Draft Environmental Impact Report / Environmental Impact Statement

Prepared by the
U.S. Department of Transportation
Federal Highway Administration
and the
State of California Department of Transportation

June 2010
GENERAL INFORMATION ABOUT THIS DOCUMENT

What’s in this document:
The California Department of Transportation (Caltrans) and the Federal Highway Administration (FHWA) have prepared this Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS), which examines the potential environmental impacts of the alternatives being considered for the proposed project located in San Diego County, California. The document describes why the project is being proposed, alternatives for the project, the existing environment that could be affected by the project, the potential impacts from each of the alternatives, and the proposed avoidance, minimization and/or mitigation measures.

What you should do:
• Please read this Draft EIR/EIS. This document and the technical studies are available for review at www.keepsandiegomoving.com/I-5-intro.html and the following locations:
  - San Diego Public Library Central
    820 E Street
    San Diego, CA 92101
  - San Diego County – Solana Beach
    157 Stevens Avenue
    Solana Beach, CA 92075
  - San Diego Public Library – Carmel Valley
    3919 Townsgate Drive
    San Diego, CA 92130
  - Del Mar Library
    1309 Camino Del Mar
    Del Mar, CA 92014

• Attend one of 5 public Hearings:
  - Encinitas
    Location: Encinitas Community and Senior Center – City of Encinitas
    Room 142 Banquet Hall
    1140 Oakcrest Park Drive
    Encinitas, CA 92024
    Date: Tuesday, July 27, 2010
  - San Diego/Bay Mar
    Location: Westfield UTC – Forum Hall
    4545 La Jolla Village Drive, Suite E-25
    San Diego, CA 92122-1212
    Date: Tuesday, August 3, 2010
  - Carlsbad
    Location: City of Carlsbad - Faraday Center
    Room 173A and 173B
    1635 Faraday Ave
    Carlsbad, CA 92008
    Date: Tuesday, August 17, 2010

  - Solana Beach
    Location: Skyline Elementary School - Solana Beach School District
    Activity Room
    606 Lomas Santa Fe Drive
    Solana Beach, CA 92075-1400
    Date: Thursday, September 9, 2010

• We welcome your comments. If you have any comments regarding the proposed project, please attend the public hearing and/or send your written comments to Caltrans by the deadline.
  - Submit comments via postal mail to:
    Shay Lynn Harrison, Environmental Analysis Branch Chief
    CA Department of Transportation – District 11
    Division of Environmental Analysis, MS 242
    4050 Taylor Street
    San Diego, CA 92110

• Submit comments via email to: I-5_NCC_EIR_EIS@dot.ca.gov

• Submit comments by the deadline: October 7, 2010

What happens next:
After comments are received from the public and reviewing agencies, Caltrans and the FHWA may undertake additional environmental and/or engineering studies. A Final EIR/EIS will be circulated; the Final EIR/EIS will include responses to comments received on the Draft EIR/EIS and will identify the preferred alternative. Following circulation of the Final EIR/EIS, if the decision is made to approve the project, a Notice of Determination will be published for compliance with the California Environmental Quality Act and a Record of Decision will be published for compliance with the National Environmental Policy Act. If the project is given environmental approval and funding is appropriated, Caltrans and FHWA could design and construct all or part of the project.

For individuals with sensory disabilities, this document can be made available in Braille, large print, on audiocassette, or on computer disk. To obtain a copy in one of these alternate formats, please call or write to Caltrans, Attn: Shay Lynn Harrison, 4050 Taylor Street, San Diego, CA 92110 (MS242); (619) 688-0190 Voice, or use the or use the California Relay Service 1 (800) 735-2929 (TTY), 1 (800) 735-2929 (Voice) or 711.

It should be noted that at a future date FHWA may publish a notice in the Federal Register, pursuant to 23 USC §139(i), indicating that a final action has been taken on this project by FHWA. If such notice is published, a lawsuit or other legal claim will be barred unless it is filed within 180 days after the date of publication of the notice (or within such shorter time period as is specified in the Federal laws pursuant to which judicial review of the Federal agency action is allowed). If no notice is published, then the lawsuit or claim can be filed as long as the periods of time provided by other Federal laws that govern claims are met.
In San Diego County, widen Interstate 5 in the Cities of San Diego, Solana Beach, Encinitas, Carlsbad and Oceanside
From La Jolla Village Drive Overcrossing to 1.6 kilometer (1 mile) north of the Harbor Drive Undercrossing,

On I-5: Kilometer Post (KP) R45.75 to R89.15 (Post Mile (PM) R28.4 to R55.4)

Abstract: The proposed action would improve Interstate 5 (I-5) from La Jolla Village Drive in the City of San Diego to Harbor Boulevard in the City of Oceanside. The proposed action would improve approximately 43 km (27 miles) of I-5 to construct one to two High-Occupancy Vehicle / Managed Lanes (HOV/Managed Lanes) in each direction. Direct Access Ramps (DARs), a freeway-to-freeway connector, auxiliary lanes, and possibly add one main general-purpose lane in each direction. Four build alternatives and the No Build alternative are assessed in this Draft EIR/EIS: 10+4 with Barrier; 10+4 with Buffer; 8+4 with Barrier; and 6+4 with Buffer. Potential benefits include maintaining or improving the existing and future traffic operations along this portion of I-5, improving the safe and efficient regional movement of people and goods, improving community connectivity, improving pedestrian and bicycle facilities, improving lagoon function, and would be compatible with planned Regional multi-modal improvements. Potential substantial environmental effects include impacts to wetlands and other waters of the U.S., threatened and endangered species and their critical habitats, sensitive plants and animals, and visual/aesthetics. Please send your comments on this document to Shay Lynn M. Harrison, California Department of Transportation at the address above, no later than by October 7, 2010.

Summary

The California Department of Transportation (Caltrans) and the Federal Highway Administration (FHWA) propose improvements to maintain or improve the existing and future traffic operations on the existing Interstate 5 (I-5) freeway from La Jolla Village Drive in San Diego to Harbor Drive in Oceanside/Camp Pendleton, extending approximately 43.4 kilometers (km) (27 miles [mi]) from kilopost (KP) R45.7 to KP R89.1 (post mile [PM] R28.4 to PM R55.4) on I-5. Figure 1-1.1 shows the limits of the proposed project.

The I-5 North Coast Corridor Project sponsors include FHWA, Caltrans and the San Diego Association of Governments (SANDAG). The proposed project improvements include one or two High Occupancy Vehicle (HOV) Managed Lanes (ML) in each direction, auxiliary lanes where needed, and possibly one general-purpose lane in each direction. The HOV/Managed Lanes would be available for carpools, vanpools, busses at no cost and be available to single-occupant vehicles for a fee when there is sufficient capacity. The proposed build alternatives and the no build alternative are presented and discussed in this Draft Environmental Impact Report / Environmental Impact Statement (EIR/EIS), which has been completed pursuant to the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) and would be used for project compliance with state and federal laws and regulations.

Caltrans has adopted a new approach to improve mobility across California, with an emphasis on productivity, resilience, flexibility, safety, and performance. As defined under a formal budgetary process, as part of the Corridor Mobility Improvement Account (CMIA) Program, the California Transportation Commission (CTC) requires all CMIA corridors develop a (CSMP). The purpose of a corridor system management plan (CSMP) is to provide one unified concept for managing, operating, improving, and preserving a corridor across all modes and jurisdictions for highest productivity, mobility, reliability, accessibility, safety and preservation outcomes. This concept integrates and coordinates all travel modes in the corridor including highways, parallel and connecting roadways, public transit and bikeways for multimodal analysis to focus on how transit, local roadways, highways, pedestrian routes and land use work together as a system. The CSMP also provides the basis for prioritizing improvements, resources, demand profile, related land use developments, modal interactions, and the environment. The larger purpose of a corridor management plan is to focus all transportation efforts of all jurisdictions on effective and efficient usage of all facilities in the corridor. The plan is a tool for effective management and a guide for implementation of system management and performance measurement. This plan integrates operational analysis with more traditional system planning based on a foundation of comprehensive performance assessment and evaluation.

This project is included in the 2007 Federal Statewide Transportation Improvement Program (FSTIP) and is proposed for funding from the Capital Programs Program. It is also included in the SANDAG Regional Transportation Plan (RTP) and the 2008 Regional Transportation Improvement Program (RTIP). The current RTIP and RTP are located on the SANDAG website, www.sandag.org.

S.1 Overview of Project Area

The project area is a portion of the I-5, a principal north-south transportation facility in the western United States that is part of the National Highway System, extending from the Mexican border to the Canadian border. The project area begins in the northern portion of the City of San Diego and extends to the northern part of San Diego County. This part of I-5 was constructed through the Cities of San Diego, Solana Beach, Encinitas, Carlsbad and Oceanside in the mid 1960s and early 1970s, tending to separate the original communities from the future developed areas. The development of additional highway transportation infrastructure in the North County coastal area is limited by existing circulation systems and residential/commercial development, geographical, and environmental constraints. As a result, two-thirds of the daily trips in the North County coastal area occur on I-5.

Land uses along the North County coastal area are varied, with the majority of land directly adjacent to the highway right-of-way developed for residential, industrial, and/or commercial. Also numerous existing natural and visual resources have been held in preserve from development. Los Peñasquitos Creek, Carmel Valley Creek and San Luis Rey River cross under I-5 before terminating at the ocean. These drainages provide wildlife corridors from inland San Diego County to the coastal region. I-5 also crosses five lagoons within the project limits – San Dieguito, San Elizio, Batiquitos, Agua Hedionda, and Buena Vista, and is adjacent to the eastern border of Los Peñasquitos Lagoon. These waterways offer habitat and wildlife that are both state and federally protected.

S.2 Purpose and Need

The I-5 North Coast Corridor (NCC) Project’s main purpose is to maintain or improve the existing and future traffic operations in the I-5 north coast corridor in order to improve the safe and efficient regional movement of people and goods for the design year of 2030.

The objectives of the project are to:
- Maintain or improve future traffic levels of service in 2030 over the existing levels of service;
- Maintain or improve travel times within the corridor;
- Provide a facility that is compatible with future bus rapid transit and other modal options;
- Provide consistency with the regional transportation plan, San Diego Regional Transportation Plan: Pathways for the Future (2030 RTP) where feasible and in compliance with federal and state regulations;
- Maintain the facility as an effective link in the national Strategic Highway Network; and
- Protect and/or enhance the human and natural environment along the I-5 corridor.

The project area has recurrent traffic congestion affected by population growth, increased goods movement, and economic growth in the region that is shown by the length of time required to travel the distance of the project. For most of the project area, there have been minimal improvements to the existing interstate facility since the original construction during the 1960s and 1970s. Traffic demand has exceeded capacity and would continue to do so as regional and interregional growth increase creating more demand for travel within the corridor. Based on forecasted 2030 traffic volumes, the I-5 traffic conditions and...
freeway operations would deteriorate in both the weekday AM and PM peak hours, as well as during weekend travel, if no improvements are made.

The existing average southbound duration to travel through the project area during peak travel time is between 31-44 min AM / 27-32 min PM and northbound peak time duration is between 24-25 min AM / 33-39 min PM. If no improvements were made, the projected year 2030 average southbound peak time duration would be 53-54 min AM / 40-48 min PM and northbound peak time duration would be 29-37 min AM / 67-69 min PM.

Along with increase duration to travel the project area, forecasts also indicate that the increase in Average Daily Traffic (ADT) would lengthen the duration of congestion for the corridor in both the northbound and southbound directions if no improvements were made. Forecasted duration of congestion in the northbound direction would be 3.5 hours in year 2030 peak AM compared to none currently, and 6 hours in year 2030 peak PM compared to 5 hours currently. Forecasted duration of congestion in the southbound direction would be 6 hours in year 2030 peak AM compared to 5 hours currently, and 6 hours in year 2030 peak PM compared to 5 hours currently.

On weekends, I-5 serves a variety of local, regional and interregional, as well as, tourist and seasonal/event-generated trips. There is a slight evening time congestion peak in the northbound direction and a consistent congestion peak in the southbound direction, a travel time through the project area is between 25 and 35 minutes, for most of the day suggesting a constant, all day flow of traffic with a slight reduction in travel time. (Source: San Diego Regional Vehicle Occupancy and Classification Study – 2000 [Revised June 2002], SANDAG, June 2002).

HOV and Value Pricing are proposed for I-5 NCC Project, with Managed Lane strategies. Managed Lanes actively manage and control traffic though a combination of access control, vehicle eligibility, and pricing strategies to make the most effective and efficient use of a freeway facility. HOV Lanes provide additional highway capacity through the number of occupants in a constrained corridor while minimizing impacts to the environment and surrounding communities. Value Pricing is another option under Managed Lanes that provides additional highway capacity by allowing single occupant vehicles (SOV) to pay to use the Managed Lanes when extra capacity exists. Therefore, the Managed Lanes strategy for SOV is to experience less congestion than the general-purpose lanes and maintain free-flow conditions while still providing a travel time-savings incentive for HOV vehicles, and reducing some demand on the general-purpose lanes.

