The compensation provided under this change order is based on steel erection being performed under a 10-hour day 6-day per week schedule in an effort to support the placement of traffic on the Temporary Bypass Structure by September 8, 2009. This effort is based on steel delivery to the jobsite or lay down yard beginning as outlined below:

1) Fabricated Steel for Skid Beam & Bent (Bents A3 through A6 & Bents B3 through B6) - Steel delivery shall begin by December 23, 2008.

2) Fabricated Steel for Skid Beam & Bent (Bents A1 through A2 & Bents B1 through B2) - Steel delivery shall begin by Apri 9, 2009.

3) Fabricated Steel for the Truss - Steel delivery shall begin by March 7, 2009.

In the event these steel delivery schedules are not met or ensuing deliveries are insufficient to sustain the Contractor's erection operations, the Contractor may be ordered by the Engineer to expedite their subsequent steel erection activities in order to mitigate any delays to the completion of the work. Any costs associated with any expedition of the work, if so ordered, shall be compensated separately from this change order.

Estimated cost of Extra Work at Lump Sum $14,712,500.00

Estimated Cost: Increase ☑ Decrease ☐ **$14,712,500.00**

By **reason of this order the time of completion will be adjusted as follows:** Deferred

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 129	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Complete the erection and construction of the East Tie-In truss and associated metal decking including all shear studs, bolting and testing by June 19, 2009, as necessary to permit placement of the East Tie-In truss deck reinforcing steel and concrete.

The Contractor agrees to accept the lump sum of $535,000.00 as full compensation for any and all additional labor, materials and equipment costs incurred as a result of this change, including all surcharges, markups, profit, and any adverse impacts to productivity and efficiency. The aforementioned lump sum shall include full compensation for all additional overtime and working nights, Sundays and holidays as necessary to perform this work.

In the event the East Tie-In truss and associated metal decking, including all shear studs, bolting and testing, are completed prior to June 19, 2009, the Contractor shall be paid additional incentives as outlined below on subsequent supplemental contract change orders:

Completion Date	Additional Incentive
6/18/2009	$107,000.00
6/17/2009	$214,000.00
6/16/2009	$321,000.00
6/15/2009	$428,000.00
6/14/2009	$481,500.00
6/13/2009	$535,000.00
6/12/2009	$588,500.00
6/11/2009	$642,000.00
6/10/2009	$695,500.00
6/9/2009	$749,000.00
6/8/2009	$802,500.00
6/7/2009	$856,000.00
6/6/2009	$909,500.00
6/5/2009	$963,000.00
6/4/2009	$1,016,500.00
6/3/2009	$1,070,000.00
6/2/2009	$1,123,500.00
6/1/2009 or earlier	$1,177,000.00

RECEIVED
010215 MAY -7 09

The contractor agrees that payment of the above referenced incentives shall constitute full compensation of all costs incurred to achieve the associated referenced completion dates, including all surcharges, markups, profit, and any adverse impacts to productivity and efficiency. No further compensation shall be allowed.

CCO DESCRIPTION: Acceleration of ETI Truss	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

a monetary incentive to the Contractor to complete the erection and construction of the East Tie-In truss and associated metal decking, including shear studs, bolting and testing, by June 19, 2009.

The Temporary Bypass Structure (TBS) was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

CCO 129 Supplemental 0 includes compensation of $535,000.00 for potential costs which may be incurred as a result of delays to the construction of temporary crane access. Supplemental 1 proposes to compensate the contractor for costs incurred to accelerate the construction of the ETI Truss and associated metal decking for $535,000.00. It is coincidental that two amounts are the same.

Compensation for this change shall be performed as an Adjustment of Compensation at Lump Sum. The contractor shall be paid the lump sum of $535,000.00 to complete the erection and construction of the East Tie-In Truss and metal decking including shear studs, bolting and testing, by June 19, 2009. In the event the contractor is able to complete said activities prior to June 19, 2009, additional incentives shall be paid as outlined below on subsequent supplemental contract change orders:

Completion Date	Additional Incentive
6/18/2009	$107,000.00
6/17/2009	$214,000.00
6/16/2009	$321,000.00
6/15/2009	$428,000.00
6/14/2009	$481,500.00
6/13/2009	$535,000.00
6/12/2009	$588,500.00
6/11/2009	$642,000.00
6/10/2009	$695,500.00
6/9/2009	$749,000.00
6/8/2009	$802,500.00
6/7/2009	$856,000.00
6/6/2009	$909,500.00
6/5/2009	$963,000.00
6/4/2009	$1,016,500.00
6/3/2009	$1,070,000.00
6/2/2009	$1,123,500.00
6/1/2009 or earlier	$1,177,000.00

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

The agreed lump sum base acceleration and potential additional incentives will be funded through the contract's contingency funds. A cost analysis is in the project files.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Patrick Treacy - HQ Asst. Construction Coordinator. TBPOC granted an Authorization to Approve at their March 5, 2009 meeting.

Maintenance concurrence is not required, as this is a temporary structure and doesn't affect any permanent roadway features.

475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

compensating the Contractor for achieving the full incentive payment as specified under Contract Change Order No. 129, Supplement No. 1 for the early completion of the erection of the East Tie-In steel truss.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In to Yerba Buena Island and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

Contract Change Order No. 129, Supplement No. 1 provided compensation to the contractor to complete the erection of the ETI steel truss by June 1, 2009. The change order also specified incentive payments to be provided based on the contractor completing the steel erection prior to June 1, 2009. The contractor had completed the steel erection on May 31, 2009 and has qualified for the full incentive payment as specified under the change order.

This change order provides for the full incentive payment as specified under Change Order No. 129, Supplement No. 1. Approval for this supplemental change order from the TBPOC was previously granted on March 5, 2009 and reaffirmed on June 4, 2009. As such it is not necessary for the Contractor to sign this supplemental, which will be processed unilaterally.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum price of $1,177,000.00 which shall be financed from the contract's contingency funds. A cost analysis are on file.

There will be no time adjustment due to work of this change since the work involved does not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Patrick Treacy - HQ Asst. Construction Coordinator.

Maintenance concurrence is not required as this is an administrative change.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 130	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

In accordance with Section 5-1.25 "Payments" of the contract Special Provisions, the retention of any percentage of the estimated value of work done or value of materials to have been furnished and delivered to the project as specified under Section 9-1.06 "Partial Payments" of the contract Standard Specifications shall not apply.

This change order provides compensation to the Contractor equal to the cumulative amount of funds withheld on the monthly Progress Payments pertaining to the retention of funds specified under the third paragraph of Section 9-1.06 of the contract Standard Specifications until such time that those retained funds are released by the Department to the Contractor.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor to account for funds retained (based on Section 9-1.06 "Partial Payments" of the contract Standard Specifications) by the Department on monthly Progress Payments. Compensation shall be paid on a monthly basis equal to the amount of funds retained on each Progress Payment.

The final compensation paid under this adjustment shall be $22,110,000.00.

Upon release of the retention withheld by the Department on the monthly Progress Payments, provide a credit to the Department of all corresponding funds paid pertaining to the $22,110,000.00 adjustment provided under this change order.

The final credit provided under this adjustment shall be $22,110,000.00.

Provide compensation to the Contractor for all interest costs incurred as a result of the funds retained (based on Section 9-1.06 "Partial Payments" of the contract Standard Specifications) by the Department on monthly Progress Payments No. 1 through No. 50. For these costs, the Contractor shall be compensated an agreed lump sum of $136,510.00 which represents full compensation for all interest cost incurred pertaining to the retained funds through the April 2008 Progress Payment.

Total Cost of Adjustment of Compensation at Lump Sum $136,510.00

475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor to account for the non-contractual retention of funds withheld on the monthly progress pay estimates with a credit provided to the Department upon the release of these withheld funds.

Section 5-1.25 "Payments" of the contract Special Provisions specify that the third and forth paragraph of Section 9-1.06 "Partial Payments" of the contract Standard Specifications shall not apply. These paragraphs pertain to the retention of 10% to 5% of the estimated value of work done or value of materials to have been furnished and delivered to the project. It was the intent of the Special Provisions that this retention would not apply to this contract.

This contractual provision was not enacted into the project's monthly progress pay estimates and retention has been withheld on these estimates over the first 4 years of the contract. This non-contractual retention of funds has recently been discovered and attempts have been made to have all withheld funds released and to eliminate the retention on future progress pay estimates. These efforts have, however, been unsuccessful due to technical issues with the Department's payment system software. This change order shall provide compensation for both the previous taken project retentions and anticipated retentions on future pay estimates in order to release these non-contractually withheld funds in a timely manner.

Through the February 2008 Progress Pay Estimate, the Department has withheld $7,023,151.63 in project retention representing 5% of the value of work paid. This change order shall immediately provide compensation equal to these withheld funds. Additional compensation shall be provided on a monthly basis equal to the retention withheld of each subsequent monthly pay estimate. Upon the release of these retained funds, this change order shall provide a credit to the Department equal to the amount of the released funds. Once all retained funds are released, the compensation and the credit provided under this change shall result in no cost to the Department.

Failure to provide the compensation specified under this change order shall result in considerable interest cost to the Department. At the current amount of $7,023,151.63 in project retention, interest will accrue at a rate of over $35,000 per month, which will increase as additional funds are retained each month. The estimated final cost could exceed $2,000,000 in interest for both past and future withheld retention. This change order provides compensation of $136,510.00 for interest cost over the 4 month period from the December 2007 Progress Payment to the April 2008 Progress Payment at a 6% annual rate. The compensation provided reflects interest costs from approximately 1 month after the contractor requested the release of retention in November 2007 to the April 2008 Progress Payment when it is anticipated that this change order will act to release those retained funds.

Compensation shall be provided as an adjustment of compensation at a lump sum of $22,110,000, which represents 5% of the current approved contract allotment of $442,200,000. An additional adjustment of compensation shall provide a credit to the Department at an equal lump sum of $22,110,000. Upon the release of all retained funds, each lump sum shall be paid in full resulting in no cost to the Department. Compensation for interest costs through the April 2008 Progress Payment shall be paid as an adjustment of compensation at an agreed lump sum of $136,510.00. The net change order cost of $136,510.00 shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as this is an administrative change and will not affect the controlling operation.

Maintenance concurrence is not required as this is an administrative change and will not affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 131	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Estimate of Decrease in Contract Item at Contract Price:

Item No. 46: EROSION CONTROL (NETTING)						
-5220 M2	(-100.00%)	$5.50	/M2	=	-$28,710.00	(-100.00%)
Item No. 47: STRAW (EROSION CONTROL)						
-5.2 TONN	(-100.00%)	$425.00	/TONN	=	-$2,210.00	(-100.00%)
Item No. 48: FIBER (EROSION CONTROL)						
-1444.55 KG	(-96.95%)	$1.00	/KG	=	-$1,444.55	(-96.95%)
Item No. 49: EROSION CONTROL (TYPE B)						
-2150 M2	(-100.00%)	$5.00	/M2	=	-$10,750.00	(-100.00%)
Item No. 50: FIBER ROLLS						
-1520 M	(-100.00%)	$15.00	/M	=	-$22,800.00	(-100.00%)
Item No. 51: COMPOST (EROSION CONTROL)						
-4403.18 KG	(-97.63%)	$1.00	/KG	=	-$4,403.18	(-97.63%)
Item No. 52: MOVE-IN/MOVE-OUT (EROSION CONTROL)						
-5 EA	(-71.43%)	$1,000.00	/EA	=	-$5,000.00	(-71.43%)
Item No. 54: STABILIZING EMULSION (EROSION CONTROL)						
-332.05 KG	(-97.66%)	$3.50	/KG	=	-$1,162.18	(-97.66%)

Total Cost for Decrease in Contract Item.....($76,479.91)

Extra Work at Lump Sum:

Compensate the Contractor for the erosion control work performed at the East Side of the USCG Captain's Hillcrest acces road.

For this work, the Contractor shall be compensated at a lump sum price of $1,978.00. This sum constitutes full and final compensation of your request for compensation as stated in your Document No. 215-STL.00401 dated July 29, 2008, including markups, for all costs associated with the work of this change.

Total Cost of Extra Work at Lump Sum $1,978.00

In accordance with Section 4-1.03B(3), "Eliminated Items," of the Standard Specifications, the adjustment due to the elimination of Item No. 46, Erosion Control (Netting), Item No. 47, Straw (Erosion Control), Item No. 49, Erosion Control (Type B), and Item No. 50, Fiber Rolls, are zero.

No adjustment to the contract unit price of Item No. 48, Fiber (Erosion Control), Item No. 51, Compost (Erosion Control), Item No. 52, Move-In/Move-Out (Erosion Control), and Item No. 54 Stabilizing Emulsion (Erosion Control) will be made in accordance with Section 4-1.03B(2), "Decrease of More Than 25 Percent," of the Standard Specifications.

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Compensate the Contractor for erosion control measures within the project limits.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, issued on December 14, 2006 and December 25, 2006, and approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), resulted in various Department-directed changes to the project scope of work. These changes made various contract pay items related to erosion control work no longer applicable.

This change order will resolved the Contractor's request for compensation as stated in their Letter No. 215-STL.00401 dated July 29, 2008 and will closeout various contract pay items that were no longer applicable due to the Department's strategy memorandums implemented on this contract.

The Contractor will be compensated at a lump sum price of $ 1,978.00 and decrease in contract pay items (- $ 76,479.91), with a total net decrease cost of (- $74,501.91), which can be financed from the contract's contingency funds. A cost analysis is on file. 1 RA 5/7/09

No adjustment of contract time is warranted, as the work will not affect the controlling operation.

Hong Wong - Project Engineer and Alec Melkonians - Asst. Project Manager concurred with this change.

Maintenance concurrence is not required since it does not affect any permanent roadway features.

Adjustment of Compensation at Lump Sum:

Compensate the Contractor for slide cleanup work on the slope under span 48 of the viaduct caused by a 2006 New Years day weekend storm.

For this work, Contractor agrees to accept a lump sum of $23,870.00. This sum constitutes full and final compensation for all costs including all markups, for the work of this change.

This change order resolves all outstanding costs associated with the Notice of Potential Claim dated February 22, 2006 and March 2, 2006 and no additional compensation shall be paid.

Total cost of Adjustment of Compensation at Lump Sum $23,870.00

Any restoration work, if required, on the slope under span 48 will be paid for in a separate contract change order.

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$23,870.00**

475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

resolution of outstanding costs for Notice of Potential Claim No. 17 dated February 22, 2006 and March 2, 2006.

This change order compensates the Contractor for slide cleanup work on the slope under span 48 of the viaduct structure caused by a 2006 New Years day weekend storm. The project site experienced a storm event that cause damage to the slope between Southgate road and the old USCG access road. Cleanup work was performed to restore the slope and to provide stable work areas. The original contract completion date was July 27, 2005, but due to numerous Department delays and temporary suspensions prior to the storm event, the project completion date was extended into the 2005/2006 winter. The extension of the contract created a significant weight in the merit analysis of the NOPC, thus making it a compensable potential claim.

The Contractor shall be compensated at an Adjustment of Compensation at Lump Sum price of $23,870.00, which can be financed by the contract's contingency funds. Records and calculations used to determine the adjustment in compensation are on file in the project records.

There will be no time adjustment by reason of this change since it does not affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager and Patrick Treacy - HQ Assistant Construction Coordinator.

Design concurrence is not required as this change does not affect the design of the project. Maintenance concurrence is not required since it does not affect any permanent roadway features.

