

STPI FACTSHEET

Statewide Transportation Projects Inventory

What is STPI?:

- GIS Data Repository
- Spatial Opportunities
- Availability & Accessibility to online Resources

Geographical Information System (GIS) Data Repository

STPI is the most complete collection for statewide planned and programmed transportation projects. The development of geospatial information and GIS tools allows visualization of project locations and their relationships with the existing transportation system and land use. Understanding these patterns and interpreting spatial project data conveys short- and long-range planning usefulness and provides opportunities for coordination and collaboration among stakeholders.

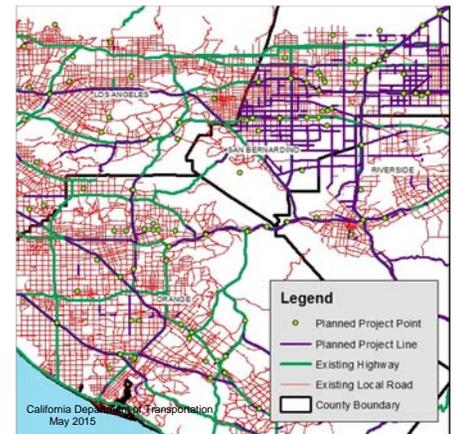

Notable Benefit:

The STPI repository assists planners, engineers, management and policy decision-makers for refining existing land use & transportation policies.

STPI applies up-to-date data from adopted state modal, tribal transportation, and regional transportation plans identify gaps and reveal deficiencies in the transportation system.

Originally, the California Interregional Blueprint (CIB) articulated the State's vision for the multimodal system by incorporating geospatial tools and information laying the foundation for the California Transportation Plan (CTP). The CTP's goals and policies complement the transportation agencies' regional transportation plans and their respective sustainable communities strategies that share land use and transportation demands.

STPI will be available in late 2015 as a data download and a viewable data layer in Caltrans Earth.

Benefits:

- Provides mapping and spatial analysis of current constrained projects in GIS
- Supports improved coordination and timing of transportation projects among California stakeholders
- Facilitates early planning for a variety of programs, such as scoping considerations in the planning process with Tribal Nations, federal, state, and regional agencies by identifying key challenges and opportunities
- Improves available transportation project data for system and corridor planning, and project scoping coordination for project development
- A way to spatially communicate analysis through GIS tools that agencies use to consider geographic features in the maintenance and design of their infrastructure, and allows to compare asset condition data with socio-economic, environmental, financial, and other types of data to identify relationships
