 MARYSVILLE HIGHWAY IMPROVEMENT PROJECT
 STATE ROUTE 70 BETWEEN 4TH AND 5TH STREETS
 STATE ROUTE 20 BETWEEN H AND F STREETS
 MARYSVILLE, YUBA COUNTY, CALIFORNIA
 CONTRACT NO. 03A2132, TASK ORDER NO. 23, EA 03-1E7601

Dear Mr. Melani:

In accordance with California Department of Transportation (Caltrans) Contract No. 03A2132 and Task Order Number (TO) No. 23, Expense Authorization (EA) 03-1E7601, Geocon Consultants, Inc. has performed environmental engineering services for the proposed Marysville Highway Improvement Project located along State Routes 70 and 20 in the City of Marysville, Yuba County, California. The accompanying report summarizes the services performed including the advancement of 17 direct-push borings for soil and groundwater sample collection, the performance of a limited geophysical survey at suspected underground storage tank locations, and analytical laboratory testing.

The contents of this report reflect the views of the author, who is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of the State of California or the Federal Highway Administration. This report does not constitute a standard, specification, or regulation.

Please contact us if there are any questions concerning the contents of this report or if we may be of further service.

Sincerely,

GEOCON CONSULTANTS, INC.

John E. Juhrend, PE, CEG
Project Manager

SITE INVESTIGATION REPORT

1.0 INTRODUCTION

This Site Investigation (SI) Report for the Marysville Highway Improvement Project, located along State Routes 70 (SR-70) and 20 (SR-20) in the City of Marysville, Yuba County, California, was prepared by Geocon Consultants, Inc. under California Department of Transportation (Caltrans) Contract No. 03A2132, Task Order (TO) No. 23 and Expense Authorization (EA) 03-1E7601.

1.1 Project Description and Proposed Improvements

The project limits consist of north-south SR-70 (E Street) between 4th and 5th Streets and east-west SR-20 (10th Street) between H and F Streets. The SI was performed within the existing Caltrans SR-70 and SR-20 right-of-way (ROW) in the commercial downtown Marysville area. SR-70 and SR-20 within the project limits are four lanes, with paved center median, signalized intersections and turning lanes. Sidewalks are present along both sides of the highways. The approximate project location is depicted on the Vicinity Map (Figure 1) and Site Plans (Figures 2-1 and 2-2).

Planned traffic operational improvements include removal of median islands, installation of turning lane pockets, relocation of street lighting from medians to sidewalks, and revised intersection signalization, ADA ramps and sidewalk rehabilitation. Planned excavations for sidewalk reconstruction may extend 2 feet into subgrade soil. Deeper excavations to a maximum depth of approximately 12 feet may be required for signal and light pole foundations.

Partial parcel ROW takes and temporary construction easements (TCEs) may be required for 19 parcels located at the intersection corners within the project boundaries to facilitate construction of the planned improvements. The triangular-shaped ROW takes generally extend from 5 to 9 feet along the adjacent highway and street ROW. Photographs of the triangular-shaped ROW takes are included in this report.

1.2 General Objectives

The objective of this investigation was to determine the potential presence of soil impacts and shallow groundwater (if encountered) impacts resulting from historical and current adjacent facility operations including underground storage tank (UST) releases. Caltrans will use the investigative results for preliminary project scoping and ROW acquisition evaluations and to inform the construction contractor(s) if impacted soil and groundwater is present within the project boundaries for health, safety, management and disposal evaluation purposes. The fieldwork, sampling, laboratory analysis, and related tasks were performed in general accordance with Contract 03A2132 requirements.

2.0 BACKGROUND

The following background information was obtained from historical documents and publicly available regulatory records.

2.1 Site Geology and Hydrogeology

The relatively flat project area is located within the central portion of the Great Valley geomorphic province at an elevation of approximately 60 feet above mean sea level. The nearest surface water bodies are Ellis Lake adjacent and north of SR-70/SR-20 (9th Street) between B and D Streets, the Yuba River approximately 1/4 mile to the south, and the Feather River approximately 1/2 mile to the west.

Local geology consists of a thick sequence of unconsolidated and interbedded alluvial sediments. Review of boring logs prepared for adjacent UST release facilities indicates that subsurface soil conditions generally consist of interbedded silt, clay and sand layers with some gravel to the maximum depth of explored of 60 feet.

Depth to groundwater within the project boundaries generally varies from 20 to 25 feet. The regional groundwater flow direction is generally northwesterly to northeasterly with local variations.

2.2 Historical and Regulatory Document Review

1871 Birds Eye View of the City of Marysville

We reviewed the 1871 Birds Eye View of the City of Marysville that covers the majority the project boundaries. The project area was generally occupied by residential structures, schools and churches. A northeast-southwest trending slough area (pre-Ellis Lake) is depicted in undeveloped areas near the project area that crossed E Street (SR-70) between 8th and 9th Streets. According to information provided by Caltrans' Project Archaeologist, the slough was used in the 1800s for refuse disposal prior to filling and creation of Ellis Lake in the early 1900s. Caltrans has designated the debris-filled slough as an area of archaeological interest.

Sanborn Fire Insurance Maps

We reviewed EDR Sanborn Fire Insurance Maps of Marysville provided by Caltrans for years 1885, 1890, 1895, 1909, 1921 and 1948. Review of the maps indicates that the SR-70 (E Street) portion of the project area was generally occupied by residential, commercial and church properties. Properties along 10th Street (SR-20) within the project boundaries generally include residential properties. Properties west of F Street are identified in the early maps as "Submerged Land." The width of E Street (SR-70) and 10th Street (SR-20) is shown as 100 feet.

Potential historical facilities of interest identified on the Sanborn Maps include:

- Storm drainage collection was accomplished by a system of drainage pipes and cisterns (cistern located at intersection of E and 4th Streets).
- Dunning Brothers Garage (1921) at the southwestern corner of E and 4th Streets.
- Oil & Gas Station (1921 & 1948 maps) at the southeastern corner of E and 4th Streets.
- Gas & Oil (1948 map) at garage (current McDonalds) south of southwestern corner of E and 4th Streets.
- Gas & Oil Station (1948 map) at the northeastern corner of E and 4th Streets.
- Oil & Gas Station (1921 & 1948) at the southwestern corner of E and 5th Streets.
- Gas & Oil Stations (1948 map) at the northwestern and northeastern corners of E and 5th Streets.

The 1921 and 1948 Sanborn Maps depicting the former service station and automobile garage locations along E Street (SR-70) are on Figures 3-1 and 3-2.

GeoTracker and EnviroStor Databases

We reviewed regulatory database records for permitted UST facilities, leaking UST (LUST) facilities, and other identified contamination assessment/remediation properties located adjacent to the project boundaries on the State Water Resources Control Board (SWRCB) GeoTracker website (<http://geotracker.waterboards.ca.gov/>) and the California Department of Toxic Substances Control (DTSC) EnviroStor website (<http://www.envirostor.dtsc.ca.gov/public/>). The information obtained for the identified facilities along with their map identification numbers (Map IDs) are summarized below and in Table 1. The approximate facility locations by Map ID number are presented on the Site Plans, Figures 2-1 and 2-1. Copies of site plans depicting former and existing UST locations, extent of associated impacts and groundwater monitoring wells are in Appendix A.

- **Sierra Central Credit Union (Former Texaco Station), 422 4th Street, Map ID #2, Photo 2.** This facility is an Open LUST Cleanup Site regulated by the Central Valley Regional Water Quality Control Board (CVRWQCB). A former Texaco service station facility reportedly operated at the southeast corner of SR-70 and 4th Streets between 1955 and 1979 (also identified as a gasoline station on 1921 and 1948 Sanborn Maps). The fuel USTs were removed from this facility by 1979. Site investigations performed at this facility since 1992 included the installation of seven onsite wells and two offsite wells within SR-70. Petroleum hydrocarbon soil and groundwater impacts have been identified at this facility. Vacuum extraction was performed at this facility in January 2013 including the removal of 740 gallons of treated groundwater. Depth to groundwater in September 2013 ranged from 19 to 22.54 feet with flow direction toward the northeast. The CVRWQCB has directed that this facility and the adjacent LUST case to the north perform coordinated groundwater monitoring and include data from both facilities showing combined groundwater impacts. An April 2013 report for this facility identified the current McDonalds property across SR-70 as being a former “gas & oil” station (former Twin Cities Garage). **Petroleum hydrocarbon-impacted soil and groundwater may exist within the planned 422 4th Street ROW parcel and TCE acquisitions in addition to the adjacent SR-70 ROW.**

- Marysville Plaza (Former Mobile Station, current Subway), 401 E Street, Map ID #3, Photo 3.** This facility is an Open LUST Cleanup Site regulated by the CVRWQCB. A former Mobile service station facility reportedly operated at this property located at the northeast corner of SR-70 and 4th Streets between 1953 and 1963 (also identified as a gasoline station on 1948 Sanborn Map). Four abandoned (sand-filled) USTs are currently located at the southwestern corner of this facility extending beneath the SR-70 sidewalk area. Site investigations performed at this facility since 1993 included the installation of three onsite wells and three offsite wells including one well within the center median area of SR-70. Petroleum hydrocarbon soil and groundwater impacts have been identified at this facility. Planned remedial action includes removing the abandoned USTs and associated contaminated soil including portions of the SR-70 sidewalk and highway ROW. Depth to groundwater in September 2013 ranged from 22 to 24 feet with flow direction toward the northeast. **Documented abandoned USTs and petroleum hydrocarbon-impacted soil and groundwater may exist within the planned 401 E Street ROW parcel and TCE acquisitions in addition to the adjacent SR-70 ROW.**
- Shell Station, 501 5th Street, Map ID # 5, Photo 6.** This gasoline station facility, located at the northwest corner of SR-70 and 5th Street, received LUST case closure status from the CVRWQCB in January 2014. The facility was identified as a gasoline station on the 1948 Sanborn Map in a different configuration from the existing station. Fuel and waste oil USTs and associated contaminated soil were removed from this facility in 1986 and 1990. Site investigations performed at this facility since 1991 included the installation of nine onsite and seven offsite wells. Petroleum hydrocarbon soil and groundwater impacts have been identified at this facility. Groundwater extraction was performed at this facility between 2006 and 2009 including the removal of 418,505 gallons of treated groundwater. Depth to groundwater in July 2012 ranged from 20.15 to 25.49 feet with variable flow direction. The site monitoring wells were destroyed in 2013. **Petroleum hydrocarbon-impacted soil and groundwater may exist within the planned 501 5th Street ROW parcel and TCE acquisitions in addition to the adjacent SR-70 ROW.**
- Former Jackpot Gasoline Station (Current Yuba Food & Liquor Mart), 605 10th Street, Map ID #10, Photo10.** This former gasoline station facility, located at the northwest corner of SR-20 and F Street, received LUST case closure status from the CVRWQCB in February 2011. The UST refueling system was removed in 1997 when gasoline-range petroleum hydrocarbon soil impacts were identified. Five onsite and five offsite monitoring wells were subsequently installed to monitor groundwater impacts. Active remediation at this facility included operation of a soil vapor/groundwater extraction system. Depth to groundwater in May 2010 was approximately 18 feet with flow direction toward the west-southwest. The site monitoring wells were destroyed in 2011. **Petroleum hydrocarbon-impacted soil and groundwater may exist within the planned 605 10th Street ROW parcel and TCE acquisitions in addition to the adjacent SR-20 ROW.**
- Econo Gas (Former Beacon Station), 704 10th Street, Map ID #13, Photo 13.** This existing gasoline station facility, located at the southwest corner of SR-20 and G Street is an Open LUST Cleanup Site regulated by the CVRWQCB. Leaks associated with the onsite fuel USTs were identified in 1988 and 1990. Site investigations performed at this facility since 1991 included the installation of four onsite and eleven offsite monitoring wells, and several remediation wells to address petroleum hydrocarbon soil and groundwater impacts. Free-product was previously removed using bailing and a skimmer. Soil and groundwater treatment systems including pump and treat, soil vapor extraction and air sparge, operated between 1985 and 2010. As of January 14, 2014, the facility is eligible for closure and the wells have been approved for destruction by

the CVRWQCB. Depth to groundwater in June 2013 ranged from 19.58 to 21.30 feet with flow direction toward the northwest. **Petroleum hydrocarbon-impacted soil and groundwater may exist within the planned 704 10th Street ROW parcel and TCE acquisitions in addition to the adjacent SR-20 ROW.**

2.3 Hazardous Waste Determination Criteria

Regulatory criteria to classify a waste as “California hazardous” for handling and disposal purposes are contained in the California Code of Regulations (CCR), Title 22, Division 4.5, Chapter 11, Article 3, § 66261.24. Criteria to classify a waste as “Resource, Conservation, and Recovery Act (RCRA) hazardous” are contained in Chapter 40 of the Code of Federal Regulations (40 CFR), Section 261.

For waste containing metal, the waste is classified as California hazardous when: 1) the representative total content equals or exceeds the respective Total Threshold Limit Concentration (TTLC); or 2) the representative soluble content equals or exceeds the respective Soluble Threshold Limit Concentration (STLC) based on the standard Waste Extraction Test (WET). A waste may have the potential of exceeding the STLC when the waste’s total content is greater than or equal to ten times the respective STLC value, since the WET uses a 1:10 dilution ratio. Hence, when an analyte is detected at a concentration greater than or equal to ten times the respective STLC, and assuming that 100 percent of the analyte is soluble, soluble analysis is required. A material is classified as RCRA hazardous, or Federal hazardous, when the representative soluble content equals or exceeds the Federal regulatory level based on the Toxicity Characteristic Leaching Procedure (TCLP). The TTLC value for lead is 1,000 milligrams per kilogram (mg/kg). The STLC and TCLP values for lead are both 5.0 milligrams per liter (mg/l).

The above regulatory criteria are based on chemical concentrations. Wastes may also be classified as hazardous based on other criteria such as ignitability and corrosivity; however, for the purposes of this investigation, toxicity (i.e., representative lead concentrations) is the primary factor considered for waste classification since waste generated during the construction activities would not likely warrant testing for ignitability or corrosivity. Waste that is classified as either California hazardous or RCRA hazardous requires management as a hazardous waste.

The DTSC regulates and interprets hazardous waste laws in California. DTSC generally considers excavated or transported materials that exhibit ‘hazardous waste’ characteristics to be a ‘waste’ requiring proper management, treatment and disposal. Soil that contains contaminants above hazardous waste thresholds and is left in-place would not be necessarily classified by DTSC as a ‘waste.’ The DTSC has provided site-specific determinations that “movement of wastes within an area of contamination does not constitute ‘land disposal’ and, thus, does not trigger hazardous waste disposal requirements.” Therefore, impacted soil that is scarified in-place, moisture-conditioned, and recompacted during roadway improvement activities might not be considered a ‘waste.’ DTSC should be consulted to confirm waste classification. It is noted that in addition to DTSC regulations, health and safety requirements and other local agency requirements may also apply to the handling and disposal of metal and/or pesticide-impacted soil.

2.4 Risk-based Screening Criteria

The California Environmental Protection Agency (Cal/EPA) has prepared technical reports entitled *Use of California Human Health Screening Levels (CHHSLs) in Evaluation of Contaminated Properties* (Cal/EPA, January 2005) and *Revised California Human Health Screening Levels for Beryllium* (Cal/EPA, March 2009) and *Lead* (Cal/EPA, September 2009), which present CHHSLs for soil, shallow soil gas, and indoor air to assist in evaluating sites impacted by releases of hazardous chemicals.

The CHHSLs are concentrations of 54 hazardous chemicals including Title 22 metals that Cal/EPA considers to be below thresholds of concern for risks to human health. The CHHSLs were developed by the Office of Environmental Health Hazard Assessment (OEHHA) on behalf of Cal/EPA. The thresholds of concern used to develop the CHHSLs are an excess lifetime cancer risk of one in a million and a hazard quotient or 1.0 for noncancer effects. Under most circumstances, the presence of a chemical at concentrations below its respective CHHSL can be assumed to not pose a significant risk. The presence of a chemical at concentrations above a CHHSL does not indicate that adverse impacts to human health are occurring or will occur but suggests that further evaluation is warranted (Cal/EPA, January 2005).