Managed lanes have two types of access control. There are intermediate access points (IAP) that occur at-grade and adjacent to the freeway main lanes. The other type of access is a Direct Access Ramp (DAR) from a grade separated interchange into the managed lanes. The DARs are compatible with carpools, bus transit, and value pricing. The four proposed DARs are located at the following locations:

- Voigt Drive
- Manchester Avenue
- Cannon Road
- Oceanside Boulevard

S.3 Alternatives Considered

A range of alternatives were developed to meet the purpose and need of the project. The build alternatives included and shown in the schematic figures are; 10+4 with Barrier, 10+4 with Buffer, 8+4 with Barrier, and 8+4 with Buffer (Figures 2-2.6 through 2-2.9, respectively). These alternatives are described below and a detailed layout for all four build alternatives are contained in the Draft Project Report (DPR). The typical cross-sections for the alternatives are Figures 2-2.10 through 2-2.13 and are located at the end of Chapter 2 for each alternative. 10+4 Buffer Alternative was used for the Project Features Map, because the footprint width is an approximate average of the other proposed build alternatives (see Figures 2.2.14a-ao).

There is a width difference of about 3.7 m (12 ft).

Build Alternatives also include: adding auxiliary lanes, adding noise barriers, adding ramp meters; utility relocations and utility avoidance through design exceptions; drainage facilities modifications; transit opportunities; and equipment for value pricing program to allow single occupancy vehicles to purchase use of HOV/Managed Lanes.

10 + 4 with Barrier Alternative

The 10+4 with Barrier alternative would separate HOV/Managed Lanes from general-purpose lanes with a concrete barrier using standard shoulder widths, 3.0 m (10 ft) that would be provided on either side of the barrier from north of Del Mar Heights Road to south of State Route 78 (SR-78). Similar to 10+4 with Buffer, there would be a buffer separator HOV/Managed Lanes from general-purpose lanes with a 1.2-m (4-ft) and variable buffer width in lieu of the barrier from Voigt Drive to Del Mar Heights Road and from SR-78 to Harbor Drive /Vandegrift Boulevard.

There would be a total of four HOV/Managed Lanes would be built from north of the freeway-to-freeway connector in San Diego to Harbor Drive in Oceanside. There would be two HOV/Managed Lanes from Voigt Drive in San Diego to the freeway-to-freeway connector. New freeway access through DARs at Voigt Drive, Manchester Avenue, Cannon Road and Oceanside Boulevard would be constructed. One general-purpose lane would be constructed in each direction on I-5 from south of Del Mar Heights Road in San Diego to SR-78 in Oceanside. There would be auxiliary lanes constructed at various locations within the project area and operational improvements.

The estimated cost (right of way, support, and construction) for the 10+4 with Barrier alternative is approximately $4.3 billion.

10 + 4 with Buffer Alternative

The 10+4 with Buffer alternative would function similarly to the 10+4 with Barrier alternative but would use a buffer to separate HOV/Managed Lanes from general-purpose lanes with a width of 1.2-m (4-ft) and in some locations instead of the barrier.

The estimated cost (right of way, support, and construction) for the 10+4 with Buffer alternative is approximately $3.5 billion.
8 + 4 with Barrier Alternative
The 8+4 with Barrier alternative would separate HOV/Managed Lanes from general-purpose lanes with a barrier using standard shoulder widths, 3.0 m (10 ft) that would be provided on either side of the barrier from Del Mar Heights Road to State Route 78 (SR-78). Similar to 10+4 with Buffer, there would be would a buffer separator HOV/Managed Lanes from general-purpose lanes with a 1.2-m (4-ft) and variable buffer width in lieu of the barrier from Voigt Drive to Del Mar Heights Road and from SR-78 to Harbor Drive /Vandegrift Boulevard.

A total of four HOV/Managed Lanes would be built from the freeway-to-freeway connector in San Diego to Harbor Drive/Vandegrift in Oceanside. There would be two HOV/Managed Lanes from Voigt Drive in San Diego to the freeway-to-freeway connector. New freeway access through DARs at Voigt Drive, Manchester Avenue, Cannon Road and Oceanside Boulevard would be constructed. There would be auxiliary lanes constructed at various locations within the project area and operational improvements.

The estimated cost (right of way, support, and construction) for the 8+4 with Barrier alternative is approximately $4.1 billion.

8 + 4 with Buffer Alternative
The 8+4 with Buffer alternative would function similarly to the 8+4 with Barrier alternative but would separate HOV/Managed Lanes from general-purpose lanes with a 1.2-m (4-ft) variable buffer width in lieu of the barrier.

The estimated cost (right of way, support, and construction) for the 8+4 with Buffer alternative is approximately $3.3 billion.

No Build
The No Build Alternative offers a basis of comparison with the build alternatives and would include ongoing operations and maintenance. In addition, a number of interchange/operations/adjacent projects would move forward independently from the I-5 NCC Project and would be analyzed within separate environmental documents. The following is a list of those projects:

- I-5/Genesee Avenue Interchange Improvements
- I-5/SR-56 Interchange Improvements
- I-5/SR-78 Interchange Improvements
- I-5/“Mid-Coast” Freeway Improvements (10+2HOV facility from I-8 to I-805)
- I-805 “North” improvements (8+4HOV/Managed Lanes facility from SR-52 to north of Mira Mesa Boulevard in San Diego)
- Sorrento Valley Road/Roselle Street Improvements
- Manchester Avenue Interchange Improvements
- Encinitas Boulevard Interchange Improvements
- Birmingham Avenue to Leucadia Boulevard Auxiliary Lanes
- LOSSAN Rail Improvements (double tracking of rail corridor between Los Angeles and San Diego)
- I-805 northbound Direct Access Ramps (DAR) at Carroll Canyon Road and HOV lanes between Carroll Canyon Road and the I-5/I-805 junction

S.4 Joint CEQA/NEPA Document
The proposed project is a joint project by the California Department of Transportation (Caltrans) and the Federal Highway Administration (FHWA) that is subject to state and federal environmental review requirements. Project documentation, therefore, has been prepared in compliance with both CEQA and NEPA. Caltrans is the lead agency under CEQA and FHWA is the Lead agency under NEPA.

Some impacts determined to be significant under CEQA may not lead to a determination of significance under NEPA. Because NEPA is concerned with the significance of the project as a whole, it is quite often the case that a “lower level” document is prepared for NEPA. One of the most commonly seen joint document types is an Environmental Impact Report/Environmental Impact Statement (EIR/EIS).

After comments are received from the public and reviewing agencies, Caltrans and FHWA may undertake additional environmental and/or engineering studies. A Final EIR/EIS would be circulated and would include responses to comments received on the Draft EIR/EIS. Following circulation of the Final EIR/EIS, if the decision is made to approve the project, a Notice of Determination (NOD) would be published for compliance with CEQA and a Record of Decision (ROD) would be published for compliance with NEPA.

S.5 Environmental Consequences

Table S.1 summarizes the project impacts by alternative. For detailed information regarding the impacts of each alternative, please see Chapter 3 of this Draft EIR/EIS and the associated technical studies.

S.5.1 Environmental Consequences Remaining Substantial After Mitigation (CEQA)

Community Cohesion
Impacts to Community Cohesion for the 10+4 with Barrier Alternative and Visual/Aesthetics would remain significant after mitigation identified in Chapter 3.

Visual/Aesthetics
As described in Section 3.7, all four alternatives would result in highly adverse changes to the existing visual environment along the project corridor. While impacts to visual resources would be similar for all four alternatives, the 10+4 with Barrier Alternative would result in the greatest change to the existing visual environment because this alternative would require the greatest amount of additional pavement. Conversely, the 8+4 with Buffer alternative would result in the least amount of change to the existing visual environment, because it would require the least amount of additional pavement. The natural character of the I-5 corridor would become noticeably more urban, and scenic resources now available to the traveling public would become less visible.

Community Character and Cohesion
The 10+4 with Barrier alternatives would displace a 47-unit apartment complex in northern Carlsbad within an area identified as having a relatively high concentration of linguistically isolated Spanish-speaking households, as well as a high proportion of minority populations. As discussed in Section 3.4, displaced
residents living in these 47 units may be difficult to relocate as the availability of apartments within Carlsbad with similar rental rates is not adequate. If relocation is not feasible in Carlsbad and up to 47 units are relocated outside of the community, this may adversely impact community cohesion in the area, which would be considered a significant impact.

**Significant Irreversible Environmental Changes**

Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and secondary impacts generally commit future generations to similar uses. The following resources would be converted: wetlands, sensitive species and natural communities, farmlands, homes, floodplain, cultural resources, and visual resources.

S.6 Coordination with the Public and Other Agencies

Early and continuing coordination with the general public and appropriate public agencies is an essential part of the environmental process. The input and advice help to determine the areas of public concern, scope of environmental documentation, the level of analysis, potential impacts, mitigation measures and related environmental requirements. Projects as large as the I-5 NCC Project benefit from federal, state and local agency consultation, and public participation. This participation has been accomplished through a variety of formal and informal methods, including: scoping meetings, project development team meetings, interagency coordination meetings, community meetings with service groups, homeowners associations and business organizations.

Caltrans and FHWA held preliminary public scoping meetings before circulating a Notice of Preparation (NOP) on October 20, 2004 and a Notice of Intent (NOI) on January 12, 2004. Additional Project Outreach occurred through two separate newsletters sent out or made available to addresses within 1.6 km (1 mi) east or west of the freeway. Also, project information was available on the project web site at www.keepsandiego-moving.com. Since 2004, Caltrans staff and Caltrans staff on behalf of FHWA have attended meetings; conducted surveys; presented handouts/mailers; and given presentations to Local Communities and Planning Groups, Homeowners Associations, Chambers of Commerce, City Council meetings, and local politician-sponsored meetings in an effort to update interested parties and the public on the status of the project. These meetings have facilitated public input into the development and design of the proposed project.

An I-5 North Coast Project Development Team (PDT) meeting was assembled by Caltrans and FHWA in 2000 to serve as the technical advisory committee and internal decision-making body for the project. The PDT consists of Caltrans staff, Caltrans staff on behalf of FHWA, and representatives from other public agencies. The PDT met (and continues to meet) monthly during the course of project development as issues arise requiring technical direction or resolution.

Considerable coordination has occurred with the resource and regulatory agencies throughout the environmental review process. Caltrans and Caltrans staff on behalf of FHWA has worked closely with representatives of the following public agencies to provide for timelier decision-making while improving the overall quality of those decisions. The regulatory agencies include: U.S. Fish and Wildlife Service (USFWS); U.S. Army Corps of Engineers (ACOE); National Oceanic and Atmospheric Administration National Marine Fisheries Service (NOAA/NMFS); California Department of Fish and Game (CDFG); Regional Water Quality Control Board – Region 9 (RWQCB); California Coastal Commission (CCC); the State Historic Preservation Officer (SHPO); Native American Tribes; the Native American Heritage Commission (NAHC); Camp Pendleton and the Cities of San Diego; Del Mar; Solana Beach; Encinitas; Carlsbad; and Oceanside.

On December 10, 2004, Caltrans and Caltrans staff on behalf of FHWA signed an interagency Memorandum of Understanding (MOU) committing to integrate NEPA and Section 404 of the Clean Water Act in transportation planning, programming, and implementation stages for federal aid surface transportation projects requiring a permit under Section 404. Under the MOU process, signatory agencies, which include FHWA, USFWS, the National Oceanic and Atmospheric Administration/National Marine Fisheries Service (NOAA/NMFS), ACOE, and the U.S. Environmental Protection Agency (EPA), were asked to concur on the following two milestones: 1) purpose and need statement; and 2) Identification of the range of alternatives and consideration of the criteria used to select and analyze the range of alternatives to be studied in the Draft EIR/EIS. Concurrence on the Preliminary Least Environmentally Damaging Practicable Alternative (LEDPA) Determination and Conceptual Mitigation Plan would be determined after public review of this Draft EIR/EIS.

The San Diego Association of Governments (SANDAG) and California Department of Transportation (Caltrans) have prepared a Public Works Plan/Transportation and Resource Enhancement Program (PWP/TREP) to plan for and implement a series of transportation, community and resource enhancement projects in a comprehensive and coordinated manner to meet the region's mobility vision through 2030 while ensuring compliance with the California Coastal Act.

The majority of the transportation, community and resource enhancement improvements associated with the PWP/TREP are located within the California Coastal Zone of Northern San Diego County. Therefore, they are subject to the coastal resource protection policies of the Coastal Act or, as applicable to the highway and community enhancement projects, the certified Local Coastal Programs of the corridor cities. The PWP/TREP has been developed to demonstrate North Coast Corridor program consistency with the California Coastal Act and applicable certified LCPs to ensure that program components are implemented to provide for maximum protection and enhancement of public access, recreation, and sensitive coastal resources.

This region's vision is to provide an efficient and integrated system of transit, local roadways, highways, pedestrian and bicycle facilities that facilitate the movement of people and goods within the North Coast Corridor. The PWP/TREP provides a planning, analytical, and implementation mechanism to address improvements throughout the corridor as a system consistent with the policies of the Coastal Act. The PWP will address Coastal Act permitting requirements and provide the Coastal Commission the necessary information to make a consistency determination for the project.

**Note:** The table summarizes the major potential impacts from the alternatives, including biological environment and other considerations such as right-of-way acquisition and total cost.
Caltrans and Caltrans staff on behalf of FHWA have coordinated with SHPO as required by federal and state law that an agency must take into account how this undertaking may affect historic properties/historical resources listed in or eligible for listing in the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR). The next step in the Section 106 consultation with the SHPO would involve preparation of a Memorandum of Agreement (MOA) to outline how Caltrans and FHWA would mitigate for adverse effects to two prehistoric archaeological sites within the project’s Area of Potential Effect (APE). The MOA would be a legally binding document that establishes the roles and responsibilities of the signatories for carrying out its stipulations. It would be executed before the Final EIR/EIS is completed.

