level determinations are kept (e.g. a particular Caltrans project file);

6. name and phone number (including area code) of project resident engineer and project manager;

7. location where Caltrans and contractor health and safety plan and records are kept;

8. location of project special provisions (including page or section number) for soil excavation, transportation, stockpile, burial and placement of cover material;

9. location of project drawings (including drawing page number) for soil excavation, burial and placement of cover in plan and cross section (for example, "The project plans are located at the resident engineer's office located at 5th and Main Streets, City of Fresno, See pages xxxxx of contract xxxx");

10. updated information if a Caltrans project within the corridor is added, changed or deleted; and

11. type of environmental document prepared for each project, date of adoption, document title, Clearing House number and where the document is available for review. A copy of the Caltrans Categorical Exemption, Categorical Exclusion Form, or if filed, the Notice of Exemption for any project shall be submitted to the DTSC Headquarters Project Manager.

v) Changes in location of lead-contaminated soil placement, quantities or protection measures (field changes) shall be noted in the resident engineer's project log within five (5) days of the field change.

w) Caltrans shall ensure that field changes are in compliance with the requirements of this variance.

x) Operational procedures described in the California Environmental Quality Act (CEQA) Special Initial Study shall be followed by Caltrans for activities conducted under this variance.

y) Caltrans shall implement appropriate health and safety procedures to protect its employees and the public, and to prevent or minimize exposure to potentially hazardous wastes. A project-specific health and safety plan must be prepared and implemented. The monitoring and exposure standards shall be based on construction standards for exposure to lead in California Code of Regulations, title 8, section 1532.1.

z) Caltrans shall provide a district Coordinator for this variance. This Coordinator will be the primary point of contact for information flowing to, or received from, DTSC regarding any matter or submission under this variance. Caltrans shall promptly notify DTSC of the name of Coordinator and any change in the Coordinator.

aa) Caltrans shall conduct regular inspections, consistent with Caltrans' Maintenance Division's current Pavement Inspection and Slope Inspection programs, of the locations where lead-contaminated soil has been buried and/or covered pursuant to this variance. If site inspection reveals deterioration of cover so

that conditions in the variance are not met, Caltrans shall repair or replace the cover.

bb) Caltrans shall develop and implement a record keeping mechanisms to record and retain permanent records of all locations where lead-contaminated soil has been buried per this variance. The records shall be made available to DTSC.

cc) If areas subject to the terms of this variance are sold, relinquished or abandoned (including roadways), all future property owners shall be notified in writing in advance by Caltrans of the requirements of this variance, and Caltrans shall provide the owner with a copy of the variance. A copy of such a notice shall be sent to DTSC and contain the corridor location and project. Caltrans shall also disclose to DTSC and the new owner the location of areas where lead-contaminated soil has been buried. Future property owners shall be subject to the same requirements as Caltrans.

dd) For the purposes of informing the public about instances where the variance is implemented, Caltrans shall:

1. maintain current fact sheets at all Caltrans resident engineer offices and the Caltrans District office. Caltrans shall make the fact sheets available to anyone expressing an interest in variance-related work.

2. maintain a binder(s) containing copies of all reports submitted to DTSC at the District office. Caltrans shall ensure that the binders are readily accessible to the public.

3. carry out the following actions when it identifies additional projects:

(A) notify the public via a display advertisement in a newspaper of general circulation in that area.

(B) update and distribute the fact sheet to the mailing list and repository locations.

ee) Lead-contaminated soil may be buried only in areas where access is limited or where lead-contaminated soil is covered and contained by a pavement structure.

ff) Dust containing lead-contaminated soil must be controlled. Water or dust palliative may be applied to control dust. If visible dust migration occurs, all excavation, stockpiling and truck loading and burying must be stopped. The granting of this variance confers no relief on Caltrans from compliance with the laws, regulations and requirements enforced by any local air district or the California Air Resources Board.

gg) Sampling and analysis is required to show the lead-contaminated soil meets the variance criteria. All sampling and analysis must be conducted in

accordance with the appropriate methods specified in U.S. EPA SW-846.

hh) DTSC retains the right to require Caltrans or any future owner to remove, and properly dispose of, lead-contaminated soil in the event DTSC determines it is necessary for protection of public health, safety or the environment.

ii) DTSC finds that some projects involving lead-contaminated soil are joint projects between Caltrans and other government entities. In these joint projects, Caltrans may not be the lead agency implementing the project although Caltrans is still involved if the project occurs on its right-of-way.