2.5 Environmental Screening Levels

The San Francisco Bay Regional Water Quality Control Board (SFRWQCB) has prepared a technical report titled *User's Guide: Derivation and Application of Environmental Screening Levels (ESLs), Interim Final* (December 2013), which presents ESLs for soil, groundwater, soil gas, and surface water, to assist in evaluating sites impacted by releases of hazardous chemicals. The ESLs are conservative values for more than 100 commonly detected contaminants, which may be used to compare with environmental data collected at a site. ESLs are strictly risk assessment tools and “not regulatory cleanup standards.” The presence of a chemical at concentrations in excess of an ESL does not necessarily indicate that adverse impacts to human health or the environment are occurring; this simply indicates that a potential for adverse risk may exist and that additional evaluation is warranted (SFRWQCB, 2013).

2.6 Waste Determination Criteria – Petroleum Hydrocarbons

Currently, regulatory criteria for the classification of wastes based solely on the concentrations of gasoline-range organics (GRO), diesel-range organics (DRO), and motor oil-range organics (ORO) and volatile organic compounds (VOCs), have not yet been promulgated. Disposal of petroleum hydrocarbon and VOC-impacted soil and groundwater is generally regulated by disposal facility permit and acceptance criteria.

3.0 SCOPE OF SERVICES

We performed the following scope of services as requested by Caltrans in TO No. 23 and by the Caltrans TO Manager, Mr. Mark Melani.

3.1 Pre-field Activities

- Mr. John Juhrend with Geocon and Mr. Mark Melani with Caltrans attended a site meeting on March 7, 2014, to identify the project boundaries and existing site conditions. Proposed boring locations were marked in white paint for subsequent utility clearance.
- Prepared a *Health and Safety Plan*, dated March 2014 to provide guidelines on the use of personal protective equipment and the health and safety procedures implemented during the field activities.
- Provided 48-hour notice to Underground Service Alert (USA Ticket Nos. 88798, 88821, 88858, 88877, and 88882) prior to job site mobilization.
- Retained the services of Advanced Geological Services (AGS) to provide utility clearance services at each boring location and a subsequent geophysical survey at two suspected UST locations.
- Retained the services of Advanced Technology Laboratories (ATL), a Caltrans-approved and California-certified analytical laboratory, to perform the chemical analyses of soil samples.
- Coordinated archaeological monitoring services provided by Pacific Legacy under direct contract with Caltrans.

3.2 Field Activities

The field sampling activities consisted of the advancement of 17 direct-push borings for the collection of soil samples and one groundwater sample. We advanced the direct-push soil borings to a maximum depth of 12 feet using our truck-mounted direct-push rig. Soil samples were generally collected at 4-foot intervals. Groundwater was only encountered and sampled in one boring.

4.0 INVESTIGATIVE METHODS

4.1 Boring Location Rationale

Caltrans requested the performance of one soil boring at each proposed partial parcel ROW acquisition adjacent to SR-70 and SR-20. Where a private property access agreement was not available, we performed a boring within the adjacent SR-70 sidewalk area. The proposed boring location at the northeastern corner of SR-70 and 4th Street was not performed due to the presence of USTs beneath the parcel boundary and adjacent SR-70 sidewalk areas. A summary of the parcel information and boring locations is on Table 1.

The boring locations were documented by Geocon using differential global positioning systems (GPS). The GPS was utilized to locate the horizontal position of each boring with an error of no more than 3.3 feet. The latitude and longitude of each boring are summarized on Table 2. The approximate soil boring locations are depicted on Figures 2-1 and 2-2 and in photographs 1, 2, 4 and 6 through 19.

4.2 Utility Surveys

Responding USA subscribers cleared the proposed boring locations prior to the start of the fieldwork. On March 12, 2014, AGS performed utility surveys using electrical locating equipment and visual observations to assist in clearing the boring locations. Several boring locations were adjusted to avoid potential utility conflicts with USA markings or unknown utilities identified by AGS.

4.3 Site Safety and Traffic Control

A project safety meeting was held prior to starting the field sampling activities conducted between March 12 and 14, 2014. Present at the meeting were the Geocon Project Manager and sampling personnel, the Caltrans TO Manager, an AGS utility locator and a Pacific Legacy archaeologist. We provided shoulder closure traffic control during the field sampling activities using advance warning signs and cones.

4.4 Direct-push Sampling Activities

We performed 17 borings between March 12 and 14, 2014, to a maximum sampling depth of 12 feet. Continuous core soil samples obtained from the direct-push borings were collected in 4-foot-long, 1.75-inch-diameter, cellulose thermoplastic (acetate) sample liners. The bottom 6 inches of each sample tube was fitted with Teflon™ sheets, capped, labeled and placed in an ice chest, pending delivery to ATL under chain-of-custody (COC) documentation. The remaining sample cores were split in half for observation and sampling by the Pacific Legacy archaeologist. The archaeologist used a trowel to examine the soil materials for logging purposes.

Following completed archeological monitoring, the remaining soil cores were logged by a Geocon Professional Geologist using the Unified Soil Classification System. Selected intervals of soil remaining in the acetate liners were transferred to re-sealable Ziploc® plastic bags and evaluated for odor and soil discoloration. The sample bags were field-screened using a photo-ionization detector (PID) as a qualitative indicator of potential volatile organic compounds. Soil sample intervals, soil description and PID readings are presented on the boring logs in Appendix B.

Groundwater was encountered in one boring (70/4-SE, Map ID #2) at a depth of approximately 7 feet. A polyvinyl-chloride (PVC) temporary casing with a slotted screen section was inserted into the boring and we then collected a groundwater grab sample using dedicated tubing tipped with a check valve lowered through the interior of the PVC casing. The groundwater grab sample was decanted into three laboratory-provided, hydrochloric acid-preserved, 40-milliliter volatile organic analysis vials and two one-liter amber glass containers. The sample containers were labeled and placed on ice in a cooler for transportation to the laboratory. En route to ATL, one of the one-liter amber glass containers broke.

An unidentified UST was encountered at a depth of approximately 4.5 feet while drilling boring 70/5-SW (Map ID #4). No soil was recovered from the boring shallower than 4.5 feet and upon encountering the UST, the drilling rods dropped from 4.5 to 7.2 feet. Approximately 2.5 feet of fluid with a strong gasoline odor was measured in the boring using a tape measure. We backfilled the boring with bentonite chips and capped it at the surface with concrete.

QA/QC procedures were performed during the field sampling activities. These procedures included decontamination of sampling equipment before each boring was advanced and providing COC documentation for each soil sample submitted to the laboratory. The soil sampling equipment was cleansed between each boring by washing the equipment with an Alconox™ solution followed by a double rinse with deionized water. The field sampling activities were performed under the supervision of Geocon's TO Manager. The direct-push borings were backfilled with bentonite chips and capped with an approximate 3-inch-thick layer of cold-patch asphalt, concrete or native soil, whichever matched the surrounding ground surface.

4.5 Geophysical Survey

On March 18, 2014, AGS performed a geophysical survey in two locations adjacent to 420 E Street (Map ID #4) based on observations made by Geocon and AGS staff during the utility markout and drilling activities. AGS surveyed one location along the southwest corner of SR-70 and 5th Street (Photo 4) where a potential UST was encountered during the direct-push sampling activities. AGS also surveyed a second location beneath the sidewalk along the eastern boundary of 420 E Street, approximately 120 feet south of the first survey location. Potential fill and vent pipes (Photo 5) were identified as well as a placard inscribed with the words “Associated Flying A Gasoline” during the utility markout for this location. AGS performed the survey using a Geonics EM61 electromagnetic metal-detector, a Fisher M-Scope metal detector, and a GSSI SIR-3000 ground penetrating radar (GPR) system. A copy of the geophysical survey report is in Appendix C.

4.6 Laboratory Analyses

Selected soil samples collected within the project boundaries were submitted to ATL for the following analyses under standard ten-day turn-around-time (TAT).

- Seventeen soil samples were analyzed for gasoline analysis package including gasoline-range organics (GRO) following EPA Test Method 8015B (modified) and benzene, toluene, ethylbenzene, total xylenes (BTEX) and methyl tert-butyl ether (MTBE) following EPA Test Method 8260B.
- Twenty-five soil samples were analyzed for diesel- and oil-range organics (DRO and ORO) following EPA Test Method 8015B.
- Twenty-one soil samples were analyzed for Title 22 metals following EPA Test Methods 6010B and 7471A (mercury).

The remaining soil samples were held by the laboratory pending receipt of the initial data. Based on review of the initial data we assigned the following analyses:

- Two additional soil samples were analyzed for total lead following EPA Test Method 6010B under five-day TAT.
- Two soil samples were analyzed for WET soluble lead using EPA Test Method 6010B under five-day TAT.
- Two soil samples were analyzed for WET soluble chromium using EPA Test Method 6010B under five-day TAT.
- One soil sample was analyzed for TCLP soluble lead EPA Test Method 6010B under five-day TAT.

The groundwater sample obtained from boring 70/4-SE was analyzed for GRO, DRO and ORO following EPA Test Method 8015B (modified for GRO).

In accordance with Caltrans Contract 03A2132, ATL homogenized the soil samples prior to analysis for metals. QA/QC procedures were conducted for each method of analysis with specificity for each analyte listed in the test method's QA/QC. The laboratory QA/QC procedures included the following:

- One method blank for every ten samples, batch of samples or type of matrix, whichever is more frequent.
- One sample analyzed in duplicate for every ten samples, batch of samples or type of matrix, whichever is more frequent.
- One spiked sample for every ten samples, batch of samples or type of matrix, whichever is more frequent, with the spike made at ten times the detection limit or at the analyte level.

The COC documentation was reviewed for accuracy and completeness prior to submitting the soil samples to the laboratory. The laboratory was instructed to handle, analyze, and conduct QA/QC procedures in accordance with Caltrans Contract 03A2132. Copies of the laboratory analytical reports including QC summary and COC documentation are in Appendix D.

5.0 FIELD OBSERVATIONS AND INVESTIGATIVE RESULTS

5.1 Soil and Hydrogeologic Conditions

Soils conditions encountered in the borings consisted of fill soils generally comprised of road base gravels and sands, topsoil, and undifferentiated fill containing trace amounts of debris fill materials overlying natural alluvial deposits. Fill materials were encountered as deep as 8 feet and consist of sandy gravel, gravelly sand, silty fine sand, fine to coarse sand, sandy silt, and sandy silty clay. The underlying alluvial deposits generally consist of fine-grained silt and clay deposits with intermittent layers of sand. In the absence of natural texture, rootlets, and mottling, the native materials appear to have been used in some locations as backfill making it difficult to distinguish the bottom depth of the fill deposits. Refusal conditions due to hard soil were encountered in nine borings at depths between 8 and 10 feet.

Trace amounts of debris consisting of brick, glass, and metal fragments were encountered in fill material in 4 of 17 borings (20/H-SW, 20/Lemon-NE, 70/4-SE, and 70/5-NE). The debris was generally limited in size (<0.5-inch long) with the exception of borings 70/5-NE (Map ID #6) and 70/4-SE (Map ID #2), where larger (>1-inch long) pieces of brick were observed at 2 and 3 feet deep, respectively. No indication of soil impacts (staining, odor, ash) were observed in conjunction with the debris. The Pacific Legacy archaeologist in the field examined the fill materials and stated in the field that none of the debris was of cultural significance.

Field indicators of petroleum hydrocarbon impacts (e.g. staining, odors, elevated PID readings) were identified at three locations within the project boundaries. Greenish gray silty clay with faint petroleum hydrocarbon odor was encountered at depths between 5 and 12 feet in boring 20/H-SE (Map ID #15). Olive grey layers of silty clay with faint petroleum hydrocarbon odor were encountered at depths between 4 and 12 feet in boring 70/5-NW (Map ID #5). A grayish brown layer of silty fine sand was encountered at depths between 5.25 and 6 feet in boring 70/5-NE (Map ID #6).

Groundwater was only encountered in boring 70/4-SE (Map ID #2) at a depth of 7 feet. Based on groundwater monitoring well data for adjacent LUST facility (Sierra Central Credit Union), depth to groundwater in the nearby vicinity of this boring varies from 15 to 26 feet. This suggests that the “groundwater” encountered in 70/4-SE is perched on top of the concrete encountered at 8 feet deep.

Boring logs depicting the soil conditions encountered, soil sample locations and PID readings are in Appendix B.

5.2 Geophysical Survey Results

Corner of SR-70 and 5th Street

AGS identified a 4.5-foot-wide by 7-foot-long anomaly centered around boring location 70/5-SW using their EM61. The definitive extent of the UST was not determined due to interference from numerous underground utilities and surficial metal objects. The UST did not register using GPR as the depth to the top of the UST (approximately 4.5 feet) is deeper than the penetration depth of the GPR signal (3 feet).

Eastern Boundary of 420 E Street

AGS identified a 5-foot-wide by 9-foot-long UST beneath the fill and vent pipes using their EM61. The UST did not register using GPR as the depth to the top of the UST is deeper than the penetration depth of the GPR signal (3 feet).

5.3 Soil Analytical Results – Petroleum Hydrocarbons

A summary of the petroleum hydrocarbon soil sample analytical results is on Table 3. The laboratory reports and chain-of-custody documentation are in Appendix D.

GRO, BTEX and MTBE were not detected at or exceeding the laboratory reporting limits (RLs) in each soil sample analyzed.

DRO and ORO were detected in each soil sample at relatively low concentrations ranging from 1.5 to 13 mg/kg. These levels are below the SFRWQCB's ESL for commercial soil of 110 and 500 mg/kg, respectively, and are likely associated with naturally occurring organics.

5.4 Soil Analytical Results – Title 22 Metals

A summary of the Title 22 metals soil sample analytical results is on Table 4. The laboratory reports and chain-of-custody documentation are in Appendix D.

The following Title 22 metals were detected exceeding RLs in the 23 soil samples analyzed:

- Antimony – <2.0 mg/kg in 21 samples
- Arsenic – 3.1 to 12 mg/kg in 21 samples
- Barium – 77 to 150 mg/kg in 21 samples
- Beryllium – <1.0 mg/kg in 21 samples
- Cadmium – <1.0 mg/kg in 21 samples
- Chromium – 25 to 60 mg/kg in 21 samples
- Cobalt – 5.9 to 18 mg/kg in 21 samples
- Copper – 25 to 44 mg/kg in 21 samples
- Lead – 3.5 to 130 mg/kg in 23 samples
- Molybdenum – <1.0 mg/kg in 21 samples
- Nickel – 30 to 75 mg/kg in 21 samples
- Selenium – 1.1 to 2.3 mg/kg in 18 of 21 samples
- Silver – <1.0 mg/kg in 21 samples
- Thallium – <1.0 mg/kg in 21 samples
- Vanadium – 41 to 69 mg/kg in 21 samples
- Zinc – 28 to 98 mg/kg in 21 samples
- Mercury – 0.17 and 0.74 in 2 of 21 samples

Other than lead, the remaining Title 22 metal detections generally fall within the range of naturally occurring background levels. Arsenic was detected at concentrations above the commercial/industrial CHHSL though within the range of naturally occurring background.

Two soil samples contained total lead concentrations at or above 50 mg/kg, ten times the STLC value for lead of 5.0 mg/l. WET soluble lead was detected in the two soil samples analyzed at 3.5 and 17 mg/l, the latter exceeding the California STLC hazardous waste criteria for lead. TLCP soluble lead for the soil sample with the highest reported WET soluble lead concentration (70/4-SE-3.5) was detected at 0.24 mg/l, which is less than federal RCRA hazardous waste criteria of 5.0 mg/l.

Nine soil samples contained total chromium concentrations at or above 50 mg/kg, ten times the STLC value for chromium of 5.0 mg/l. WET soluble chromium was not detected in the two soil samples analyzed with the highest reported total chromium concentrations of 59 and 60 mg/kg. Therefore, chromium is not a potential contaminant of concern.