Caltrans and Caltrans staff on behalf of FHWA have also consulted with NAHC, Native American tribes and Native American individuals. This consultation has been ongoing since the earliest days of the project dating back to 2002, when the first archaeological survey for the project was undertaken. Consultation would continue until all project-related activities have been completed.

The following permits, reviews, and approvals listed in Table S.2 below would be required for project construction. Caltrans and FHWA would continue to work closely with all the resources agencies to maintain communication and coordination throughout the project development process and receipt of the permits, reviews and approvals.

</table>
S.7  Avoidance, Minimization, and/or Mitigation Measures

Many avoidance and minimization measures were incorporated into the project design to reduce the level of impact to resources found within the project area. The amount of right-of-way was reviewed for each alternative to reduce the amount of land required to fulfill the purpose and need of the project as well as meet operational requirements of the roadway. Best management practices have also been incorporated into the project design to minimize impacts and to expedite the permit process. Mitigation would off-set impacts to sensitive resources that would result from the project. For some resources, permit requirements require mitigation to occur even though there is no substantial impact to the resource. A list of permits and approvals is contained in Table S.2 Permits and Approvals Needed.

Avoidance and minimization measures, and proposed mitigation measures are discussed in detail in Chapter 3. Due to the length of the project, the sensitive habitats it transverses, and the sensitive species that live along the corridor, there are impacts that could not be avoided. Compensatory mitigation measures would be used to mitigate for the unavoidable biological impacts. Possible mitigation ratios and compensatory mitigation have not been agreed upon by the resource agencies at this time. However, the following identifies potential mitigation that has been identified to offset impacts associated with the I-5 NCC Project.

Community Impacts

The following measures would be incorporated into the project design to minimize potential impacts to the community during construction and operation of the proposed project.

- Landscape and streetscape improvements would be provided in affected areas, where possible, and would be consistent with the visual atmosphere, historic architecture, and native vegetation in the area.
- Reconfiguration of interchanges, overcrossings and undercrossings along the project corridor would improve pedestrian and bicycle facilities, provide linkages, and allow for improvements to public transit. Most notably, project features would serve to improve and facilitate connectivity between communities east and west of I-5 in locations that have been previously bisected by the freeway.

In addition to the measures mentioned above, measures specified in other issue areas of this Draft EIR/EIS may also serve to minimize impacts to the community. Such issue areas with additional measures include, but are not limited to the noise abatement (Section 3.15), traffic and transportation (Section 3.6), and visual/aesthetics (Section 3.7).

Construction-Related Measures

The following measures would help to minimize impacts to communities during construction activities:

- Preparation of a Traffic Management Plan (TMP) to minimize traffic delays and closures through the use of various traffic handling practices.
- Public awareness program would be developed to inform the public of upcoming detours and construction schedules.
- Traffic impacts around schools would be noted in the TMP.
- Equipment would have sound-control devices to minimize noise, and other specifications to turn off idling equipment and installing temporary acoustic barriers around stationary construction noise sources would be implemented.
- Construction equipment and truck staging and maintenance areas would be located as far as feasible and nominally downwind of schools, active recreation areas, and other communities of high-population density.

Relocations

The proposed project has been designed to minimize impacts, where possible, by taking the reduced amounts of right-of-way and limiting the grading footprint in order to minimize impacts to existing structures while still meeting project objectives. The Draft Relocation Impact Report (DRIR) concluded that adequate relocation resources existed for the majority of displacees. Additionally, displacees that may face difficulty finding suitable relocation resources would be eligible for assistance from Caltrans through the State’s relocation program or Last Resort Housing (LRH) Program options, including LRH payments.

Utilities

Relocation of utilities would be coordinated with the appropriate utility owners. Impacts to resources would be avoided when utilities are relocated, and Environmentally Sensitive Areas (ESAs) would be delineated when working near sensitive areas to prevent construction activities from impacting resources. Should it become necessary to relocate the high-voltage transmission towers at the I-5/Cannon Road interchange, no environmental impacts would be anticipated, therefore no mitigation would be required.

Emergency Services

During construction activities, the following strategies would be employed to aid in incident management, as per Caltrans’ standard practice.

- The Construction Zone Enhancement Enforcement Program (COZEEMP) involves the presence of CHP to improve project safety by encouraging motorists to slow down and use care while driving through construction zones.
- The Freeway Service Patrol program is a cooperative effort between Caltrans, SANDAG and the CHP to alleviate incident-related traffic congestion by operating tow services to aid stranded or disabled vehicles on urban freeways during morning and afternoon commuter periods. Common services performed include changing flat tires, jump-starting vehicles, providing gas, and towing disabled vehicles.
- A TMP would be developed to include various strategies to minimize delay during construction.
- Emergency providers and law enforcement officials would be informed of all detours to avoid or minimize increases in response times.
- The project would have compliance with all applicable solid waste regulations.
Traffic & Transportation
A construction phasing plan has been proposed, as detailed in Chapter 2, to further identify the sequence of construction and help minimize traffic delays. Traffic delays would be controlled to the extent feasible during periods of many simultaneous construction operations. A comprehensive TMP to further minimize delays would be developed after selection of a preferred alternative but prior to the start of construction.

The TMP would be similar for each build alternative. It is designed to increase driver awareness, ease congestion, and minimize delay during construction. Many TMP components would be implemented prior to construction and could continue after construction with local funding. The components of the TMP would be:

Public Awareness Program
Strategies that would be considered to increase public awareness may include one or more of the following items:
- Mailings – construction bulletins, newsletters, public notices
- Speakers bureau
- Public service announcements: radio, television, and newspapers
- Paid advertising
- Signs along roadway: changeable message signs
- Telephone information line, hotline, “800” number
- Updates to local businesses
- Webpage

Traffic Operations Strategies Program
This includes ongoing evaluation of traffic operations and would provide for incident response during construction. Strategies that would be considered may include one or more of the following items:
- TMP evaluation and adjustment
- Alternate route strategies
- Construction Strategies, including lane closure charts for closing lanes, ramps, and connectors
- Delay clauses for the late re-opening of lane closures
- Temporary signal location
- California Highway Patrol enforcement of construction zone speed limits during lane closures
- Freeway Service Patrol
- Demand Management strategies, including improvement to HOV/Managed Lanes and public transit

Pedestrian & Bicycle Facilities
During construction of transportation facilities, particularly construction of new facilities, the work can act as both a physical and psychological barrier to pedestrians and bicycle users. Where freeway construction crosses bikeways and sidewalks, access may be restricted or severed entirely. The TMP would also include components for pedestrians and bicyclists along with consideration for the motoring public. As well as the items listed for the motoring public, signs would be used, as appropriate, to provide notices of bike and pedestrian closures, detours and other pertinent information. Temporary access would be provided where possible.

Visual
Since the project has not yet been designed, specific visual mitigation measures cannot be proposed at this time. Instead, the general design requirements and guidelines are contained in this document. A set of corridor guidelines would guide the design of specific project features and areas. This corridor guidelines would be developed and contain detailed architectural and landscape mitigation requirements developed with consultation with the District 11 Landscape Architect (DLA) that reflect comments received during public outreach meetings with interested community groups, city staff members, regulatory agencies, and the general public. Mitigation measures shown in photo simulations in Section 3.7.4 are generic and illustrative.

The mitigation options include: landscape buffers; varied profiles; planting pockets; setbacks; architectural detailing; transparent soundwalls on private property; terrain contoured elements; pedestrian lighting; enhanced fencing; railings; and other urban amenities. Additional or alternative mitigation measures may be required in each viewshed as project designs are developed and mitigation design guidelines are applied. In addition, mitigation measures that require regular maintenance and are located outside Caltrans right-of-way such as trees planted along local streets or measures that require the installation of non-standard equipment within the right-of-way such as pedestrian bridge lighting can be implemented only if the responsible local government would be willing to maintain them in perpetuity.

Cultural
Caltrans undertook other efforts to avoid impacting sites. Additional efforts to avoid causing indirect impacts to eligible archaeological sites would include archaeological and Native American monitoring and establishment of Environmentally Sensitive Areas (ESA) around the sites. ESAs would be marked on the construction contract Plans, and would be called out in the contract Specifications. A letter would be sent to the Resident Engineer’s file, along with a copy of the ESA Action Plan. The Action Plan would identify the individuals involved, and their roles and responsibilities for implementing the plan. The construction contract would also contain language related to unanticipated discoveries should they be made during construction, including diverting activities away from such finds until an archaeologist could assess their nature and significance. If unanticipated discoveries would occur, Section 106 consultation with the SHPO would be reopened, if appropriate.

Caltrans would undertake data recovery excavations to salvage data from those portions of CA-SDI-12670 and CA-SDI-17928 to be impacted. Native American monitors would be present during excavations. The collections would be handled in accordance with professional archaeological standards and only qualified
personnel would be utilized. The archaeological materials would be analyzed using a variety of specialists and techniques, and then reported upon in final data recovery reports. The artifacts would then be curated in perpetuity at the San Diego Archaeological Center, located in the San Pasqual Valley. The reports would be properly disseminated to local, regional, and state repositories. Information gained from the data recoveries would also be incorporated in an interpretive public display proposed for the San Elijo Scenic Overlook. The overlook would teach passersby about Native American regional culture and why Caltrans considers impacts to cultural resources as part of the environmental process it follows. If cultural materials are discovered during construction, all earth-moving activity within and around the immediate discovery area would be diverted until a qualified archaeologist can assess the nature and significance of the find. If unanticipated human remains are discovered, State Health and Safety Code Section 7050.5 states that further disturbances and activities would cease in any area or nearby area suspected to overlie remains, and the County Coroner would be contacted. Pursuant to Public Resources Code Section 5097.98, if the remains are thought to be Native American, the Coroner would notify the Native American Heritage Commission (NAHC), who would then notify the Most Likely Descendant (MLD). At the same time, the person who discovered the remains would contact the District 11 Chief of the Environmental Resources Branch so that they could work with the MLD on the respectful treatment and disposition of the remains. Further provisions of PRC 5097.98 would be followed, as applicable.

Built Environment Resources
For the two NRHP/CRHR eligible historic properties identified within the Built Environment APE, 510-514 La Costa Avenue and 767 Orpheus Avenue, project design changes were made that avoided adverse effects to the resources by reducing impacts to an absolute minimum. Therefore no mitigation measures are required.

Hydrology and Floodplains
The proposed project has been designed to minimize impacts, where possible, by taking the reduced amounts of right-of-way and limiting the grading footprint in order to minimize impacts to existing structures while still meeting project objectives. Specifically, the structures over Los Peñasquitos Creek were designed to entirely span the floodplain. The replacement of the Sorrento Valley Road Culvert would remove an existing constriction point in the Carmel Valley Creek and lower the base floodplain. Also, the replacement of the Batiquitos Lagoon Bridge would reduce an existing constriction point in the lagoon and lower the base floodplain. In addition, standard engineering practices would be used, where feasible, to facilitate drainage. Minimization measures for Floodplain impacts include:

- Limiting the area affected by construction with utilization of barrier or fences to protect sensitive areas
- Employing Best Management Practices (BMPs) to control erosion and runoff
- Designating Environmentally Sensitive Areas in order to demarcate and protect Floodplain habitats

Implementation of the No Build Alternative would not result in changes to the floodplain patterns, natural and beneficial floodplain values.

Water Quality
BMPs would be implemented to address potential water quality impacts during the planning and design, construction, and operational (maintenance) stages. The Statewide Storm Water Management Plan (SWMP) describes how Caltrans would comply with the provisions of the NPDES Permit (Order 99-06-DWQ). The SWMP describes the program that Caltrans would implement to reduce the discharge of pollutants to the storm water drainage systems that serve the highway and highway-related properties, facilities and activities. The SWMP divides the BMPs into separate categories from the planning and design phase to the operational (maintenance) phase.

Short term potential impacts to water quality during the construction phase are prevented/minimized through the use of Construction Site BMPs while the long term potential impacts during the facility operation and maintenance are prevented/minimized through the use of Design Pollution Prevention BMPs, Treatment BMPs and Maintenance BMPs.

Minimization measures would be implemented during construction at crossings over six designated “navigable” waterways. Minimization measures at waterways can typically be, but not limited to: flagging the perimeter of the proposed impact area to restrict access; training all contractors and construction personnel on sensitive resources, such as navigable vessel use; scheduling construction outside of breeding season or conducting pre-construction surveys for presence/absence of sensitive species; restricting equipment, material storage and staging to disturbed areas; designing project to avoid/reduce stormwater impacts where feasible, otherwise, control sediment with silt fencing, gravel bags, hay bales and fiber rolls; controlling of fugitive dust, restriction changing oil and/or refueling to designated areas, constructing velocity dissipation structures at drainage outlets; during night time construction, all lighting shall be directed to the construction area; temporary diversion of water around the work area by use of sandbags or gravel dams, or cofferdams.

Geology / Soils / Seismic / Topography
- For preliminary design purposes, soils at all the lagoons and river valleys would be assumed to be predisposed to liquefaction.
- The use of large retaining structures to accommodate embankment widening over the lagoons should be avoided.

Surface and Subsurface Drainage
- Drainage for proposed improvements would be constructed in accordance with Caltrans Highway Design Manual.
- Impacts to water quality would be minimized by directing surface runoff away from the top of slopes, and also by not allowing runoff to discharge over the top of slopes.
- Surface water would be conveyed offside by appropriate erosion-reducing devices.
- Where groundwater is present, subsurface drainage devices would be installed.
Minimization of Embankment Settlement

- Settlement waiting periods would be employed at all soft soil locations before establishment of the final grade.