Caltrans may invoke this variance for joint projects where Caltrans and local government entity are involved provided that 1) the project is within the Caltrans Right-of-Way; 2) Caltrans reviews/ oversees all phases of the project including design, contracting, environmental assessment, construction, operation, and maintenance; and 3) Caltrans oversees the project to verify all variance conditions are complied with. Caltrans will be fully responsible for the variance notification and implementation in these joint projects.

jj) All correspondence shall be directed to the following office:

Hazardous Waste Permitting
Department of Toxic Substances Control
8800 Cal Center Drive
Sacramento, CA 95826

Attn: Caltrans Lead Variance Notification Unit

10. DISCLAIMER.

a) The issuance of this variance does not relieve Caltrans of the responsibility for compliance with Health and Safety Code, chapter 6.5, or the regulations adopted thereunder, and any other laws and regulations other than those specifically identified in Section 8 of this variance. Caltrans is subject to all terms and conditions herein. The granting of this variance confers no relief from compliance with any federal, State or local requirements other than those specifically provided herein.

b) The issuance of this variance does not release Caltrans from any liability associated with the handling of hazardous waste, except as specifically provided herein and subject to all terms and conditions of this variance.

11. VARIANCE MODIFICATION OR REVOCATION. This variance is subject to review at the discretion of DTSC and may be modified or revoked by DTSC upon change of ownership and at any other time pursuant to Health and Safety Code, section 25143.

12. CEQA DETERMINATION. DTSC adopted a Negative Declaration on June 30, 2009.

RE: 101 Aux Lanes

Order No.: 0904088

Dear Patrick Walz:

Torrent Laboratory, Inc. received 36 samples on 4/14/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director 4/24/09

CASE NARRATIVE

Analytical Comments for Asbestos PLM, Note: Analysis performed by NVLAP Certified sub-contract laboratory. (Certification # 101048-3).

Analytical Comment for Method 6010B for RunNo 19315 and 19317, Note:The % recoveries in the MS/MSD for Lead are outside of laboratory control limits but within % RPD limits and % recovery limits for the LCS/LCSD. No corrective action is required.

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

EMSL recommends that soil samples reported as "ND" be tested by the EPA Screening Method/Qualitative. The above report relates only to the items tested. This report may not be reproduced, except in full, without written approval by EMSL Analytical, Inc. The above test must not be used by the client to claim product endorsement by NVLAP nor any agency of the United States Government. Unless otherwise noted, the results in this report have not been blank corrected.Samples received in good condition unless otherwise noted.

THIS IS THE LAST PAGE OF THE REPORT.

RE: 101 Aux Lanes - See narrative for revision details

Order No.: 0904088

Dear Patrick Walz:

Torrent Laboratory, Inc. received 36 samples on 4/14/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director 6/18/09 Date

Patti Sandrock
QA Officer

Torrent Laboratory, Inc.

Date: *18-Jun-09*

CLIENT: URS Corporation, San Jose
Project: 101 Aux Lanes
Lab Order: 0904088

CASE NARRATIVE

Analytical Comments for Asbestos PLM, Note: Analysis performed by NVLAP Certified sub-contract laboratory. (Certification # 101048-3).

Analytical Comment for Method 6010B for RunNo 19315 and 19317, Note:The % recoveries in the MS/MSD for Lead are outside of laboratory control limits but within % RPD limits and % recovery limits for the LCS/LCSD. No corrective action is required.

REVISIONS:

Per client request, STLC, DI STLC and TCLP analysis was added to specified samples. Due to insufficient sample mass available, no DI STLC or TCLP was performed on requested sample -001 (N-1-2 @ 0.5). Due to limited sample available for all samples, STLC, DI STLC and TCLP was performed using only 25 g of homogenized sample.