CONTRACT SPECIALS WITH ADDENDA

SECTION 10-2. (BLANK)

SECTION 10-3. ELECTRICAL WORK

10-3.01 DESCRIPTION (Altered significantly via Add#5, Add #9)

The following electrical work shall conform to the provisions in Section 86, "Signals, Lighting and Electrical Systems," of the Standard Specifications and these special provisions:

LIGHTING SYSTEM DESIGN

Lighting system design shall include but not limited to the following:

The Contractor shall design a lighting system for the westbound and eastbound Temporary Bypass Structure (TBS) per Caltrans Lighting Standard. Lighting fixtures on westbound shall be mounted on the pole as shown on ES-6A of Standard Plans. Lighting fixtures on eastbound shall be pendant soffit mounted as shown on ES-9E. Attention is directed to "Contractor's Design" of these special provisions. Lighting shall be designed to minimize glare to the motorists, the new lighting fixtures shall be similar to the existing (such as type, voltage input, and lamp wattage). Minimum illumination level of 1.5 lux shall be maintained along edge of travel way across the structure in addition to illumination level requirements at connection points. The lighting system will be 480 V, 3-phase. The wire size for the lighting circuit shall be 3/C #6+G AWG armored for each light circuit.

The Contractor shall submit to the Engineer all design drawings, engineering calculations (illumination levels) and estimate for approval. The Engineer will be allowed at least 15 working days for the review of the approval documents.

~~ELECTRICAL WORK (Stage 2)~~

This work shall include but not limited to intercepting all eastbound circuits to the east of vault No.5, route the circuits to vault No. 2 and splice or terminate to the existing splice/terminal boxes as shown on the plans. The following circuits shall be intercepted:

1. Install 15 kV splice box at approximately Sta. 55+80. Intercept existing 12.47 kV cable, splice to temporary armored cable and reroute to a splice box in vault No. 2 as shown on the plans. Splice the 12.47 kV armored cable to the existing 12.47 kV cable in vault No.2.
2. Locate existing DC terminal box on the bridge, install and terminate new 40/C No. 14 armored cable and reroute to a terminal box in vault No.-2 as shown on the plans. Terminate the 40/C armored cable to the terminal box in vault No. 2. The terminal box will be supplied and installed by others.
3. Locate existing RTU/Telephone communication terminal box on the bridge, install and terminate new 50 pairs, No. 18 AWG, armored cable and reroute to a terminal box in vault No. 2 as shown on the plans. Terminate the 50 pairs armored cable to the terminal box in vault No.2. The terminal box will be supplied and installed by others.
4. Locate and intercept traffic operation system circuits as listed on the plans. Install a new TOS terminal box at approximately sta. 56+40. Install and terminate new TOS armored cables and reroute to a terminal box in vault No. 2 as shown on the plans. Terminate TOS armored cables to the terminal box in vault No. 2. The terminal box will be supplied and installed by others.
5. The Contractor shall determine the exact cable routing and location of cable supports and splice boxes.
6. Before completion of all electrical work, the Contractor shall label all conductors and cables by type and circuit number.
7. Install Temporary Bypass roadway lighting poles, pendant soffits and fixtures.
8. Install and terminate new armored cable lighting circuits from the light fixtures to the terminal box in vault No. 2.
9. Conduct cable continuity and insulation tests on all circuits.
10. Conduct cable continuity test and functional test on all new lighting circuits.
11. Install and terminate cable itemized under "Cost Break-down" elsewhere in these special provisions.
12. Install 8 new State-furnished wireless solar powered call boxes and replace 4 existing outdated call boxes with 4 new solar powered call boxes.

94

13. Locate existing 96 VDC terminal boxes on the bridge, splice and route the armored cables to a terminal box in vault No. 2. The terminal box will be supplied and installed by others.
14. Install one 3/C #6+G, 480 V armored cable for the new exit sign. Route the armored cable to a terminal box in vault No.2 as shown on the plans. Terminate the armored cable to the terminal box. The terminal box will be supplied and installed by others..
15. Install and terminate cables as shown on the plans and cable schedule.
16. Install 47 new NEMA 4 splice boxes.
17. Install approximately 200 meters of 41C galvanized rigid steel (GRS) conduit.
18. Install and splice approximately 270 meters of 27C liquid tight flexible conduit with 3/C #10+ G.
19. Install and splice approximately 367 meters of 3-27C #6 + #8G.
20. Remove all existing conduits, signal lights, Tesco flex control panel, splice boxes, receptacles/utility outlets and call boxes that are no longer required and shall become the property of the Contractor.
21. Install and terminate armored cables as shown on the cable schedule.
22. Conduct cable continuity and insulation tests on all circuits.
23. Conduct functional test on all lighting circuits
24. Remove all existing conduit and splice boxes on the North side of the longitudinal girder as shown on the plan.
25. Replace existing call boxes with new State furnished wireless solar powered call boxes.
26. Install new splice boxes, rigid steel galvanized conduit and liquid tight flexible conduit as shown on the plans.
27. Perform cable continuity and insulation tests.
28. Conduct functional test on call boxes and lighting circuits.

REGISTERED PROFESSIONAL ENGINEER CHEUK-MONG TONG 6/30/10 CIVIL STATE OF CALIFORNIA

10-3.02 COST BREAK-DOWN

Cost break-downs shall conform to the provisions in Section 86-1.03, "Cost Break-Down," of the Standard Specifications and these special provisions.

The Engineer shall be furnished a cost break-down for each contract lump sum item of work described in this Section 10-3.

The cost break-down shall be submitted to the Engineer for approval within 30 days after the contract has been approved. The cost break-down shall be approved, in writing, by the Engineer before any partial payment for the items of electrical work will be made.

The cost break-down for the Electrical Work (Stage 2) shall be broken down, as a minimum, to include the following listed items in addition to those listed in the Standard Specifications:

Electrical Work (Stage 2). Electrical installation is shown on the plans and shall include, but not be limited to the following additional items of the cost break-down:

1. Cables and cable terminations – list each size and type.
2. Termination boxes, splice boxes pull and junction boxes – list each size and type.
3. Cable anchors, fittings and supports – list each size and type.
4. Equipment required for functional testing – list size and type.
5. Equipment rental – list each over $500.00 – list size and type.
6. Light poles – list size and type.
7. Light fixtures – list size and type.
8. Soffit luminaires – list size and type.
9. Electrical hardware – list size and type.
10. Conduits, conduit anchors, fittings and supports - list each size and type.

10-3.03 MAINTAINING EXISTING AND TEMPORARY ELECTRICAL SYSTEMS

The Contractor shall visit the site of the proposed routing of cables and base his bids from site examination and estimate. The Contractor shall study the contract documents included under this contract to determine

CONTRACT NO. 04-0120R4

DESIGN OVERSIGHT	REGISTRATION NO.	DATE
C. Hong Wong		

Approved as to impact on State facilities and conformance with applicable State standards and practices and that technical oversight was performed as described in the California Department of Transportation A & E Consultant Services Manual.

The special provisions contained herein have been prepared by or under the direction of the following Registered Persons.

ELECTRICAL _____

REGISTERED ELECTRICAL ENGINEER

REGISTERED PROFESSIONAL ENGINEER
CAROL LIGHT
No. 10145
Exp. 9/30/10
ELECTRICAL
STATE OF CALIFORNIA

SECTION 10-3. SIGNALS, LIGHTING AND ELECTRICAL SYSTEMS

10-3.01 DESCRIPTION

Traffic signals, flashing beacons, lighting, sign illumination, traffic operation system and call box system shall conform to the provisions in Section 86, "Signals, Lighting and Electrical Systems," of the Standard Specifications and these special provisions:

ELECTRICAL WORK

This work shall include but not limited to intercepting all eastbound circuits to the east of ~~vault No.2A,~~ the ~~Southside Detour Viaduct~~ the Temporary Bypass structure, route the circuits to and through cable tray on Temporary Bypass Structure and the East Tie-in Roll-in Structure. The following circuits shall be intercepted:

Install new relocated RTU #8 cabinet along with **new** service cabinet, contactor/relay cabinet and control cable terminal box at existing pier E1.

2. Disconnect and reroute RTU cable from existing RTU #8 cabinet to new relocated RTU #8 cabinet located on top of existing pier E1 as shown on plans.
3. Disconnect and reroute all existing cables from existing service cabinet and control terminal box to new service cabinet and terminal box at Pier 1 located on top of existing pier E1 as shown on plans.
4. ~~.~~Install new RTU armored cable from existing RTU #8 cabinet to new RTU #8 cabinet at existing Pier E1.
5. Install new armored cable (DC Cable) from existing control terminal box to new control terminal box at existing Pier E1.
6. Install new 480 volt call box main feeder from existing service cabinet to new service cabinet at existing Pier E1.
7. Install new Photoelectric unit (PEU) at new contactor/relay cabinet at existing Pier E1.
8. Connect new cables from East tie-in structure to new RTU #8, service cabinet and contactor/relay terminal box at Pier 1.
9. Splice new 15 KV cable to the existing 15 KV cable on the East span of the existing bridge. Provide new splice box. Extend 15 KV cable in cable tray across East tie-in structure to continue on viaduct structure
10. The Contractor shall determine the exact cable routing and location of cable supports and splice boxes.
11. Before completion of all electrical work, the Contractor shall label all conductors and cables by type and circuit number.
12. Install Temporary Bypass roadway lighting poles and soffit lighting fixtures.
13. Install and terminate new armored cable lighting circuits from the light fixtures to the viaduct structure and on to the East span of the existing bridge.
14. Conduct cable continuity and insulation tests on all circuits.
15. Conduct cable continuity test and functional test on all new lighting circuits.
16. Install and terminate cable itemized under "Cost Break-down" elsewhere in these special provisions.

17. Remove unnecessary wiring per documents when new installation is complete.
18. Install and terminate cables as shown on the plans and cable schedule.
21. Install new NEMA 4 splice boxes.
22. –Provide 47m of 15 KV cable, tested, along with two splice kits.
23. Conduct cable continuity and insulation tests on all circuits.
24. Conduct functional test on all lighting circuits.
25. Conduct functional test on call boxes and lighting circuits.
26. Route G30 ground conductor -across East tie-in structure from the viaduct structure and connect to existing ground conductor on the existing bridge.

10-3.02 COST BREAK-DOWN

Cost break-downs shall conform to the provisions in Section 86-1.03, "Cost Break-Down," of the Standard Specifications and these special provisions.

The Engineer shall be furnished a cost break-down for each contract lump sum item of work described in this Section 10-3.

The cost break-down shall be submitted to the Engineer for approval within 20 days after the contract has been approved. The cost break-down shall be approved, in writing, by the Engineer before any partial payment for the items of electrical work will be made.

The cost break-down for the Electrical Work shall be broken down, as a minimum, to include the following listed items in addition to those listed in the Standard Specifications:

A. Electrical Work: Electrical installation is shown on the plans and shall include, but not be limited to the following additional items of the cost break-down:
   1. Call box installation.
   2. Cables and cable terminations – list each size and type.
   3. Termination boxes, splice boxes, pull and junction boxes – list each size and type.
   4. Cable anchors, fitting and suports – list size and type.
   5. Westbound lighting.
   6. Eastbound lighting.
   7. 12.47 kV power system.
   8. Equipment required for functional testing – list size and type.
   9. Equipment rental – list each over $500.00 – list size and type.
   10. Electrical hardware – list size and type.
   11. Conduits, cable tray, conduit anchors, fittings and supports – list each size and type.

10-3.03 CODES AND STANDARDS

All work performed and material installed or furnished on this contract shall confom to Section 86-1.02 "Regulations and Code," and the following codes and standard to the modifications and additional requirements in these special provisions:

A. California Administrative Code, Title 24, part 3, "Basic Electrical Regulations."
B. National Fire Protection Association Standards
C. All local ordinances.

10-3.__ MAINTAINING EXISTING AND TEMPORARY ELECTRICAL SYSTEMS

The Contractor shall visit the site of the proposed routing of cables and base his bids from site examination and estimate. The Contractor shall study the contract documents included under this contract to determine exactly the extent of the work provided under this contract, as well as to ascertain the difficulty to be encountered in the performing the work. Continuous operation of the bridge shall be required while rerouting and splicing of the existing circuits are being performed. Outages required for construction purposes shall be scheduled for the shortest practical periods of time, in coordination with the Engineer. No outages or shutdowns of service shall occur without the written authorization of the Engineer.

Before commencing the work, the Contractor shall submit in writing to the Engineer a description and detailed schedule of the intended operations relative to keeping the bridge east and west spans lighting systems in continuous operation. Such schedule shall be part of the progress schedule.

Regardless of construction procedure, methods and equipment selected, the Contractor shall have all materials and equipment on the site for the installation of the electrical system prior to commencement of work. Disconnection of existing or temporary lighting or electrical systems will not be permitted until the new cables have been properly installed and tested.

The Contractor shall provide any and all necessary temporary materials as required to keep any and all electrical facilities in continuous operation. The Contractor shall be responsible for coordinating all electrical work with all other Contractors, State forces agencies, and local entities with jurisdiction. Where damage to facilities is caused by the Contractor's operations, the Contractor shall, at the Contractor's expense, repair or replace the damaged facilities promptly in accordance with the Standard Specifications. If the Contractor fails to complete the repairs, the repairs will be made by the State agencies at the Contractor's expense.

Full compensation for temporary facilities shall be considered as included in the contract lump sum prices paid for the various contract items of work involved and no additional compensation will be allowed.

10-3.05 CONDUIT

All conduit installed shall be Type 2 unless otherwise specified.

RIGID GALVANIZED STEEL CONDUIT, THREADED COUPLINGS AND ELBOWS

The rigid galvanized steel (RGS) conduit, threaded couplings, and elbows shall conform to Section 86-2.05, "Conduit," of the Standard Specifications for Type 1 where shown on the plans.

LIQUIDTIGHT FLEXIBLE METAL CONDUIT

The liquid tight flexible metallic conduit shall conform to the following requirements:

A. The flexible metal shall be constructed of continuously interlocked strip and shall be coated with sunlight resistant PVC jacket.

B. The metal core shall be hot-dipped galvanized steel core with a heavy coating of zinc.
C. The jacket shall be resistant to weather, temperature, oil and chemical breakdown.
D. Conform to the provisions of NEC Article 351 under "Liquid-tight Flexible Metal Conduit".
E. UL listed for Safety 360.

10-3.06 SUPPORT HARDWARE FOR CONDUITS AND CABLES

STAINLESS STEEL POWER-STUD ANCHOR-THREADED VERSION

All electrical items that use anchors to attach to the concrete structures shall use stainless steel power stud anchor-threaded version.

Stainless steel power-stud, anchor-threaded version shall have a one-piece anchor body with the length identification code. The anchor bodies shall be manufactured from Type 316 stainless steel and shall have an expansion mechanism, which consists of a pair of interlocking independent wedges.

Anchors that have less than a 40 mm hole depth can be installed anywhere in the box. If the anchor will require a hole depth of greater than 40 mm, the Engineer will consult with the Structural Engineer of Record prior to approving the location and depth of the anchor. The f"c for the superstructure is 55 Mpa. The average strength of the concrete will therefor be almost 62 MPa. As a consequence it will be difficult to drill.

Anchor Component	Component Material
Anchor Body	Type 316L Stainless Steel
Nut	Type 316L Stainless Steel
Washer	Type 316L Stainless Steel
Expansion Wedge	Type 316L Stainless Steel

ELECTRICAL HARDWARE

All electrical hardware, including but not limited to, bolts, nuts, washers, lock washers, fastening screws, expansion anchors, U-bolts and hold-down clamps shall be Type 316L stainless steel unless otherwise noted.

CONDUIT AND TRAY SUPPORTS

Conduit and tray support brackets, as shown on the plans, shall conform to the provisions in Section 75-1.03, "Miscellaneous Bridge Metal," of the Standard Specifications and these special provisions.

The anchoring and supports of trays shown on the plans are designed to Seismic Zone 4 requirements. The Contractor shall determine the construction methods for Seismic Zone 4 for conduit supports at each support location, including location and length of support channel. Once determined, the Contractor shall submit to the Engineer for review and approval at least 30 working days prior to ordering or fabrication of conduit supports.

The Engineer will consult with the Structural Engineer of Record prior to approving concrete anchors requiring a depth of greater than 40 mm. Therefore it is recommended that support channels be embedded in the pre-fabricated concrete girder sections, during manufacture, for all trays and all major conduit runs. The following tray and conduit weight tables shall be used by the Contractor for determining the spacing of supports.

The tables show the maximum probable mass of insulated copper conductors assuming maximum tray and conduit fill.