Construction Monitoring and Instrumentation

- Caltrans personnel would be present during project construction to observe all cuts, foundation subgrade, and embankment subgrade to assure that all provisions are enforced. If unanticipated subsurface conditions are encountered, a geotechnical representative would be notified to make additional recommendations to the Resident Engineer, who in turn, would direct the contractor. Instrumentation for measuring settlement or slope distress, and periodic surveying for ground movement would be included during construction in areas where the potential for ground movement or failure exists.
- Grading and roadway work would be performed in accordance with Caltrans Standard Plans and Specifications.
- To avoid surface erosion, which may supply an unacceptable sediment load to the watershed, temporary slopes would not be left unprotected throughout the wet season.
- Concentrated flows would not be allowed on slopes.
- Appropriate construction scheduling, soil trackifiers, geosynthetic mats, and plastic sheeting are some of the techniques that may be used to avert excessive soil erosion.

Paleontology

Paleontological mitigation would be carried out primarily during the project's construction phase. The mitigation program would consist of: Monitoring, fossil salvage, macrofossil and microfossil analysis, fossil preparation, report preparation, and curation.

Hazardous Waste / Materials

Designs of the alternatives for the proposed project are a result of extensive research, technical analysis, and community input. The amount of right-of-way required for each alternative is the minimum amount of land required to fulfill the purpose and need of the project as well as meet operational requirements of the roadway. Wherever possible, the proposed project alternatives follow the existing I-5 alignment to avoid and/or minimize impacts from hazards and hazardous materials. In particular, avoidance of the gasoline stations and soil excavation at Manchester Avenue, Birmingham Drive, Palomar Airport Road, Tamarack Avenue, and avoidance at Carlsbad Village Drive would be considered. Agricultural land and nurseries soil may require reuse, or proper offsite disposal with further testing at Manchester Avenue, between Birmingham Drive and Palomar Airport Road, Cannon Road. Soils from landfills near Pirateus Street may be reused, or disposed as non-hazardous material at the appropriate landfill location; however, Maxson Street would be avoided. Further hazardous waste investigation may be necessary on individual parcels to be acquired. Therefore, Environmental Engineering staff shall be kept informed of parcel takes and changes in scope or design. Since there are chemical constituents present in soil and groundwater within the I-5 corridor, soil excavation activities shall be performed under the guidelines of a site-specific Soil Management Plan and Health and Safety Plan.

In addition, the DTSC lead variance would be followed for ADL soil excavated in the median. Soil in the median along I-5 to a depth of 0.6 m (2 ft) is hazardous with regard to soluble ADL concentrations. This soil may be reused onsite in accordance with a DTSC lead variance issued to Caltrans. If this criterion cannot be met, then disposal of ADL soil would be a necessary at a Class I landfill. Soil excavated as a whole along the shoulders may be reused/ as clean material with regard to ADL, unless soil adjacent to the shoulder is segregated from the whole. The DTSC lead variance will apply for segregated soil from the shoulder. Measures for groundwater impacts to service stations would be contained in the NPDES permit. However, if soil from abutment excavations at Via de la Valle, Birmingham Drive, Brooks Street, Palomar Airport Road, Carlsbad Village Drive, and Mission Avenue would be exported, the soil may require further characterization for petroleum hydrocarbons, volatile organic compounds, or semi-volatile organic compounds to evaluate the proper disposal method. Investigation near the Olympus and Maxson Street Landfill did not encounter wastes associated with the landfill. It is recommended that widening activities in the vicinity of the landfills be performed to the west, avoiding the landfills. If parcels were acquired at these landfill locations, excavated soil would require further characterization to evaluate the proper disposal method. If soil from locations containing farmland and nurseries is exported, further characterization for pesticide/herbicides would be warranted to evaluate the proper disposal method. Chemical spills along I-5 would be unknown, a contingency of would be written into the construction contract to deal with this potential hazardous waste issue. Proper handling and disposal measures would be carried out for asbestos, lead, and treated wood wastes.

Air Quality

For temporary construction impacts, the following measures would be incorporated into the project to minimize the emission of fugitive dust, PM$_{10}$, and PM$_{2.5}$ during construction:

San Diego Air Pollution Control District (SDAPCD) Rule 51

- Minimize land disturbance
- Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas
- Suspend grading and earth moving when wind gusts exceed 25 mph unless the soil is wet enough to prevent dust plumes
- Cover trucks when hauling dirt
- Stabilize the surface of dirt piles if not removed immediately
- Limit vehicular paths on unpaved surfaces and stabilize any temporary roads
- Minimize unnecessary vehicular and machinery activities
- Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway
- Revegetate disturbed land, including vehicular paths created during construction to avoid future off-road vehicular activities
- Remove unused material
Additionally, the following measure would be incorporated into the project to minimize exposure to diesel particulate emissions.

**Caltrans Specification Section 10: Dust Control**

- Locate construction equipment and truck staging and maintenance areas as far as feasible and nominally downwind of schools, active recreation areas, and other areas of high population density.
- Diesel particulate emissions are of concern, as described above. While there is no formal guidance for impact analysis, potential adverse impacts would be increased if construction equipment and truck staging areas were to be located near schools, active recreation areas, or areas of higher population density.

Thus, a measure to reduce this potential impact has been identified in SDAPCD Rule 51 and Caltrans Specification Section 10: Dust Control.

**Construction**

Air Quality measures to minimize emissions for construction include:

- Maintain equipment in tune per manufacturer’s specifications.
- Retard diesel engine injection timing by two to four degrees unless not recommended by manufacturer (due to lower emission output in-place).
- Use reformulated, low-emission diesel fuel.
- Use catalytic converters on gasoline-powered equipment.
- Do not leave inactive construction equipment idling for prolonged periods.

**Noise Barriers**

Noise barriers are proposed for several locations along the corridor as described in Section 3.15 and the recommended soundwall are listed in Table S.3 below. Retaining walls would be utilized in numerous locations throughout the corridor to reduce property acquisition impacts, to stabilize slopes, to minimize biological impacts, and to accommodate engineering structures. Locations of retaining walls and noise barriers can be found on the project features maps, Figures 2-2.14 a-ao. The length, height, and location of noise barriers are subject to change during final design. The data presented reflects engineering data and reasonableness allowances for abatement at the time of the draft environmental document. If parameters change during final project design, such as vertical and/or horizontal alignment or an increase in reasonableness allowance, the proposed preliminary noise abatement may also change. That is, abatement features, such as berms or walls, could be added or deleted based on final project design and changes in the dollar amount of the reasonableness allowance.

A severe noise impact is considered to occur when predicted exterior noise levels equal or exceed 75 dBA-Leq(h) or are 30 dB or more above existing noise levels. Such measures are considered “unusual and extraordinary” abatement measures and may include measures such as constructing noise barriers that have an estimated construction cost that exceeds the reasonableness allowance or providing interior abatement in residential units. Unusual and extraordinary abatement proposed on a Federal-aid project is subject to approval by FHWA on a case-by-case basis.

</table>
Regionally important mitigation in the I-5 corridor has been discussed with the resource agencies. Large restoration projects have already been completed at Batiquitos and Agua Hedionda Lagoons and a large restoration project is currently underway in San Dieguito Lagoon. San Elijo and Buena Vista Lagoons are the two lagoons within the project limits where large-scale restoration plans are being developed in cooperation with Caltrans, the County, the Cities and resource agencies. Potential mitigation sites are in Table S.4 and the proposed mitigation within each of the watersheds are below.

* Property owners must donate an easement. Please refer to NADR. ** These soundwalls are preliminarily recommended to address severely impacted receptors.

### Energy

Efforts to minimize energy consumption include:
- Public awareness campaigns to encourage carpooling and commuting during non-peak traffic hours
- The recycling of materials
- The use of recycled materials
- The salvage of material such as roadside sign posts, and sign structures, chain link fence fabric, lighting standards, and/or traffic signal standards and appurtenances
- The use of energy-efficient construction and maintenance vehicles

### Mitigation Measures for Biological Resources

Opportunities for compensatory mitigation have been reviewed in all the watersheds along the I-5 corridor. To the extent practicable, some compensatory mitigation would be completed in each watershed; however, there may be more opportunities in some watersheds versus those where extensive restoration projects have already taken place. Coastal sage scrub (CSS) occupied by California gnatcatcher would be a priority for acquisition and restoration. Coastal lagoon habitats are also a focus for wetland mitigation.
Caltrans, in cooperation with the San Dieguito River Valley Joint Powers Authority, is proposing to implement creation of approximately 17 ha (42 ac) of coastal salt marsh adjacent to the SCE restoration project in San Dieguito Lagoon. In addition to the 17 ha (42 ac) of coastal salt marsh created, approximately 7 ha (17.2 ac) of upland habitat would be created along the berms around the wetland and in a native grassland floodplain area adjacent to the wetland. Approximately 1.1 ha (2.73 ac) of the created coastal salt marsh habitat would be used by the JPA for mitigating impacts from their trail system and treatment wetlands. The remainder of the created coastal salt marsh and upland habitat would be used as mitigation for the I-5 North Coast Corridor Project. The proposed plan has already been reviewed and found to be hydraulically compatible with the larger restoration project in San Dieguito Lagoon.

Caltrans, the City of Del Mar, and the San Dieguito River Valley Land Conservancy (SDRVLC) either own or are attempting to purchase several small parcels of land along Racetrack View Drive and the San Dieguito River. These parcels are currently located on fill vegetated with ice plant with salt marsh habitat. The property would be turned over to the SDRVLC for management in perpetuity. Caltrans would then create saltmarsh habitat on the approximately 0.8 ha (2 ac) of fill habitat. The property would be turned over to the SDRVLC for management in perpetuity.

In addition, Caltrans is currently in negotiations to purchase approximately 9.3 ha (23.1 ac) of former tomato fields immediately east of I-5 and south of San Dieguito Lagoon. The area is currently vegetated with weedy species and some coyote bush (Baccharis pilularis). Approximately 2.0 ha (5 ac) of this parcel is proposed for a detention basin or water quality treatment area and the remaining 7.3 ha (18.1 ac) would be used to create southern maritime chaparral and CSS.

San Elijo Lagoon. Currently, Caltrans, the City of Encinitas, ACOE, USFWS, CDFG, County of San Diego, and the San Elijo Lagoon Conservancy are coordinating efforts to prepare a draft EIR for restoration of the lagoon. This would include restoration of the hydrologic regime and the marsh habitat, and conversion from mudflats and low marsh habitat to middle and high marsh habitat.

Caltrans is also proposing out-of-kind mitigation, such as relocating the lagoon inlet at Coast Highway 101, to better facilitate tidal flow. This restoration project also proposes to enhance all lagoon functions and increase tidal muting effects. Caltrans has already funded hydraulic studies to facilitate the development of the restoration documents. This proposed restoration project would also enhance coastal lagoon habitat, in particular mudflats, which are relatively rare within the region. In addition, upland slopes around the proposed DAR at Manchester would be planted with CSS habitat to mitigate for upland impacts.

Cottonwood Creek. There is a small creek that flows intermittently above and below ground through Encinitas. Cottonwood Creek Park was opened in 2004 west of I-5, which included restoring the creek to an above ground naturalized channel between I-5 and the ocean. Moonlight Creek is an additional small tributary that primarily carries urban runoff from both sides of the freeway parallel to I-5, immediately west of I-5 and enters Cottonwood Creek at the park. There is some riparian habitat along this drainage, but the habitat is also disturbed with invasive and ornamental species. This creek could be restored, as could the slopes, which are a mixture of disturbed CSS and ornamental plants. In addition to creating a trail, approximately 1.4 ha (3.5 ac) of riparian habitat and 2.0 ha (5.0 ac) of CSS could be restored in this area.

Batiquitos Lagoon. A large restoration project was completed in Batiquitos Lagoon in the 1990s by the Port of Los Angeles/Long Beach to mitigate for impacts to marine habitat. Maintenance dredging and monitoring of created least tern nesting sites were part of the restoration. No large-scale mitigation opportunities have been identified at this lagoon, but several parcels for preservation of upland CSS have been identified, and some small parcels along the edge of the lagoon have been identified for purchase and preservation as permanent open space.

Encina Creek. Encina Creek is a small, constricted creek with no lagoon at the outfall to the ocean. The creek flows through culverts under I-5 and through the Encina Sewer Treatment Plant west of I-5. Immediately east of I-5 the creek is heavily disturbed with invasive plant species, trash, and poor water quality. Upstream of I-5 several mitigation projects have been completed. Caltrans would pursue additional opportunities to remove exotic species and restore habitat throughout Encina Creek.

Agua Hedionda Lagoon. A large dredging project was completed in 1998/1999 that created an average depth of 2.4 to 3.4 m (8 to 11 ft), and extensive eelgrass planting was completed in the dredged areas. This lagoon is primarily a deepwater lagoon with little fringing wetland habitat. Agua Hedionda was the location of a large project to eradicate Caulerpa toxic algae that was first discovered in 2002. It was thought to be eradicated in 2006; however, monitoring continues.

Caltrans has identified two areas for purchase on the eastern side of the lagoon. These properties are a combination of disturbed CSS, salt marsh, and disturbed habitat along the northern shore of the eastern basin. Approximately 8.5 ha (21.1 ac) of habitat have been identified for acquisition. Mitigation on this site would be...
Summary

Loma Alta Creek. Loma Alta Creek is a highly disturbed and constricted creek that flows parallel to Oceanside Boulevard in a developed portion of Oceanside. West of I-5 the creek is channelized where it flows through a trailer park to an industrial area. The portion through the trailer park is within a concrete channel with limited potential for restoration. However, west of the trailer park the creek is in an earthen channel surrounded by industrial businesses. There may be an opportunity in this portion of the creek to enhance the wetland habitat and water quality before the water empties into the Pacific Ocean.