5.5 Groundwater Analytical Results – Petroleum Hydrocarbons

The groundwater analytical results are summarized on Table 5. Laboratory reports and chain-of-custody documentation are presented in Appendix D.

GRO, DRO, and ORO were not detected above laboratory RLs for the grab groundwater sample collected from boring 70/4-SE.

5.6 Laboratory Data Validation

Review of ATL's QA/QC reports indicate acceptable surrogate recoveries and non-detect results for the method blanks. Matrix spikes (MS) and/or matrix spike duplicates (MSD) for numerous samples were outside recovery criteria; however, the data were validated by the laboratory control sample (LCS). The relative percent difference (RPD) for MS/MSD samples was outside the RPD limit, stating "RPD value outside acceptance criteria. Calculation is based on raw values". RPD values for several duplicate samples were outside acceptance criteria due to possible matrix interference. The data show acceptable non-detect results for the method blanks and acceptable recoveries and RPDs for the rest of the matrix spikes and duplicates. Based on the laboratory QA/QC data, no additional qualification of the data presented herein is necessary, and the data are of sufficient quality for the purposes of this report.

6.0 CONCLUSIONS AND RECOMMENDATIONS

6.1 Soil Impacts

Field indicators (i.e. staining and odors) of petroleum hydrocarbon soil impacts were only identified at three locations within the project boundaries. However, the lack of elevated PID readings and the faintness of the odor suggest that the soil impacts are from older degraded fuel releases. GRO and BTEX were not detected at concentrations at or exceeding their RLs for these or any of the soil samples analyzed. Low-level DRO and ORO concentrations were detected in each of the soil samples analyzed. Since DRO and ORO concentrations were consistently low and there was no significant increase in concentrations from samples collected from borings with field indicators of petroleum hydrocarbon impacts compared to those without, the diesel- and oil-range concentrations are likely attributable to naturally occurring organics.

The presence of petroleum hydrocarbons in soil (regardless of the source(s)) may restrict offsite disposal/reuse options. Excavated soil exhibiting obvious field indicators of petroleum hydrocarbon contamination should be stockpiled and sampled for laboratory analysis to determine acceptable offsite disposal/reuse options. Areas of undocumented apparent contamination identified during construction should be isolated from surrounding non-impacted areas and further evaluated for appropriate action.

Trace amounts of debris consisting of brick, glass, and metal fragments were identified in 4 of 17 borings. No indication of soil impacts (staining, odor, ash) were observed in conjunction with fill materials containing debris. Elevated lead levels above California hazardous waste criteria was identified in the fill material in boring 70/4-SE at a depth of 3.5 feet. We recommend that excavated soil from this location be analyzed for lead content to determine appropriate disposal options.

6.2 Groundwater Impacts

Groundwater in the project area has been impacted by adjacent refueling facility releases. Based on monitoring well data, current groundwater levels (20 to 25 feet) are deeper than the planned construction excavation depth of 12 feet. Therefore, the presence of petroleum impacted groundwater should not impact planned construction activities.

6.3 Underground Storage Tanks and ROW Parcel Acquisition

A total of at least seven abandoned USTs have been identified at three locations within the existing SR-70 ROW at the northeast corner of 4th Street (Map ID. 3) and southwest corner of 5th Street (Map ID 4). The legal responsibility for these USTs should be confirmed with the City of Marysville and adjacent parcel owners to determine who is financially responsible for removing the tanks and any identified contamination requiring remediation. It is anticipated that the tanks at the intersection corners will require removal prior to construction of planned improvements.

Undocumented USTs, dry wells, or other subsurface features not associated with active buried utilities that are identified during the construction activities should be properly removed/abandoned in-place in accordance with Yuba County permitting requirements where applicable.

6.4 Worker Protection

Per Caltrans' requirements, the contractor(s) should prepare a project-specific health and safety plan to prevent or minimize worker exposure to petroleum hydrocarbons and lead in soil (Lead Compliance Plan). The plan should include protocols for environmental and personnel monitoring, requirements for personal protective equipment, and other health and safety protocols and procedures for handling of soil.

7.0 REPORT LIMITATIONS

This report has been prepared exclusively for Caltrans. The information contained herein is only valid as of the date of the report and will require an update to reflect additional information.

This report is not a comprehensive site characterization and should not be construed as such. The findings as presented in this report are predicated on the results of the limited sampling and laboratory testing performed. In addition, the information obtained is not intended to address potential impacts related to contaminant sources other than those specified herein. Therefore, this report should be deemed conclusive with respect to only the information obtained. We make no warranty, express or implied, with respect to the content of this report or any subsequent reports, correspondence or consultation. We strived to perform the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered.

Notes: 70/5-NE-3.5

< = Less than laboratory reporting limits

TTLc = California Code of Regulations, Title 22 Total Threshold Limit Concentration

STLC = California Code of Regulations, Title 22 Soluble Threshold Limit Concentration in milligrams per liter

10 x STLC = Ten times the Soluble Threshold Limit Concentration

mg/kg = milligrams per kilogram

mg/l = milligrams per liter

¹ = Chromium III / Chromium VI

² = Background: Mean Concentration - Background Concentrations of Trace and Major Elements in California Soils, U.C. Calif., March 1996

CHHSLs = California Human Health Screening Levels (CHHSLs) in Evaluation of Contaminated Properties

Analyte concentrations in parentheses () were performed using the Waste Extraction Method for soluble metals; units reported are milligrams per liter.

Analyte concentrations in brackets [] were performed using the Total Characteristic Leaching Procedure soluble analysis; units reported are milligrams per liter.

**Subject: Geophysical Investigation Results
Underground Storage Tank (UST) Delineation
420 E Street and SW Corner of 5th St. and E St.
Marysville, California**

Mr. Juhrend-

1.0 INTRODUCTION

This letter presents the findings of Advanced Geological Services, Inc. (AGS) geophysical investigation to delineate the extent of underground storage tanks (UTSs) that were encountered at two locations along SR-70 (E Street) in Marysville, California (Figure 1). One location is on the southwest corner of 5th and E Street and the other location is at 420 E Street, about 120 feet south of the first location. For convenience in this report, the locations are designated as the North Site, and South site, respectively.

The field work was performed on March 18, 2014 by AGS geophysicist Roark Smith, who used a Geonics EM61 electromagnetic (EM) metal-detector with digital recording capabilities, a Fisher M-Scope metal detector (MD), and a GSSI SIR-3000 ground penetrating radar (GPR) system. Briefly, the EM61 and M-Scope instruments were used to look for buried metal areas indicative of a UST, and GPR was used to obtain graphical profiles of the subsurface to better identify buried metal objects detected by the EM61 survey. In general, EM61 surveying is an important part of a UST investigation because it provides a deeper investigation depth than GPR, which can be as shallow as two feet at some sites. Depending on their size, the EM61 can detect objects as deep as 10 feet; however, the EM61 can detect only metallic objects and is subject to interference from vehicles, buildings, and other above-ground metallic objects.

2.0 RESULTS SUMMARY

North Site- A UST was encountered at a depth of about four feet during Geocon’s direct-push (DP) sampling activities at the North site. AGS identified a 4.5- by 7.0-foot area of elevated, metal-indicating EM61 response centered on the DP sample location. The elevated response may be associated with a UST; however, because the EM61 data were extremely noisy due to interference from numerous underground utilities and surface metal objects, the EM61 survey did not provide a definitive result regarding the extent of the UST. GPR achieved a signal penetration depth of about three feet; accordingly, the UST was not detected with GPR because it is too deeply buried to be imaged. North Site results are presented on Figure 5.

South Site- The presence of UST(s) at the South Site is indicated by two shallow pipe-wells imbedded in the sidewalk along E Street. Removing the metal plates (“lids”) covering each well revealed capped vertical pipes protruding from the ground, and one of the wells contained a placard reading “Associated Flying A Gasoline.” EM61 data show a single 5- by 9-foot area of elevated response associated with the two pipe-wells; accordingly, the EM61 data suggest that only one UST is present at this location. It’s possible that the two pipe-wells house UST vent and fill pipes, respectively. GPR achieved a signal penetration depth of about three feet; accordingly, the UST was not detected with GPR because it is too deeply buried to be imaged. South Site results are presented on Figure 6.

3.0 SITE DESCRIPTIONS

The investigation was performed at two sites along the west side of SR-70 (E Street) between 4th and 5th Streets. For convenience, they are referred to as the “North Site” and the “South Site.” The North Site is on the southwest corner of 5th and E Street, where AGS understands that an underground storage tank UST was encountered during Geocon’s recent direct-push (DP) sampling activities. AGS investigated an approximately 20- by 30-foot area centered on Geocon’s direct-push sample location. The area was crowded with numerous geophysical noise sources that included metal bollards and traffic signal poles, a metal storm drain grate, and three small pull-boxes for electrical cables and traffic signal control wiring (Figure 5).

The South Site is at 420 E Street, approximately 120 feet south of the North Site (Figure 6). The presence of UST(s) at this location is indicated by two shallow pipe-wells imbedded in the sidewalk (Figure 2, right). Removing the metal plates (“lids”) covering each well revealed a capped vertical pipe protruding from the ground, and one of the wells contained a placard reading “Associated Flying A Gasoline” (Figure 3, right).

4.0 GEOPHYSICAL METHODS AND EQUIPMENT

The geophysical investigation was performed using the following

Figure 2 – UST fill/vent pipe wells at 420 E Street

Figure 3 – Placard found in UST fill port at 420 E Street (South Site).

geophysical methods:

- Time-domain Electromagnetics (EM), using a Geonics EM61
- Electromagnetic metal detection (MD), using a Fisher TW-6 M-Scope
- Ground Penetrating Radar (GPR), GSSI SIR-3000 system connected to a 400-MHz antenna

Time-Domain Electromagnetics (EM) using a Geonics EM61

The EM61 is a high-sensitivity, high-resolution recording metal detector commonly used to search for buried metal objects, particularly at developed sites cluttered with surface obstructions such as buildings, parked cars, chain-link fences, and buried utilities. Typical targets for EM61 surveys include underground storage tanks (USTs), buried drums, reinforced concrete foundation remnants, buried refuse (which nearly always includes metallic debris), and individual metallic debris items. The EM61 operates by transmitting a pulsed magnetic field, which causes (induces) small electrical currents (eddy currents) to flow through metallic objects near (below) the instrument. The strength of these eddy currents is measured by the EM61 receiver coil at a relatively long time after the magnetic field pulse subsides. This delayed measurement technique produces a reading (in millivolts) that responds strongly to metal but very weakly to the electrical properties of the surrounding soil, thus making the EM61 a high-sensitivity metal detector. The EM61 employs a one-meter-wide square coil, and its sensitivity can be enhanced by the deployment of a second receiver coil above the first; the second coil response can be used to reduce interference caused by nearby power lines and cultural objects such as vehicles and metal fences.

Electromagnetic Metal Detecting using the Fisher M-Scope

AGS uses the M-Scope to rapidly scan for localized, shallowly-buried metal masses (e.g., a buried vault lid, manhole cover, metallic trash). Briefly, the M-Scope comprises a pair of wire coils (transmitter and receiver coils) connected by a short metal staff; the receiver coil is first “tuned” to a null position with respect to the magnetic field emanating from the transmitter coil. When the M-Scope is held near a metal object, the magnetic field becomes disrupted or distorted and the system is thrown “out of tune.” The M-Scope is designed to emit an audible tone when it is out of tune, thus signaling the presence of a nearby metal object. However, the M-Scope has a limited investigation depth (about 3 feet bgs) and is not effective near surface metal objects; in addition, because the M-Scope responds to changes in soil conductivity, its sensitivity setting must be reduced in electrically conductive (e.g., moist, fine-grained) soil, which results in a corresponding reduction in the instrument’s effectiveness.

Ground Penetrating Radar (GPR)

GPR uses radar technology to produce a graphical profile of the subsurface that shows soil layering and images of buried objects. GPR systems typically use a single transeiving antenna (one that both transmits and receives the radar signal) that is dragged along the ground surface. The antenna emits a radar pulse into the ground; some of the radar energy reflects off of interfaces between materials with different electrical properties (e.g., soil and a UST) and returns to the surface where it is detected by the antenna and sent via the cable to a separate control unit where it is amplified and displayed on a computer screen as a vertical “wobble trace,” which is a plot of the strength (amplitude) of the received GPR signal (i.e., the reflection) over time. Although the vertical scale of a GPR profile is usually

considered as depth, it actually measures the travel time of the radar pulse from the surface to a reflecting interface and back to the surface.

A subsurface profile is built as the antenna is pulled along the survey line and successive wiggle traces are recorded. GPR data are usually displayed as an array of closely-spaced traces; this procedure produces an image of the subsurface as the reflections (wiggles) on adjacent traces merge into coherent patterns. Soil layer boundaries appear as laterally continuous horizontal bands across a GPR profile. Buried objects appear as localized, high-amplitude (dark) reflection patterns. Buried pipes and USTs exhibit a characteristic “upside down U” hyperbolic pattern, which allows them to be readily identified on a GPR record. Burial depths are determined by using calibrating GPR profiles with images objects buried at known depths. Culverts and storm drain pipelines observed in drop inlets are often used for this purpose.

5.0 FIELD PROCEDURES

AGS first prepared a detailed map of each site so the investigation findings and the locations of the geophysical survey lines could be documented. The maps also showed site features that could produce geophysical noise so their presence and locations would be known when the geophysical data were examined for UST indications. The maps were prepared by laying down fiberglass tape measures in a grid pattern across each site and plotting the locations of significant site features, such as curb lines, building faces, metal poles, on grid paper (at scale of 1-inch equals 5 feet). AGS then performed a GPR survey by hand-pushing the cart-mounted GPR system back-and-forth across each site along a grid of lines spaced approximately three feet apart. AGS took special care to scan across the Geocon direct-push sample location where the UST was encountered and also across the UST pipe-wells to insure that GPR profiles at the UST locations were obtained. AGS plotted the starting and ending points of each GPR line on the site map as the GPR survey progressed. Next, AGS performed the EM61 survey by wheeling the EM61 instrument back-and-forth across the site along north-south survey lines spaced approximately three feet apart. The EM61 readings were obtained by pressing the instrument’s “demand-read” button every 2.5 feet along each survey line, and the readings were recorded by the EM61 data logger. As with the GPR survey, AGS plotted the starting and ending points of each line on the site map as the EM61 progressed. After the recording the EM61 data, AGS then scanned the site in “reconnaissance mode” to look for real-time UST indications. In reconnaissance mode, the EM61 instrument emits an audible tone in when the coils pass near metal objects, but no data are recorded. AGS also scanned each site with the Fisher M-Scope to look for buried metal indications.

6.0 DATA PROCESSING AND ANALYSIS

The M-Scope and GPR data were analyzed in the field as the investigation progressed. The M-Scope is designed to produce an audible tone when held near a metallic object; a detected object’s location is then pinpointed by adjusting the instrument’s sensitivity and monitoring the instrument readout to determine the “peak signal” location. For the GPR survey, AGS monitored the GPR data in the field to look for definitive

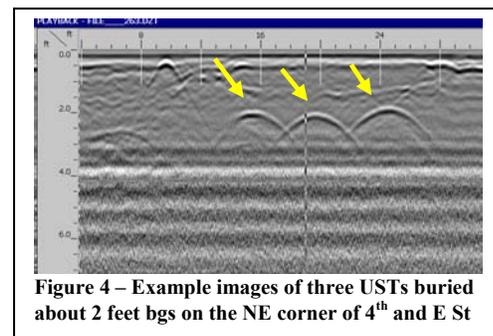

Figure 4 – Example images of three USTs buried about 2 feet bgs on the NE corner of 4th and E St

“upside-down U” reflection patterns, which would indicate a UST with near certainty. For reference, example USTs images from another Marysville location nearby (not part of this investigation) are presented on Figure 4, above. AGS took special care to obtain GPR data across suspected UST locations as indicated by the pipe-wells direct-push findings. AGS then re-examined the GPR data upon returning to the office to look for weaker images that may have gone unnoticed in the field.