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to DI wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/30/2009 @ 12.15 PM and ended on 06/01/2009 @ 12:15 PM

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/30/2009 @ 12.15 PM and ended on 06/01/2009 @ 12:15 PM

Note: Extraction of 25 g sample / 500g TCLP Fluid #1 was performed according to Toxicity Characteristic Leaching Procedure (TCLP) which was rotated in a rotary shaker for 18 hours.

Extraction started on 06/12/2009 @ 4:00 PM and ended on 06/13/2009 @ 10:00 AM

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

EMSL recommends that soil samples reported as "ND" be tested by the EPA Screening Method/Qualitative. The above report relates only to the items tested. This report may not be reproduced, except in full, without written approval by EMSL Analytical, Inc. The above test must not be used by the client to claim product endorsement by NVLAP nor any agency of the United States Government. Unless otherwise noted, the results in this report have not been blank corrected.Samples received in good condition unless otherwise noted.

THIS IS THE LAST PAGE OF THE REPORT.

RE: 101 Aux Lanes

Order No.: 0904074

Dear Patrick Walz:

Torrent Laboratory, Inc. received 34 samples on 4/13/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director

Lab Order: 0904074

CASE NARRATIVE

Analytical Comments for Asbestos PLM, Note: Analysis performed by NVLAP Certified sub-contract laboratory. (Certification # 101048-3).

Note: although pH was measured upon laboratory receipt, the samples were received outside of the recommended holding time (24 hours from collection).

Lab Sample ID: 0904074-032
Date Prepared: 4/16/2009

Parameters	Analysis Method	Date Analyzed	RL	Dilution Factor	MRL	Result	Units	Analytical Batch
Lead	SW6010B	4/17/2009	1	1	1.0	4.5	mg/Kg	5110

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Report prepared for: Patrick Walz
URS Corporation, San Jose

Date Received: 4/13/2009
Date Reported: 4/23/2009

Client Sample ID: N-2-5@3.0
Sample Location: 101 Aux Lanes
Sample Matrix: SOIL
Date/Time Sampled 4/13/2009 1:50:00 AM

Lab Sample ID: 0904074-033
Date Prepared: 4/16/2009

Parameters	Analysis Method	Date Analyzed	RL	Dilution Factor	MRL	Result	Units	Analytical Batch
Lead	SW6010B	4/17/2009	1	1	1.0	3.2	mg/Kg	5110

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Report prepared for: Patrick Walz
URS Corporation, San Jose

Date Received: 4/13/2009
Date Reported: 4/23/2009

Client Sample ID: N-3-1@0.5
Sample Location: 101 Aux Lane
Sample Matrix: SOIL
Date/Time Sampled 4/13/2009 12:40:00 AM

Lab Sample ID: 0904074-034
Date Prepared: 4/16/2009

Parameters	Analysis Method	Date Analyzed	RL	Dilution Factor	MRL	Result	Units	Analytical Batch
Lead	SW6010B	4/17/2009	1	1	1.0	24	mg/Kg	5110

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

EMSL recommends that soil samples reported as "ND" be tested by the EPA Screening Method/Qualitative. The above report relates only to the items tested. This report may not be reproduced, except in full, without written approval by EMSL Analytical, Inc. The above test must not be used by the client to claim product endorsement by NVLAP nor any agency of the United States Government. Unless otherwise noted, the results in this report have not been blank corrected.Samples received in good condition unless otherwise noted.

THIS IS THE LAST PAGE OF THE REPORT.

RE: 101 Aux Lanes - See case narrative for revision details.

Order No.: 0904074

Dear Patrick Walz:

Torrent Laboratory, Inc. received 34 samples on 4/13/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director 6/18/09 Date

Patti Sandrock
QA Officer

Torrent Laboratory, Inc.

Date: *18-Jun-09*

CLIENT: URS Corporation, San Jose
Project: 101 Aux Lanes
Lab Order: 0904074

CASE NARRATIVE

Analytical Comments for Asbestos PLM, Note: Analysis performed by NVLAP Certified sub-contract laboratory. (Certification # 101048-3).

Note: although pH was measured upon laboratory receipt, the samples were received outside of the recommended holding time (24 hours from collection).