San Luis Rey River. The San Luis Rey River near I-5 is a large open water channel with primarily freshwater marsh and arundo scrub along the banks. Two projects proposed for the area, Coast Highway Seismic Retrofit and the Pacific Street Bridge have already proposed restoration of wetlands along the banks of the river through the removal of exotic species and revegetation with natives. Mitigation for impacts at the San Luis Rey River would be completed by debiting credits from the Pilgrim Creek Mitigation Bank.

For the proposed I-5 NCC Project, compensatory mitigation for upland habitats would likely encompass creation of a mix of new CSS habitat and purchase of parcels of high quality habitat near the lagoons for preservation. Several parcels have been identified around the lagoons for potential purchase for upland mitigation. All of the mitigation ratios and potential options would continue to be discussed with the resource agencies to determine the most appropriate selection of options to mitigate impacts from this project.

Natural Communities

Permanent impacts to CSS have been minimized where possible along the right-of-way by construction of retaining walls and minimizing the grading behind the walls. There may be temporary impacts due to construction access in these areas; however, the CSS would be restored when construction is completed.

Due to the fact that I-5 already crosses six coastal lagoons, wetland impacts could not be completely avoided. Several design alternatives were examined to minimize fill placed in the lagoons, including using retaining walls and steeper fills than 2:1. However, due to liquefaction of soils in the lagoons and the need for very deep footings, retaining walls were impractical. The sandy soils within the vicinity of the lagoons would not support steeper fill slopes. Although impacts to the lagoons cannot be avoided, there are ongoing studies of the hydrology in the lagoons and methods to enhance water flow under the bridges that would be used during the bridge design.

The following conservation measures are proposed for the project during construction to minimize impacts to sensitive communities.

- All native habitats outside the permanent and temporary construction limits would be designated as Environmentally Sensitive Areas (ESA) on project maps. ESAs shall be temporarily fenced during construction with orange plastic snow fence. No access would be allowed within the ESAs.

Wetlands and Other Waters

Impacts to wetlands have been minimized to the extent practicable. All impacts to wetlands could not be avoided due to the existing alignment crossing six lagoons and a river. The following conservation measures are proposed to minimize impacts to wetlands.

- All debris from the replacement of old bridges or construction of new bridges would be contained, so that it does not fall into rivers and lagoons.
- Appropriate best management practices (BMP) would be used to control erosion and sedimentation. No sediment or debris would be allowed to enter the creeks, rivers, or lagoons.
- Bioswales and detention basins would be placed throughout the project limits to filter runoff prior to reaching wetlands and other waters of the U.S.
- Fueling of construction equipment would occur at a designated area at a distance greater than 30 m (98.4 ft) from drainages/lagoons, and associated plant communities to preclude adverse water quality impacts. Fuel cans and fueling of equipment would take place outside the drainages.
- Studies underway to determine if water flow under lagoon bridges could be enhanced with design changes to the bridges.

Plant Species

Seed would be collected or plants would be salvaged to the extent practicable in the impact areas. Salvaged plants and seed would be planted in mitigation sites, on revegetated new slopes, or in revegetated areas that were temporarily impacted.
**Animal Species**

To minimize impacts to nesting migratory bird species, all native vegetation and nonnative shrubs and trees within the impact areas would be removed outside of the breeding season (February 15 to August 31), if possible. Otherwise, a qualified biologist would thoroughly survey all vegetation prior to removal to ensure there are no nesting birds onsite. If nesting birds are identified onsite, vegetation removal would be delayed until the chicks have fledged or the nest has failed.

The lagoons are important stop over, resting, and foraging habitats for birds migrating along the Pacific flyway. To minimize impacts to migratory birds, construction would not occur in more than two lagoons at any one time.

Exclusion devices would be installed on bridge drain holes and ledges during the non-breeding season (September 1 through February 15) to stop swallows, swifts, and any other birds or bats from nesting on or within bridges to be demolished.

Measures listed under natural communities and wetlands and other waters of the U.S. concerning minimizing sediment entering the lagoon and habitat protection would minimize affects to Essential Fish Habitat (EFH).

**Threatened and Endangered Species**

Locations of the endangered Del Mar manzanita have been identified and avoided to the maximum extent practicable. Some of the Del Mar manzanita individuals are growing immediately adjacent to brow ditches that would require reconstruction for proper slope drainage and in those areas the plants could not be avoided. These plants would likely be salvaged and placed in a compensatory mitigation site for the project.

Caltrans is working currently with the groups planning restoration of San Elijo Lagoon and Buena Vista Lagoon to incorporate the needs of that restoration into our bridge design. This could result in longer bridges over these lagoons; however, these studies are not yet completed. Therefore, the current bridge lengths and worse case impacts are examined in this document.

The following are proposed measures to minimize impacts to threatened and endangered species during construction.

- A channel large enough for fish movement would be kept open throughout construction within the San Luis Rey River and all of the lagoons.
- Measures to minimize potential adverse effects of pile driving on fish species would be negotiated with NOAA Fisheries and CDFG.
- All pile driving near the lagoons would be completed outside the bird breeding season (February 15-August 31) to minimize construction noise impacts to bird species around the lagoons.
- A qualified biologist would review grading plans, address protection of sensitive biological resources, and monitor ongoing work both pre-construction and construction phases. The biologist shall be familiar with the habitats, plants, and wildlife of the Project area, and maintain communications with the resident engineer, to ensure that issues relating to biological resources are appropriately and lawfully managed.
- Detention basins would be placed in many of the loop ramps, and bioswales would be placed on many of the slopes to treat runoff from the freeway.
- Lighting used at night for construction would be shielded away from ESAs.
- Dust generated by proposed operations would be controlled with BMPs.

**Invasive Species**

The construction of any of the build alternatives provides an opportunity to control some of the invasive species on the slopes of the project. Through careful handling of the soil and equipment that works the soil, the invasive plants currently within the impact area can be removed. Revegetation of the slopes would require maintenance to keep the weed species from reinvading the new slopes. Partnerships would be required with the lagoon foundations and landowners to simultaneously work to eradicate similar invasive species outside of the impact areas.

There are several invasive weed species already growing within the right-of-way along I-5. Special care would be taken when transporting, use and disposing of soils with invasive weed seeds. All heavy equipment would be washed and cleaned of debris prior to entering a lagoon area, to minimize spread of invasive weeds.

Bioswales and detention basins would be planted with appropriate native species as determined by the biologist and storm water personnel. Slopes adjacent to developed urban areas would be vegetated with native and drought tolerant non-invasive species selected by the biologist and landscape architect. Interchanges located in urban areas would be landscaped with native or ornamental non-invasive species.

**S.8 Other Projects and Considerations**

**LOSSAN**

Los Angeles – San Diego (LOSSAN) rail corridor connects major metropolitan areas of Southern California and serves some of the most populous areas of the state, and runs through three counties: Los Angeles, Orange, and San Diego. It is the second busiest intercity rail. The corridor houses Amtrak’s Pacific Surfliner service, Metrolink, Coaster commuter rail services, as well as, the Burlington North Santa Fe (BNSF) and Union Pacific (UP), which provide freight service on the corridor, predominantly from the Ports of Los Angeles and Long Beach. A Record of Decision (ROD) was issued March 18, 2009 and the Final Program EIR/EIS was released in September 2007. The purpose was to establish a program of projects for the long-term improvement of the rail corridor needed to support existing and proposed levels of rail service, which includes intercity passenger rail, commuter rail, and freight/goods movement. Collectively, they lay out a vision for the phased enhancement of this heavily-used rail corridor. Moreover, the efficiencies as a result of
rail improvements carry over to all users of the rail corridor, and benefit commuter rail and freight services as well, making them even more cost-effective. Rail improvement projects are in various stages of development from preliminary engineering and environmental review to pre-final design.

**Del Mar Fairgrounds**
The 2008 Master Plan for the Del Mar Fairgrounds and Horsepark includes both immediate proposed projects as well as conceptual, long-term projects for a period of 25 years. The immediate proposed projects would provide maintenance and improvement to the current Fairgrounds facilities, including renovation and modernization of several structures and parking areas, construction of new structures, demolition of structures, and relocation of a maintenance yard and fire station. The long-term projects are conceptual and would provide for the maintenance of existing facilities as well as construction of new structures and trails. The long-term projects would require additional planning in the future to define precise building parameters and may require additional environmental analysis. Future projects for the Horsepark remain conceptual in nature and therefore would be subject to further evaluation at a later date and would not be addressed in the 2008 Master Plan EIR.

The Del Mar Fairgrounds is an approximately 137.6-ha (340-ac) Fairgrounds and Racetrack facility (Fairgrounds) located in the Cities of Del Mar and San Diego in San Diego County that includes a 26.3-ha (65-ac) equestrian facility (Horsepark). There is also an off-site property, not owned by the 22nd District Agricultural Association (22nd DAA) located at the corner of Jimmy Durante Boulevard and San Dieguito Drive. The Horserace is located approximately 2.4 km (1.5 miles) east of the Fairgrounds in the San Dieguito River Valley at Via de la Valle and El Camino Real.

In late 2009, a draft EIR for Del Mar Fairgrounds was circulated. The potential for traffic impacts at Via de la Valle was identified.

**Carlsbad Energy Center**
The Carlsbad Energy Center Project would be a 558 megawatt (MW) gross combined-cycle generating facility configured using two units with one natural-gas-fired combustion turbine and one steam turbine per unit to meet the electrical resource needs as defined by San Diego Gas and Electric (SDG&E). Application for Certification was filed with the California Energy Commission and was accepted as complete on October 31, 2007. This would provide rapid response to demand helping to support local use and overall system reliability. Carlsbad Energy Center LLC, an indirect wholly owned subsidiary of NRG Energy, Inc. proposes to develop a natural gas-fired generating facility in the City of Carlsbad in San Diego County, California. This would reconfigure approximately 9.3 ha (23 ac) of existing land zoned for public utilities at the Encina Power Station in the City of Carlsbad. The goal is to bring this facility online by summer 2013.

As part of the Carlsbad Project, existing steam boiler Units 1, 2, and 3 at the Encina Power Station would be retired. The retirements would occur upon the successful commercial operations of the new Carlsbad Project generating units. The retirements would create substantial environmental benefits, including permanent air emission reductions from the boiler units; elimination of the 851.7 million liters (225 million gallons) per day of cooling water (seawater) intake capacity for Units 1-3 and the resulting decrease in impingement and entrainment of marine organisms attributed to those unit's cooling water flow; cessation of discharge of wastewaters to the Pacific Ocean from Units 1-3; and elimination of the use of potable water attributed to the existing operation of Units 1-3.

The Carlsbad Desalination Project by Poseidon
The Carlsbad desalination Project would provide San Diego County with a locally-controlled 189.2 million liters (50 million gallons) per day (6907.5 ha-m per year [56,000 ac-ft per year]) seawater desalination plant and associated water delivery pipelines of high-quality water that meets or exceeds all state and federal drinking water standards. The project is located at the Encina Power Station in the City of Carlsbad. The desalination plant is a 1.62-ha (4-ac) parcel in a portion of the site. Public water agencies serving the cities of Carlsbad, Oceanside, San Marcos, San Diego, Encinitas, Solana Beach, Rancho Santa Fe, Escondido, Chula Vista, National City and the unincorporated communities of Rainbow, Bonsall and Fallbrook would be the direct beneficiaries of a new, affordable and reliable water supply developed at no expense to the region’s taxpayers.
Chapter 1 - Proposed Project

1.1 Introduction

The California Department of Transportation (Caltrans) and the Federal Highway Administration (FHWA) propose improvements to maintain or improve the existing and future traffic operations on the existing Interstate 5 (I-5) freeway from La Jolla Village Drive in San Diego to Harbor Drive in Oceanside/Camp Pendleton, extending approximately 43.4 kilometers (km) (27 miles [mi]) from kilopost (KP) R45.7 to KP R89.1 (post mile [PM] R28.4 to PM R55.4) on I-5. Figure 1-1.1 shows the limits of the proposed project.

The I-5 North Coast Corridor (NCC) Project sponsors include FHWA, Caltrans and the San Diego Association of Governments (SANDAG). The proposed project improvements include one or two High Occupancy Vehicle (HOV) / Managed Lanes (ML) in each direction, auxiliary lanes where needed, and possibly one general-purpose lane in each direction. The HOV/Managed Lanes would be available for carpools, vanpools, busses at no cost and be available to single-occupant vehicles for a fee when there is excess capacity. The proposed build alternatives and the no build alternative are presented and discussed in this Draft Environmental Impact Report / Environmental Impact Statement (EIR/EIS), which has been prepared pursuant to the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) and would be used for project compliance with state and federal laws and regulations.

This project is included in the 2007 Federal Statewide Transportation Improvement Program (FSTIP) and is proposed for funding from the Capital Improvements Program. It is also included in the SANDAG Regional Transportation Plan (RTP) and the 2008 Regional Transportation Improvement Program (RTIP).

1.2 PURPOSE FOR THE PROJECT

Overall Project Purpose Statement:
To maintain or improve the existing and future traffic operations in the I-5 north coastal corridor in order to improve the safe and efficient regional movement of people and goods for the planning design year of 2030.

The objectives of project are to:

- Maintain or improve future traffic levels of service in 2030 compared to existing levels of service;
- Maintain or improve travel times within the corridor;
- Provide a facility that is compatible with future bus rapid transit and other modal options;
- Provide consistency with the regional transportation plan, San Diego Regional Transportation Plan: Pathways for the Future (2030 RTP) where feasible and in compliance with federal and state regulations;
- Maintain the facility as an effective link in the national Strategic Highway Network; and
- Protect and/or enhance the human and natural environment along the I-5 corridor.