EM61 data processing was done using the GEOSOFT Oasis montaj earth science software system. A GEOSOFT kriging algorithm was used to prepare color-filled contour maps showing EM61 response variations (in millivolts) across the site (Figures 5 and 6). As part of the analysis, AGS looked for high-amplitude responses not readily attributable to known metallic site features, such as vehicles and metal debris. Such responses are considered “anomalies” and are attributed to subsurface source bodies, which may include USTs, buried utilities, reinforced concrete foundations, and miscellaneous metallic debris. On the color contour maps, anomalies appear as “hot” (orange, red, and pink) colors representing areas with elevated EM61 measurements indicative of metallic objects.

Because the EM61 was designed to produce a positive signal peak at the center of the metallic source body, it tends to produce anomalies with a shape and extent that approximates the footprint of the metal source object. Accordingly, AGS looked for rectangular anomalies with a footprint corresponding to common UST dimensions, although it is worth noting that as part of the interpretation process AGS considers all buried metal anomalies and endeavors to attribute each one to a source object(s). Anomaly amplitudes associated with USTs and similarly-sized metallic substructures depend on burial depth, but they are typically 200 millivolts (mV) or greater.

AGS incorporated the site map into the EM61 contour map so that responses associated with surface metal objects and underground utilities could be identified and disregarded from consideration as a possible UST indication. As a further aid to the analysis, data profiles for each survey transect were prepared and inspected. The profiles are especially useful for assessing anomaly amplitudes and for identifying bad data caused by, say, a loose connection within the EM system or other type of equipment malfunction.

7.0 RESULTS

Investigation results are shown on Figures 5 and 6. Figure 5 is a map of the North Site investigation area that shows the EM61 and GPR survey line locations; the map also presents the EM61 survey results as a color-filled contour map. Similarly, Figure 6 is a map of the South Site investigation area that shows the EM61 and GPR survey line locations and the EM61 survey results.

North Site- A UST was encountered at a depth of about four feet during Geocon’s direct-push (DP) sampling activities at the North site. AGS identified a 4.5- by 7.0-foot area of elevated, metal-indicating EM61 response centered on the DP sample location. The elevated response may be associated with a UST; however, because the EM61 data were extremely noisy due to interference from numerous underground utilities and surface metal objects, the EM61 survey did not provide a definitive result regarding the extent of the UST. GPR achieved a signal penetration depth of about three feet; accordingly, the UST was not detected with GPR because it is too deeply buried to be imaged. North

Site results are presented on Figure 5.

South Site- South Site- The presence of UST(s) at the South Site is indicated by two shallow pipe-wells imbedded in the sidewalk along E Street. Removing the metal plates (“lids”) covering each well revealed capped vertical pipes protruding from the ground, and one of the wells contained a placard reading “Associated Flying A Gasoline.” EM61 data show a single 5- by 9-foot area of elevated response associated with the two pipe-wells; accordingly, the EM61 data suggest that only one UST is present at this location. It’s possible that the two pipe-wells house UST vent and fill pipes, respectively. GPR achieved a signal penetration depth of about three feet; accordingly, the UST was not detected with GPR because it is too deeply buried to be imaged. The overall high readings observed at the South Site indicate that other buried metal objects may also be present. South Site results are presented on Figure 6.

8.0 LIMITATIONS OF GEOPHYSICAL LOCATING METHODS

In general, a geophysical method’s limitations for detecting a particular target are related to the target’s size, burial depth, the amount of contrast in material properties between the target and surrounding material, and finally, the amount of interference from surrounding site features. For a target to be detected it must have sufficient size to reflect or otherwise disturb some the incoming energy used for detection. It also must have enough contrast with the surrounding material to reflect or otherwise disturb enough of the incoming energy so as to be detected. And, finally, it can’t be buried so deeply that the reflected/disturbed energy is so dissipated that it is too weak to be detected when it returns to the surface. Weak energy returns during geophysical investigations are further exacerbated by ambient noise like that produced by natural and cultural features, such as utilities, fences, parked vehicles, vegetative cover, and debris.

In general, metal USTs make good targets for geophysical investigations because the electrical properties of metal contrast greatly with those of the surrounding soil or fill material; however, UST investigations are often complicated by unfavorable soil conditions and by interference from surface or near-surface metallic objects such a vehicles, reinforced concrete pavement, and buried utilities, sometimes to the degree that little or no useful subsurface information can be obtained. As stated above and shown on Figure 5, the North Site contained numerous surface metal objects and a number of buried utilities that produced interfering noise in the EM61 geophysical data. In addition, the soil conditions limited the GPR signal penetration to approximately 3 feet and no UST images were observed on the GPR records. Accordingly, the geophysical investigation did not provide any additional information about the UST at the North Site. Although the South Site had the same GPR limitations as the North Site, it was relatively free of surface metal and buried utilities so that a coherent EM61 anomaly, one that appears to be associated with a UST, could be identified.

9.0 CLOSING

All geophysical data and field notes collected for this investigation will be archived at the AGS office. The data collection and interpretation methods used in this investigation are consistent with standard practices applied to similar geophysical investigations. The correlation of geophysical responses with probable subsurface features is based on the past results of similar surveys although it is possible that

some variation could exist at this site. Due to the nature of geophysical data, no guarantees can be made or implied regarding the targets identified or the presence or absence of additional objects or targets.

We appreciated working for you on this project and hope to work with you again. If you have any questions, I can be reached at (925) 808-8965 or Rsmith@Advancedgeo.com.

Respectfully,

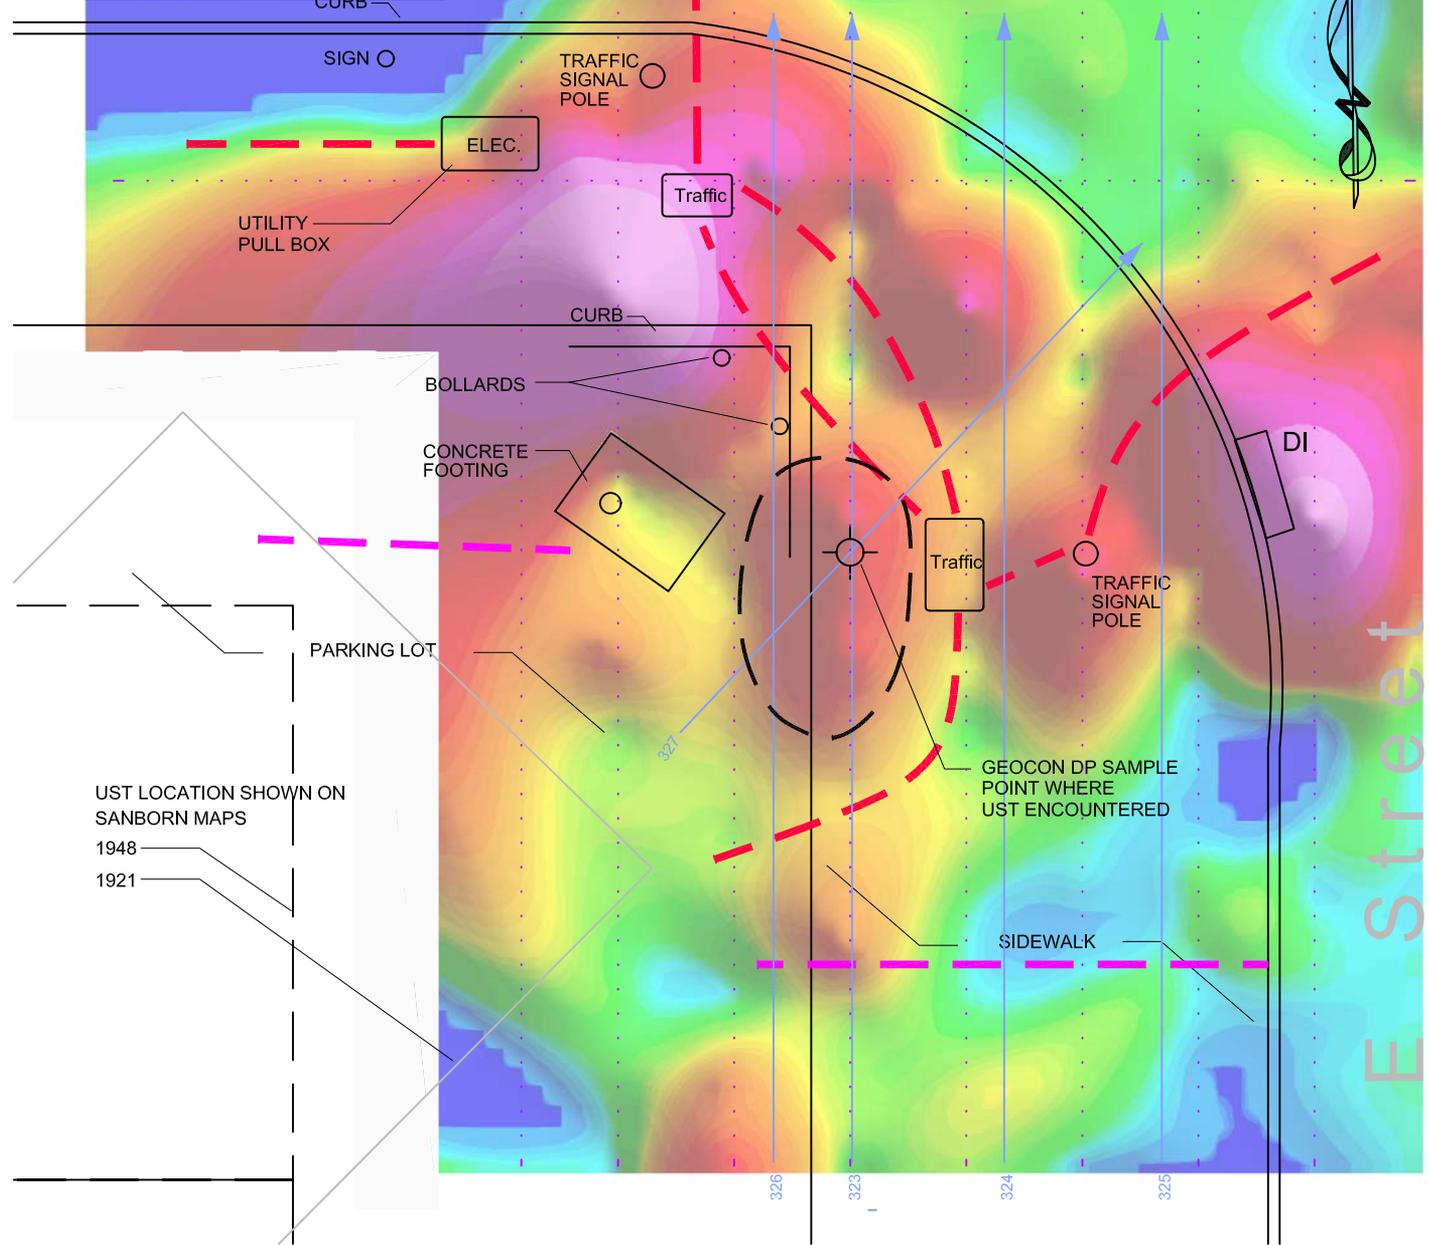

Roark W. Smith, GP 987
Senior Geophysicist
Advanced Geological Services

Enclosed are the results for sample(s) received on March 15, 2014 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

Notes and Definitions

S7	Surrogate recovery was outside of laboratory acceptance limit. Chromatogram shows high concentration of heavy hydrocarbons.
R	RPD value outside acceptance criteria. Calculation is based on raw values.
M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
F1	Sample contains hydrocarbons within the diesel range that do not match the diesel pattern. Quantitation was based on a diesel standard.
ND	Analyte is not detected at or above the Practical Quantitation Limit (PQL). When client requests quantitation against MDL, analyte is not detected at or above the Method Detection Limit (MDL)
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

- (1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.
- (2) The suffix [2C] of specific analytes signifies that the reported result is taken from the instrument's second column.
- (3) Results are wet unless otherwise specified.

TERMS

1. Sample receiving hours: 7:30 AM to 7:30 PM Monday - Friday; Saturday 8:00 AM to 12:00 PM.
 2. Samples submitted AFTER 3:00 PM are considered received the following business day at 8:00 AM.
 3. The following turnaround time conditions apply:
 TAT = 0 - 300% Surcharge SAME BUSINESS DAY if received by 9:00 AM
 TAT = 1 - 100% Surcharge NEXT BUSINESS DAY (COB 5:00 PM)
 TAT = 2 - 50% Surcharge 2ND BUSINESS DAY (COB 5:00 PM)
 TAT = 3 - 30% Surcharge 3RD BUSINESS DAY (COB 5:00 PM)
 TAT = 4 - 20% Surcharge 4TH BUSINESS DAY (COB 5:00 PM)
 TAT = 5 - NO SURCHARGE 5th BUSINESS DAY (COB 5:00 PM)
 4. Weekend, holiday, after-hours work --- ask for quote.
 5. Subcontract TAT is 10 - 15 business days. Projects requiring shorter TATs will incur a surcharge respective to the subcontract lab --- ask for quote.
 6. Liquid and solid samples will be disposed of after 45 calendar days from receipt of samples; air samples will be disposed of after 14 calendar days after receipt of samples.
 7. Electronic records maintained for five (5) years from report date.
 8. Hard copy reports will be disposed of after 45 calendar days from report date.
 9. Storage and Report Fees:
 - Liquid & solid samples: Complimentary storage for forty-five (45) calendar days from receipt of samples; \$2/sample/month if extended storage or hold is requested.
 - Air samples: Complimentary storage for ten (10) calendar days from receipt of samples; \$20/ sample/week if extended storage is requested.
 - Hard copy and regenerated reports/EDDs: \$17.50 per hard copy report requested; \$50.00 per regenerated/reformatted report; \$35 per reprocessed EDD.
 10. Rush TCLP/STLC samples: add 2 days to analysis TAT for extraction procedure.
 11. Unanalyzed samples will incur a disposal fee of \$7 per sample.

As the authorized agent of the company above, I hereby purchase laboratory services from ATL as shown above and hereby guarantee payment as quoted.

TERMS

1. Sample receiving hours: 7:30 AM to 7:30 PM Monday - Friday; Saturday 8:00 AM to 12:00 PM.
 2. Samples submitted AFTER 3:00 PM are considered received the following business day at 8:00 AM.
 3. The following turnaround time conditions apply:
 TAT = 0 : 300% Surcharge SAME BUSINESS DAY if received by 9:00 AM
 TAT = 1 : 100% Surcharge NEXT BUSINESS DAY (COB 5:00 PM)
 TAT = 2 : 50% Surcharge 2ND BUSINESS DAY (COB 5:00 PM)
 TAT = 3 : 30% Surcharge 3RD BUSINESS DAY (COB 5:00 PM)
 TAT = 4 : 20% Surcharge 4TH BUSINESS DAY (COB 5:00 PM)
 TAT = 5 : NO SURCHARGE 5th BUSINESS DAY (COB 5:00 PM)
 4. Weekend, holiday, after-hours work --- ask for quote.
 5. Subcontract TAT is 10 - 15 business days. Projects requiring shorter TATs will incur a surcharge respective to the subcontract lab --- ask for quote.
 6. Liquid and solid samples will be disposed of after 45 calendar days from receipt of samples; air samples will be disposed of after 14 calendar days after receipt of samples.
 7. Electronic records maintained for five (5) years from report date.
 8. Hard copy reports will be disposed of after 45 calendar days from report date.
 9. Storage and Report Fees:
 - Liquid & solid samples: Complimentary storage for forty-five (45) calendar days from receipt of samples; \$2/sample/month if extended storage or hold is requested.
 - Air samples: Complimentary storage for ten (10) calendar days from receipt of samples; \$20/ sample/week if extended storage is requested.
 - Hard copy and regenerated reports/EDDs: \$17.50 per hard copy report requested; \$50.00 per regenerated/reformatted report; \$35 per reprocessed EDD.
 10. Rush TCLP/STLC samples: add 2 days to analysis TAT for extraction procedure.
 11. Unanalyzed samples will incur a disposal fee of \$7 per sample.

As the authorized agent of the company above, I hereby purchase laboratory services from ATL as shown above and hereby guarantee payment as quoted.