Conduit size in mm:	41	53	63	78	103
Mass in kg/m:	6.15	9	12.9	18.75	28.5

Tray size in mm:	305	610	762
Mass in kg/m:	37.5	75	93.75

Maximum tray support span shall be as shown on the design drawings, but no larger than 4.74 meters..

Maximum conduit support span shall be as shown on the design drawings, but no larger than 3.00 meters.

10-3.__ PULL BOXES

NEMA TYPE 4 PULL BOXES SINGLE DOOR

The NEMA Type 4 single door pull box shall conform to the following:

Construction

A. Enclosure bodies are either 14-gage or 16-gage steel. All doors are 14-gage steel.
B. Seams shall be continuously welded and ground smooth, no holes or knockouts.
C. Stainless steel clamps on three sides of cover assure watertight seal.
D. Heavy gauge continuous hinge.
E. Cover removed by pulling stainless steel hinge pin.
F. Oil-resistant gasket and adhesive
G. The box engraving, physical size and dimensions shall be as shown on the plan drawings.
H. Finish shall be white inside with ANSI 61 gray outside finish over phosphatized surfaces. Optional panels shall be white.

Industry Standards

A. UL 508 Type 12.
B. NEMA/EEMAC Type 12.
C. JIC standard EGP-1-1967 (14-gage only).
D. CSA Type 12.
E. IEC 529, IP-65.

15 kV SPLICE BOX

The high voltage splice box shall be NEMA Type 4 as shown on the plans. The box shall conform to all applicable requirements in NEC, Article 370(D). Each cover shall be secured with at least ten stainless steel bolts. Cover makings for high voltage splice box shall read "Danger-High Voltage-Keep Out" and be permanently marked and readily visible. Enclosures and covers shall be 14-gage steel minimum with seams continuously welded and ground smooth. High voltage splice box shall be installed at each high voltage cable splice location.

SCADA and Telephone Termination Enclosure

The cabinets shall include terminations for 50 twisted pair communication leads. Noise suppression resistors with a 1-percent tolerance shall be provided for each pair.

10-3. CONDUCTORS, CABLES AND WIRING

Splices shall be insulated by heat-shrink tubing of the appropriate size after thoroughly painting the spliced conductors with electrical insulating coating.

The minimum insulation thickness, at any point, for Type USE, RHH or RHW wire shall be 1.0 mm for conductor sizes No. 14 to No. 10, inclusive, and 1.3 mm for No. 8 to No. 2, inclusive. The minimum insulation thickness, at any point, for Type THW and TW wires shall be 0.69 mm for conductor sizes No. 14 to No. 10, inclusive, 1.02 mm for No. 8, and 1.37 mm for No. 6 to No. 2, inclusive.

TESTING

The Contractor shall perform a high-voltage series lighting test consisting of the open circuit voltage of the connected constant current transformer between conductors and ground.

The high-voltage test shall not be performed on existing circuits or equipment. Non-testing of existing circuits and equipment shall not relieve the Contractor from the responsibility for malfunctioning of existing lighting circuits due to the Contractor making splices in or connecting to the circuits and such malfunctions shall be corrected at the Contractor's expense.

600 VOLT SINGLE CONDUCTOR CABLE

All 600-volt single conductor cable shall be the following unless otherwise noted on the plans. The cables shall be insulated with a EPR insulation rated for 600 volts. The cables shall be UL listed as Type RHH, RHW-2, or USE-2, VW-1 600 V. All cables No. 1/0 and larger shall be UL Type TC rated.

The conductor shall be soft annealed uncoated copper Class B stranded per ASTM B-8. The EPR insulation shall meet the requirements of ICEA S-68-516, NEMA WC-8, and UL Standards 44 and 854. The composite insulation thickness shall be as follows:

Conductor Size	EPR Thickness
No. 14 - No. 10	1.14 mm
No. 8	1.52 mm
No. 6 - No. 2	1.91 mm

The cable surface shall be printed in a contrasting color with the following information:

A. Manufacturers' name.
B. Plant number.
C. Conductor size.

D. Cable type.
E. Voltage rating.

The cable shall be manufactured by The Okonite Company, BICC Cables, Pirelli, or equal. Manufacturer shall furnish a notarized certificate of compliance to demonstrate cable furnished is in compliance with ICEA S-68-516 and UL 44.

600 VOLT MULTI-CONDUCTOR CABLE

All 600 volt rated multi-conductor cables shall be the following unless otherwise noted on the plans drawings. The cables shall be insulated with ethylene propylene rubber, assembled as a multi-conductor cable with flame resistant fillers and binder tape with an overall PVC jacket. The cables shall be capable of operating continuously in both wet and dry locations at conductor temperature of 90°C for normal operation, 130°C for emergency overload rating, and 250°C short circuit rating.

The conductors shall be soft annealed uncoated copper Class B stranded in conformance to the requirements in ASTM Designations: B 8. The single conductors shall be ethylene propylene rubber insulated meeting the requirements of UL 1581 and ICEA S-68-516. Color coding for sizes No. 10, 12, 14 and 16 AWG shall conform to the requirements in ICEA Method I Table K-2. Sizes No. 8 and larger shall be numerically coded using ICEA Method 4. The insulation thickness shall be as follows:

Conductor Size	EPR Thickness
No. 16	0.64 mm
No. 14 - No. 10	0.76 mm
No. 8 - No. 2	1.14 mm

The insulated conductors (and grounding conductor if required) shall be cabled together with flame resistant fillers and binder tape. The jacket shall be extruded PVC meeting the physical and dimensional requirements of ICEA S-68-516. The cable shall pass the vertical tray flame test requirements of IEEE 383 and 1202 and UL 1277. The cable shall be UL listed as Type TC.

The cable surface shall be printed in a contrasting color with the following information:

A. Manufacturers' name.
B. Plant number.
C. Number of conductors.
D. Conductor size.
E. Cable type.
F. Voltage rating.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 134

SHEET 11 OF 94

The cable shall be manufactured by The Okonite Company, BICC Cables, Pirelli, or equal. The manufacturer shall furnish a notarized certificate of compliance to demonstrate cable furnished is in compliance with ICEA S-68-516 and UL 1277.

500 kcmil Insulated Grounding Conductor

The 500 kcmil insulated grounding conductor shall be Class B stranded, annealed uncoated copper per UL Standard 83. The conductor shall be insulated with PVC complying with the physical and electrical requirements of UL Standard 83 for Type THW. The conductor shall bear the UL label for Type THW.

600 Volt Armored Multi-Conductor Cable

The 600 V armored cables shall be installed for the Temporary Bypass Structure. The individual conductor of the armored cable shall conform to the 600 V cable requirements as specified above in the special provisions. The armor sheath shall exceed the grounding conductor requirements of Table 250-95 of the National Electrical Code and UL 1569. The cable shall have stranded copper grounding conductor, located in the outer interstices. The armor sheath shall be impervious, continuous, welded, corrugated aluminum that will provides complete protection against moisture, liquid, and gasses and has excellent mechanical strength. The armor sheath shall be covered with low temperature black polyvinyl chloride to protect cable against chemical attack. The cable shall be UL Listed as type MC cable per Article 334 of the NEC.

SHIELDED TWISTED PAIR CABLES

All shielded twisted pair No. 18 (0.832 mm2) multi-conductor communication cables (fifty pairs, six pairs and two pairs) and twisted triad No. 16 shall be stranded annealed copper (per ASTM Designations: B 3 and ASTM B 8). The insulated single conductors shall be twisted into pairs, triads or multiple conductor components. The insulation shall be flame-retardant cross-linked polyethylene with color code in conformance with the requirements in ICEA Method 1. The insulation shall be 0.76 mm nominal.

The cable components are cabled with non-hygroscopic fillers, as necessary, and an overall binder tape. The individual pairs or triads shall be shielded with a 0.19 mm Aluminum/polymer tape with tinned copper drain wire applied helically over the pairs or triads. The overall shield shall be a 0.19 mm Aluminum/polymer tape with tinned copper drain wire applied helically over the cable core.

The overall jacket shall be 2.8 mm Flame-retardant and sunlight resistant polyvinyl chloride (PVC). A nylon ripcord shall be applied longitudinally under the overall jacket to facilitate jacket removal.

The cable shall be suitable for Cable Tray use and have the following ratings and listings:

A. UL Type TC - 600 volt.
B. UL Class XL.
C. UL Subject 13 and 1277.
D. IEEE 383 and 1202.
E. ICEA S-66-524 - 600 volt.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 134

SHEET 12 OF 94

The cable shall be manufactured by Belden Cable, The Okonite Company, BICC Cables, Pirelli, or equal. The manufacturer shall furnish a notarized certificate of compliance to demonstrate cable furnished is in compliance with ICEA S-68-516 and UL 44.

Communication Cable Splices

Splices shall be done only as approved by the Engineer. Splices for shielded No. 18

multi-conductor, twisted pair cables shall be as recommended by the cable manufacturer and suitable for the environment that the splice is located. The Contractor shall submit the cable manufacturer's recommended splicing method to the Engineer for approval prior to using the method. The Engineer shall approve splice locations. The splicing kits shall be manufactured by Raychem, 3M or other approved manufacturer.

15 kV CABLE

Cable Splices

All 15 kV splices shall be enclosed on a 15 kV splice box. The splices, shall be IEEE 404, heat shrinkable cable splices in kit form, capable of properly splicing cables specified in this section. Splice kits shall contain all necessary components to reinstate primary cable insulation, metallic shielding and grounding systems and overall jacket to the equivalent of the cable itself. Splices shall be of a uniform cross-section and shall consist of heat-shrinkable radiation crosslinked insulation. The outer insulating layer shall be bonded to a conducting layer for shielding. The splice shall be rejacketed with a heavy-wall, heat-shrinkable sealant lined sleeve to provide a waterproof hot melt adhesive seal. Splices shall contain heat-shrinkable radiation cross-linked high dielectric constant linear stress relief material. Splices shall contain a high relative permittivity electric stress relief mastic for insulation shield cutback treatment and a heat-activated sealant for environmental sealing. Kits shall allow splicing cables with different types of insulation, conductor sizes, and shielding construction. Kits shall accommodate commercially available standard connectors.

Cable End Sealing Caps

The end seal caps shall be heat-shrinkable crosslinked polymeric end sealing caps capable of sealing cables specified in this section. End caps shall be precoated with a heat activated sealant.

DC High Potential Test

Perform DC high potential test of each conductor in accordance with NEMA WC 5.

15 kV Armored Shielded Cable

The three conductor 15 kV armored shielded cables shall be 133 percent insulation rated power cable designed to operate at conductor temperatures of 90°C normal, 130°C emergency, and 250°C short circuit conditions as defined by ICEA S-93-639 (NEMA WC-78) and (UL) Standard 1072. The cable shall be suitable for installations above or below grade, indoors or outdoors, and in wet or dry locations. The qualifying cable shall be (UL) labeled as MV-90, Sunlight Resistant and for cable tray use in accordance with UL Standard 1072.

The cable shall have a continuous corrugated welded aluminum sheath encases the cable core per UL 1072 and UL listing E-38916 recognized as a grounding conductor by NEC. The cable sheath shall provide complete protection against moisture, liquid and gasses and shall have excellent mechanical strength. The sheath shall be protected with a low temperature polyvinyl chloride jacket in accordance with UL 1072 to protect the cable against chemical attack.

Conductors

The conductors shall be compressed, Class B stranded copper and shall be in

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 134
SHEET 12 OF 94

accordance with the requirements of ICEA S-93-639. The copper conductors shall consist of all bare strands or tin-coated strands in the outer layer in conformance with the requirements in ASTM Designations: B 3, B 8 and B 33. Conductors shall be unbroken for the full length of the reels specified in the Purchase Order. Reels containing splices will be rejected.

Conductor Shield

The conductor shielding shall consist of an extruded, black-colored, nonmetallic semiconducting EPR thermosetting compound material in conformance with the provisions in Section 2.7 of ICEA S-93-639. The minimum average thickness shall be 0.5 mm.

Insulation

The insulation shall be a discharge resistant, ethylene propylene (EP) based compound and be listed by Underwriters Laboratories. The minimum average thickness of the insulation shall be 5.59 mm. The manufacturer shall perform the Insulation Corona Discharge Resistance Test (3.9.3.3 of ICEA S-93-639) tested in conformance with the requirements in ASTM Designation: D 2275-89, "Standard Test Method for Voltage Endurance of Solid Electrical insulating materials Subjected to Partial Discharges (Corona) on the Surface," and submit the results to the Engineer before acceptance of the cable.

Insulation Shielding

The insulation shielding shall consist of a nonmetallic semiconducting EPR material extruded directly over the insulation and a 0.12-mm bare copper tape. The nonmetallic semi conducting layer shall be black-colored with properties and thickness conforming to the requirements of Table 4a of ICEA S-68-516-93-639 and Tables 14.2 and 14.3 of UL-1072. The layer shall be free stripping from the EP insulation. The 0.12-mm bare copper tape shall be helical applied with a 15 percent overlap, directly over the nonmetallic layer.

Metallic Shield

The metallic shield shall be coated copper tape, helically applied with a minimum overlap of 12.5 percent, directly over the nonmetallic layer.

Phase Identification

A colored tape shall be applied longitudinally under the copper shielding tape to provide phase identification.

Assembly

The three phase conductors shall be cabled together with class B stranded, uncoated copper grounding conductor and suitable fillers to make round. Length of lay shall not exceed 35 times the phase conductor diameter. The grounding conductor shall comply with the requirement of UL Standard 1072.

Cable Tape

A suitable cable tape shall be applied over the assembly to hold the core together and provide bedding for the armor.

Armor

Aluminum steel interlocked armor shall be applied over the cable core. Armor shall be in accordance with UL Standard 1072 and Part 4 of ICEA.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 134

Jacket

An extruded covering of PVC shall be applied over the armor. The average thickness and properties of the PVC covering shall be as specified in Part 4 of ICEA. The minimum thickness at any point shall be not less than 70 percent of the required average thickness. The covering shall meet the Sunlight Resistant requirements of UL.

Identification

An ink print legend shall be applied to the surface of the PVC covering providing cable and manufacturer identification.

Shielded-Twisted Pair Armored Cables

The instrumentation armored cables shall be installed for the ~~south-south staging~~ temporary bypass structure. The individual conductor of the armored cable shall conform to the shielded-twisted pair cable requirements as specified above in the special provisions. The armor sheath shall be impervious, continuous, welded, corrugated aluminum that will provides complete protection against moisture, liquid, and gasses and shall have excellent mechanical strength and provides equipment grounding through the sheath. The armor sheath shall be covered with low temperature black polyvinyl chloride to protect cable against chemical attack. The cable shall be UL Listed.

Cable Tray

Cable tray shall be provided where shown on the plans and shall include the complete system defined to include, but not be limited to, straight sections of ladder type cable tray, bends, elbows, barriers, tees, drop-outs, supports and accessories. Cable tray shall meet requirements of ASTM A123, A653, A1011, A1008, B633 as well as NEMA VE1 and VE2, NEC Article 392, NFPA 70B and UL compliance.

Cable tray shall be made from structural quality steel meeting the minimum properties of ASTM A1011 SS, Grade 33. All splice plates must also be hot dipped galvanized after fabrication. Tray shall consist of two longitudinal members (side rails) with transverse members (rungs) welded to the side rails. Rungs shall be 12 inches on center. Spacing in radiused fittings shall be 9 inches and measured at the center of the tray's width. Each rung shall be capable of supporting the cable load, with safety factor of 1.5 and a 200 lb. concentrated load when tested in accordance with NEMA VE1, section 5.4. Tray shall be 610 mm in width. Splice plates shall be manufactured of high strength steel and shall be attached with ribbed carriage bolts and serrated locknuts. Hardware shall be Chromium Zinc in accordance with ASTM F-1136-88.

Barrier strips shall be as specified on the drawings and fastened into the tray with self drilling screws. All trays shall be constructed with rounded edges and smooth surfaces.