Figure 1-1.1: Project Location Map
1.3 Need for the Project

1.3.1 Existing Circulation System and Infrastructure Constraints

The cities of San Diego, Del Mar, Solana Beach, Encinitas, Carlsbad and Oceanside maintain beach identities. I-5 was constructed through these communities in the mid 1960s and early 1970s resulting in expansion and new development to the east of I-5 and tending to separate the original communities from the new developed areas. Today, I-5 is the main north-south coastal corridor connecting San Diego County and Mexico with Orange County, the Los Angeles Metropolitan area, and beyond to the Canadian border. The development of additional highway transportation infrastructure in the North County coastal area is severely limited by existing circulation systems and residential/commercial development, geographical and environmental constraints. These constraints have resulted in a mode split where travel on I-5 facilitates over two-thirds of the daily trips in the North Coast Corridor.

The proposed project area is situated within the unique coastal geography of Southern California, where urbanized land uses and natural environment combine. This area of I-5 parallels the Pacific coastline to the west and the coastal ranges to the east, as it traverses the rolling terrain, urbanized land uses, canyon topography, and numerous water resources running from the coastal ranges to the Pacific Ocean. I-5 crosses (or is adjacent to) residential, commercial, and industrial urbanized uses that have developed directly up to Caltrans’ right-of-way. I-5 also crosses six lagoons and several rivers and creeks, which are major natural and visual resources. There are also directly along I-5 many locations of critical habitat and/or locations that serve as designated wildlife corridors for numerous plant and animal species that are protected by state and/or federal laws.

The existing physical and environmental constraints have contributed to the development of a transportation infrastructure system within the North Coast area. The north-south highway alternative to I-5 is I-15, which is located an average of 16 kilometers (10 miles) to the east. Highway access to I-15 is limited to three east-west highways in the north part of the county: State Routes (SR) 56, 78 and 76. On I-5, SR-56 and SR-78 are separated by a distance of 29 kilometers (18 miles), with Del Dios Highway being the only viable east-west arterial alternative.

The primary north-south arterial alternatives to I-5 are El Camino Real and County Route S21 (“Coast Highway”). Route S21 is a four-lane road running along the coast serving the established coastal communities within Del Mar, Solana Beach, Carlsbad and Oceanside. This 39 kilometer (24 mile) arterial traverses many of the same water resources in the project area and runs adjacent to existing rail right-of-way.

El Camino Real is a major 26 kilometer (16 mile) arterial located one to three miles east of I-5. El Camino Real runs through the newer, developing inland areas of the communities of Encinitas, Carlsbad and Oceanside. El Camino Real is incomplete across the San Elizio Lagoon into Solana Beach. The southern segment of El Camino Real serves the communities of Lomas Santa Fe, Rancho Santa Fe, and Carmel Valley in the City of San Diego.

The San Diego Northern Railway is the primary railroad in San Diego County, facilitating intercity passenger rail (Amtrak), peak period commuter rail (Coaster) and freight rail (BN&S) services. The railroad is mainly single-tracked within the project area, constrained by surrounding urbanized land uses and Route S21.

Major Arterials

- Route S21, also known as Coast Highway (Oceanside), Carlsbad Boulevard (Carlsbad), Highway 101/First Street (Encinitas), South Highway 101 (Solana Beach), Camino del Mar (Del Mar), and Pacific Highway (San Diego) parallels I-5 about 0.8 km (0.5 mi) to the west traversing many of the same water resources in the project area. This is a primarily north-south arterial that generally is a four-lane road running along the coast serving the established coastal communities within Del Mar, Solana Beach, Carlsbad and Oceanside. Congestion on I-5 generally spills over onto S21 creating congestion as drivers seek an alternate coastal route.

- El Camino Real is an additional north-south arterial located 1 to 5 km (1 to 3 mi) east of I-5, which runs through the newer, developing inland areas of the communities of Encinitas, Carlsbad and Oceanside. El Camino Real becomes disjointed between the cities of Encinitas and Solana Beach as the southern segment curves around the San Elizio Lagoon, through the community of Rancho Santa Fe. El Camino Real continues through Solana Beach and the community of Carmel Valley in the City of San Diego. There is extensive commercial development in the vicinity of El Camino Real interchanges at SR-76, SR-78 and SR-56. El Camino Real becomes congested during peak traffic hours as drivers seek an alternate parallel route to I-5.

Interstate Highway

- The north-south highway alternative to I-5 is I-15, which parallels I-5 to the east. The distance between the two interstates range from 0 km south of I-8 to about 45 km (28 mi) at the Orange County line with an average of 16 km (10 mi). I-15 is not a feasible alternative route due to distance, away from I-5 and congestion during peak traffic hours.

State Highways

- SR-78 is a four-lane west to east freeway from I-5 east to North Santa Fe Avenue, and a four-lane conventional highway to Jeffries Ranch Road before tying into the existing two-lane highway roadway winding past east to I-15 and beyond. SR-76 is located approximately 5 km (3 mi) north of SR-78. It listed on the California State Scenic Highway System and is an east-west corridor between the communities of western Riverside County and the work and recreational areas of north coastal San Diego County.

- SR-78 is the principal east-west arterial for northern San Diego County linking I-5 with I-15 to the east. There is extensive commercial development along SR-78.

- SR-56 is located 29 km (18 mi) south of SR-78 and is another east-west corridor that connects I-5 with I-15 to the east.
1.3.2 Traffic Demand

Typically regional traffic forecast models are updated every three to four years to reflect such changes in assumptions as future land use, planned infrastructure, and modal mix. Because of the complexity of the I-5 NCC Project, the model used as the basis for the I-5 studies has been updated since traffic studies were initiated. The forecasts presented in this Draft EIR/EIS and the associated technical studies are based on the Region’s Series 10 model, whereas the current model is referred to as Series 11. As the model forecasts forms the basis for the project scope and performance analysis presented in this Draft EIR/EIS, it’s important to establish that the I-5 demand estimates (traffic volumes) are not significantly different between series 10 and series 11.

One of the most meaningful ways of comparing model outputs is to look at screenlines. Screenlines are often used in traffic analyses to determine how much volume is entering or exiting a particular area as they capture all of the traffic that moves across a real or perceived barrier (e.g., a lagoon that has limited crossings). With that in mind, screenlines were developed that captured the regional travel demand patterns within the I-5 north coast corridor. The traffic volumes were compared on these screenlines from both versions of the model for the I-5 No Project Build and I-5 Project Build (10+4) conditions. Overall traffic for all screenlines is within 10 percent. A similar check was done by comparing the forecasted Vehicle Miles Traveled (VMT) in the corridor between each of the models. Similarly, the comparison for the Build scenario shows VMT estimates to be within 10 percent of each other. The comparison of traffic volumes and VMT clearly shows that the differences between the two versions of the model are not materially different.

Annual Average Daily Use

The project area experiences daily recurrent traffic congestion affected by population growth, increased goods movement, and economic growth in the region that is shown by the amount of time required for a vehicle to traverse the distance of the project. The I-5 corridor currently experiences periodic traffic congestion during weekday peak hours. The congestion corresponds with trips to activity centers along the project area. The project area begins south of the University of California San Diego Campus and Scripps Hospital, where institutional uses, employment centers, and public beaches are located. The project area continues north through two more employment centers near Del Mar Heights Road and Palomar Airport Road. Other trip generators in the project area include; town centers, visitor attractions, regional retail, more public beaches, and transit centers. The current amount of vehicles per day near La Jolla Village Drive is 87,200 for northbound and 82,500 for southbound, while near Harbor Drive it is 62,800 for northbound and 60,000 for southbound. In 2030 the amount of vehicles per day increases near La Jolla Village Drive is 111,500 for northbound and 123,150 for southbound; while near Harbor Drive it is 97,600 for northbound and 100,500 for southbound (Figures 1-3.1-a-f).

Periodic traffic congestion would occur in the 10+4 Alternatives and 8+4 Alternatives. The amount of vehicles per day in the 10+4 Alternatives near La Jolla Village Drive is 113,800 for northbound and 126,390 for southbound; while near Harbor Drive it is 105,500 for northbound and 104,700 for southbound. In the 8+4 Alternatives, the amount of vehicles per day near La Jolla Village Drive is 107,200 for northbound and 114,800 for southbound; while near Harbor Drive it is 105,300 for northbound and 105,500 for southbound. (Figures 1-3.2-a-f).

Travel demands on I-5 have grown considerably since the eight-lane facility opened in the late 1960s. There have been minimal improvements to the existing interstate facility since the original construction. Traffic demand has exceeded capacity causing congestion and would continue to do so as regional and interregional growth increase creating even more demand for travel within the corridor.

As represented in Table 1.3.1, historic trends indicate that traffic volumes, represented by Average Daily Traffic (ADT), would continue to increase along the I-5 corridor without a project (No Build). This data was gathered through Performance Measurement Systems (PeMS) a realtime and historical traffic data collection, processing, and analysis tool based on data from the highway’s existing detection systems. The forecasts for increased traffic volumes indicate that improvements to the existing facilities would be needed to maintain or improve highway operations in the future.

</table>

The existing average travel time during off-peak hours and in free-flow conditions to travel the project area in the northbound or southbound direction is about 24 minutes (Table 1.3.2). The existing northbound average AM peak travel time is between approximately 24 and 25 minutes (Table 1.3.2).

The existing southbound average AM peak travel time is between approximately 31 and 44 minutes and the PM peak travel is between approximately 27 and 32 minutes (Table 1.3.3).

By 2030, if no improvements are made, the projected average northbound travel time through the project area during the AM peak hours is between approximately 29 and 37 minutes (Table 1.3.2). It is projected to take between approximately 67 and 69 minutes in the PM peak hours (Table 1.3.2).
By 2030, if no improvements are made, the projected average southbound direction travel time through the project area during the AM peak hours would take between approximately 53 and 54 minutes (Table 1.3.3). It is projected to take between approximately 40 and 48 minutes in the PM peak hours (Table 1.3.3).

Along with increased travel time, forecasts also indicate that the increase in ADT would lengthen the amount of time congestion exists for the corridor in both the northbound and southbound directions, if no improvements are made. Currently, the duration of congestion in the northbound direction is approximately 5 hours in the PM peak hours, and no congestion in the AM peak hours (Table 1.3.4). In the southbound direction the duration of congestion is approximately 5 hours in the AM peak hours, and no congestion in the PM peak hours (Table 1.3.5). By 2030, it is forecasted that the duration of congestion in the northbound direction would be approximately 3.5 hours in the AM peak hours, and 6 hours in the PM peak hours (Table 1.3.4) if no improvements are made. In 2030, the duration of congestion in the southbound direction is forecasted to be approximately 6 hours in the AM peak hours, and 7 hours in the PM peak hours (Table 1.3.5) if no improvements are made.

* Congestion would continue through the AM and PM hours.

**Weekend Use**

There is an influx of midday traffic on weekends. Average travel times on Saturday and Sunday using recent 2003-2006 average travel times on the I-5 within the project area revealed that the weekend does not contain a morning time peak period. This lack of a peak period can be attributed to the majority of people having weekends free from work and businesses operating on different schedules that are open during the weekends. However, there is a notable travel trend on Saturday in the southbound direction and on Sunday in the northbound direction. There is an increase travel time period from 9:00 am to 8:00 pm and on Sunday the increased travel time period is from 1:00 pm to 8:00 pm. Saturday southbound peak average travel time occurs between 12:00 pm and 1:00 pm, while Sunday northbound average peak travel time occurs between 5:00 pm and 6:00 pm. In the southbound direction, there is a consistent peak, between 26 and 30 minutes, for most of the daytime suggesting a constant, all day flow of traffic with a slight reduction in travel time the peak average travel time is 35 minutes. In the northbound direction, the peak average travel time was 28 minutes.

**HOV Use**

During weekday peak periods, approximately 13 percent of the vehicles within the project limits are HOVs with two or more occupants. There is a directional tendency to the HOV demand volume between the northbound and southbound directions. The demand volume in the northbound direction is higher during the PM peak hour and lower during the AM peak hour. In contrast, the demand volume in the southbound direction is lower during the PM peak hour and higher during the AM peak hour. The HOV percentages are typically higher (13-23 percent) during the midday and the off-peak periods. (Source: San Diego Regional...
Vehicle Occupancy and Classification Study – 2000 [Revised June 2002], SANDAG, June 2002). This percentage is anticipated to increase approximately 2-7 percent by 2030.

On the weekends, I-5 serves a variety of local, regional and interregional, as well as, tourist and seasonal/event-generated trips. During weekend peak periods, approximately 60 percent of the vehicles within the project limits are HOV. The percentages of those vehicles are typically higher, 55-65 percent, during peak travel times mid-day southbound on Saturday, and northbound on Sunday (Tables 1.3.6 and 1.3.7).

Weaving Analysis

One source of vehicle conflict occurs where vehicles are required to change one or more lanes creating a "weaving section." This can contribute to bottlenecks, ramp queues, and reduction in travel time for general-purpose lanes. This occurs most frequently at closely spaced interchanges, ramps, lane drop, or access points. Weaving between interchanges was analyzed in both the AM and PM peak hours in 21 freeway segments at 1,800 vehicles per hour per lane (vphpl) for weaving lanes and 2,000 vphpl for general-purpose lanes. In the existing condition, there were six AM peak and 17 PM peak exceedances in the northbound direction and 16 AM peak and eight PM peak exceedances in the southbound direction. In the 2030 No Build, there would be 20 AM peak and 20 PM peak exceedances in the each direction.