TERMS

- Sample receiving hours: 7:30 AM to 7:30 PM Monday - Friday; Saturday 8:00 AM to 12:00 PM.
- Samples submitted AFTER 3:00 PM are considered received the following business day at 8:00 AM.
- The following turnaround time conditions apply:
 TAT = 0: 300% Surcharge SAME BUSINESS DAY if received by 9:00 AM
 TAT = 1: 100% Surcharge NEXT BUSINESS DAY (COB 5:00 PM)
 TAT = 2: 50% Surcharge 2ND BUSINESS DAY (COB 5:00 PM)
 TAT = 3: 30% Surcharge 3RD BUSINESS DAY (COB 5:00 PM)
 TAT = 4: 20% Surcharge 4TH BUSINESS DAY (COB 5:00 PM)
 TAT = 5: NO SURCHARGE 5th BUSINESS DAY (COB 5:00 PM)
- Weekend, holiday after-hours work - ask for quote.
- Subcontract TAT to 10 - 15 business days. Projects requiring shorter TATs will incur a surcharge respective to the subcontract lab - ask for quote.
- Liquid and solid samples will be disposed of after 45 calendar days from receipt of samples; air samples will be disposed of after 14 calendar days after receipt of samples.
- Electronic records maintained for five (5) years from report date.
- Hard copy reports will be disposed of after 45 calendar days from report date.
- Storage and Report Fees:
 - Liquid & solid samples: Complimentary storage for forty-five (45) calendar days from receipt of samples; \$2/sample/month if extended storage or hold is requested.
 - Air samples: Complimentary storage for ten (10) calendar days from receipt of samples; \$20/sample/week if extended storage is requested.
 - Hard copy and regenerated reports/EDDs: \$17.50 per hard copy report requested; \$50.00 per regenerated/reformatted report; \$35 per reprocessed EDD.
- Rush TCLP/STLC samples: add 2 days to analysis TAT for extraction procedure.
- Unanalyzed samples will incur a disposal fee of \$7 per sample.

As the authorized agent of the company above, I hereby purchase laboratory services from ATL as shown above and hereby guarantee payment as quoted.

Reported : 03/31/2014

Notes and Definitions

R	RPD value outside acceptance criteria. Calculation is based on raw values.
M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
ND	Analyte is not detected at or above the Practical Quantitation Limit (PQL). When client requests quantitation against MDL, analyte is not detected at or above the Method Detection Limit (MDL)
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

- (1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.
- (2) The suffix [2C] of specific analytes signifies that the reported result is taken from the instrument's second column.
- (3) Results are wet unless otherwise specified.

Subject: RE: Results - Yuba HIP, S9805-01-23 (ATL# 1400806)

Hi Rachelle,

I would like to run some additional analysis on soil samples for this Yuba HIP project. Please run soil samples 20/H-SW-3.5 and 70/4-SE-3.5 for wet soluble lead. Additionally, please run soil samples 20/H-6.5 and 20/H-7.5 for total lead. And just as a heads up, I believe the hold time on these samples will expire in the next day or two.

Thank you,

-Josh Ewert, PG | Project Geologist

Advanced Technology Laboratories is a full-service environmental lab providing organic and inorganic analyses of soil, water, wastewater, storm water and hazardous waste samples. ATL is accredited by the State of California, NELAP and State of Oregon (Air) and holds various SBE, DBE and MBE certificates and a USDA soil permit. ATL takes pride in providing our customers with quick turnaround time, excellent customer service and defensible data while offering very competitive rates. *Advanced Technology Labs - Your Partner for Quality Environmental Testing*

Re: ATL 1400806 samples 32 and 48

Hi Diane – please analyze these two soil samples for WET soluble chromium under 5-day TAT.

Please reply and confirm.

Thanks!

John

Enclosed are the results for sample(s) received on March 15, 2014 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

Eddie Rodriguez
Laboratory Director

Dear Mr. Melani:

In accordance with California Department of Transportation (Caltrans) Contract No. 03A2132 and Task Order Number (TO) No. 45, Expense Authorization (EA) 03-1E7601, Geocon Consultants, Inc. has performed additional environmental engineering services for the proposed Marysville Highway Improvement Project located along State Route 70 in the City of Marysville, Yuba County, California. The accompanying report summarizes the services performed including the performance of nine borings for soil sample collection at two suspected underground storage tank locations and analytical laboratory testing. This information is supplemental to prior site assessment activities reported in our referenced *Site Investigation Report* for the subject project dated April 16, 2014.

The contents of this report reflect the views of the author, who is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of the State of California or the Federal Highway Administration. This report does not constitute a standard, specification, or regulation.

Please contact us if there are any questions concerning the contents of this report or if we may be of further service.

Sincerely,

SUPPLEMENTAL SITE INVESTIGATION REPORT

1.0 INTRODUCTION

This Supplemental Site Investigation (SSI) Report for the Marysville Highway Improvement Project, located along State Route 70 (SR-70) in the City of Marysville, Yuba County, California, was prepared by Geocon Consultants, Inc. under California Department of Transportation (Caltrans) Contract No. 03A2132, Task Order (TO) No. 45 and Expense Authorization (EA) 03-1E7601.

1.1 Project Description and Proposed Improvements

The project limits consist of north-south SR-70 (E Street) between 4th and 5th Streets in the commercial downtown Marysville area. SR-70 within the project limits is four lanes, with a paved center median, signalized intersections, and turning lanes. Sidewalks are present along both sides of the highway. The approximate project location is depicted on the Vicinity Map, Figure 1, and Site Plan, Figure 2.

Planned traffic operational improvements include removal of the paved center median, installation of turning lane pockets, relocation of street lighting from medians to sidewalks, revised intersection signalization, construction of Americans with Disabilities Act-compliant ramps, and sidewalk rehabilitation. Planned excavations for sidewalk reconstruction may extend 2 feet into subgrade soil. Deeper excavations to a maximum depth of approximately 12 feet may be required for signal and light pole foundations.

Partial parcel right-of-way (ROW) takes and temporary construction easements may be required for six parcels located at the intersection corners within the project boundaries to facilitate construction of the planned improvements. The triangular-shaped ROW takes generally extend from 5 to 9 feet along the adjacent highway and street ROW.

1.2 General Objectives

The objective of this investigation was to further evaluate potential subsurface impacts from suspected underground storage tanks (USTs) at two locations within the SR-70 ROW (sidewalk areas) adjacent to the 420 E Street Parcel. An abandoned UST was previously encountered during the performance of a boring (70/5-SW) in the southwest corner of SR-70 and 5th Street and in front of the vacant portion of the 420 E Street Parcel. Boring 70/5-SW was performed in the sidewalk area at the southwest corner of SR-70 and 5th Street during our initial site investigation in March 2014. The UST was encountered at a depth of approximately 4.5 feet with the bottom at approximately 7.2 feet. Approximately 2.5 feet of fluid with a strong gasoline odor was noted in the boring. Two gasoline UST fill pipes were further observed within the SR-70 ROW (sidewalk area) approximately 130 feet south of the southwest corner of SR-70 and 5th Street in front of the former auto sales/service building at the 420 E Street Parcel.

Caltrans will use the investigative results for preliminary project scoping, ROW acquisition, regulatory UST closure evaluations, and to inform the construction contractor(s) if subsurface impacts are present within the project boundaries for health, safety, management and disposal evaluation purposes. The fieldwork, sampling, laboratory analysis, and related tasks were performed in general accordance with Contract 03A2132 requirements.

2.0 BACKGROUND

The following background information was obtained from our April 16, 2014, *Site Investigation Report* prepared for the Marysville Highway Improvement Project and updated regulatory records.

2.1 2014 Site Investigation Report

We completed the referenced 2014 site investigation within the overall project boundaries that included assessment of planned ROW takes at the following six parcels and associated map identification numbers (Map IDs):

- Map ID #1 - 504 4th Street (McDonalds parking lot, former garage facility)
- Map ID #2 - 422 4th Street (Sierra Central Credit Union, former Texaco gasoline station)
- Map ID #3 - 401 E Street (Subway, former Mobil gasoline station)
- Map ID #4 - 420 E Street Parcel (420 MVL art studio and vacant lot, former auto sales/service building and gasoline station)
- Map ID #5 - 501 5th Street (active Shell gasoline station)
- Map ID #6 - 431 5th Street (D&D Motorsports, former gasoline station)

The relatively flat project area is located within the central portion of the Great Valley geomorphic province at an elevation of approximately 60 feet above mean sea level. Local geology consists of a thick sequence of unconsolidated and interbedded alluvial sediments generally composed of interbedded silt, clay and sand layers with some gravel. Depth to groundwater within the project boundaries generally varies from 20 to 25 feet. The regional groundwater flow direction is generally northwesterly to northeasterly with local variations.

Abandoned USTs were identified at the following three locations within the project boundaries during the 2014 site investigation:

- Map ID #3 - four USTs partially located within the SR-70 ROW (sidewalk area) as documented during site investigation activities associated with the former Mobil gasoline station.

- Map ID #4 - at least one UST partially located in the SR-70 ROW (sidewalk area) at the southwest corner of SR-70 and 5th Street as evidenced by conditions encountered in boring 70/5-SW and the results of a geophysical survey completed during our referenced 2014 site investigation (Photos 1 and 2).
- Map ID #4 - two USTs located in the SR-70 ROW (sidewalk area) approximately 130 feet south of the southwest corner of SR-70 and 5th Street as evidenced by two fill pipes with gasoline brand tags (Flying A and Union 76) (Photos 3 through 5) and the results of a geophysical survey completed during our referenced 2014 site investigation.

The approximate abandoned UST locations are depicted on Figure 2. A copy of the *Geophysical Investigation Results* prepared by Advanced Geological Services is in Appendix A.

2.2 Historical and Regulatory Document Review

2.2.1 Sanborn Fire Insurance Maps

1921 and 1948 Sanborn Maps provided by Caltrans depict historical service station facilities (“Gas & Oil”) at the southwest corner of SR-70 and 5th Street on the current vacant lot portion of the 420 E Street Parcel (Map ID #4). The 1948 Sanborn Map depicts an “Auto Sales & Service” building at the current building location on the 420 E Street Parcel (Map ID #4).

Other potential historical facilities of interest identified within the project limits on the Sanborn Maps include:

- “Dunning Bros. Co. Garage” (1921) at the southwestern corner of E and 4th Streets (Map ID #1).
- “Garage” and “Gas & Oil” (1921 and 1948 maps) immediately south of southwestern corner of E and 4th Streets (adjacent and south of Map ID #1).
- “Oil & Gas” station (1921 & 1948 maps) at the southeastern corner of E and 4th Streets (Map ID #2).
- “Gas & Oils” station (1948 map) at the northeastern corner of E and 4th Streets (Map ID #3).
- “Gas & Oil” stations (1948 map) at the northwestern and northeastern corners of E and 5th Streets (Map ID #5 and #6).

The 1921 and 1948 Sanborn Maps depicting the former service station and automobile garage locations along SR-70 (E Street) within the project limits are on Figures 3-1 and 3-2.

2.2.2 GeoTracker and EnviroStor Databases

We reviewed regulatory database records for leaking UST (LUST) facilities within the project boundaries on the State Water Resources Control Board (SWRCB) GeoTracker website (<http://geotracker.waterboards.ca.gov/>). The information obtained for the identified facilities along

with their Map IDs are summarized below. The approximate facility locations by Map ID number are presented on the Site Plan, Figure 2.

- **Sierra Central Credit Union (Former Texaco Station), 422 4th Street, Map ID #2.** This facility is an Open LUST Cleanup Site regulated by the Central Valley Regional Water Quality Control Board (CVRWQCB). A former Texaco service station facility reportedly operated at the southeast corner of SR-70 and 4th Streets between 1955 and 1979 (also identified as a gasoline station on 1921 and 1948 Sanborn Maps). The fuel USTs were removed from this facility by 1979. Site investigations performed at this facility since 1992 included the installation of seven onsite wells and two offsite wells within SR-70. Petroleum hydrocarbon soil and groundwater impacts have been identified at this facility. Vacuum extraction was performed at this facility in January 2013 including the removal of 740 gallons of treated groundwater. Depth to groundwater in May 2014 ranged from 21 to 24 feet with flow direction toward the east-northeast. The CVRWQCB has directed that this facility and the adjacent LUST case to the north (former Mobil, Map ID #3) to perform coordinated groundwater monitoring and include data from both facilities showing combined groundwater impacts. An April 2013 report for this facility identified the current McDonalds property across SR-70 as being a former “gas & oil” station (former Twin Cities Garage). A November 20, 2014, workplan for this facility proposed the performance of two soil borings near the existing bank building to determine if the facility meets the vapor intrusion criteria for a low-threat regulatory case closure. The workplan was approved by the CVRWQCB in writing dated December 2, 2014. Groundwater impacts associated with this facility likely extend into the Caltrans ROW to the west but do not appear to have impacted the 420 E Street Parcel. Copies of the most recent (May 2014) groundwater flow direction/plume maps and monitoring well analytical summary tables for this facility are in Appendix B.
- **Marysville Plaza (Former Mobil Station, current Subway), 401 E Street, Map ID #3.** This facility is an Open LUST Cleanup Site regulated by the CVRWQCB. A former Mobil service station facility reportedly operated at this property located at the northeast corner of SR-70 and 4th Streets between 1953 and 1963 (also identified as a gasoline station on 1948 Sanborn Map). Four USTs were closed-in-place (sand-filled) at the southwestern corner of this facility extending beneath the SR-70 sidewalk area. Site investigations performed at this facility since 1993 included the installation of three onsite wells and three offsite wells including well MW-4 within the center median area of SR-70 and well MW-6 located directly across SR-70 from the southern USTs on the 420 E Street Parcel. Petroleum hydrocarbon soil and groundwater impacts have been identified at this facility. Planned site activities in a workplan dated March 27, 2013, include quarterly groundwater monitoring, soil gas sampling and interim remediation consisting of high-vacuum hydrocarbon mass removal. The workplan was approved by the CVRWQCB in writing dated April 9, 2013. Depth to groundwater in August 2014 ranged from 24 to 26 feet with an easterly flow direction. Groundwater impacts associated with this facility likely extend into the Caltrans ROW but do not appear to have impacted the 420 E Street Parcel. Further, based on the lack of impacts in well MW-6, potential groundwater impacts from the southern USTs located on the 420 E Street Parcel have not migrated across SR-70. Copies of the most recent (August 2014) groundwater flow direction/plume maps and monitoring well analytical summary tables for this facility are in Appendix B.
- **Shell Station, 501 5th Street, Map ID # 5, Photo 6.** This active gasoline station facility, located at the northwest corner of SR-70 and 5th Street, received LUST case closure status from the CVRWQCB in January 2014. The facility was identified as a gasoline station on the 1948 Sanborn Map in a different configuration from the existing station. Fuel and waste oil USTs and associated contaminated soil were removed from this facility in 1986 and 1990. Site investigations performed

at this facility since 1991 included the installation of nine onsite and seven offsite wells. The facility-related monitoring wells, including wells MW-6 and MW-8 located adjacent to and on the 420 E Street Parcel, were destroyed in 2013. Petroleum hydrocarbon soil and groundwater impacts have been identified at this facility. Groundwater extraction was performed at this facility between 2006 and 2009 including the removal of 418,505 gallons of treated groundwater. Depth to groundwater in July 2012 ranged from 20 to 25.5 feet with variable flow direction. The lateral extent of gasoline-groundwater from this facility likely extends onto the 420 E Street Parcel as evidenced by elevated gasoline constituents (7,800 micrograms per liter [$\mu\text{g/l}$] gasoline and 62 $\mu\text{g/l}$ benzene) in monitoring well MW-6 formerly located on the south side of 5th Street in the Caltrans ROW (sidewalk area). Former monitoring well MW-8 located further south on the 420 E Street parcel was non-impacted by the gasoline groundwater plume associated with this active gasoline station facility. Copies of the most recent (July 2012) groundwater flow direction/plume map and monitoring well analytical summary tables for this facility are in Appendix B.