REVISIONS: 6/18/09

Per client request, STLC, DI STLC and TCLP analysis was added to specified samples.
Due to limited sample available for all samples, STLC, DI STLC and TCLP was performed using only 25 g of homogenized sample.

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to DI wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/30/2009 @ 12.15 PM and ended on 06/01/2009 @ 12:15 PM

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/30/2009 @ 12.15 PM and ended on 06/01/2009 @ 12:15 PM

Note: Extraction of 25 g sample / 500g TCLP Fluid #1 was performed according to Toxicity Characteristic Leaching Procedure (TCLP) which was rotated in a rotary shaker for 18 hours.

Extraction started on 06/12/2009 @ 4:00 PM and ended on 06/13/2009 @ 10:00 AM

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

EMSL recommends that soil samples reported as "ND" be tested by the EPA Screening Method/Qualitative. The above report relates only to the items tested. This report may not be reproduced, except in full, without written approval by EMSL Analytical, Inc. The above test must not be used by the client to claim product endorsement by NVLAP nor any agency of the United States Government. Unless otherwise noted, the results in this report have not been blank corrected.Samples received in good condition unless otherwise noted.

THIS IS THE LAST PAGE OF THE REPORT.

RE: 101 Aux Lanes

Order No.: 0904073

Dear Patrick Walz:

Torrent Laboratory, Inc. received 46 samples on 4/13/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director

Report prepared for: Patrick Walz
URS Corporation, San Jose

Date Received: 4/13/2009
Date Reported: 4/23/2009

Client Sample ID: N-3-10-GW
Sample Location: 101 Aux Lanes
Sample Matrix: GROUNDWATER
Date/Time Sampled 4/12/2009 8:30:00 PM

Lab Sample ID: 0904073-044
Date Prepared:

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

CLIENT: URS Corporation, San Jose
Project: 101 Aux Lanes
Lab Order: 0904073

CASE NARRATIVE

Note: although pH was measured upon laboratory receipt, the samples were received outside of the recommended holding time (24 hours from collection).

REVISIONS:

Per client request, STLC, DI STLC and TCLP analysis was added to specified samples. Due to insufficient sample mass available, no TCLP was performed on requested sample -021 (S-3-11 @ 1.0-D). Due to limited sample available for all samples, STLC, DI STLC and TCLP was performed using only 25 g of homogenized sample.

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to DI wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/30/2009 @ 12.15 PM and ended on 06/01/2009 @ 12:15 PM

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/30/2009 @ 12.15 PM and ended on 06/01/2009 @ 12:15 PM

Note: Extraction of 25 g sample / 500g TCLP Fluid #1 or Fluid #1 (-030 and -036) was performed according to Toxicity Characteristic Leaching Procedure (TCLP) which was rotated in a rotary shaker for 18 hours.

Extraction started on 06/16/2009 @ 4:45PM and ended on 06/17/2009 @ 10:45 AM

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

CLIENT: URS Corporation, San Jose
Work Order: 0904073

LABORATORY, INC.

April 08, 2009

Patrick Walz
URS Corporation, San Jose
55 South Market St., Suite 1500
San Jose, CA 95113

TEL: (408) 297-9585
FAX: (408) 297-6962

RE: Hwy 101-Aux Lane

Order No.: 0903162

Dear Patrick Walz:

Torrent Laboratory, Inc. received 30 samples on 3/26/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director 4/8/09 Date

Patti Sandrock
QA Officer

Torrent Laboratory, Inc.

Date: *08-Apr-09*

Project: Hwy 101-Aux Lane
Lab Order: 0903162

CASE NARRATIVE

Analytical Comments for Asbestos, PLM Note: Analysis performed by NVLAP Certified sub-contract laboratory. (Certification # 101048-3).

Analytical Comment for METHOD 6010B_S, 0903162-026A MS/MSD, QC Batch ID 19125, Note:The % recoveries in the MS/MSD for Lead and Nickel are not recoverable. The sample concentration is greater than 4X the spike concentration. No corrective action is required.

Analytical Comment for METHOD 6010B_S, 0903162-026A MS/MSD, QC Batch ID 19125, Note:The % recoveries in the MS for Barium, Chromium, Copper and Zinc, and in the MSD for Barium are outside of laboratory control limit but are within % RPD limits and % Recovery limits for the LCS/LCSD. No corrective action is required.