Cable Installation in Cable Tray

All cable installed in cable trays shall be dressed neatly, arranged in bundles by function and strapped to the cable tray at intervals no less than 600 mm using plastic ties.

10-3.09 FIELD TESTING

Field testing shall be performed in the presence of the Engineer. The Contractor shall notify the Engineer five days prior to conducting tests. The Contractor shall furnish all materials, instruments, labor, and equipment necessary to conduct field tests. The Contractor shall perform all tests recommended by the manufacturer unless specifically waived by the Engineer. The Contractor shall perform acceptance tests of all installed

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 134

electrical equipment in accordance with latest applicable ICEA, NETA and IEEE standards.

The Contractor shall maintain a written record of all tests performed which includes date, test performed, personnel involved, devices tested, serial number and name of test equipment, and test results. All field test report shall be signed and dated by the Contractor.

The Contractor shall provide and use safety devices such as rubber gloves, protective barriers, and danger signs to protect and warn personnel in test vicinity. The Contractor shall replace cables that are damaged due to improper procedures or handling.

GENERAL NOTES

1. All electrical work shall conform to (1999 and 2004) the latest issue of State of California Department of Transportation Standard Specifications and Standard Plans. These general notes and the special provisions under this contract also apply. For any conflict of provisions, California State Guidelines apply.
2. All conduit routing is shown diagrammatically. Pull box locations are located and shown on plan drawings. The Contractor shall provide additional pull boxes as required. Exact location of equipment and devices may be adjusted by field conditions or as directed by the Engineer.
3. Minimum conduit sizes shall be 21 mm. All conduits located outside shall be rigid galvanized steel, PVC coated. All conduits routed inside girder shall be rigid galvanized steel.
4. All conduit fittings for 78 mm and above shall have a 610 mm minimum bending radius.
5. All equipment and devices shall be provided with nameplate tags as shown in the drawings.
6. All feeders and branch circuits shall be provided with an equipment ground wire.
7. 15 kV splice boxes shall be installed as shown and permanently marked "DANGER-HIGH VOLTAGE-KEEP OUT". The letters shall be block type and at least 50 mm in height.
8. The Contractor shall label all conductors and cables per cable schedules.
9. Call boxes will be State-furnished.
10. The Contractor shall provide all conduits with permanent field markers and labels.
11. The Contractor shall verify existing installation prior to intercepting and splicing with the new armored cable to ensure continuity of electrical service to West span.
12. The Contractor shall provide and install new armored cables on metal racks, troughs, in cable trays or secured to supports spaced not greater than 1500 mm apart.
13. The Contractor shall provide splice boxes for armored cables.
14. For other related work not shown on the plan sheets, see Electrical Special Provisions.
15. Contractor to verify all controlling field dimensions before ordering or fabricating any material.
16. Provide and install new armored cables or conduit as shown, scheduled and as needed in construction. Support cables or conduit from surface using 41x41 channel, hot dipped galvanized and appropriate strut mounted clamps. See Detail. Support armored cables or conduit horizontally along Temporary Bypass Structure (TBS) using steel ladder cable trays, hot dipped galvanized steel after fabrication (Cooper E-Line Series 148C12-24-144 or equal). See Details E-17 and E-18 for cable tray sizing, support, etc.
17. Verify cables no longer used or already abandoned by Caltrans. These cables will not be intercepted or spliced and are to be abandoned in place. After completion of work the Contractor is to remove cables, pullboxes, junction boxes, terminal boxes and cabinets inside Vaults #2, #3, #5 and connecting utility tunnels, including cables abandoned by others.
18. New armored cable will be completely routed and tested before cutting existing circuits and/ or interconnecting new.
19. Existing temporary power/ signal cables installed on Southgate Road wall and by YBI Substation project are to be removed after cutover (Reference SFOBB Electrical YBI Substation project are to be removed after cutover (Reference SFOBB Electrical Design RFI response, Letter 05.03.01-00453, June 6, 2005 from Caltrans).
20. Contractor to provide expansion fittings or loops at bridge expansion joints or points of deflection. Provide stainless steel support grips to hold the weight of electrical cable as it loops or hang in vertical, sloping or horizontal position.

SHEET NOTES:

1. Install surface mounted Type III soffit lighting fixture with 150 watt HPS lamp. Secure light fixture to concrete structure of westbound deck between bent caps.
2. Install new NEMA type 4 splice box. Splice box to have a minimum dimension of 305(L) x 305(W) x 152(D). Fasten box on the ceiling with four (4) 10-24 concrete expansion anchors and hex head cap screws. Provide and fuse splice connectors to each ungrounded
3. Locate light fixture 4.0 m from the inside face of barrier unless otherwise indicated.
4. Install new 41C conduit with 6 #6 AWG and 1 #8G conductors (CKT #241 and #242). Provide conduit support every 1.5 meter maximum. See detail 1 on Sheet E-18.
5. Install new 27C liquidtight flexible metal conduit with 3 #12 AWG conductors from splice box to lighting fixture.
6. Intercept (E) ckt #241 and ckt #242 in (E) vault #2A and route via (N) TB-23E.
7. Disconnect (E) soffit lighting fixture between bent #38 thru 48 after new temporary 55D soffit lighting is operational.
8. (E) TB-20E located in (E) MH-2.
9. See 600V cable block diagram for more information.
10. Install 6 #6 & 1 #8 (CKT #241 & 242) in (E) 103 conduit and route from (E) TB-20E to (N) TB-23E via (E) vault 2B and vault 2A.

SHEET NOTES:

1. Install new 15kV armored cable in 103 mm conduit from Vault #2A to Cable tray. Route along inside face of existing tunnel wall to (E) 103 mm extension conduits installed from (E) vault #2A. See cable and pull box schedules on Sheet E-8.
2. Transition from tunnel wall to exposed face of retaining wall, then rise to cable tray at south edge of westbound roadway. Provide expansion fittings or loops at bridge expansion joints or points of deflection.
3. Intercept and Splice (E) East Span 15 kV cable and new Temporary 15 kV cable in (E) Tee Splice Box located in (E) MH-1.
4. Refer to schedule "A" on E-8 for new armored cable schedule. Mount new cables on cable tray.
5. Transition to cable tray at the edge of the upper deck structure.
6. Route CKT #G30 together with new cables routed from (E)vault #2A.
7. Provide Ladder Drop out and stainless steel mesh grip for cable support at this location. See Detail on E-18 for more information.
8. Install new 15 kV Splice box with minimum dimensions of 914(W) x 610(H) x 610(D), screw cover type. 12 gauge, Nema 1 galvanized steel front removable cover.
9. Locate and splice (exothermic connection) (E) 500 MCM equipment ground in (E) vault #2A to new CKT #G30.
10. Install new armored cable in (E) 103 mm conduit and route via (E) vault 2B and vault #2A.

SHEET NOTES:

(1) CKT #G30 should be interconnected in Vault #4. Extend CKT #G30 from Vault #4 to inside YBI substation and connect to ground bar.

(2) Intercept existing circuits shown in table A with new cable.

(3) Pull box dimensions/voltage apply to cables listed in pull Box schedule. Other required pull boxes to be selected according to this table and Standard Specifications

(4) Install and connect new cables from existing circuits #241, #242, #243 and #249 in (E) TB-20E and route to temporary South-South detour lower deck lighting circuits.

(5) At (E) LVCC-C located in (E) YBI substation, install and splice new temporary cable for CKT #244-A and route temporary cable to temporary South-South detour UD North-East lighting to remain.

SHEET 36 OF 94

Item No.	Description
(A)	Expansion anchor, 13 mm dia, 89 mm depth embedment and allowable load (in tension) of 4.45 kN
(B)	Strut transverse brace for seismic support
(C)	Hinged seismic bracket with retaining clip
(D)	Strut channel, 41 mm x 82 mm
(E)	Threaded rod (13 mm) with stiffener & stiffener clips
(F)	Rod coupler, hex nut and washer for expansion anchor

ES-6A LIGHTING STANDARDS TYPES 15, 21 AND 22

ES-10 SIGNAL, LIGHTING AND ELECTRICAL SYSTEMS ISOLUX DIAGRAMS

STANDARD PLAN SHEET NO.

DETAIL NO.

GENERAL NOTES

1. All electrical work shall conform to (1999 and 2004) the latest issue of State of California Department of Transportation Standard Specifications and Standard Plans. These general notes and the special provisions under this contract also apply. For any conflict of provisions, State Guidelines apply.
2. Conduit routing is shown diagrammatically. Pull box locations are located and shown on plans. Provide additional pull boxes as required. Exact location of equipment and devices may be adjusted by field conditions or as directed by the Engineer.
3. Minimum conduit size to be 21 mm. Conduits located at exterior locations or exposed to moisture to be rigid galvanized steel, PVC coated. Conduits routed at interior locations to be rigid galvanized steel.
4. Conduit fittings for 78 mm and larger are to have a 610 mm minimum bending radius.
5. Equipment and devices to be provided with nameplate tags as shown on the plans.
6. Feeders and branch circuits to be provided with an equipment ground wire.
7. 15 KV splice boxes to be installed as shown and permanently marked "DANGER-HIGH VOLTAGE-KEEP OUT". The letters are to be block type and at least 50 mm in height.
8. Label conductors and cables per cable schedules.
9. Contractor to reuse existing call boxes currently on existing bridge. Contractor to relocate\rewire to TBS Bridge Structure. The state will provide a spare call box to test TBS locations prior to call box relocations.
10. Contractor to verify all controlling field dimensions before ordering or fabricating any material.
11. Provide and install new armored cables or conduit as shown, scheduled and as needed in construction. Support cables or conduit from surfaces using 41x41 channel, hot dipped galvanized and appropriate strut mounted clamps. See Detail. Support armored cables or conduit horizontally along Temporary Bypass Structure (TBS) using steel ladder cable trays, hot dipped galvanized steel after fabrication (Cooper B-Line Series 148G12-24-144 or equal). See Details for cable tray sizing, support, etc.
12. See Electrical Special Provisions for other related work not shown on the plans.
13. New armored cable will be completely routed and tested before cutting existing circuits and/or interconnecting new.
14. Contractor to verify existing installations and function prior to intercepting or splicing to ensure continuity of electrical and other services.
15. The Contractor shall provide all conduits with permanent field markers and labels.
16. The Contractor shall verify existing installation prior to intercepting and splicing with the new armored cable to ensure continuity of electrical service to West span.
17. The Contractor shall provide and install new armored cables on metal racks, troughs, in cable trays or secured to supports spaced not greater than 1.5 meters apart.
18. The Contractor shall provide splice boxes for armored cables.
19. New armored cable will be completely routed and tested before cutting existing circuits and/or interconnecting new.
20. Contractor to provide expansion fittings or loops at bridge expansion joints or points of deflection. Provide stainless steel support grips to hold the weight of electrical cable as it loops or hang in vertical, sloping or horizontal position.
21. 15kV splicing shall be done by a certified High Voltage Splicer. The Contractor shall allow 5 working days to approve splicer by Engineer.
22. If there are cables or conduit not shown on the plans, the Contractor shall verify the use of these equipment. If this equipment has to be maintained, the Contractor shall relocate the equipment and maintain as directed by Engineer.
23. All conduits and cables shall be connected to junction boxes using threaded insulated bonding bushing (pressure Type lug) with gasketed sealing locknut and moisture proof hub with "O" ring.
24. Exact location of equipment maybe adjusted to field conditions by the Engineer.

SHEET NOTES:

1. Type III Short soffit fixtures. 150W HPS. Secured to steel structure of Westbound deck. See sheet E-27.
2. Existing Eastbound light fixtures to be removed.
3. Junction box with feeder splices and fused protection for each fixture conductor derived.
4. CKT #241-2T and CKT #242-2T to junction box supplied under East Tie-In drawings.
5. Coordinate with East Tie-In light fixture placements to confirm fixtures will continue alternating pattern, North and South of the ED1 Line.
6. See East Tie-In drawings for continuation.
7. Eastbound deck structure shown for reference. Secure fixtures approx 1 meter East of floor beam or parts, oriented in the direction of travel.

CABLE TRAY LAYOUT

SCALE: 1:5

SHEET NOTES:

1. Route lighting circuits in cable tray. Provide pull boxes and activation at electrollers as needed per standard specifications. See plan views for electroller and pull box locations.
2. Route remaining cables in cable tray. Secure to top of structural post or cantilever from bottom of girder. Provide and install pull boxes and termination boxes as shown and as needed by field conditions. See Detail on this sheet and sheet E-4A. Secure cables at intervals not to exceed 1.4m (4ft) and within 300mm (12in) of every box, outlet, fitting, etc. Secure cable with Stainless Steel cable cleats (Copper Emperer cleats or equal).
3. Install 27C conduit from center of pole base to bottom of barrier electrollar support. Install 27C conduit with conductors and drip loop to junction box containing fused splice connectors.
4. Cable tray barrier pieces to create separation between 12kv, 600v and control cable. Barriers and accesories to be by same manufacturer as tray system.
5. Conduit containing underdeck lighting circuits, offset below or around deck beams.
6. Lateral conduit to underdeck light fixtures.

USER NAME = reyes1

CU 04251 EA 0120R4

DATE PLOTTED = 5/7/2008
DATE REVISED = 5/6/2008

GENERAL NOTES

1. All electrical work shall conform to (1998 and 2004) the latest issue of State of California Department of Transportation Standard Specifications and Standard Plans. These general notes and the special provisions under this contract also apply. For any conflict of provisions, State Guidelines apply.
2. All conduit routing is shown diagrammatically. Pull box locations are located and shown on plan drawings. The Contractor shall provide additional pull boxes as required. Exact location of equipment and devices may be adjusted by field conditions or as directed by the Engineer.
3. Minimum conduit sizes shall be 21 mm. All conduits located outside shall be rigid galvanized steel, PVC coated.
4. All conduit fittings for 78 mm and above shall have a 610 mm minimum bending radius.
5. All equipment and devices shall be provided with nameplate tags as shown in the drawings.
6. All feeders and branch circuits shall be provided with an equipment ground wire.
7. 15 KV splice boxes shall be installed as shown and permanently marked "DANGER-HIGH VOLTAGE-KEEP OUT". The letters shall be block type and at least 50 mm in height.
8. The Contractor shall label all conductors and cables per cable schedules.
9. Cell boxes will be State-furnished.
10. The Contractor shall provide all conduits with permanent field markers and labels.
11. The Contractor shall verify existing installation prior to intercepting and splicing with the new armored cable to ensure continuity of electrical service to West span.
12. The Contractor shall provide and install new armored cables on metal racks, troughs, in cable trays or secured to supports spaced not greater than 1.5 meters apart.
13. The Contractor shall provide splice boxes for armored cables.
14. For other related work not shown on the plan sheets, see Electrical Special Provisions.
15. Contractor to verify all controlling field dimensions before ordering or fabricating any material.
16. Provide and install new armored cables or conduit as shown, scheduled and as needed in construction. Support cables or conduit from surface and as needed in construction. Support cables or conduit from surface mounted using 41x41 channel, hot dipped galvanized and appropriate strut mounted clamps. See Detail. Support armored cables or conduit horizontally along Temporary Bypass Structure (TBS) using steel ladder cable trays, hot dipped galvanized steel after fabrication (Cooper B-Line Series 14BG12-24-144 or equal). See Details for cable tray sizing, support, etc.
17. Verify cables no longer used or already abandoned by Caltrans. These cables will not be intercepted or spliced and are to be abandoned in place. After completion of work the Contractor is to remove cables, pullboxes, junction boxes, terminal boxes and cabinets inside Vaults #2, #3, #5 and connecting utility tunnels, including cables abandoned by others.
18. New armored cable will be completely routed and tested before cutting existing circuits and/ or interconnecting new.
19. Conduit stub-ups (Eight-103C) have been installed by others at Vault #2A for utilization in this project.
20. Existing temporary power/ signal cables installed on Southgate Road wall and by YBI Substation project are to be removed after cutover (Reference and by YBI Substation project are to be removed after cutover (Reference SFOBB Electrical Design RFI response, Letter 05.03.01-00453, June 6, 2005 from Caltrans).
21. Contractor to provide expansion fittings or loops at bridge expansion joints or points of deflection. Provide stainless steel support grips to hold the weight of electrical cable as it loops or hang in vertical, sloping or horizontal position.
22. 15kV splicing shall be done by a certified High Voltage Splicer. The contractor shall allow 5 working days to approve splicer by Engineer.
23. If there are cables or conduit not shown on the plans, the contractor shall verify the use of these equipment. If this equipment has to be maintained, the contractor shall relocate the equipment and maintain as directed by Engineer.
24. All conduits and cables shall be connected to junction boxes using threaded insulated bonding bushing (pressure type lug) with gasketed sealing locknut and moisture proof hub with "O" ring.
25. All new conduits and cables shall be secured at a maximum 1.5 meters interval.
26. Exact location of equipment maybe adjusted to field conditions by the Engineer.