2.3 Waste Determination Criteria – Petroleum Hydrocarbons

Currently, regulatory criteria for the classification of wastes based solely on the concentrations of gasoline-range organics (GRO), diesel-range organics (DRO), oil-range organics (ORO), and volatile organic compounds (VOCs) have not yet been promulgated. Disposal of petroleum hydrocarbon and VOC-impacted soil and groundwater is generally regulated by disposal facility permit and acceptance criteria.

3.0 SCOPE OF SERVICES

We performed the following scope of services as requested by Caltrans in TO No. 45 and by the Caltrans TO Manager, Mr. Mark Melani.

3.1 Pre-field Activities

- Mr. John Juhrend with Geocon performed a brief site visit on December 12, 2014, to identify the project boundaries and existing site conditions. The proposed UST investigation areas at the 420 E Street Parcel (Map ID #4) were marked in white paint for subsequent utility clearance.
- Utilized the *Health and Safety Plan* dated March 2014 to provide guidelines on the use of personal protective equipment and the health and safety procedures implemented during the field activities.
- Provided 48-hour notice to Underground Service Alert (USA Ticket No. 0521456) prior to job site mobilization.
- Retained the services of Advanced Technology Laboratories (ATL), a Caltrans-approved and California-certified analytical laboratory, to perform the chemical analyses of soil samples.

3.2 Field Activities

The field sampling activities consisted of the advancement of borings B1 through B9 to a maximum depth of 20 feet using hand-auger methods and Geocon's truck-mounted direct-push rig. Soil samples were generally collected at 4-foot intervals.

4.0 INVESTIGATIVE METHODS

4.1 Boring Location Rationale

Caltrans requested the performance of soil borings at each of the abandoned UST locations within the SR-70 ROW (sidewalk area) in front of the 420 E Street Parcel (Photo 1). The borings were performed to confirm the approximate UST locations and to obtain soil samples for initial characterization of potential UST-related soil impacts. Borings B1 and B2 were located to either side of the abandoned UST previously encountered in boring 70/5-SW during our March 2014 site investigation at the southwest corner of SR-70 and 5th Street (Photo 2). Borings B3 through B9 were performed in the vicinity of the two abandoned gasoline USTs located approximately 130 feet south of the corner of SR-70 and 5th Street (Photo 3). The approximate soil boring locations are depicted on Figure 4 and in the attached site photographs.

4.2 Utility Surveys

Responding USA subscribers marked potential utility conflicts prior to the start of the fieldwork. The presence of the USTs and buried utilities required that each boring location be hand-augured to a depth of at least 5 feet prior to using direct-push sampling techniques.

4.3 Site Safety and Traffic Control

A project safety meeting was held prior to starting the field sampling activities. We provided advance warning signs and cones including “sidewalk closed ahead” signs during the field sampling activities.

4.4 Soil Sampling Activities

We performed the field sampling activities on December 17, 2014. Shallow soil samples were collected directly from the hand-auger bucket and placed in stainless steel sample tubes. Continuous core soil samples obtained from the deeper direct-push portion of the borings were collected in 4-foot-long, 1.75-inch-diameter, cellulose thermoplastic (acetate) sample liners. Selected 6-inch-long sample intervals were cut from the continuous core sample tubes. Each soil sample container was fitted with Teflon™ sheets, capped, labeled and placed in an ice chest, pending delivery to ATL under chain-of-custody (COC) documentation.

The borings were logged by a Geocon Professional Geologist using the Unified Soil Classification System. Selected intervals of soil remaining in the acetate liners were transferred to re-sealable Ziploc® plastic bags and evaluated for odor and soil discoloration. The sample bags were field-screened using a photo-ionization detector (PID) as a qualitative indicator of potential VOCs. Soil sample intervals, soil description and PID readings are presented on the boring logs in Appendix C.

Quality assurance/quality control (QA/QC) procedures were performed during the field sampling activities. These procedures included decontamination of sampling equipment before each boring was advanced and providing COC documentation for each soil sample submitted to the laboratory. The soil sampling equipment was cleansed between each boring by washing the equipment with an Alconox™ solution followed by a double rinse with deionized water. The field sampling activities were performed under the supervision of Geocon's TO Manager.

The borings advanced to a depth exceeding 5 feet were backfilled with Portland cement through a tremie pipe. Borings advanced to a depth of five feet or shallower were backfilled with clean native soil. Each boring was capped at the surface with an approximate 3-inch-thick layer of concrete. Excess soil generated from the borings was placed into one labelled 55-gallon drum that was transported to the Geocon warehouse pending proper disposal as non-hazardous waste.

4.5 Laboratory Analyses

Selected soil samples collected within the project boundaries were submitted to ATL for the following analyses under standard ten-day turn-around-time (TAT).

- Eighteen soil samples were analyzed for gasoline analysis package including GRO following United States Environmental Protection Agency (EPA) Test Method 8015B (modified), benzene, toluene, ethylbenzene, and total xylenes (BTEX) following EPA Test Method 8021, and methyl tert-butyl ether (MTBE) following EPA Test Method 8260B.
- Twelve soil samples were analyzed for DRO and ORO following EPA Test Method 8015B.
- Four soil samples were analyzed for semi-volatile organic compounds (SVOCs) following EPA Test Method 8270C.
- Two soil samples were analyzed for Title 22 metals following EPA Test Methods 6010B and 7471A (mercury).

In accordance with Caltrans Contract 03A2132, ATL homogenized the soil samples prior to analysis for metals. QA/QC procedures were conducted for each method of analysis with specificity for each analyte listed in the test method's QA/QC. The laboratory QA/QC procedures included the following:

- One method blank for every ten samples, batch of samples or type of matrix, whichever is more frequent.
- One sample analyzed in duplicate for every ten samples, batch of samples or type of matrix, whichever is more frequent.
- One spiked sample for every ten samples, batch of samples or type of matrix, whichever is more frequent, with the spike made at ten times the detection limit or at the analyte level.

The COC documentation was reviewed for accuracy and completeness prior to submitting the soil samples to the laboratory. The laboratory was instructed to handle, analyze, and conduct QA/QC

procedures in accordance with Caltrans Contract 03A2132. Copies of the laboratory analytical report including QC summary and COC documentation are in Appendix D.

5.0 FIELD OBSERVATIONS AND INVESTIGATIVE RESULTS

5.1 Soil and Hydrogeologic Conditions

Soils conditions encountered in the borings consisted of fill soils generally comprised of road base gravels and sands and undifferentiated fill containing trace amounts of brick debris overlying natural alluvial deposits. Fill materials were encountered as deep as 5 feet and primarily consist of fine sand and silty clay. The underlying alluvial deposits generally consist of fine-grained silty clay with intermittent layers of sand and gravel. In the absence of natural texture, rootlets, and mottling, the native materials appear to have been used in some locations as backfill making it difficult to distinguish the bottom depth of the fill deposits.

Field indicators of petroleum hydrocarbon impacts (e.g. staining, odors, elevated PID readings) were identified in soil cores obtained from borings B1, B2, B6, and B7. In borings B1 and B2, hydrocarbon impacts were first observed at 5 and 6.5 feet, respectively, and continued to be observed for the total respective depths explored of 20 and 15 feet. In borings B6 and B7, hydrocarbon impacts were observed in two depths separated by approximately 7 feet of unimpacted soil between them. The shallower contamination in borings B6 and B7 was observed from approximately 5.5 to 7.5 feet, and the deeper contamination started at depths of 14.25 and 13 feet, respectively. Perched groundwater (localized seepage) was encountered in borings B1 and B2 at depths of 4 and 3 feet respectively.

5.1.1 UST Observations

The bottom depths of the USTs located approximately 130 feet south of the southwest corner of SR-70 and 5th Street were determined by opening and lowering a tape measure inside the fill pipes. The bottom of the northern and southern fill pipes were measured at 7.2 and 7.0 feet, respectively. No liquid was observed on the tape measure upon its removal from the fill pipes indicating that both USTs do not contain liquid. We encountered the top of the USTs in borings B4, B5, and B8 at depths of 3.4, 3.8 and 3.8 inches, respectively. Based on the approximate top and bottom measurements, the USTs are likely 500 gallon tanks in capacity. Rusted metal piping associated with the USTs was observed in borings B3 and B4 (Photo 6). UST-related parts (UST, piping) were not encountered while drilling borings B1, B2, B6, B7, and B9.

Boring logs depicting the soil conditions encountered, soil sample locations and PID readings are in Appendix C.

5.2 Soil Analytical Results

Summaries of the soil sample analytical data are on Tables 1 and 2. The laboratory report and chain-of-custody documentation are in Appendix D.

5.2.1 Abandoned UST location at Southwest Corner of SR-70 and 5th Street (B1 & B2)

Benzene, toluene, MTBE and SVOCs were not detected at or exceeding the laboratory reporting limits (RLs) for each soil sample analyzed. GRO was detected in eight of nine soil samples analyzed at concentrations ranging from 150 to 2,000 milligrams per kilogram (mg/kg). DRO and ORO were detected in each of the six soil samples analyzed at concentrations ranging from 2.1 to 340 mg/kg. Ethylbenzene and/or total xylenes were detected in two soil samples at concentrations ranging from 600 to 2,300 micrograms per kilogram ($\mu\text{g}/\text{kg}$).

Nine Title 22 metals were detected exceeding RLs in soil sample B1-4.5 at concentrations ranging from 4.6 to 120 mg/kg. The Title 22 metal detections generally fall within the range of naturally occurring background levels as presented in *Background Concentrations of Trace and Major Elements in California Soils* (Kearney Foundation of Soil Science, Division of Agriculture and Natural Resources, University of California, March 1996).

5.2.2 Abandoned USTs 130 feet South of Southwest Corner of SR-70 and 5th Street (B3 – B9)

MTBE and SVOCs were not detected at or exceeding the laboratory RLs for each soil sample analyzed. GRO was detected in four of nine soil samples analyzed at concentrations ranging from 510 to 1,600 mg/kg. DRO and/or ORO were detected in each of the six soil samples analyzed at concentrations ranging from 1.5 to 570 mg/kg. BTEX and/or ethylbenzene were detected in two soil samples at concentrations ranging from 850 to 28,000 $\mu\text{g}/\text{kg}$.

Nine Title 22 metals were detected exceeding RLs in soil sample B6-4.5 at concentrations ranging from 4.7 to 94 mg/kg. The Title 22 metal detections generally fall within the range of naturally occurring background levels.

5.3 Laboratory Data Validation

Review of ATL's QA/QC reports indicate non-detect results for the method blanks. ATL's Case Narrative stated that surrogate recovery was diluted out for three samples and was outside the laboratory acceptance limits in several samples. Post spike, matrix spikes (MS) and/or matrix spike duplicates (MSD) for numerous samples were outside recovery criteria; however, the data were validated by the laboratory control samples (LCS). The relative percent difference (RPD) for three duplicate and two MS/MSD samples was outside the RPD limit, stating "RPD value outside acceptance criteria. Calculation is based on raw values". Dilution was necessary for each MS/MSD sample analyzed by EPA Test Method 8270C due to possible matrix interference. Also, MS samples were

biased high and MS recovery for Test Method 8270C was outside acceptance limits for two sample due to possible matrix interference; however, the analytical batch was validated by the LCS. Based on the laboratory QA/QC data, no additional qualification of the data presented herein is necessary, and the data are of sufficient quality for the purposes of this report.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The presence of at least three abandoned gasoline USTs has been confirmed at two locations within the sidewalk area adjacent to the 420 E Street Parcel at the southwest corner of SR-70 and 5th Street. The USTs are associated with historical auto sales/service and gasoline station facilities at the 420 E Street Parcel.

Field indicators (i.e. staining, odors, elevated PID readings) of petroleum hydrocarbon soil impacts were identified at the UST locations. Field observations, soil analytical data and the presence of gasoline tags on the southern UST fill pipes confirm the tanks were previously utilized for gasoline storage. The tanks appear to be approximately 500 gallons in capacity.

Gasoline-range petroleum hydrocarbon impacts were encountered in borings B1 and B2 located adjacent to the abandoned UST at the southwest corner of SR-70 and 5th Street. The impacts extend from the approximate tank location (4.5 to 7.2 feet) to the maximum depths explored of 20 feet. Gasoline-range petroleum hydrocarbon impacts were further encountered in borings B6 and B7 performed adjacent to the two abandoned USTs located approximately 130 feet south of the southwest corner of SR-70 and 5th Street. The impacts were identified at sample depths of 6 and 14.5 feet but not in intermediate sample depths of 7.5 and 11.5 feet.

Based on the soil analytical data, regulatory closure status of the adjacent active Shell gasoline station and ongoing groundwater monitoring data generated for the former gasoline stations located across SR-70, the abandoned tank locations in the sidewalk area in front of the 420 E Street Parcel are likely suitable for regulatory closure status under the SWRCB's Low-Threat UST Case Closure Policy (LTCP, August 17, 2012). Potential application of the LTCP case closure policy is based on the following conditions:

- The maximum detections of benzene, ethylbenzene and naphthalene in shallow soil (10 feet deep or less) are less than the threshold soil concentrations presented in Table 1 of the LTCP (Table 1).
- The UST at the southwest corner of SR-70 and 5th Street resides within the former monitoring well network for the Shell station (Map ID #5, Figure 2). Former Shell well MW-6 was located approximately 35 feet to the east of the UST, and MW-8 was located approximately 35 feet to the south of the UST (Figure 4). Based on the reported detections of hydrocarbon constituents in groundwater samples from MW-6 and the lack of impacts detected in groundwater samples from MW-8, it appears that any contamination being contributed from the UST at the corner of SR-70 and 5th Street is minimal.
- Gasoline-range impacts detected in shallow soil samples collected from borings B6 and B7 performed adjacent to the two abandoned USTs located approximately 130 feet south of the southwest corner of SR-70 and 5th Street were separated from a deeper contaminated zone by approximately 7 feet of clean soil. Furthermore, soil samples from the two contaminated zones identified in boring B7 were reported with dissimilar BTEX concentrations, suggesting that the contamination may have originated from different sources.

- The USTs located approximately 130 feet south of the southwest corner of SR-70 and 5th Street reside between the former monitoring well network for the Shell station (Map ID #5, Figure 2) and the current monitoring well network for the former Mobil station (Map ID #3, Figure 2). Former Shell well MW-8 and Mobil wells MW-4 and MW-6 were/are located approximately 90 feet north, 200 feet south and 100 feet east of the USTs, respectively. MTBE has not been detected in groundwater samples collected from any of these three wells. Benzene concentrations in Mobil well MW-4 varied between relatively low-levels and below reporting limits. Benzene has predominantly not been detected in former Shell well MW-8 and Mobil well MW-6 (Figure 4). This indicates that impacts to groundwater (if any) originating from the USTs located approximately 130 feet south of the southwest corner of SR-70 and 5th Street are limited.

It is anticipated that the three abandoned tanks located within the sidewalk area adjacent to the 420 E Street Parcel will require removal prior to construction of planned highway improvements. Any regulatory requirements for additional soil and groundwater assessment will be determined following completed removal of the tanks and the results of soil confirmation sampling.

7.0 REPORT LIMITATIONS

This report has been prepared exclusively for Caltrans. The information contained herein is only valid as of the date of the report and will require an update to reflect additional information.

This report is not a comprehensive site characterization and should not be construed as such. The findings as presented in this report are predicated on the results of the limited sampling and laboratory testing performed. In addition, the information obtained is not intended to address potential impacts related to contaminant sources other than those specified herein. Therefore, this report should be deemed conclusive with respect to only the information obtained. We make no warranty, express or implied, with respect to the content of this report or any subsequent reports, correspondence or consultation. We strived to perform the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered.