The analysis identified where the exceedances were due to high ramp volumes, main through lanes being above 2,000 vphpl, and auxiliary lanes exceeding 1,800 vphpl.

Accident Analysis

The number of accidents and accident rates for July 2004 through June 2007 from the California Highway Patrol (CHP) accident database available through PeMS were used. The total accident rates along the project area were less than the Statewide average for total accident rates. There were three segments that were over the Statewide average for fatal plus injuries.

Other Related Congestion Analysis

A bottleneck is a persistent drop in speed between two locations on the freeway as seen through increased travel time due to duration of bottleneck and queue length. There can be a number of causes, a visual distraction, an incident, a weaving section or a change in capacity, such as a reduction in the number of lanes.
lanes. Consistently there are three major bottlenecks in the northbound direction during the PM peak period near Carmel Valley Road, Via de la Valle, Lomas Santa Fe and smaller bottlenecks near Leucadia Boulevard and Cannon Road. In the southbound direction there are bottlenecks during the AM peak near Via del la Valle, Manchester Avenue, and Birmingham Drive. In the PM peak the southbound direction has bottle necks at Birmingham Drive, Manchester Ave, and Oceanside Boulevard. The No build bottlenecks would increase in duration and queue length. The northbound direction for AM peak would now include bottlenecks at La Jolla Village Drive and Del mar Heights Road. The northbound PM peak would include bottlenecks near Del Mar Height Road and Oceanside Boulevard. The southbound AM peak would include bottlenecks near Via del la Valle, Tamarack Avenue and Manchester Avenue. The southbound PM peak would include bottlenecks near La Jolla Village Drive and Manchester Avenue.

Freeway interchanges were analyzed to assess if modifications could improve capacity and alleviate congestion at ramp intersections. In addition, all freeway on ramp locations within the project limits would be metered. This modification would be administratively controlled by the California Highways and Transportation Agency (Caltrans). The weaving lengths for the interchanges within the Project limits were analyzed and the length of time was developed from weaving results.

1.3.3 Population, Housing, and Employment

Travel demand in the project area has been influenced considerably by population and housing growth in the San Diego region. From 1970 to 2000, San Diego County doubled in population to over 2.8 million residents. Approximately 20 percent of the 1.5 million residents were added to San Diego County over the last 30 years. The coastal communities in the area grew two- to three-fold. The Cities of San Diego and Carlsbad grew 500 percent over the 30-year period (Table 1.3.8).

There are currently over 500,000 people residing within the project area, which represents approximately 16 percent of the regional population. An additional 125,000 people are anticipated to reside in the project area by the year 2030, an increase of 25 percent (Table 1.3.9). There are approximately 197,000 housing units in the project area, representing 17 percent of the regional housing stock in San Diego County. An additional 36,000 housing units are anticipated to be constructed within the project area by 2030, a 19 percent increase (Table 1.3.9).

Employment within the North Coast Corridor is primarily located along established transportation routes or concentrated into large activity/employment centers. A considerable portion of the project area employment is located in the City of San Diego, particularly within Sorrento Valley, Sorrento Mesa, the University/Golden Triangle area and the University of California San Diego (UCSD) campus. Future employment growth in the project area would continue to occur with these established employment centers, along with burgeoning centers in the eastern portions of Carlsbad and Oceanside (Table 1.3.10).

Note: Jurisdictions represented in this table represent a different geographic area compared to the North Coast Corridor

a Source: U.S. Census Bureau
c Source: SANDAG, Series 10 Final Regional Growth Forecast (December 2003)
d Selected Census Tracts in the northern portions of the City of San Diego within the Project travel shed
Interregional travel demand on I-5 is also influenced by growth in surrounding regions. Population growth in Riverside and Imperial Counties, as well as Baja California, Mexico, is anticipated to increase by 60 to 70 percent by the year 2030.

Growth forecasts for San Diego County and the surrounding regions have a tremendous impact on travel demand for I-5 in the project area. By the year 2030, travel demand in San Diego County is projected to increase to over 13.7 million trips, an increase of 25 percent. In the project area, travel demand would increase to over 3.2 million trips. Approximately one million of these trips are anticipated to use at least one segment of I-5.

Rail
The Los Angeles to San Diego Rail (LOSSAN) is a north-south corridor that parallels I-5. The Amtrak Surfliner provides daily passenger service along the LOSSAN corridor while North County Transit District (NCTD) provides commuter service (known as the Coaster) within San Diego County. Burlington Northern and Santa Fe Railway (BNSF) transport goods for interstate, intrastate and international commerce. Improvements are proposed to the LOSSAN corridor (Final Program EIR/EIS 2007); however, even with the proposed improvements, capacity would not be sufficient to address anticipated travel demand along the I-5 corridor in 2030.

1.3.4 Legislation
The I-5 NCC Project is a high priority project under the President’s Executive Order (E.O.) 13274 Environmental Stewardship and Transportation Infrastructure Project Reviews to “promote environmental stewardship” for major transportation infrastructure projects. E.O 13274 states, “The Secretary of Transportation, in coordination with agencies as appropriate, shall advance environmental stewardship through cooperative actions with project sponsors to promote protection and enhancement of natural and human environment in the planning, development, operation, and maintenance of transportation facilities and services.”

Assembly Bill 574 (2007) gave SANDAG the authority to conduct, administer, and operate a value pricing and transit demonstration program on a maximum of two transportation corridors in San Diego County. AB 574 also authorizes SANDAG to operate the program indefinitely by deleting the four-year limitation provision. These facilities combine pricing and vehicle eligibility to maintain free-flow conditions while still providing a travel time-savings incentive for HOVs, and reducing some demand on the general-purpose lanes.

The 2004 TransNet Extension includes an Environmental Mitigation Program (EMP), which is a funding allocation category for the costs to mitigate habitat impacts for regional transportation projects. The EMP is a unique component of the TransNet Extension in funding allocation for habitat acquisition, management, and monitoring activities as needed to help implement the Multiple Species Conservation Program (MSCP) and the Multiple Habitat Conservation Program (MCHP). This funding allocation is tied to mitigation requirements for project outlined in the Regional Transportation Plan (MOBILITY 2030).

1.3.5 Managed Lanes
The I-5 corridor has high travel demand with periodic traffic congestion during weekday peak hours and on weekends is heavily traveled, as a major interregional route for recreation and tourism. Managed Lanes seek to manage travel demand and encourage use of other travel modes in response to changing traffic and roadway conditions. Traffic and roadway conditions change throughout the day affecting demand and performance on both the managed lane and the adjoining general-purpose travel lanes. Actively managing and controlling traffic though a combination of access control, vehicle eligibility, and pricing strategies combines elements to make the most effective and efficient use of a freeway facility. Specifically, Managed Lanes set aside certain freeway lanes and use a variety of operating strategies to move traffic more efficiently in those lanes regulated by vehicle eligibility (number of occupants or vehicle type), amount of lanes with moveable median barrier to match the direction of commuter flow, pricing and access control in response to changing conditions. The I-5 NCC Project proposes HOV and Value Pricing. HOV specifies the amount of riders in a vehicle, while Value Pricing uses fees/tolls for road use which vary with the level of congestion.

HOV lanes provide additional highway capacity through number of occupants in a constrained corridor while minimizing impacts to the environment and surrounding communities. These types of lanes are intended to give carpool users and bus riders a quicker and more reliable ride by bypassing areas of heavy traffic congestion during peak periods. HOV lanes can serve as a strong incentive for ridesharing, which can help to manage congestion and contribute to improving air quality.

Value Pricing is an option under Managed Lanes that provides additional highway capacity by allowing single occupant vehicles (SOV) to pay to use the lanes when extra capacity exists, as approved by Assembly Bill 574 (2007). These managed lanes would be monitored to ensure that all user groups (HOV, buses, and SOV) experience less congestion than the general-purpose lanes to maintain free-flow conditions while still providing a travel time-savings incentive for HOV, and reducing some demand on the general-purpose lanes. These types of lanes provide flexibility in the overall highway facility, allowing for system and corridor management that can be changed on a daily basis or as corridor travel needs change in response to changing conditions, helping to manage congestion on all highway lanes and contribute to improving air quality.

These operating strategies to move traffic more efficiently in those lanes regulated by vehicle eligibility may vary by the time of day, or day of week and allow flexibility for changes over the life of the facility as conditions change. This flexibility is within a larger network of connected and free-flowing Managed Lanes throughout San Diego County, a key strategy outlined in SANDAG’s 2008 RTP. This provides option to travelers, and increases trip reliability (reliable amount of time to make a trip). A traveler may choose to meet the eligibility requirements, such as including a permitted number of occupants (HOV), traveling in a certain vehicle, or paying for the use of Managed Lanes, especially if the general-purpose lanes become congested. Therefore, the tolling capacities along the corridor would vary per changes in demand volumes throughout the AM and PM peak periods.
1.3.6 Other I-5 Projects

Other I-5 Corridor Projects

Although the I-5 NCC Project addresses the congestion from the generation points for congestion (Tables 1.3.2-1.3.5), and encompasses an area large enough to address the environmental concerns, there are several additional proposed operational improvements. These operational improvements do not require the proposed project to be implemented nor are themselves required because of project implementation. I-5 NCC Project does not preclude alternatives for these operational improvement projects that are all included in the SANDAG 2030 RTP. For any of these projects to be considered and approved prior to the completion of the environmental review process under NEPA and CEQA for the proposed I-5 NCC Project, they would have to satisfy the following requirements:

- Demonstrate Independent Utility;
- Present Logical Termini;
- Not restrict consideration of alternatives for other reasonably foreseeable transportation improvements; and
- Where Practicable/Feasible minimize impacts to sensitive resources.

The following is a list of those projects that would move forward independently from the I-5 NCC Project and be analyzed within separate environmental documents.

- I-5/Genesee Avenue Interchange Improvements
- I-5/SR-56 Interchange Improvements
- I-5/SR-78 Interchange Improvements
- I-5 “Mid-Coast” Freeway Improvements (10+2HOV facility from I-8 to I-805)
- I-805 “North” improvements (8+4HOV/Managed Lanes facility from SR-52 to north of Miramar Boulevard in San Diego)
- Sorrento Valley Road/Roselle Street Improvements
- Manchester Avenue Interchange Improvements
- Encinitas Boulevard Interchange Improvements
- Birmingham Avenue to Leucadia Boulevard Auxiliary Lanes
- LOSSAN Rail Improvements (double tracking of rail corridor between Los Angeles, and San Diego I-5 northbound Direct Access Ramps (DAR) at Carroll Canyon Road and HOV lanes between Carroll Canyon Road and the I-5/I-805 junction.

LOSSAN

Los Angeles – San Diego (LOSSAN) rail corridor connects major metropolitan areas of Southern California and serves some of the most populous areas of the state, and runs through three counties: Los Angeles, Orange, and San Diego. It is the second busiest intercity rail corridor in the nation. The corridor houses Amtrak’s Pacific Surfliner service, Metrolink, Coaster commuter rail services, as well as, the BNSF and Union Pacific (UP), which provide freight service on the corridor, predominantly from the Ports of Los Angeles and Long Beach.

A Record of Decision (ROD) was issued March 18, 2009 and the Final Program EIR/EIS was released in September 2007 by Federal Rail Administration (FRA). The purpose was to establish a program of projects for the long-term improvement of the rail corridor needed to support existing and proposed levels of rail service, which includes intercity passenger rail, commuter rail, and freight/goods movement. Collectively, they lay out a vision for the phased enhancement of this heavily-used rail corridor. Moreover, the efficiencies as a result of rail improvements carry over to all users of the rail corridor and benefit commuter rail and freight services as well, making them even more cost effective. Rail improvement projects are in various stages of development from preliminary engineering and environmental review to pre-final design.

The rail line originally established by the late 1800’s traverses some of California’s most scenic and environmentally-sensitive areas, and is located for extended stretches directly adjacent to the Pacific Ocean. Communities established and grew around the rail line and as a result of these geographic and social constraints, opportunities for the corridor’s expansion are limited. The existing alignment traverses natural drainages, small creeks, rivers, lagoons and wetland habitats. The alignment also traverses habitats for threatened and endangered species, crosses numerous 100-year floodplain zones, and areas subject to liquefaction.

Caltrans continues efforts to coordinate phased of the LOSSAN project as to not preclude alternatives for LOSSAN. Currently San Diego Projects include the following:

Range of cost depends upon which project alternative is selected (e.g. low-build or high-build)

Del Mar Fairgrounds

The 2008 Master Plan for the Del Mar Fairgrounds and Horsepark includes both immediate proposed projects as well as conceptual, long-term projects for a period of 25 years. The immediate proposed projects would provide maintenance and improvement to the current Fairgrounds facilities, including renovation and modernization of several structures and parking areas, construction of new structures, demolition of structures, and relocation of a maintenance yard and fire station. The long-term projects are conceptual and would provide for maintenance of existing facilities as well as construction of new projects.
Chapter 1 – Proposed Project

structures and trails. The long-term projects would require additional planning in the future to define precise building parameters and may require additional environmental analysis. Future projects for the Horsepark remain conceptual in nature and therefore would be subject to further evaluation at a later date and would not be addressed in the 2008 Master Plan EIR. A DAR at Via de la Vallee may be analyzed in conjunction with the anticipated traffic impacts from the Del Mar Fairgrounds projects.