SEQUENCE OF CONSTRUCTION

STAGE 1: (Reference : Sheets E-15 and E-17)

1. Install new Service Cabinet, Contactor/Relay Cabinet, Control Cable Terminal Box and PEU unit on new RTU #8 Station at existing Pier E1.
2. Disconnect and remove existing RTU #8 cabinet and reinstall to new RTU #8 Station at existing Pier E1.
3. Locate and intercept existing DC cable (40/c, #16) and existing RTU cable (50pr, #19) and reroute cables to new Control Cable Terminal Box and RTU #8 cabinet respectively at new RTU #8 Station at existing Pier E1.
4. Locate and intercept existing conduit/cables (for call boxes #141, 142, 241, 242, 341, 342, 441 and 442) and reroute to relocated RTU #8 cabinet on new RTU #8 Station at existing Pier E1.
5. Remove and relocate existing call boxes from existing structure to be demolished, keeping 9-pin straight plug (male and female) connection intact with one meter length of cable pigtail for splicing at new location on Temporary Bypass Structure. (Installation and reconnection of these call boxes will be by "TRC")
6. Locate and intercept existing 480 volt call box main feeder (3 #2, & 1 #6G) cable and reroute to new Service Cabinet on new RTU #8 Station of existing Pier E1 and connect.

STAGE 2: (Reference: Sheet E-18)

1. Terminate and connect all new associated cables from Temporary Bypass Structure to new Cabinets and box at Pier E1 (including new service cabinet, relocated RTU #8 cabinet and new contactor/ relay terminal box).
2. Demo existing service cabinet, contactor/relay cabinet and control terminal box including related cables of existing location.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 134

SHEET 69 OF 94

PROJECT NOTES

1. Existing 78c, 3 #8, 8-6 #16 conductor cable under upper deck beam.
2. Existing 53c, 3 #8, 4-6 #16 conductor cable.
3. Existing 53c, 50 twisted pair #19 conductor shielded cable.
4. nstall new 3 #6+G armored cable (ckt #244)
5. nstall new 3 #6+G armored cable (ckt #243).
6. Install new armored cable with 3 #2 & 1 #8G (480 V, Call Box Main Feeder)
7. Install new 41C with 5 #8 and 1 #12G.
8. Install new 21C, with 3 #14 (120 V, PEU).
9. 3 #12 AWG conductors from splice boxes to lighting fixtures.
10. Secure conduit with unistrut assembly to structure, and per CEC.
11. Locate conduit adjacent to new cable tray.
12. Install 40C, #16 AWG conductor cable..
13. install new armored cable with 50 pair, #18 conductors.
14. Install new 53C, liquid tight flexible conduit with 3 #8, 4- 6 #16 conductor cable.
15. Install new 41C, 5 #8 and 2 #14 AWG.
16. Existing 40c, #16 AWG conductor cable.
17. Existing 50pr, #18 AWG conductor cable.

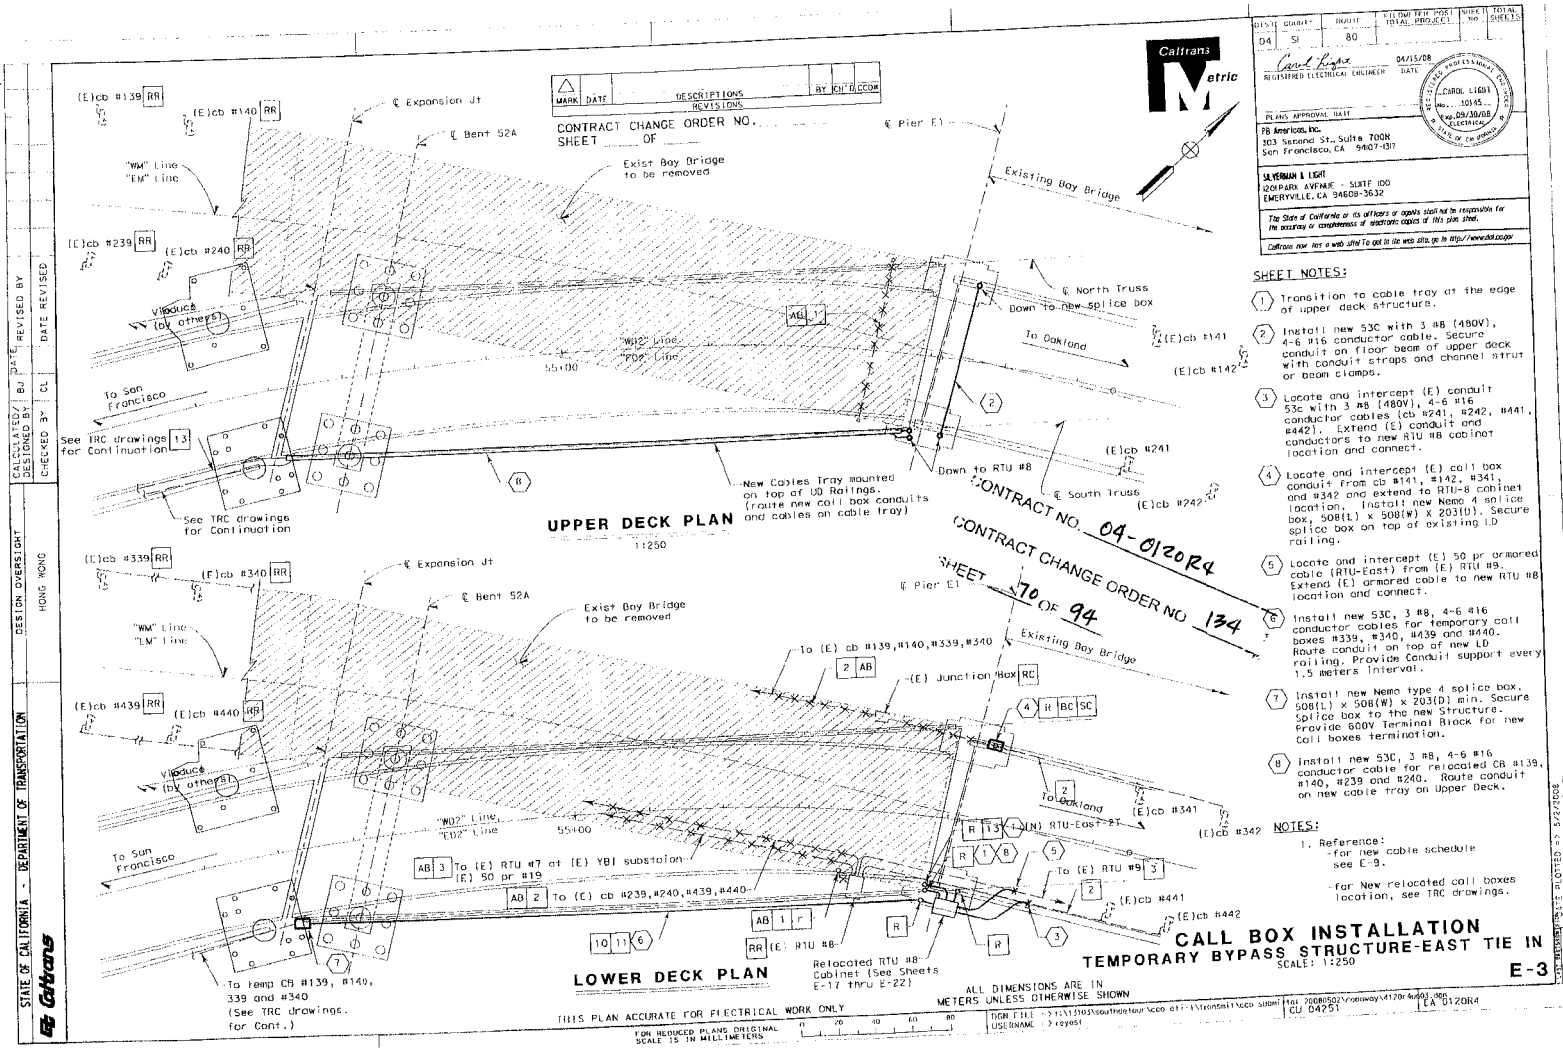
REVISIONS



CONTRACT CHANGE ORDER NO. 04-0120R4
SHEET 70 OF 94
CONTRACT CHANGE ORDER NO. 134

SHEET NOTES:

1. Transition to cable tray at the edge of upper deck structure.
2. Install new 53C with 3 #8 (480V), 4-6 #16 conductor cable. Secure conduit on floor beam of upper deck with conduit straps and channel strut or beam clamps.
3. Locate and intercept (E) conduit 53c with 3 #8 (480V), 4-6 #16 conductor cables (cb #241, #242, #441, #442). Extend (E) conduit and conductors to new RTU #8 cabinet location and connect.
4. Locate and intercept (E) call box conduit from cb #141, #142, #341, and #342 and extend to RTU-8 cabinet location. Install new Nemo 4 splice box, 508(L) x 508(W) X 203(D). Secure splice box on top of existing LD railing.
5. Locate and intercept (E) 50 pr armored cable (RTU-East) from (E) RTU #9. Extend (E) armored cable to new RTU #8 location and connect.
6. Install new 53C, 3 #8, 4-6 #16 conductor cables for temporary call boxes #339, #340, #439 and #440. Route conduit on top of new LD railing. Provide Conduit support every 1.5 meters interval.
7. Install new Nemo type 4 splice box, 508(L) x 508(W) x 203(D) min. Secure Splice box to the new Structure. Provide 600V Terminal Block for new Call boxes termination.
8. Install new 53C, 3 #8, 4-6 #16 conductor cable for relocated CB #139, #140, #239 and #240. Route conduit on new cable tray on Upper Deck.

NOTES:

1. Reference:
   -for new cable schedule see E-9.
   -for New relocated call boxes location, see TRC drawings.

SHEET NOTES:

1. New Armored cables on cable tray. See Sheet E-9 for new armored cable schedule.
2. Transition to cable tray at the edge of upper deck structure.
3. Locate and intercept existing armored cable with 40/c, #16 conductor and extend to new Control Cable Terminal Box located in new RTU-8 Station.
4. Route CKT #G30 together with new cables routed from Vault #2A and splice with existing ckt #G30 near Pier E1.
5. Locate existing 500 MCM equipment ground and splice (Exothermic connection) to new 500 MCM insulated equipment ground from YBJ substation.

NOTES:

1. Contractor shall verify existing installation prior to intercepting and splicing the new armored cables to ensure continuity of the electrical service.
2. Contractor shall provide and install new armored cables and secure them tog supports no greater than 1.5 meters apart.

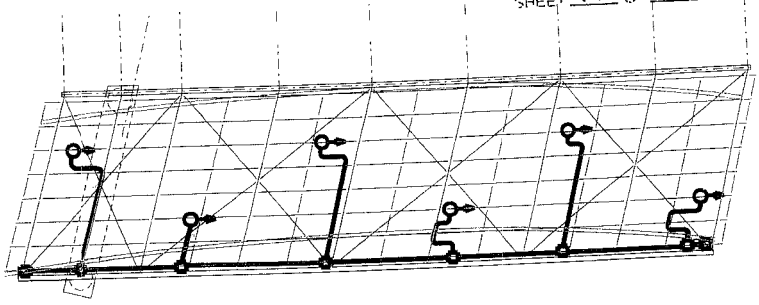
WESTBOUND STRUCTURE (UPPER DECK)

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO. 134

SHEET 74 OF 94



EASTBOUND STRUCTURE (LOWER DECK)

SHEET NOTES:

1. Install new Type 21 light fixture mounted on barrier rails with 400 watts HPS luminaire on 3.7 meter mounting arm. See Caltrans Standard ES-6A for more detail.
2. Install new Nema Type 4X splice box on the outside face of barrier. Splice box shall have a minimum dimension of 305(L) x 305(W) x 152(D). Secure box on the concrete barrier with four (4) 10-24 concrete expansion anchors and hex head cap screws. Provide fused splice connectors. See Caltrans Standard E-13A and 13-B for splicing details and fuse ratings.
3. Install new surface mounted Type III Soffit Light fixture with 150 watts HPS. Secure fixture to steel structure of west bound deck. Locate fixture 4.0 meter off inside face of barrier.
4. Install new Nema Type 4X splice box with minimum dimensions of 305(L) x 305(W) x 152(D). Fasten box on the first longitudinal steel member inside south truss. Provide fused splice connectors. See Caltrans Standard E-13A and 13-B for splicing details and fuse ratings.
5. Install new Nema Type 4X splice box with minimum dimensions of 305(L) x 305(W) x 152(D). Fasten box on the steel structure. Provide enough cable length and coil cable in box for reconnection, to power existing East bound luminaires to remain.
6. Install new Nema Type 4X splice box with minimum dimensions of 305(L) x 305(W) x 152(D). Fasten box on the steel structure. Provide enough cable length and coil cable inside box for connection to new East bound soffit fixtures. See TRC dwgs. for more information.
7. Install new 4IC, with 6 #6 & 1 #8G (CKTs #241 and #242). Secure conduit to Steel Structure. See Detail on Sheet E-25.
8. Install new 2TC, LTFC with 3 #12 & 1 #12G from splice box to Lighting Fixture.

RTU INTERPOSING RELAYS-GENERAL OPERATING SCHEME

1. Initiatory CB flasher is activated locally by CJ pushbuttion. Magnetically held coil C3 is energized. Contact C3-1 closes and the signal for CB initiatory identification number and for Master station to energize Tandem flashers are transmitted. Tandem CB flashers are activated when SC command from Master station energizes latching coil C4B and closes contact C4B-1 of each respective circuit.

2. Initiatory CB flasher is deactivated locally when key operated switch is momentarily open at the initiatory CB. Coil FC and C3 de-energize and the flasher is deactivated. Contact C3-1 opens and signal is transmitted to Master station to deactivate Tandem CB flashers. Tandem CB circuit latching coil C4A is energized by SC command from master station. Contact C4A-1 closes and Tandem CB flashers are deactivated.

3. Initiatory CB flasher is activated remotely when SC command from Master station energizes magnetically helc coil C2. Contact C2-1 closes. Coil FC and C3 energize, contact C3-1 closes and signal is transmitted to Master station to activate Tandem CB flashers. Tandem CB flashers are activated in the same manner as described in 1.

4. Initiatory CB flasher is deactivated remotely when SC command from Master station energizes pulse operated coil C1, Contact C1-1 momentarily opens. Coil FC and C3 de-energize and initiatory CB flasher is deactivated.
Tandem CB flasher are deactivated in the same manner as described in 2.

5. When call box power is off, coil C5 de-energizes, contact C5-1 closes signal is transmitted to Master station.

NOTE:

1. See symbols and abbreviations on E-1.
2. For RTU #8 elementary connection, see E-21 and E-22

SECTION AT BENT 52A

SCALE: NONE

Notes:

1. The Contractor is to verify all controlling field dimensions before ordering or fabricating any material.
2. Fabricate bracket clips and brace from A36 steel, grind sharp edges, hot dip galvanized.
3. See Structural plans for additional mounting detail and specifications.