**Subject: Geophysical Investigation Results
Underground Storage Tank (UST) Delineation
420 E Street and SW Corner of 5th St. and E St.
Marysville, California**

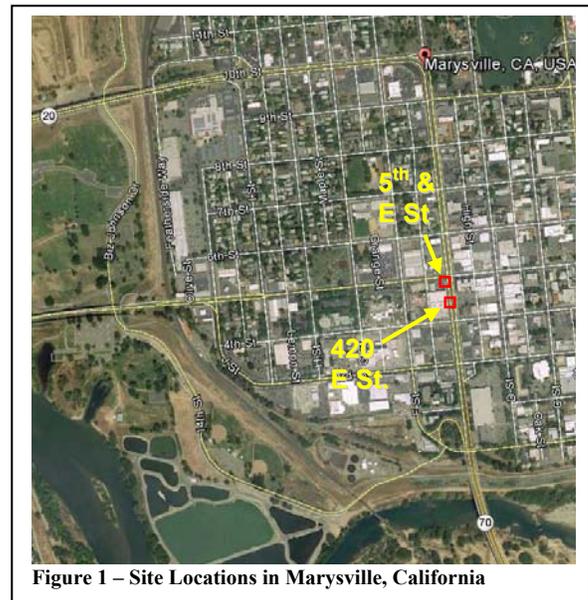

Mr. Juhrend-

1.0 INTRODUCTION

This letter presents the findings of Advanced Geological Services, Inc. (AGS) geophysical investigation to delineate the extent of underground storage tanks (UTSs) that were encountered at two locations along SR-70 (E Street) in Marysville, California (Figure 1). One location is on the southwest corner of 5th and E Street and the other location is at 420 E Street, about 120 feet south of the first location. For convenience in this report, the locations are designated as the North Site, and South site, respectively.

The field work was performed on March 18, 2014 by AGS geophysicist Roark Smith, who used a Geonics EM61 electromagnetic (EM) metal-detector with digital recording capabilities, a Fisher M-Scope metal detector (MD), and a GSSI SIR-3000 ground

penetrating radar (GPR) system. Briefly, the EM61 and M-Scope instruments were used to look for buried metal areas indicative of a UST, and GPR was used to obtain graphical profiles of the subsurface to better identify buried metal objects detected by the EM61 survey. In general, EM61 surveying is an important part of a UST investigation because it provides a deeper investigation depth than GPR, which can be as shallow as two feet at some sites. Depending on their size, the EM61 can detect objects as deep as 10 feet; however, the EM61 can detect only metallic objects and is subject to interference from vehicles, buildings, and other above-ground metallic objects.

2.0 RESULTS SUMMARY

North Site- A UST was encountered at a depth of about four feet during Geocon’s direct-push (DP) sampling activities at the North site. AGS identified a 4.5- by 7.0-foot area of elevated, metal-indicating EM61 response centered on the DP sample location. The elevated response may be associated with a UST; however, because the EM61 data were extremely noisy due to interference from numerous underground utilities and surface metal objects, the EM61 survey did not provide a definitive result regarding the extent of the UST. GPR achieved a signal penetration depth of about three feet; accordingly, the UST was not detected with GPR because it is too deeply buried to be imaged. North Site results are presented on Figure 5.

South Site- The presence of UST(s) at the South Site is indicated by two shallow pipe-wells imbedded in the sidewalk along E Street. Removing the metal plates (“lids”) covering each well revealed capped vertical pipes protruding from the ground, and one of the wells contained a placard reading “Associated Flying A Gasoline.” EM61 data show a single 5- by 9-foot area of elevated response associated with the two pipe-wells; accordingly, the EM61 data suggest that only one UST is present at this location. It’s possible that the two pipe-wells house UST vent and fill pipes, respectively. GPR achieved a signal penetration depth of about three feet; accordingly, the UST was not detected with GPR because it is too deeply buried to be imaged. South Site results are presented on Figure 6.

3.0 SITE DESCRIPTIONS

The investigation was performed at two sites along the west side of SR-70 (E Street) between 4th and 5th Streets. For convenience, they are referred to as the “North Site” and the “South Site.” The North Site is on the southwest corner of 5th and E Street, where AGS understands that an underground storage tank UST was encountered during Geocon’s recent direct-push (DP) sampling activities. AGS investigated an approximately 20- by 30-foot area centered on Geocon’s direct-push sample location. The area was crowded with numerous geophysical noise sources that included metal bollards and traffic signal poles, a metal storm drain grate, and three small pull-boxes for electrical cables and traffic signal control wiring (Figure 5).

The South Site is at 420 E Street, approximately 120 feet south of the North Site (Figure 6). The presence of UST(s) at this location is indicated by two shallow pipe-wells imbedded in the sidewalk (Figure 2, right). Removing the metal plates (“lids”) covering each well revealed a capped vertical pipe protruding from the ground, and one of the wells contained a placard reading “Associated Flying A Gasoline” (Figure 3, right).

4.0 GEOPHYSICAL METHODS AND EQUIPMENT

The geophysical investigation was performed using the following

Figure 2 – UST fill/vent pipe wells at 420 E Street

Figure 3 – Placard found in UST fill port at 420 E Street (South Site).

geophysical methods:

- Time-domain Electromagnetics (EM), using a Geonics EM61
- Electromagnetic metal detection (MD), using a Fisher TW-6 M-Scope
- Ground Penetrating Radar (GPR), GSSI SIR-3000 system connected to a 400-MHz antenna

Time-Domain Electromagnetics (EM) using a Geonics EM61

The EM61 is a high-sensitivity, high-resolution recording metal detector commonly used to search for buried metal objects, particularly at developed sites cluttered with surface obstructions such as buildings, parked cars, chain-link fences, and buried utilities. Typical targets for EM61 surveys include underground storage tanks (USTs), buried drums, reinforced concrete foundation remnants, buried refuse (which nearly always includes metallic debris), and individual metallic debris items. The EM61 operates by transmitting a pulsed magnetic field, which causes (induces) small electrical currents (eddy currents) to flow through metallic objects near (below) the instrument. The strength of these eddy currents is measured by the EM61 receiver coil at a relatively long time after the magnetic field pulse subsides. This delayed measurement technique produces a reading (in millivolts) that responds strongly to metal but very weakly to the electrical properties of the surrounding soil, thus making the EM61 a high-sensitivity metal detector. The EM61 employs a one-meter-wide square coil, and its sensitivity can be enhanced by the deployment of a second receiver coil above the first; the second coil response can be used to reduce interference caused by nearby power lines and cultural objects such as vehicles and metal fences.

Electromagnetic Metal Detecting using the Fisher M-Scope

AGS uses the M-Scope to rapidly scan for localized, shallowly-buried metal masses (e.g., a buried vault lid, manhole cover, metallic trash). Briefly, the M-Scope comprises a pair of wire coils (transmitter and receiver coils) connected by a short metal staff; the receiver coil is first “tuned” to a null position with respect to the magnetic field emanating from the transmitter coil. When the M-Scope is held near a metal object, the magnetic field becomes disrupted or distorted and the system is thrown “out of tune.” The M-Scope is designed to emit an audible tone when it is out of tune, thus signaling the presence of a nearby metal object. However, the M-Scope has a limited investigation depth (about 3 feet bgs) and is not effective near surface metal objects; in addition, because the M-Scope responds to changes in soil conductivity, its sensitivity setting must be reduced in electrically conductive (e.g., moist, fine-grained) soil, which results in a corresponding reduction in the instrument’s effectiveness.

Ground Penetrating Radar (GPR)

GPR uses radar technology to produce a graphical profile of the subsurface that shows soil layering and images of buried objects. GPR systems typically use a single transeiving antenna (one that both transmits and receives the radar signal) that is dragged along the ground surface. The antenna emits a radar pulse into the ground; some of the radar energy reflects off of interfaces between materials with different electrical properties (e.g., soil and a UST) and returns to the surface where it is detected by the antenna and sent via the cable to a separate control unit where it is amplified and displayed on a computer screen as a vertical “wobble trace,” which is a plot of the strength (amplitude) of the received GPR signal (i.e., the reflection) over time. Although the vertical scale of a GPR profile is usually

considered as depth, it actually measures the travel time of the radar pulse from the surface to a reflecting interface and back to the surface.

A subsurface profile is built as the antenna is pulled along the survey line and successive wiggle traces are recorded. GPR data are usually displayed as an array of closely-spaced traces; this procedure produces an image of the subsurface as the reflections (wiggles) on adjacent traces merge into coherent patterns. Soil layer boundaries appear as laterally continuous horizontal bands across a GPR profile. Buried objects appear as localized, high-amplitude (dark) reflection patterns. Buried pipes and USTs exhibit a characteristic “upside down U” hyperbolic pattern, which allows them to be readily identified on a GPR record. Burial depths are determined by using calibrating GPR profiles with images objects buried at known depths. Culverts and storm drain pipelines observed in drop inlets are often used for this purpose.

5.0 FIELD PROCEDURES

AGS first prepared a detailed map of each site so the investigation findings and the locations of the geophysical survey lines could be documented. The maps also showed site features that could produce geophysical noise so their presence and locations would be known when the geophysical data were examined for UST indications. The maps were prepared by laying down fiberglass tape measures in a grid pattern across each site and plotting the locations of significant site features, such as curb lines, building faces, metal poles, on grid paper (at scale of 1-inch equals 5 feet). AGS then performed a GPR survey by hand-pushing the cart-mounted GPR system back-and-forth across each site along a grid of lines spaced approximately three feet apart. AGS took special care to scan across the Geocon direct-push sample location where the UST was encountered and also across the UST pipe-wells to insure that GPR profiles at the UST locations were obtained. AGS plotted the starting and ending points of each GPR line on the site map as the GPR survey progressed. Next, AGS performed the EM61 survey by wheeling the EM61 instrument back-and-forth across the site along north-south survey lines spaced approximately three feet apart. The EM61 readings were obtained by pressing the instrument’s “demand-read” button every 2.5 feet along each survey line, and the readings were recorded by the EM61 data logger. As with the GPR survey, AGS plotted the starting and ending points of each line on the site map as the EM61 progressed. After the recording the EM61 data, AGS then scanned the site in “reconnaissance mode” to look for real-time UST indications. In reconnaissance mode, the EM61 instrument emits an audible tone in when the coils pass near metal objects, but no data are recorded. AGS also scanned each site with the Fisher M-Scope to look for buried metal indications.

6.0 DATA PROCESSING AND ANALYSIS

The M-Scope and GPR data were analyzed in the field as the investigation progressed. The M-Scope is designed to produce an audible tone when held near a metallic object; a detected object’s location is then pinpointed by adjusting the instrument’s sensitivity and monitoring the instrument readout to determine the “peak signal” location. For the GPR survey, AGS monitored the GPR data in the field to look for definitive

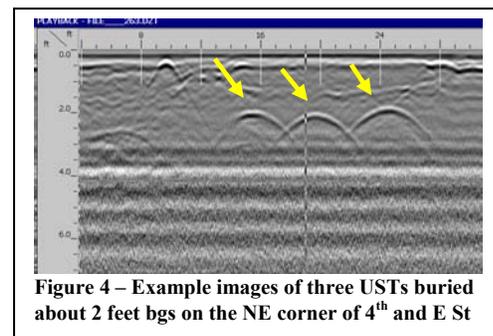

Figure 4 – Example images of three USTs buried about 2 feet bgs on the NE corner of 4th and E St

“upside-down U” reflection patterns, which would indicate a UST with near certainty. For reference, example USTs images from another Marysville location nearby (not part of this investigation) are presented on Figure 4, above. AGS took special care to obtain GPR data across suspected UST locations as indicated by the pipe-wells direct-push findings. AGS then re-examined the GPR data upon returning to the office to look for weaker images that may have gone unnoticed in the field.

EM61 data processing was done using the GEOSOFT Oasis montaj earth science software system. A GEOSOFT kriging algorithm was used to prepare color-filled contour maps showing EM61 response variations (in millivolts) across the site (Figures 5 and 6). As part of the analysis, AGS looked for high-amplitude responses not readily attributable to known metallic site features, such as vehicles and metal debris. Such responses are considered “anomalies” and are attributed to subsurface source bodies, which may include USTs, buried utilities, reinforced concrete foundations, and miscellaneous metallic debris. On the color contour maps, anomalies appear as “hot” (orange, red, and pink) colors representing areas with elevated EM61 measurements indicative of metallic objects.

Because the EM61 was designed to produce a positive signal peak at the center of the metallic source body, it tends to produce anomalies with a shape and extent that approximates the footprint of the metal source object. Accordingly, AGS looked for rectangular anomalies with a footprint corresponding to common UST dimensions, although it is worth noting that as part of the interpretation process AGS considers all buried metal anomalies and endeavors to attribute each one to a source object(s). Anomaly amplitudes associated with USTs and similarly-sized metallic substructures depend on burial depth, but they are typically 200 millivolts (mV) or greater.

AGS incorporated the site map into the EM61 contour map so that responses associated with surface metal objects and underground utilities could be identified and disregarded from consideration as a possible UST indication. As a further aid to the analysis, data profiles for each survey transect were prepared and inspected. The profiles are especially useful for assessing anomaly amplitudes and for identifying bad data caused by, say, a loose connection within the EM system or other type of equipment malfunction.

7.0 RESULTS

Investigation results are shown on Figures 5 and 6. Figure 5 is a map of the North Site investigation area that shows the EM61 and GPR survey line locations; the map also presents the EM61 survey results as a color-filled contour map. Similarly, Figure 6 is a map of the South Site investigation area that shows the EM61 and GPR survey line locations and the EM61 survey results.

North Site- A UST was encountered at a depth of about four feet during Geocon’s direct-push (DP) sampling activities at the North site. AGS identified a 4.5- by 7.0-foot area of elevated, metal-indicating EM61 response centered on the DP sample location. The elevated response may be associated with a UST; however, because the EM61 data were extremely noisy due to interference from numerous underground utilities and surface metal objects, the EM61 survey did not provide a definitive result regarding the extent of the UST. GPR achieved a signal penetration depth of about three feet; accordingly, the UST was not detected with GPR because it is too deeply buried to be imaged. North

Site results are presented on Figure 5.

South Site- South Site- The presence of UST(s) at the South Site is indicated by two shallow pipe-wells imbedded in the sidewalk along E Street. Removing the metal plates (“lids”) covering each well revealed capped vertical pipes protruding from the ground, and one of the wells contained a placard reading “Associated Flying A Gasoline.” EM61 data show a single 5- by 9-foot area of elevated response associated with the two pipe-wells; accordingly, the EM61 data suggest that only one UST is present at this location. It’s possible that the two pipe-wells house UST vent and fill pipes, respectively. GPR achieved a signal penetration depth of about three feet; accordingly, the UST was not detected with GPR because it is too deeply buried to be imaged. The overall high readings observed at the South Site indicate that other buried metal objects may also be present. South Site results are presented on Figure 6.

8.0 LIMITATIONS OF GEOPHYSICAL LOCATING METHODS

In general, a geophysical method’s limitations for detecting a particular target are related to the target’s size, burial depth, the amount of contrast in material properties between the target and surrounding material, and finally, the amount of interference from surrounding site features. For a target to be detected it must have sufficient size to reflect or otherwise disturb some the incoming energy used for detection. It also must have enough contrast with the surrounding material to reflect or otherwise disturb enough of the incoming energy so as to be detected. And, finally, it can’t be buried so deeply that the reflected/disturbed energy is so dissipated that it is too weak to be detected when it returns to the surface. Weak energy returns during geophysical investigations are further exacerbated by ambient noise like that produced by natural and cultural features, such as utilities, fences, parked vehicles, vegetative cover, and debris.

In general, metal USTs make good targets for geophysical investigations because the electrical properties of metal contrast greatly with those of the surrounding soil or fill material; however, UST investigations are often complicated by unfavorable soil conditions and by interference from surface or near-surface metallic objects such a vehicles, reinforced concrete pavement, and buried utilities, sometimes to the degree that little or no useful subsurface information can be obtained. As stated above and shown on Figure 5, the North Site contained numerous surface metal objects and a number of buried utilities that produced interfering noise in the EM61 geophysical data. In addition, the soil conditions limited the GPR signal penetration to approximately 3 feet and no UST images were observed on the GPR records. Accordingly, the geophysical investigation did not provide any additional information about the UST at the North Site. Although the South Site had the same GPR limitations as the North Site, it was relatively free of surface metal and buried utilities so that a coherent EM61 anomaly, one that appears to be associated with a UST, could be identified.