Analytical Comment for METHOD 6010B, 0903162-005A MS/MSD, QC Batch ID 19162, Note:The % recoveries in the MS/MSD for Lead are outside of laboratory control limits but within % RPD limits and % recovery limits for the LCS/LCSD. No corrective action is required.

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

EMSL recommends that soil samples reported as "ND" be tested by the EPA Screening Method/Qualitative. The above report relates only to the items tested. This report may not be reproduced, except in full, without written approval by EMSL Analytical, Inc. The above test must not be used by the client to claim product endorsement by NVLAP nor any agency of the United States Government. Unless otherwise noted, the results in this report have not been blank corrected.Samples received in good condition unless otherwise noted.

Torrent Laboratory, Inc.

Date: *18-Jun-09*

CLIENT: URS Corporation, San Jose
Project: Hwy 101-Aux Lane
Lab Order: 0903162

CASE NARRATIVE

Analytical Comments for Asbestos, PLM Note: Analysis performed by NVLAP Certified sub-contract laboratory. (Certification # 101048-3).

Analytical Comment for METHOD 6010B_S, 0903162-026A MS/MSD, QC Batch ID 19125, Note:The % recoveries in the MS/MSD for Lead and Nickel are not recoverable. The sample concentration is greater than 4X the spike concentration. No corrective action is required.

Analytical Comment for METHOD 6010B_S, 0903162-026A MS/MSD, QC Batch ID 19125, Note:The % recoveries in the MS for Barium, Chromium, Copper and Zinc, and in the MSD for Barium are outside of laboratory control limit but are within % RPD limits and % Recovery limits for the LCS/LCSD. No corrective action is required.

Analytical Comment for METHOD 6010B, 0903162-005A MS/MSD, QC Batch ID 19162, Note:The % recoveries in the MS/MSD for Lead are outside of laboratory control limits but within % RPD limits and % recovery limits for the LCS/LCSD. No corrective action is required. Analytical Comments for METHOD 6010B (STLC), SAMPLE 0903162-003AMSD: Pb,Ni are out of control limit.

REVISIONS:

Per client request, STLC, DI STLC and TCLP analysis was added to specified samples. Due to insufficient sample mass available, no TCLP was performed on requested sample -027 (N-2-11@1.0). Due to limited sample available for all samples, STLC, DI STLC and TCLP was performed using only 25 g of homogenized sample.

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to DI wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/27/2009 @ 2.00 PM and ended on 05/29/2009 @ 2:00 PM

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

CLIENT:	URS Corporation, San Jose
Project:	Hwy 101-Aux Lane
Lab Order:	0903162

CASE NARRATIVE

Extraction started on 05/27/2009 @ 2.00 PM and ended on 05/29/2009 @ 2:00 PM

Note: Extraction of 25 g sample / 500g TCLP Fluid #1 was performed according to Toxicity Characteristic Leaching Procedure (TCLP) which was rotated in a rotary shaker for 18 hours.

Extraction started on 06/12/2009 @ 4:00 PM and ended on 06/13/2009 @ 10:00 AM

RE: Hwy 101-Aux Lane - See narrative for revision details.

Order No.: 0903161

Dear Patrick Walz:

Torrent Laboratory, Inc. received 40 samples on 3/26/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director 6/18/09 Date

Patti Sandrock
QA Officer

CASE NARRATIVE

Analytical Comments for Asbestos, PLM Note: Analysis performed by NVLAP Certified sub-contract laboratory. (Certification # 101048-3).

Analytical Comment for METHOD 6010B_S, 0903161-007A MS/MSD, QC Batch ID 190138, Note:The % recoveries in the MS/MSD for Lead are not recoverable. The sample concentration is greater than 4X the spike concentration. No corrective action is required.

Analytical Comment for METHOD 6010B_S, 0903154-001A MS/MSD, QC Batch ID 19067, Note:The % recoveries in the MS/MSD for Lead are outside of laboratory control limits and % RPD but are within % RPD limits and % Recovery limits for the LCS/LCSD. A post digestion spike on the parent sample was anlayzed and Lead was recovered within control limits indicating probable non-homogenity of the samples. No corrective action is required.