SHEET NOTES:

1. Route lighting circuits in cable tray. Provide pull boxes and activation at electroliers as needed per standard specifications. See plan views for electrolier and pull box locations.
2. Route remaining cables in cable tray. Secure to top of structural post or cantilever from bottom of girder. Provide and install pull boxes and termination boxes as shown and as needed by field conditions. See Detail on this sheet and sheet E-4A.
3. Install 27C conduit from center of pole base to bottom of barrier electrolier support. Install 27C conduit with conductors and drip loop to junction box containing fused splice connectors.
4. Install cable tray barriers to create separation between 12 kV, 600 V and control cables. Barriers and accessories to be by same manufacturer as tray system.

CCO DESCRIPTION: Project Wide Electrical Changes	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Performing all electrical work as shown on Sheets 1 to 94 of the change order.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

Because of the approved strategy memorandums, the Department assumed responsibility for the electrical design and issued revised electrical plans for the YBID. Consequently, the original scope of work has been changed and this change order provides for the elimination of Contract Bid Item No. 78, Electrical Work (Stage 2) as this work is no longer necessary.

Due to the extent of the electrical changes to the YBID and the 5 year delay that has been incurred on the project, the original contract bid item shall be eliminated and an agreed lump sum price shall be paid for the work.

Contract Bid Item No. 78 Electrical Work (Stage 2), in the amount of $1,000,000.00 will be deleted from the contract. The Contractor will be compensated for the Department's revised electrical work at an agreed lump sum of $3,300,924.00. The net change order cost of $2,300,924.00 shall be financed from the projects contingency funds. A cost analysis for this agreed lump sum is on file in the project records.

No adjustment of contract time is warranted, as the work will not affect the controlling operation.

Alec Melkonians - Toll Bridge Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Maintenance, concurred with this change. The TBPOC provided approval for this change on May 7, 2009.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 135	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, provide compensation to the contractor for additional bar reinforcing steel costs for the Viaduct deck and barrier rail to be incurred by the Contractor's subcontractor Harris Salinas Rebar, Inc. (HSR) due to all the schedule changes and design enhancements by the Department to the steel Viaduct of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) that were incorporated into Imbsen & Associates Inc. approved "Final Superstructure Resubmittal" Viaduct plans (Sheets 1 through 112) dated July 19, 2007.

For this work, the Contractor will be compensated $995,100.00. This lump sum constitutes full compensation for all additional costs to be incurred by HSR, including all markups, due to all the schedule changes and design enhancements by the Department to the work concerning the Viaduct structure for furnishing all labor, material, tools, equipment, and incidentals for doing the work involved in this change.

Escalation costs associated with the Contractor's support of HSR's installation of the deck and barrier reinforcing steel for the Viaduct have not been addressed by this change order and shall remain outstanding.

Total Cost of Adjustment of Compensation at Lump Sum $995,100.00

Estimated Cost: Increase ☑ Decrease ☐ **$995,100.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

CONTRACT CHANGE ORDER MEMORANDUM

DATE: 3/3/2009 Page 1 of 1

TO: MIKE FORNER / DEANNA VILCHECK	FILE: E.A. 04 - 0120R4
	CO-RTE-PM SF-80-12.6/13.2
FROM: BILL CASEY	FED. NO. ACBRIM-080-1(097)N
CCO#: 136 SUPPLEMENT#: 2 Category Code: CJXX	CONTINGENCY BALANCE (incl. this change) $70,823,345.05
COST: $400,000.00 INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: USCG Access Additional Funds	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	0 Day(s)	0 %	0

THIS CHANGE ORDER PROVIDES FOR:

Provide additional funds for the construction of a temporary access road for USCG personnel.

The original contract change order calls for the construction of a temporary dirt road for the United States Coast Guard's (USCG) use, to provide and maintain a 24-hour a day, 7 days per week access on Macalla Road with no more than 15 minutes of blocked access per agreement between the Department and USCG, and to provide emergency access to the USCG facility in the event the main entrance becomes unavailable for any extended period of time.

A Supplemental No. 1 on the original CCO 136 in the amount of $100,000.00 (Extra Work @ Force Account) was executed to cover the work originally contemplated. However, all funds have been depleted and the Department anticipates additional work to be performed to include realigning the temporary access road due to advanced Yerba Buena Island Transitional Structure (YBITS) work at Bent W6R, realigning the USCG Command Circle Road that ties in to the temporary access road, and pavement improvements along Macalla Road for public access.

It is anticipated that additional funds of $400,000.00 will cover all the work as identified above, which can be financed from the project's contingency fund. A cost analysis is on file.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

There will be no time adjustment due to work of this change since the work involved does not affect the controlling operation.

This change was concurred by Alec Melkonians - Assistant Project Manager and concurred by Hong Wong - Project Engineer.

Maintenance concurrence is not required since it does not affect any permanent roadway features on this project.

475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Provide additional funds for the construction of a temporary access road for USCG personnel.

The original contract change order calls for the construction of a temporary dirt road for the United States Coast Guard's (USCG) use, to provide and maintain a 24-hour a day, 7 days per week access on Macalla Road with no more than 15 minutes of blocked access per agreement between the Department and USCG, and to provide emergency access to the USCG facility in the event the main entrance becomes unavailable for any extended period of time.

A Supplemental No. 2 on the original CCO 136 in the amount of $400,000.00 (Extra Work @ Force Account) was executed to cover the work originally contemplated. However, all funds have been depleted and the Department need to pay all extra work bills on the holding file in the amount of $211,000.00.. In addition, this office anticipates additional workto upkeep the temporary access road.

It is anticipated that additional funds of $350,000.00 will cover all the work as identified above, which can be financed from the project's contingency fund. A cost analysis is on file.

The Contractor's signature is not required for additional funds request for Extra Work at Force Account change orders, therefore, this change order is being issued unilaterally.

Alec Melkonians, Asst. Project Manager, and Hong Wong, Project Engineer, both concurred on this change.

There will be no time adjustment due to work of this change since the work involved does not affect the controlling operation.

Maintenance concurrence is not required since it does not affect any permanent roadway features on this project.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 138	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Provide and install underground water lines and fire hydrant in accordance with Sheets 3 through 7 of this Contract Change Order.

Water line construction will be done in accordance with the stancard specifications and plans for Ductile Iron Water Mains from the San Francisco Water Department. Contractor will provide and install all pipeline materials, including pipe, valves, valve boxes, hydrants, fittings, approved joint restraining measures, thrust blocks, and polyethylene encasement tube, to the satisfaction of the San Francisco Water Department. Contractor will conduct all required pressure tests, chlorination and bacterial tests, and complete connections to the existing water lines and hydrants to the satisfaction of the San Francisco Water Department inspector.

The pipeline routing shown on Sheet 3 of this change order is schematic in nature. The Contractor, with the Engineer's approval, may adjust routing of the pipe to avoid interferences or to minimize the traffic control requirements, or to minimize the amount of surface replacement required. The allowed rerouting includes adjusting the location of the connection of the new 200 mm DIP to the existing water line. The contractor shall conduct exploratory excavations at existing utilities as required to locate any potential conflicts, and re-route the new line as required to avoid interferences. The contractor shall conduct investigations as required to locate any potential conflict with planned future pile driving, and re-route the new line as required to avoid interferences.

Surface repairs: Attached contract change order sheets 3 through 7 do not detail any pavement removal or replacement, but this will be required. Any paved areas that are damaged or removed will be replaced with equal surfacing. In all paved or concrete areas, the contractor is to replace any damaged or removed pavement and base material with an equal or greater section thickness. A neat line sawcut is required at the edges of all pavement or concrete removal and replacement.

Traffic access: If there is any closure of streets required during working hours, the Contractor is responsible to provide flaggers as required to maintain traffic. The cost of providing flaggers will be paid for under CCO No. 1. Contractor will provide necessary measures, including but not limited to: temporary plates, temporary asphalt, barricades, and alternate access roads for vehicles and equipment to pass on existing roads without disruption during non-working hours. The cost of these measures (with the exception of the flaggers) is included in the lump sum amount of this change order.

This change order price includes full compensation for any required testing and legal disposal of excavated spoils and debris materials generated during the work. This change order does not include removal of asbestos or hazardous substances. If any asbestos or hazardous substances are encountered, the Contractor shall conform to the provisions of Special Provision section 5-1.06, "REMOVAL OF ASBESTOS AND HAZARDOUS SUBSTANCES".

For this work, the Contractor will be compensated at extra work at agreed lump sum of $278,200.00. This lump sum constitutes full compensation, including all markups, for furnishing all labor, material, tools, equipment, and incidentals for doing the work involved in this change.

There will be no adjustment in contract time for this change order.

Total Cost of Extra Work at Agreed Lump Sum $278,200.00

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 139	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

As determined by the Engineer and as shown on Sheet 4 of 4 of this change, modify Section 5-1.30, Environmentally Sensitive Areas (General), of the Contract Special Provisions to read as follows:

I. ENVIRONMENTALLY SENSITIVE AREAS (GENERAL)

A. ENVIRONMENTALLY SENSITIVE AREAS

Environmentally sensitive areas (ESA) shall consist of areas within and near the limits of construction where access is prohibited or limited for the preservation of archeological site, historic architectural resource or existing vegetation, or protection of biological habitat as shown on the plans. The Engineer will determine the exact location of the boundaries of the ESAs. No work shall be conducted within the ESAs, except ESAs 1a and 1b:

1. ESA 1a and 1b, Environmentally Sensitive Areas
   ESA 1a consists of asphalt concrete paved area and unpaved slope area.
   ESA 1b is located within the asphalt concrete paved area.
   The boundaries of the paved areas of the ESAs 1a and 1b shall be installed with a 200-mm white thermoplastic delineation.
   Within the paved areas and delineated boundaries of the ESAs 1a and 1b, no work involving asphalt removal or earth disturbance and/or removal, including but not limited to driving posts for fencing, signing, or utility trenching, shall be allowed.. Limited access to these ESAs may be allowed for vehicle and equipment access, storage or transport of materials or equipment vehicle or equipment access, storage and stockpiling, or transport of materials, when approved in writing by the Engineer.
   Within the unpaved slope area of ESA 1a, no work involving earth disturbance, including but not limited to driving posts for fencing, or signing, shall be allowed. The Contractor shall submit to the Engineer the protection plans including the scope of the work, in conformance with the requirements in "Working Drawings," of these special provisions. The Contractor equipment access will not be allowed, unless the Contractor has obtained a written approval from the Engineer.

2. ESA 2b and 2c
   ESA 2b consists of the Senior Officers' Quarters Historic District (Quarters 1 through 7), Historic Architectural Resource, and grounds. There will be no truck traffic through ESA 2b and the holly tree adjacent to the southeast corner of Quarters 1/Nimitz House shall remain in place.
   ESA 2c consists of Quarters 8, and grounds.

3. ESA 3, Quarters 10, Building 267 (garage), and grounds.

4. ESA 5, Vegetation, Environmentally Sensitive Areas, including mature vegetation screen located on slope southwest of Quarters 1 (Nimitz House), and pittosporum trees.

5. ESA 6, Tidal wetlands, water-based ESA (by others), located on the north side of YBI.

6. ESA 7, Eelgrass beds, water-based ESA (by others), located on the south sides of YBI.

7. ESA 8, Eelgrass beds, water-based ESA (by others), located on the north sides of YBI.

8. ESA 9a and 9b, concrete retaining walls and weir, Historic Architectural Resource.

Attention is directed to Section 7—1.01 "Laws to be Observed," and Section 7—1.04 "Permits and Licenses," of the Standard Specifications regarding State and Federal regulations, permits, or agreements which pertain to an ESA.

Water-based ESA boundaries have been marked with USCG-approved buoys, and have been established and will be maintained by others.

Land-based ESA boundaries shall be clearly marked by either the installation of Temporary Fence (Type ESA) or thermoplastic pavement delineation as specified elsewhere in these special provisions. The boundaries shall be checked periodically and the markings repaired or replaced as necessary during construction.

Within the boundaries of land-based ESAs 1a (unpaved area), ESAs 2b and 2c, ESA 3, ESA 5, and ESA 9a and 9b and water-based ESAs 6, 7, and 8, no project related activities shall take place, without the written approval from the Engineer. This specifically prohibits vehicle and barge access, storage or transport of any materials, including hydrocarbon and lead contaminated material, or any other project related activities. The Contractor shall take such measures, including the posting of written notices to his employees and subcontractors, to ensure that ESAs are not entered or disturbed.

The Contractor shall mitigate damage or impacts to the ESAs caused by the Contractor's operations, at the Contractor's expense in accordance with Section 7-1.11 of the Standard Specifications. Any additional mitigation assessed to the Department will be the responsibility of the Contractor. If necessary, deductions from moneys due or to become due the Contractor will be made for the mitigation costs.

RESOURCE REGULATIONS AND MANDATES

In compliance with Section 106 of the National Historic Preservation Act of 1966, any archaeological resource discovered during construction activities must be evaluated by the Department of Transportation Archaeologist.

The California Public Resources Code (PRC) Sections 5097.00 and 5097.98 require protection of Native American remains which might be discovered and outlines procedures for handling any burials found. The California PRC Section 5097.9 and Health and Safety Code Section 7050 require coordination with the Native American Heritage Commission.

Under California PRC, Chapter 1.7, Section 5097.5, it is a misdemeanor charge for anyone to knowingly disturb a historical feature or steal an archaeological resource. The California Administrative Code, Title 14, Section 4307, mandates that no person shall disfigure any object of historical interest or value. Under California Penal Code, Title 14, Part 1, Section 622-1.2, it is a misdemeanor to destroy anything of historical value within any public place.

All archaeological resources located on Department of Transportation property are property of the State of California. All archaeological resources located on Federal property are property of the Federal government and are governed by federal environmental laws, such as, but not limited to, the Antiquities Act of 1906, the Archaeological Resources Protection Act, and the Native American Graves Protection and Repatriation Act.

B. AREA TO BE MONITORED (ATM)

The Department Archaeologist will monitor the delineated ATM area.

No construction activities involving asphalt removal or earth disturbance and/or removal shall be allowed within the ATM area shown on the plans, unless the Contractor has obtained a written approval from the Engineer.

The Contractor shall obtain the Engineer's approval in writing at least 20 days in advance of the beginning of the removal of the top 0.6-m in depth of roadway excavation within the ATM, in order to have the Department Archaeologist begin to mobilize

CONSTRUCTION

The Department Archaeologist shall have the authority to halt construction operations in the vicinity of an archaeological find, if significant or potentially significant cultural resources are exposed or if the find will be adversely affected by construction operations.

In the event that human skeletal material or archaeological resources should be uncovered within the ATM area and/or contract limits, the Contractor shall immediately notify the Engineer, who in turn will notify the Department Archaeologist and the State may conduct an archaeological investigation. The Contractor's construction activities within 15-m of the find shall be halted immediately and shall not be resumed until so permitted, in writing by the Engineer.

When determined by the Department Archaeologist that an archaeological investigation is required, and as requested by the Engineer, the Contractor shall provide construction equipment and operators and/or laborers and shall cooperate with and assist Department Archaeologist(s) in their conducting of any of the archaeological work, if necessary.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 139	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

The Contractor shall provide, within 24 hours at the request of the Engineer:

1. A grading bucket with flat blade.
2. Suitable access/egress ramp or ladders or stairs in the ATM area as directed by the Engineer.

The above equipment and material items required for the archaeological work as specified in this sectionwill be paid for as extra work as provided in Section 4-1.03D of the Standard Specifications.

If, in the opinion of the Engineer, the Contractor's operations are delayed or interfered with by reason of such discoveries, the State will compensate the Contractor for the delays to the extent provided in Section 8-1.09, "Right of Way Delays," of the Standard Specifications, and not otherwise, except as provided in Section 8-1.10, "Utility and Non-Highway Facilities," of the Standard Specifications.

C. SPECIAL CONSTRUCTION AREA (SCA)

The special construction area is designated as the landscaping restoration area to be constructed by others.

The Contractor will be allowed inside SCA area. The Contractor shall not encroach into the designated ESA area bounded by ESA 2b, the Senior Officers' Quarters Historic District (Quarters 1 through 7), as shown on the plans. Damages to the existing pavement, sidewalk and curb caused by the Contractor's operations, shall be replaced in kind at the Contractor's expenses.