The Del Mar Fairgrounds is an approximately 137.6-ha (340-ac) Fairgrounds and Racetrack facility (Fairgrounds) located in the Cities of Del Mar and San Diego in San Diego County that includes a 26.3-ha (65-ac) equestrian facility (Horsepark). There is also an off-site property, not owned by the 22nd District Agricultural Association (22nd DAA) located at the corner of Jimmy Durante Boulevard and San Dieguito Drive. The Horsepark is located approximately 2.4 km (1.5 mi) east of the Fairgrounds in the San Dieguito River Valley at Via de la Vallee and El Camino Real.

Carlsbad Energy Center

Carlsbad Energy Center Project would be a 558 megawatt (MW) gross combined-cycle generating facility configured using two units with one natural-gas-fired combustion turbine and one steam turbine per unit to meet the electrical resource needs as defined by San Diego Gas and Electric (SDG&E). Application for Certification was filed with the California Energy Commission and was accepted as complete on October, 31, 2007. This would provide rapid response to demand helping to support local use and overall system reliability. Carlsbad Energy Center LLC, an indirect wholly owned subsidiary of NRG Energy, Inc. proposes to develop a natural gas-fired generating facility in the City of Carlsbad in San Diego County, California. This would reconfigure approximately 9.3 ha (23 ac) of existing land zoned for public utilities at the Encina Power Station in the City of Carlsbad. The goal is to bring this facility online by summer 2013.

As part of the Carlsbad Project, existing steam boiler Units 1, 2, and 3 at the Encina Power Station would be retired. The retirements would occur upon the successful commercial operations of the new Carlsbad Project generating units. The retirements would create substantial environmental benefits, including permanent air emission reductions from the boiler units; elimination of the 851.7 million liters (225 million gallons) per day of cooling water (seawater) intake capacity for Units 1-3 and the resulting decrease in impingement and entrainment of marine organisms attributed to those unit's cooling water flow; cessation of discharge of wastewaters to the Pacific Ocean from Units 1-3; and elimination of the use of potable water attributed to the existing operation of Units 1-3.

The Carlsbad Desalination Project by Poseidon

The Carlsbad desalination Project would provide San Diego County with a locally-controlled 189.2 million liters (50 million gallons) per day (6907.5 ha-m per year [56,000 ac-ft per year]) seawater desalination plant and associated water delivery pipelines of high-quality water that meets or exceeds all state and federal drinking water standards. The project is located at the Encina Power Station in the City of Carlsbad. The desalination plant is a 1.62-ha (4-ac) parcel in a portion of the site. Public water agencies serving the cities of Carlsbad, Oceanside, San Marcos, San Diego, Encinitas, Solana Beach, Rancho Santa Fe, Escondido, Chula Vista, National City and the unincorporated communities of Rainbow, Bonsall and Fallbrook would be the direct beneficiaries of a new, affordable and reliable water supply developed at no expense to the region's taxpayers.

1.4 History and Background

I-5 is a principal North-South transportation facility in the western United States and is part of the National Highway System, extending from the Mexican border to the Canadian border. I-5 serves as the commuter link for the coastal communities of San Diego County and the regional link with the Los Angeles Metropolitan area.

During the 1980s, traffic on I-5 increased steadily with regional population growth and the major restructuring of the region’s economy from sector-based manufacturing to cluster-based service and high technology employment. By the late 1980s, traffic congestion on I-5 became an issue of regional concern. In the early 1990s, Caltrans conducted an operational study of I-5 from I-805 to Camp Pendleton, assessing long-range highway needs to the year 2015. Given the anticipated constraints on I-5, the coastal rail and parallel arterials, transportation agencies concurred that a corridor-level study was needed to address the long-range needs of this multimodal transportation corridor. Between 1995 and 1997, Caltrans, SANDAG and other stakeholders conducted scoping meetings in order to develop a Major Investment Study (MIS) for the corridor, as prescribed by the Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991.

From 1997 to 2000, SANDAG conducted the North Coast Transportation Study, which served as the MIS for the North Coast Transportation Corridor. The goals of the MIS were to provide the full range of transportation modal alternatives that are cost-effective, promote and provide incentives for ridesharing and alternative modes, accommodate regional and interregional freight movements, mitigate environmental and community impacts, and enhance the visual quality unique to the corridor. The MIS also identified transportation deficiencies within the designated study area, which extended along I-5 and I-805 in San Diego County from SR-52 to the Orange County Line. The study recommended long-range improvements for highways, bus transit, passenger and freight rail, commuter rail transit, and arterials/roads to address corridor travel demands to the year 2020. The recommended highway program includes HOV lanes for the length of the study area, adding general-purpose lanes from Del Mar Heights Road to north of Oceanside. Double-tracking the rail line was recommended to help provide an efficient commuting alternative to the freeway.

I-5 also serves as the predominant freight, goods movement, and commerce facility in the region. In 2006, between 5-7 percent of the trips on I-5 were made by trucks. This high percentage of freight trucks, in conjunction with rolling terrain, creates conflicting speed differentials between trucks and automobiles. The existing and projected increases in congestion from regional and interregional traffic could have a profound negative impact to the state and regional economies.

The North Coast Corridor has limited transportation alternatives other than I-5. Even with the proposed full double tracking of the rail line and increasing the number and capacity of the trains, the daily 2030 projection of riders is less than 30,000. The arterial street system is also inadequate to provide a viable alternative to I-5 given the disjointed and non-contiguous state. A new north-south transportation corridor was examined as part of SANDAG’s North Coast Transportation Study; however, it was rejected due to substantial environmental impacts and community opposition.
As part of the NEPA/404 Integration Memorandum of Understanding (MOU) process to provide for more timely decision making while improving the overall quality of those decisions by fostering agreement among the signatory agencies. There were four build alternatives that the signatory agencies agreed would be developed from one of the alternatives on I-5 from Del Mar Heights Road in San Diego to Vandegrift Boulevard/Harbor Drive in Oceanside. This alternative was identified as the long-range improvement concept for this portion of I-5 in the 2000 RTP.

In preparation of the 2003 RTP, SANDAG had adopted regional policies that directly influenced the long-range improvement concept for the I-5 North Coast Corridor as well as the scope of the proposed PSR alternative. These regional policies included the Regional High Occupancy Vehicle/Managed Lanes Study completed by SANDAG in 2002, which identified future HOV and Managed Lane facilities in the San Diego Region. The study concluded that the I-5 North Coast Corridor required a four-lane HOV/Managed Lanes facility to meet forecasted HOV demands in the year 2030. This future facility would be part of a larger regional HOV/Managed Lanes system that included similar Managed Lanes facilities on I-15 and I-805.

In response to shifts in regional policies, Caltrans redefined the proposed PSR alternative to reflect the new 2030 design year and the recommended HOV/Managed Lanes facility, as reflected in the I-5 North Coast Corridor Draft Project Report. The resulting proposed alternative proposed four HOV/Managed Lanes from I-805 to Harbor Drive, and two additional general-purpose lanes from SR-56 to Leucadia Boulevard. In order to support the future regional Bus Rapid Transit (BRT) service on I-5 to El Camino Real, DARs on I-805 in Sorrento Valley and on I-5 at Manchester Avenue were included in this alternative. This alternative was subsequently adopted as the long-range improvement concept for this portion of I-5 in the 2003 RTP, known as MOBILITY2030. Subsequent technical studies revealed that the two proposed general-purpose lanes were needed from Leucadia Boulevard to SR-78 in order to meet year 2030 demand.

The scope of this alternative was further expanded with the inclusion of the future proposed HOV/Managed Lanes freeway-to-freeway on I-5 over Los Penasquitos Creek. Initially proposed in the Regional HOV/Managed Lanes Study, this viaduct is a critical segment of the HOV/Managed Lanes network that connects proposed HOV lanes on I-5 with the proposed four-lane HOV/Managed Lanes facility on I-5 at the I-805 junction. Furthermore, the future HOV lanes on I-805 just south of the I-5 / I-805 junction were determined to be integral part of the proposed I-5 North Coast HOV/Managed Lanes facility, due to limited highway access from I-5 into Sorrento Valley. In late 2003, the proposed alternative was re-scoped to include I-5 from north of La Jolla Village Drive to I-805, and I-805 from north of Mira Mesa Boulevard to I-5.

After the adoption of the 2003 RTP, development of the alternative continued with a further examination of the design features of the proposed Managed Lanes facility in the median of I-5. Design features and operational issues related to Managed Lanes such as DARs, intermediate access points (IAPs) and facility separation were further examined.
1.5 Other I-5 Considerations

**Corridor System Management Plan**
There is a Corridor System Management Plan (CSMP) for the travel way along I-5 North Coast Corridor. CMIA funded projects include a provision for CSMP to address the transportation system as a whole, and integrate land use to promote multi-modal analysis. Multi-modal analysis focuses on how transit, local roadways, highways, pedestrian routes and land use work together as a system. As a living document, the CSMP would be revisited and updated to analyze the effect improvements have on mobility due to improvement implementation and/or as new data and technologies become available. This promotes a strategy that prioritizes resources to phase in improvements across jurisdictions and transportation modes to achieve enhanced productivity, mobility, reliability, accessibility, and safety.

**Public Works Plan**
The San Diego Association of Governments (SANDAG) and California Department of Transportation (Caltrans) have prepared the North Coast Corridor (NCC) Transportation and Resource Enhancement Program and Highway Public Works Plan (TREP/PWP) to plan for and implement a series of transportation, community and resource enhancement projects in a comprehensive and coordinated manner to meet the region's mobility vision through 2030 while ensuring compliance with the California Coastal Act.

The majority of the transportation, community and resource enhancement improvements associated with the TREP/PWP are located within the California Coastal Zone of Northern San Diego County. Therefore, they are subject to the coastal resource protection policies of the Coastal Act or, as applicable to the highway and community enhancement projects, the certified Local Coastal Programs of the corridor cities. The TREP/PWP has been developed to demonstrate NCC program consistency with the California Coastal Act and applicable certified LCPs to ensure that program components are implemented to provide for maximum protection and enhancement of public access, recreation, and sensitive coastal resources.

This region's vision is to provide an efficient and integrated system of transit, local roadways, highways, pedestrian and bicycle facilities that facilitate the movement of people and goods within the NCC. As an alternative to efforts designed to maintain and improve transportation facilities and address coastal resource issues, the TREP/PWP provides a planning, analytical, and implementation mechanism to address improvements throughout the corridor as a system consistent with Coastal Act mandates that focus on protecting, enhancing, and maintaining coastal resource values, and maximizing public access to coastal resources and recreational facilities.

**National Defense**
I-5 is also a critical transportation link for national defense and transportation security providing direct and indirect access to major military installations in the southwestern United States including Naval Air Station North Island, Marine Corps Air Station Miramar, Marine Corps Recruiting Depot, and Marine Corps Base Camp Pendleton. I-5 is identified as a Strategic Highway Network link, providing defense access, continuity, and emergency capabilities for movement of personnel and equipment in both peace and war times.

**Corridor of the Future**
On September 10, 2007, the U.S. Department of Transportation announced six interstate routes that would be the first to participate in a new federal initiative to develop multi-state corridors to help reduce congestion. The "Corridors of the Future" program aims at developing innovative national and regional approaches to reduce congestion and improve the efficiency of freight delivery. The selected corridors carry 22.7 percent of the nation's daily interstate travel.

The routes are anticipated to receive the following funding amounts to implement their development plans:
- $21.8 million for I-95 from Florida to the Canadian border;
- $5 million for I-70 in Missouri, Illinois, Indiana, and Ohio;
- $15 million for I-15 in Arizona, Utah, Nevada, and California;
- $15 million for I-5 in California (outside of San Diego County), Oregon, and Washington;
- $8.6 million for I-10 from California to Florida; and
- $800,000 for I-69 from Texas to Michigan.

The proposals were selected for their potential to use public and private resources to reduce traffic congestion within the corridors and across the country. The concepts include building new roads and adding lanes to existing roads, building truck-only lanes and bypasses, and integrating real time traffic technology, such as, lane management that can match available capacity on roads to changing traffic demands.

**Environmental Resources**
Along this portion of the I-5 corridor there are numerous existing natural and visual resources. Los Penasquitos Creek, Carmel Valley Creek, and the San Luis Rey River cross under I-5 before terminating at the ocean. They provide wildlife corridors from inland San Diego County to the coastal region. I-5 also crosses six lagoons – San Dieguito, San Elijo, Batiquitos, Agua Hedionda, Buenavista and Los Penasquitos Lagoon. These waterways offer habitat to federally listed wildlife (coastal California gnatcatcher), state and federally listed wildlife (least Bell’s vireo, southwestern willow flycatcher, least tern, and clapper rail), state listed wildlife (Belding’s savannah sparrow and peregrine falcon), and Fully Protected Species (clapper rail, least tern and peregrine falcon). In addition, sensitive wetland communities occur along the creek and rivers and within the lagoons.

Caltrans’ and FHWA’s environmental policies recognize the need to protect and enhance the quality of life in accordance with the environmental, economic, and social goals of the State. Both agencies are mindful of the sensitivity of the coastal resources and the ongoing lagoon restoration efforts established as a result of state, county, and various foundation efforts, as well as from required mitigation for previously permitted federal and/or state projects (Table 1.5.1). Both agencies would seek to not impede these efforts and would identify opportunities to minimize potential project impacts to the maximum extent practicable.

The protection of important coastal environmental resources, such as the lagoons and coastal bluffs, would also be a consideration when designing improvements to the north coast i-5 corridor. Enhancements of sensitive environmental habitat would be incorporated, where feasible and practicable when considering cost, logistics and technology.