9.0 CLOSING

All geophysical data and field notes collected for this investigation will be archived at the AGS office. The data collection and interpretation methods used in this investigation are consistent with standard practices applied to similar geophysical investigations. The correlation of geophysical responses with probable subsurface features is based on the past results of similar surveys although it is possible that

some variation could exist at this site. Due to the nature of geophysical data, no guarantees can be made or implied regarding the targets identified or the presence or absence of additional objects or targets.

We appreciated working for you on this project and hope to work with you again. If you have any questions, I can be reached at (925) 808-8965 or Rsmith@Advancedgeo.com.

Respectfully,

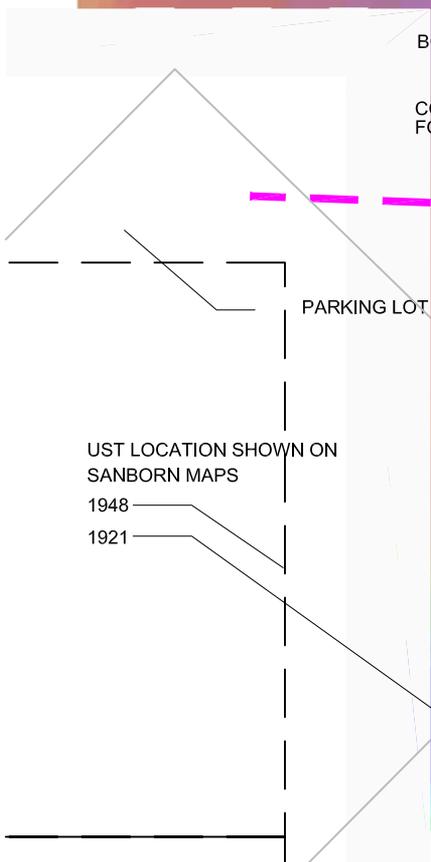

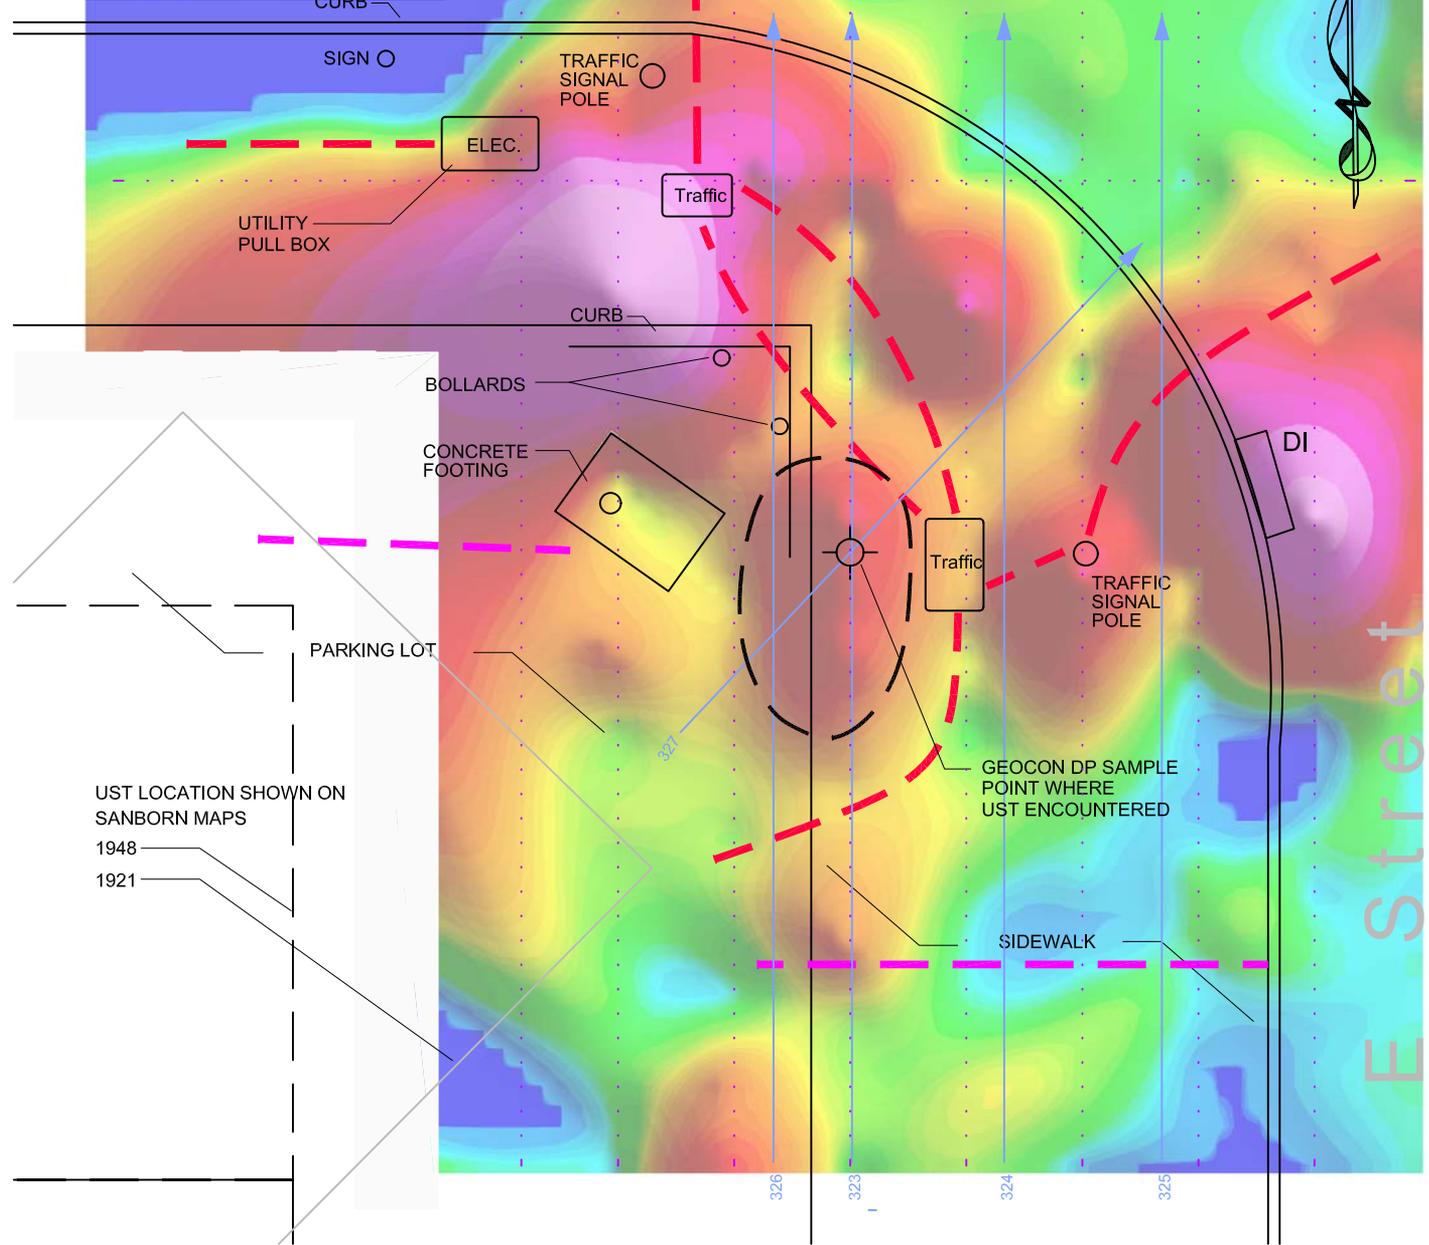

Roark W. Smith, GP 987
Senior Geophysicist
Advanced Geological Services

Abbreviations and Notes:

- TOC = Top of casing
- DTW = Depth to water
- GWE = Groundwater elevation
- (ft-amsl) = Feet above mean sea level
- ft = Feet
- µg/L = Micrograms per liter
- TPH-GRO = Total petroleum hydrocarbons - gasoline range organics
- VOCS = Volatile organic compounds

Oxygenate Compounds = diisopropyl ether, ethyl tertiary butyl ether, tert-amyl methyl ether, and tert-butanol by EPA Method 8260B.

Top of Riser Elevations = Elevations surveyed to mean sea level.

TPH = Total petroleum hydrocarbons.

MTBE = Methyl tertiary butyl ether.

Lead Scavengers = 1,2-dichloroethane (1,2 DCA), and 1,2 dibromoethane (EDB)

mg/L = Micrograms per liter.

NS = Not sampled.

NM = Not measured.

NC = Not calculated.

NA = Not analyzed.

ND = Concentrations not detected at or above laboratory reporting limits.

* = Diesel analysis using Silica Gel.

^a = Tert-Butanol.

^b = 1,2-DCA.

^c = Lower boiling point hydrocarbons present, atypical for Diesel Fuel.

Note: Top of riser (casing) elevations are based on survey performed by Morrow Surveying of West Sacramento, California on April 13, 2006 as reported by previous consultant, Earthtec, Inc.

TABLE 1

GROUNDWATER DATA
SHELL-BRANDED SERVICE STATION
501 EAST FIFTH STREET
MARYSVILLE, CALIFORNIA

Notes and Abbreviations:

TPPH = Total petroleum hydrocarbons as gasoline by EPA Method 8260B; prior to November 14, 2000, analyzed by EPA Method 8015, except where noted.

TEPH = Total petroleum hydrocarbons as diesel by modified EPA Method 8015.

BTEX = Benzene, toluene, ethylbenzene, xylenes by EPA Method 8260B; prior to November 14, 2000, analyzed by EPA Method 8020.

MTBE = Methyl tertiary butyl ether

DIPE = Di-isopropyl ether, analyzed by EPA Method 8260B

ETBE = Ethyl tertiary butyl ether, analyzed by EPA Method 8260B

TAME = Tertiary amyl methyl ether, analyzed by EPA Method 8260B

TBA = Tertiary butyl alcohol, analyzed by EPA Method 8260B

Ethanol analyzed by EPA Method 8260B.

Methanol analyzed by EPA Method 8260B.

1,2-DCA = 1,2-Dichloroethane, analyzed by EPA Method 8260B

EDB = 1,2-Dibromoethane, analyzed by EPA Method 8260B

TOC = Top of casing elevation (Elev) in feet relative to mean sea level (MSL)

SPH = Separate-Phase Hydrocarbons

GW = Groundwater

DO = Dissolved Oxygen

µg/L = Micrograms per liter (parts per billion)

ppm = Parts per million

ft = Feet

<n = Below detection limit

(D) = Duplicate sample

- = Not applicable

a = Chromatogram pattern indicated an unidentified hydrocarbon/Hydrocarbon does not match pattern of laboratory's standard.

b = Analyzed by EPA Method 8015.

c = Samples not analyzed due to labeling error; resampled on June 21, 2001.

d = DO Reading not taken

e = Top of casing elevation altered during wellhead maintenance.

f = Quantity of unknown hydrocarbon in sample based on gasoline.

g = The concentration reported reflect(s) individual or discrete unidentified peaks not matching a typical fuel pattern.

h = Hydrocarbon reported as TPH as Gasoline does not exhibit a typical Gasoline chromatographic pattern.

i = Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.

j = Laboratory Control Sample recovery was above the method control limits. Analyte not detected, data not impacted.

k = Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.

l = Analyzed by EPA Method 8015B (M).

m = Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.

n = The sample chromatographic pattern for TPH does not match the chromatographic pattern of the specified standard. Quantitation of the unknown hydrocarbon(s) in the sample was based upon the specified standards.

o = Sample container contained headspace.

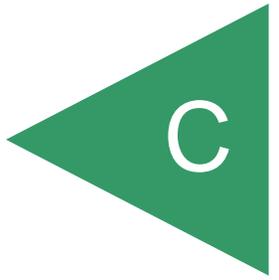

p = The MS/MSD were below the acceptance limits due to sample matrix interference. See Blank Spike (LCS).

q = Hydrocarbon result partly due to individual peak(s) in quantitation range.

r = The RPD exceeded the method control limit due to sample matrix effects. The individual analyte QA/QC recoveries, however, were within acceptance limits. Corrected groundwater elevation when SPH is present = Top-of-Casing Elevation - Depth to Water + (0.8 x Hydrocarbon Thickness).

Site surveyed March 15, 2002 and April 17, 2002 by Virgil Chavez Land Surveying (VCLS) of Vallejo, CA. MW-15 surveyed on October 22, 2008 by VCLS. Survey data for wells MW-7D and MW-9 provided by Cambria Environmental Technology.

Re: ATL Work Order Number : 1404056
Client Reference : SR70 & 5th St UST, S9805-01-45

Enclosed are the results for sample(s) received on December 19, 2014 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

Notes and Definitions

S7	Surrogate recovery was outside of laboratory acceptance limit. Chromatogram shows high concentration of heavy hydrocarbons.
S4	Surrogate was diluted out.
R	RPD value outside acceptance criteria. Calculation is based on raw values.
M7	Matrix spike was high biased. Sample result/s was non-detect (ND) for the target analyte; therefore reanalysis was not necessary.
M2	Matrix spike recovery outside of acceptance limit due to possible matrix interference. The analytical batch was validated by the laboratory control sample.
M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
D2	Sample required dilution due to high concentration of non-target analyte.
D1	Sample required dilution due to possible matrix interference.
ND	Analyte is not detected at or above the Practical Quantitation Limit (PQL). When client requests quantitation against MDL, analyte is not detected at or above the Method Detection Limit (MDL)
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

- (1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.
- (2) The suffix [2C] of specific analytes signifies that the reported result is taken from the instrument's second column.
- (3) Results are wet unless otherwise specified.

REMARKS: Hold

As the authorized agent of the company above, I hereby purchase laboratory services from ATL as shown above and hereby guarantee payment as quoted.

Submitter Print Name: **Josh Ewert** Signature:

Date: 12/16/14 Time: 16:30

Received by: (Signature and Printed Name) **Josh Ewert** Date: 12/16/14 Time: 16:30

Relinquished by: (Signature and Printed Name) _____ Date: _____ Time: _____

1. Sample receiving hours: 7:30 AM to 7:30 PM Monday - Friday; Saturday 8:00 AM to 12:00 PM.
 2. Samples submitted AFTER 3:00 PM are considered received the following business day at 8:00 AM.
 3. The following turnaround time conditions apply:
 TAT = 0 : 300% Surcharge SAME BUSINESS DAY if received by 9:00 AM
 TAT = 1 : 100% Surcharge NEXT BUSINESS DAY (COB 5:00 PM)
 TAT = 2 : 50% Surcharge 2ND BUSINESS DAY (COB 5:00 PM)
 TAT = 3 : 30% Surcharge 3RD BUSINESS DAY (COB 5:00 PM)
 TAT = 4 : 20% Surcharge 4TH BUSINESS DAY (COB 5:00 PM)
 TAT = 5 : NO SURCHARGE 5th BUSINESS DAY (COB 5:00 PM)
 4. Weekend, holiday, after-hours work ... ask for quote.
 5. Subcontract TAT 10 - 15 business days. Projects requiring shorter TATs will incur a surcharge respective to the subcontract lib ... ask for quote.
 6. Liquid and solid samples will be disposed after 45 calendar days from receipt of samples, air samples will be disposed after 14 calendar days from receipt of samples.
 7. Electronic reports may be needed for five (5) years from receipt of samples.
 8. Hard copy reports will be disposed after 45 calendar days from report date.
 9. Storage and Report ...
 - Liquid & solid as no es: Complimentary storage for forty-five (45) calendar days from receipt of samples; \$2/sample/month if extended storage - o' hold is requested.
 - Air samples: Complimentary storage for ten (10) calendar days from receipt of samples; \$20/sample/week if extended storage is requested.
 - Hard copy and leg' nated reports/EOD: \$17.50 per hard copy report requested; \$50.00 per regenerated/reformatted report; \$35 per processed i 3D.
 10. Rush TAT/STLC as n, les: add 2 days to analysis TAT for extraction procedure.
 11. Unanalyzed samples will incur a disposal fee of \$7 per sample.