There will be no cost/no credit due to the work of this change at this time, however, any additional cost incurred such as delineation work, as ordered by the Engineer, will be handled in a separate contract change order.

CCO DESCRIPTION: ESA Specification Change	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Modifying Section 5-1.30, Environmentally Sensitive Areas (General), of the Contract Special Provisions.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

This change is necessary to accurately delineate each of the ESA limits within the project, to include the specific nature of each ESA, and to detaill what work is needed to protect each ESA.

Alec Melkonians, Assistant Project Manager - Toll Bridge Program, requested this change per his memo dated February 19, 2008 and was concurred by with Hong Wong - Project Engineer.

Any cost incurred by the Contractor will be deferred at this time.

Maintenance concurrence is not required as the work doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 140	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform all work shown on the plans and specifications of Pages No. 3 through 81 of this change order to provide for the steel fabrication and delivery of the steel truss of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

For this work, the Contractor shall be compensated a lump sum of $7,578,730.00. Except for the items of work specifically excluded below, this sum constitutes full and final compensation, including all markups, for all costs associated with the work of this change.

The costs of procuring all raw steel, welding wire and fasteners for the truss are excluded from this change and shall be compensated under Change Order No. 112.

The cost of furnishing all expansion joints, elastomeric bearing pads, decking and floor beam shear studs for the truss are excluded from this change order.

The costs associated with the erection of the truss and the fabrication and erection of the ETI skid bent and beam are excluded from this change order.

The cost of transporting the fabricated steel of the truss to the project site is included in this change order. In the event the fabricated steel is required to be delivered and stored off-site, all additional storage, handling and transportation costs associated with this off-site storage shall be compensated under a separate change order.

The costs of unloading the fabricated steel at the project site are excluded from this change order and shall be compensated under a separate change order.

Total Cost of Extra Work at Agreed Lump Sum $7,578,730.00

There shall be no reduction in compensation for check samples removed from any mill located more than 480 airline kilometers from Sacramento and Los Angeles or for additional shop inspection expenses sustained by the State for fabrication sites more than 300 airline miles from both Sacramento and Los Angeles.

All payment clauses contained within the specifications of this change order are superseded by the agreed lump sum and force account payment methods specified above.

10-1.__ STEEL STRUCTURES

Construction of steel structures, including skid bents, shall conform to the provisions in Section 55, "Steel Structures," of the Standard Specifications and these special provisions.

GENERAL

Skid bents shall be constructed by the Contractor and, when no longer required for the construction of the work, shall be removed in conformance with the provisions in "Bridge Removal" of these special provisions.

Attention is directed to "Welding" in Section 8, "Materials," of these special provisions. Fabrication and erection shall conform to ANSI/AASHTO/AWS D1.5, the Standard Specifications, and these special provisions.

Attention is directed to "Bridge Removal," of these special provisions regarding removal of skid bents.

Facing of Bearing Surfaces

The surface finish of bearing and base plates and other bearing surfaces that are to come in contact with each other or with concrete shall meet the ANSI surface roughness requirements as defined in ANSI B46.1, "Surface Roughness, Waviness, and Lay," Part I:

Bearing Surface	ANSI Requirement
Heavy plates in contact in shoes to be welded	1 000
Milled ends of compression members, milled or ground ends of stiffeners and fillers	500
Sliding bearings	125

The following substitutions, A 490 for A 490M only or A 325 for A 325M only as shown on the plans, of high-strength steel fasteners may be made:

METRIC SIZE SHOWN ON THE PLANS	SIZE TO BE SUBSTITUTED
ASTM Designation: A490M or A 325M (Nominal bolt diameter (mm))	ASTM Designation: A490 or A 325 (Nominal bolt diameter (inch))
13, 12.70, or M12	1/2
16, 15.88, or M16	5/8
19, 19.05, or M20	3/4
22, 22.22, or M22	7/8
24, 25, 25.40, or M24	I
29, 28.58, or M27	1 1/8
32, 31.75, or M30	1 1/4
38, 38.10, or M36	1 1/2

MATERIALS

Structural steel shall conform to ASTM Designation: A709M or as otherwise shown in the plans. Charpy V-notch testing shall use Zone 2 requirements.

HSS members shall conform to ASTM Designation: A500, Grade B, or ASTM Designation: A847, with Charpy V-Notch testing performed on a heat basis (H) per ASTM Designation: A673 with an acceptance criteria of 20J at 4C minimum average.

Steel for members, shown on the plans as fracture critical members, shall conform to the requirements in AWS D1.5, Section 12, "AASHTO/AWS Fracture Control Plan (FCP) for Non-Redundant Members." Charpy V-notch (CVN) impact values for fracture critical members shall conform to the requirements for Zone 2.

At the option of the Contractor, steel pipe for skid bents may be fabricated from plate as specified below or purchased as a tubular fabricated in accordance with API SPECIFICATION 5L, Grade X52 with PSL2. Pipe shall be fabricated by an API licensed facility and shall include API Monogram marking. Pipe furnished in accordance with these requirements will be considered equivalent to ASTM Designation: A709, Grade 345T2 with respect to weld procedure qualification and other requirements of AWS D1.5.

FABRICATION

The Contractor shall submit to the Engineer for approval in accordance with the requirements for "Working Drawings" of these special provisions, written detailed procedures for the fabrication and erection of the ETI Truss. Procedures shall include inspection hold points and description of the sequence and practices to be used to ensure that the dimensional tolerances are met.

Fabricated Steel Pipe (Skid Bents)

Cylindrical tubular members formed from steel plate shall be fabricated as single seam welded pipe in accordance with the requirements in API "Specification for the Fabrication of Structural Steel Pipe- API SPECIFICATION 2B," 6th Edition, with the following modifications:

A. Plate shall conform to the requirements on the plans
B. Welding consumables shall conform to AWS D1.5, Table 4.1 for matching filler
C. Weld procedures shall be qualified and applied in accordance with AWS D1.5, including Charpy V-Notch testing and welding heat input control.
D. Charpy V-Notch tests of the coarse grained heat affected zone shall be included in the weld procedure qualification tests and shall meet the base steel Zone 1 requirement
E. Longitudinal seams shall be examined 100% by radiographic or ultrasonic inspection in accordance with API Spec 2B.
F. Acceptance criteria for RT and UT in API Spec 2B, Section 7.3 shall be replaced by AWS D1.5, Section 6.26 for welds in tension.

ELASTOMERIC BEARING PADS

Elastomeric bearing pads shall conform to the provisions in Section 51-1.12H, "Elastomeric Bearing Pads," of the Standard Specifications and these special provisions.

Elastomeric bearing pads shall be bonded to steel with adhesive conforming to Federal Specification MMM-A-121, where shown on the plans.

CHECK TESTING

Structural steel shall conform to the designated ASTM Standard and the check testing requirements of this section.

Check samples shall be furnished for each heat of maximum thickness of:

A. Tension flanges and webs of fracture critical members.

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 140
SHEET 7 OF 84

Steel plates, shapes, or bars containing check samples shall be furnished from the mill with extra length in order to provide for removal of material for check samples at the point of fabrication. Check samples may be cut from either end of the designated plate, shape, or bar.

At the option of the Contractor, check samples may be removed at the rolling mill rather than at the point of fabrication. The sample will be removed from the mill plate that will be stripped by the fabricator to produce the designated plate and may be taken from any location within that plate. The mill plate from which samples are removed shall be marked with the same identifying numbers as are used on the samples.

Material for check samples shall be removed by the Contractor in the presence of the Engineer. Check samples for plates wider than 610 mm shall be 355 mm wide and 460 mm long with the long dimension transverse to the direction of rolling. Check samples for all other products shall be 460 mm long, taken in the direction of rolling, and the width shall be the product width. Check samples shall be removed and delivered to the Engineer before the material is fabricated into components. The direction of rolling, heat numbers, and plate numbers shall be marked on the samples with paint or other indelible marking material or may be steel stamped in one corner of the plate.

Check samples shall be delivered to the Transportation Laboratory at the Contractor's expense. The check samples will be tested by the Transportation Laboratory for compliance with the requirements specified in ASTM and these special provisions. Check sample test results will be reported to the Contractor within 3 weeks of delivery to the Transportation Laboratory. In the event several samples are submitted on the same day, an additional day will be added for every 2 samples submitted. The test report will be made for the group of samples.

The results of the tensile and impact tests shall not vary more than 5 percent below the specified minimum or 5 percent above the specified maximum requirements. If the initial check test results vary more than 5 percent but not more than 10 percent from the specified requirements, a retest may be performed on another sample from the same heat and thickness. The results of the retest shall not vary more than 5 percent from the original specified requirements. If the results of check tests exceed these permissible variations, material planned for use from the heat represented by said check samples shall be subject to rejection.

ROTATIONAL CAPACITY TESTING PRIOR TO SHIPMENT TO JOB SITE

Rotational capacity tests shall be performed on all lots of high-strength fastener assemblies prior to shipment of these lots to the project site. Zinc-coated assemblies shall be tested after all fabrication, coating, and lubrication of components has been completed. One hardened washer shall be used under each nut for the tests.

The requirements of this section do not apply to high-strength cap screws or high-strength bolts used for slip base plates.

Each combination of bolt production lot, nut lot, and washer lot shall be tested as an assembly.

A rotational capacity lot number shall be assigned to each combination of lots tested. Each shipping unit of fastener assemblies shall be plainly marked with the rotational capacity lot number.

Two fastener assemblies from each rotational capacity lot shall be tested.

The following equipment, procedure, and acceptance criteria shall be used to perform rotational capacity tests on and determine acceptance of long bolts. Fasteners are considered to be long bolts when full nut thread engagement can be achieved when installed in a bolt tension measuring device:

A. Long Bolt Test Equipment:

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 140
SHEET 8 OF 84

1. Calibrated bolt tension measuring device with adequate tension capacity for the bolts being tested.
2. Calibrated dial or digital torque wrench. Other suitable tools will be required for performing Steps 7 and 8 of the Long Bolt Test Procedure. A torque multiplier may be required for large diameter bolts.
3. Spacer washers or bushings. When spacer washers or bushings are required, they shall have the same inside diameter and equal or larger outside diameter as the appropriate hardened washers conforming to the requirements in ASTM Designation: F436.
4. Steel beam or member, such as a girder flange or cross frame, to which the bolt tension measuring device will be attached. The device shall be accessible from the ground.

B Long Bolt Test Procedure:

1. Measure the bolt length. The bolt length is defined as the distance from the end of the threaded portion of the shank to the underside of the bolt head.
2. Install the nut on the bolt so that 3 to 5 full threads of the bolt are located between the bearing face of the nut and the underside of the bolt head. Measure and record the thread stickout of the bolt. Thread stickout is determined by measuring the distance from the outer face of the nut to the end of the threaded portion of the shank.
3. Insert the bolt into the bolt tension measuring device and install the required number of washers, and additional spacers as needed, directly beneath the nut to produce the thread stickout measured in Step 2 of this procedure.
4. Tighten the nut using a hand wrench to a snug-tight condition. The snug tension shall not be less than the Table A value but may exceed the Table A value by a maximum of 2 kips.

Table A—High-Strength Fastener Assembly Tension Values to Approximate Snug-Tight Condition

Bolt Diameter (inches)	Snug Tension (kips)	
	A 325	A 490
1/2	1	2
5/8	2	2
3/4	3	4
7/8	4	5
1	5	6
1 1/8	6	8
1 1/4	7	10
1 3/8	9	12
1 1/2	10	15

5. Match-mark the assembly by placing a heavy reference start line on the face plate of the bolt tension measuring device which aligns with 1) a mark placed on one corner of the nut, and 2) a radial line placed across the flat on the end of the bolt, or on the exposed portions of the threads of tension control bolts. Place an additional mark on the outside of the socket that overlays the mark on the nut corner such that this mark will be visible while turning the nut. Make an additional mark on the face plate, either 2/3 of a turn, one turn, or 1 1/3 turn clockwise from the heavy reference start line, depending on the bolt length being tested as shown in Table B.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 140
SHEET 9 OF 84

A325 and A490 Table B

Required Nut Rotation for Rotational Capacity Tests[a,b]	
Bolt Length (measured in Step 1)	Required Rotation (turn)
4 bolt diameters or less	2/3
Greater than 4 bolt diameters but no more than 8 bolt diameters	1
Greater than 8 bolt diameters, but no more than 12 bolt diameters[c]	1 1/3
(a) Nut rotation is relative to bolt, regardless of the element (nut or bolt) being turned. For bolts installed by 1/2 turn and less, the tolerance shall be plus or minus 30 degrees; for bolts installed by 2/3 turn and more, the tolerance shall be plus or minus 45 degrees. (b) Applicable only to connections in which all material within grip of the bolt is steel. (c) When bolt length exceeds 12 diameters, the required rotation shall be determined by actual tests in a suitable tension device simulating the actual conditions.	

6. Turn the nut to achieve the applicable minimum bolt tension value listed in Table C. After reaching this tension, record the moving torque, in foot-pounds, required to turn the nut, and also record the corresponding bolt tension value in pounds. Torque shall be measured with the nut in motion. Calculate the value, T (in ft-lbs), where T=[(the measured tension in pounds) x (the bolt diameter in inches) / 48 in/ft].

Table C—Minimum Tension Values for High-Strength Fastener Assemblies

Bolt Diameter (inches)	Minimum Tension (kips)	
	A 325	A 490
½	12	15
5/8	19	24
¾	28	35
7/8	39	49
1	51	64
1 1/8	56	80
1 ¼	71	102
1 3/8	85	121
1 ½	103	148

7. Turn the nut further to increase bolt tension until the rotation listed in Table B is reached. The rotation is measured from the heavy reference line made on the face plate after the bolt was snug-tight. Record this bolt tension.
8. Loosen and remove the nut and examine the threads on both the nut and bolt.

C. Long Bolt Acceptance Criteria:

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 140
SHEET 10 OF 14

1. An assembly shall pass the following requirements to be acceptable: 1) the measured moving torque (Step 6) shall be less than or equal to the calculated value, T (Step 6), 2) the bolt tension measured in Step 7 shall be greater than or equal to the applicable turn test tension value listed in Table D, 3) the nut shall be able to be removed from the bolt without signs of thread stripping or galling after the required rotation in Step 7 has been achieved, 4) the bolt does not shear from torsion or fail during the test, and 5) the assembly does not seize before the final rotation in Step 7 is reached. Elongation of the bolt in the threaded region between the bearing face of the nut and the underside of the bolt head is expected and will not be considered a failure. Both fastener assemblies tested from one rotational capacity lot shall pass for the rotational capacity lot to be acceptable.

Table D—Turn Test Tension Values

Bolt Diameter (inches)	Turn Test Tension (kips)	
	A 325	A 490
½	14	17
5/8	22	28
3/4	32	40
7/8	45	56
1	59	74
1 1/8	64	92
1 1/4	82	117
1 3/8	98	139
1 1/2	118	170

The following equipment, procedure, and acceptance criteria shall be used to perform rotational capacity tests on and determine acceptance of short bolts. Fasteners are considered to be short bolts when full nut thread engagement cannot be achieved when installed in a bolt tension measuring device:

A. Short Bolt Test Equipment:

1. Calibrated dial or digital torque wrench. Other suitable tools will be required for performing Steps 7 and 8 of the Short Bolt Test Procedure. A torque multiplier may be required for large diameter bolts.
2. Spud wrench or equivalent.
3. Spacer washers or bushings. When spacer washers or bushings are required, they shall have the same inside diameter and equal or larger outside diameter as the appropriate hardened washers conforming to the requirements in ASTM Designation: F436.
4. Steel plate or girder with a hole to install bolt. The hole size shall be 1.6 mm greater than the nominal diameter of the bolt to be tested. The grip length, including any plates, washers, and additional spacers as needed, shall provide the proper number of threads within the grip, as required in Step 2 of the Short Bolt Test Procedure.