REVISIONS:

Per client request, STLC, DI STLC and TCLP analysis was added to specified samples. Due to insufficient sample mass available, no TCLP was performed on requested sample -027 (N-2-11@1.0). Due to limited sample available for all samples, STLC, DI STLC and TCLP was performed using only 25 g of homogenized sample.

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to DI wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/19/2009 @ 4.00 PM and ended on 05/21/2009 @ 4:00 PM

Note: Extraction of 25 g sample / 250g 0.2M Sodium Citrate Solution was performed according to wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

Extraction started on 05/19/2009 @ 4.00 PM and ended on 05/21/2009 @ 4:00 PM

Note: Extraction of 25 g sample / 500g TCLP Fluid #1 was performed according to Toxicity

Characteristic Leaching Procedure (TCLP) which was rotated in a rotary shaker for 18 hours.

Extraction started on 06/11/2009 @ 5:00 PM and ended on 06/12/2009 @ 11:00 AM
and
Extraction started on 06/12/2009 @ 4:00 PM and ended on 06/13/2009 @ 10:00 AM

Lead	SW6010B	4/6/2009	1	1	1.0	71	mg/Kg	5070

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Report prepared for: Patrick Walz
URS Corporation, San Jose

Date Received: 3/26/2009
Date Reported: 6/18/2009

Client Sample ID: N-2-13@1.5
Sample Location: Hwy 101-Aux Lane
Sample Matrix: SOIL
Date/Time Sampled 3/26/2009 12:01:00 AM

Lab Sample ID: 0903161-038
Date Prepared: 6/3/2009

Parameters	Analysis Method	Date Analyzed	RL	Dilution Factor	MRL	Result	Units	Analytical Batch
Lead (DI-STLC)	6010B (DI-STLC)	6/3/2009	0.1	1	0.10	2.6	mg/L	5250
Lead (STLC)	6010B (STLC)	6/3/2009	0.1	1	0.10	42	mg/L	5248
Lead (TCLP)	6010B (TCLP)	6/15/2009	0.1	1	0.10	ND	mg/L	5284
Lead	SW6010B	4/6/2009	1	1	1.0	2200	mg/Kg	5070

Client Sample ID: N-2-13@2.0
Sample Location: Hwy 101-Aux Lane
Sample Matrix: SOIL
Date/Time Sampled 3/26/2009 12:01:00 AM

Lab Sample ID: 0903161-039
Date Prepared: 3/31/2009

Parameters	Analysis Method	Date Analyzed	RL	Dilution Factor	MRL	Result	Units	Analytical Batch
Lead	SW6010B	4/6/2009	1	1	1.0	7.4	mg/Kg	5070

Client Sample ID: N-2-13@3.0
Sample Location: Hwy 101-Aux Lane
Sample Matrix: SOIL
Date/Time Sampled 3/26/2009 12:01:00 AM

Lab Sample ID: 0903161-040
Date Prepared: 3/31/2009

Parameters	Analysis Method	Date Analyzed	RL	Dilution Factor	MRL	Result	Units	Analytical Batch
Lead	SW6010B	4/6/2009	1	1	1.0	14	mg/Kg	5070

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

EMSL recommends that soil samples reported as "ND" be tested by the EPA Screening Method/Qualitative. The above report relates only to the items tested. This report may not be reproduced, except in full, without written approval by EMSL Analytical, Inc. The above test must not be used by the client to claim product endorsement by NVLAP nor any agency of the United States Government. Unless otherwise noted, the results in this report have not been blank corrected.Samples received in good condition unless otherwise noted.

This report relates only to the samples listed above and may not be reproduced except in full, without EMSL's written approval. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government. EMSL is not responsible for sample collection activities or method limitations. Some samples may contain asbestos fibers below the resolution limit of PLM. EMSL recommends that samples reported as none detected or less than the limit of detection undergo additional analysis via TEM.Samples received in good condition unless otherwise noted.

THIS IS THE LAST PAGE OF THE REPORT.

RE:

Order No.: 0903160

Dear Patrick Walz:

Torrent Laboratory, Inc. received 36 samples on 3/26/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.