B. Short Bolt Test Procedure:

1. Measure the bolt length. The bolt length is defined as the distance from the end of the threaded portion of the shank to the underside of the bolt head.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 140
SHEET 11 OF 84

2. Install the nut on the bolt so that 3 to 5 full threads of the bolt are located between the bearing face of the nut and the underside of the bolt head. Measure and record the thread stickout of the bolt. Thread stickout is determined by measuring the distance from the outer face of the nut to the end of the threaded portion of the shank.
3. Install the bolt into a hole on the plate or girder and install the required number of washers and additional spacers as needed between the bearing face of the nut and the underside of the bolt head to produce the thread stickout measured in Step 2 of this procedure.
4. Tighten the nut using a hand wrench to a snug-tight condition. The snug condition shall be the full manual effort applied to the end of a 305 mm long wrench. This applied torque shall not exceed 20 percent of the maximum allowable torque in Table E.

Table E—Maximum Allowable Torque for High-Strength Fastener Assemblies

Bolt Diameter (inches)	Torque (ft-lbs)	
	A 325	A 490
½	145	180
5/8	285	360
3/4	500	630
7/8	820	1030
1	1220	1540
1 1/8	1500	2160
1 1/4	2130	3060
1 3/8	2800	3990
1 1/2	3700	5320

5. Match-mark the assembly by placing a heavy reference start line on the steel plate or girder which aligns with 1) a mark placed on one corner of the nut and 2) a radial line placed across the flat on the end of the bolt or on the exposed portions of the threads of tension control bolts. Place an additional mark on the outside of the socket that overlays the mark on the nut corner such that this mark will be visible while turning the nut. Make 2 additional small marks on the steel plate or girder, one 1/3 of a turn and one 2/3 of a turn clockwise from the heavy reference start line on the steel plate or girder.
6. Using the torque wrench, tighten the nut to the rotation value listed in Table F. The rotation is measured from the heavy reference line described in Step 5 made after the bolt was snug-tight. A second wrench shall be used to prevent rotation of the bolt head during tightening. Measure and record the moving torque after this rotation has been reached. The torque shall be measured with the nut in motion.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 140

SHEET 12 OF 84

A325 and A490 Table F

Nut Rotation Required for Turn-of-Nut Installation[a,b]	
Bolt Length (measured in Step 1)	Required Rotation (turn)
4 bolt diameters or less	1/3
(a) Nut rotation is relative to bolt, regardless of the element (nut or bolt) being turned. For bolts installed by 1/2 turn and less, the tolerance shall be plus or minus 30 degrees. (b) Applicable only to connections in which all material within grip of the bolt is steel.	

7. Tighten the nut further to the 2/3-turn mark as indicated in Table G. The rotation is measured from the heavy reference start line made on the plate or girder when the bolt was snug-tight. Verify that the radial line on the bolt end or on the exposed portions of the threads of tension control bolts is still in alignment with the start line.

A325 and A490 Table G

Required Nut Rotation for Rotational Capacity Test	
Bolt Length (measured in Step 1)	Required Rotation (turn)
4 bolt diameters or less	2/3

8. Loosen and remove the nut and examine the threads on both the nut and bolt.

C. Short Bolt Acceptance Criteria:

1. An assembly shall pass the following requirements to be acceptable: 1) the measured moving torque from Step 6 shall be less than or equal to the maximum allowable torque from Table E, 2) the nut shall be able to be removed from the bolt without signs of thread stripping or galling after the required rotation in Step 7 has been achieved, 3) the bolt does not shear from torsion or fail during the test, and 4) the assembly shall not seize before the final rotation in Step 7 is reached. Elongation of the bolt in the threaded region between the bearing face of the nut and the underside of the bolt head will not be considered a failure. Both fastener assemblies tested from one rotational capacity lot shall pass for the rotational capacity lot to be acceptable.

INSTALLATION TENSION TESTING AND ROTATIONAL CAPACITY TESTING AFTER ARRIVAL ON THE JOB SITE

Installation tension tests and rotational capacity tests on high-strength fastener assemblies shall be performed by the Contractor prior to acceptance or installation and after arrival of the fastener assemblies on the project site. Installation tension tests and rotational capacity tests shall be performed at the job-site, in the presence of the Engineer, on each rotational capacity lot of fastener assemblies.

The requirements of this section do not apply to high-strength cap screws or high-strength bolts used for slip base plates.

Installation tension tests shall be performed on 3 representative fastener assemblies in conformance with the provisions in Section 8, "Installation," of the RCSC Specification. For short bolts, Section 8.2, "Pretensioned Joints," of the RCSC Specification shall be replaced by

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 140
SHEET 13 OF 84

the "Pre-Installation Testing Procedures," of the "Structural Bolting Handbook," published by the Steel Structures Technology Center, Incorporated.

The rotational capacity tests shall be performed in conformance with the requirements for rotational capacity tests in "Rotational Capacity Testing Prior to Shipment to Job Site" of these special provisions.

At the Contractor's expense, additional installation tension tests, tests required to determine job inspecting torque, and rotational capacity tests shall be performed by the Contractor on each rotational capacity lot, in the presence of the Engineer, if 1) any fastener is not used within 3 months after arrival on the jobsite, 2) fasteners are improperly handled, stored, or subjected to inclement weather prior to final tightening, 3) significant changes are noted in original surface condition of threads, washers, or nut lubricant, or 4) the Contractor's required inspection is not performed within 48 hours after all fasteners in a joint have been tensioned.

Failure of a job-site installation tension test or a rotational capacity test will be cause for rejection of unused fasteners that are part of the rotational capacity lot.

When direct tension indicators are used, installation verification tests shall be performed in conformance with Appendix Section X1.4 of ASTM Designation: F959, except that bolts shall be initially tensioned to a value 5 percent greater than the minimum required bolt tension.

SURFACE PREPARATION

For all bolted connections, the 1) contact surfaces, 2) outer surfaces of existing members that are within the grip and will be hidden by surfaces of outside existing members within the grip under bolt heads, nuts, and washers, and 3) inside surfaces of bolt holes shall be cleaned and coated before assembly in conformance with the provisions for cleaning and painting structural steel of these special provisions.

SEALING

The perimeter around all direct tension indicator gaps shall be completely sealed with non-silicone type sealing compound conforming to the provisions in Federal Specification TT-S-230, Type II. The sealant shall be gray in color and have a minimum thickness of 1.3 mm. If painting is required, the sealing compound shall be applied prior to painting.

When zinc-coated tension control bolts are used, the sheared end of each fastener shall be completely sealed with non-silicone type sealing compound conforming to the provisions in Federal Specification TT-S-230, Type II. The sealant shall be gray in color and shall have a minimum thickness of 1.3 mm. The sealant shall be applied to a clean sheared surface on the same day that the splined end is sheared off.

REMOVE AND REPLACE FASTENERS

Existing rivets shall be removed and replaced with new high strength bolts as shown on the plans, as specified in these special provisions, and as directed by the Engineer.

Cleaning and painting of exposed steel surfaces in connection with drilling and bolting operations shall conform to the provisions in "Surface Preparation" and "Sealing" of this section.

The Contractor shall submit to the Engineer, in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the standard specifications, the proposed method of rivet removal and replacement for approval. The Contractor shall allow 10 working days review time, after complete drawings and procedures are received by the Engineer.

Unless otherwise shown on the plans, Contractor shall replace rivets with bolts in one group at a time, where a group consists of those rivets connecting a single member to a single gusset plate. The Contractor shall remove and replace no more than 20% of the rivets in a group at a

CONTRACT NO. 04-012084
CONTRACT CHANGE ORDER NO 140
SHEET 14 OF 84

time. Rivet removal will not be permitted until the removal and replacement method has been approved by the Engineer.

Where existing rivets are removed, the holes shall be enlarged not more than 1.5 mm in diameter greater than the nominal diameter of the replacement bolt.

Rivets to be removed shall have their head chipped off and the shank driven or drilled out. Care shall be taken not to enlarge rivet holes or to damage remaining material. If heat is to be used, the Contractor shall demonstrate the adequacy of his proposed removal method to the Engineer for approval.

Heat resulting from any removal method shall not damage or change rivet holes or the surrounding material.

Rust on the sides of the holes shall be removed. Holes shall be reamed, as approved by the Engineer, in conformance with the provisions in "Surface Preparation Specification No.2" of the SSPC: The Society for Protective Coatings, if the rust cannot be removed by any other means.

Where reamed holes are enlarged by more than 3 mm larger than the replacement bolt nominal diameter, the next larger size bolt shall be installed. If the Engineer orders such hole enlargement, replacement with the next larger size bolt will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications.

Where such hole enlargement is done without the Engineer's approval, replacement with the next larger size bolt will be at the Contractor's expense.

Holes shall be enlarged by reaming. Flame cutting will not be permitted.

Holes which must be enlarged to facilitate entry of the bolt shall be reamed. Poor alignment of holes shall be cause for rejection. Where reamed holes exceed the nominal diameter of the bolt by more than 3 mm, the next larger size bolt shall be installed. Where the misalignment occurs in existing material, the larger bolt will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications, otherwise the larger bolt shall be at the Contractor's expense.

Full compensation for removing and replacing fasteners as shown on the plans, or removing and replacing fasteners in order to erect new structural steel, or as needed by the Contractor to verify dimensions, shall be considered as included in the contract prices paid per pound for erect structural steel of the types shown on the Engineer's Estimate and no additional compensation will be allowed therefor.

WELDING

Table 2.2 of AWS D1.5 is superseded by the following table:

Base Metal Thickness of the Thicker Part Joined, mm	Minimum Effective Partial Joint Penetration Groove Weld Size, * mm
Over 6 to 13 inclusive	5
Over 13 to 19 inclusive	6
Over 19 to 38 inclusive	8
Over 38 to 57 inclusive	10
Over 57 to 150 inclusive	13
Over 150	16

* Except the weld size need not exceed the thickness of the thinner part

Dimensional details and workmanship for welded joints in tubular and pipe connections shall conform to the provisions in Part A, "Common Requirements of Nontubular and Tubular Connections," and Part D, "Specific Requirements for Tubular Connections," in Section 2 of AWS D1.1.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 140
SHEET 15 OF 84

Backing for welds, subject to computed stresses, that is left in place in the completed structure as shown on the plans or approved by the Engineer shall be a single length. Backing shall be of the same material as the structural steel being welded. Single lengths of backing shall be obtained by using a continuous strip, or may consist of lengths of backing joined by full penetration butt welds. Butt welds in the backing material shall be subject to the same type and frequency of testing as specified for the type of joint in the material being joined. Butt welds in backing material shall be ground flush as necessary to obtain proper inspection and for proper fit-up in the welded joint with which the backing is to be used.

Welding of temporary fixtures such as lifting lugs or temporary shear enhancement devices shall be shown on the working drawings and shall conform to AWS D1.5. After removal, the structure shall be repaired as necessary to meet the requirements of these special provisions and AWS D1.5.

Gas Metal Arc Welding (GMAW), but not with short-circuiting transfer, will be permitted only for tack welding of structural members.

Weld joint details BTC-P10, BTC-P10-GF, BTC-P10-S from Figure 3.3 of AWS D1.1 shall be included as standard weld joint details as if it were included in Figure 2.5 in AWS D1.5.

MEASUREMENT AND PAYMENT

If a portion of or all check samples are removed at a mill more than 480 air line kilometers from both Sacramento and Los Angeles, shop inspection expenses will be sustained by the State which are in addition to expenses incurred for fabrication site inspection. Payment to the Contractor for furnishing structural steel will be reduced $2,000 for each mill located more than 480 air line kilometers from both Sacramento and Los Angeles.

Furnish structural steel (truss) and furnish structural steel (skid bent) will be paid for in the same manner as specified for furnish structural steel (bridge) in Section 55-4.02, "Payment," of the Standard Specifications.

Erect structural steel (truss) and erect structural steel (skid bent) will be paid for in the same manner as specified for erect structural steel (bridge) in Section 55-4.02, "Payment," of the Standard Specifications.

The contract lump sum price paid for strengthen existing bridge shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all work involved in strengthen existing bridge, complete in place, including elastomeric bearing pads, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 140

SHEET 16 OF 84

10-5.__ CLEAN AND PAINT STRUCTURAL STEEL

New metal surfaces, except where galvanized, shall be cleaned and painted in conformance with the provisions in Section 59-2, "Painting Structural Steel," and Section 91, "Paint," of the Standard Specifications and these special provisions.

Cleaning and painting of skid bents will not be required.

Prior to performing any painting or paint removal, the Contractor shall submit to the Engineer, in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications, 3 copies of a separate Painting Quality Work Plan (PQWP) for each item of work for which painting or paint removal is to be performed. As a minimum, each PQWP shall include the following:

A. The name of each Contractor or subcontractor to be used.
B. One copy each of all current "SSPC: The Society for Protective Coatings" specifications or qualification procedures which are applicable to the painting or paint removal to be performed. These documents shall become the permanent property of the Department.
C. Proposed methods and equipment to be used for any paint application.
D. Proof of written documents and demonstration to the Engineer showing conformance with the requirements in Section 3, "General Qualification Requirements of SSPC-QP 3. Equal or greater certification will be acceptable.

The Engineer shall have 2 weeks to review the PQWP submittal after a complete plan has been received. No painting or paint removal shall be performed until the PQWP for that work is reviewed by the Engineer. Should the Engineer fail to complete the review within this time allowance and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in reviewing the PQWP, the delay will be considered a right of way delay in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

CLEANING

New metal surfaces shall be dry blast cleaned in conformance with the requirements in Surface Preparation Specification No. 10, "Near White Blast Cleaning," of the "SSPC: The Society for Protective Coatings." Blast cleaning shall leave surfaces with a dense, uniform, angular anchor pattern of not less than 40 µm nor more than 86 µm as measured in conformance with the requirements in ASTM Designation: D 4417.

Mineral and slag abrasives used for blast cleaning steel shall conform to the requirements in Abrasive Specification No. 1, "Mineral and Slag Abrasives," of the "SSPC: The Society for Protective Coatings" and shall not contain hazardous material. Mineral and slag abrasives shall comply with the requirements for Class A, Grade 2 to 3 as defined therein.

A Certificate of Compliance conforming to the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications and a Material Safety Data Sheet shall be furnished prior to use for each shipment of blast cleaning material for steel.

The inside surfaces of bolt holes shall be cleaned in conformance with the requirements in Surface Preparation Specification No. 1, "Solvent Cleaning," of the "SSPC: The Society for Protective Coatings," and visible rust shall be removed.

Corners shall be chamfered to remove sharp edges.

Thermal cut edges (TCEs) to be painted shall be conditioned such that the blast profile is achieved as required in these special provisions.

PAINTING

Blast cleaned surfaces shall receive a single undercoat, consisting of an inorganic zinc coating conforming to the requirements in AASHTO Designation M 300, Type I or Type II, except that: 1) the first 3 sentences of Section 5.6, "Primer Field Performance Requirements," and the entire Section 5.6.1 shall not apply for Type II inorganic zinc coating, and 2) zinc dust shall be Type II in conformance with the requirements in ASTM Designation: D 520. The inorganic zinc coating shall be listed on the qualified products list which may be obtained from the Transportation Laboratory.

Standard Specifications Section 59-1.03 shall be amended that airless spray method shall be allowed to be used.

The inside surfaces of bolt holes shall be painted with one application of a zinc rich primer (organic vehicle type) after the application of the undercoat of inorganic zinc on adjacent steel. The steel surfaces adjacent to the bolt holes shall be kept clean and protected from drippings during the application of the primer.

The color of the final application of inorganic zinc coating shall be grey.

Inorganic zinc coating shall be used within 12 hours of initial mixing.

Application of inorganic zinc coating shall conform to the provisions for applying zinc-rich coating in Section 59-2.13, "Application of Zinc-Rich Primer," of the Standard Specifications.

Inorganic zinc coating shall not be applied when the atmospheric or surface temperature is less than 7°C or more than 29°C, nor when the relative humidity exceeds 85 percent.

The single undercoat of inorganic zinc coating shall be applied to the required dry film thickness in 2 or more applications within 24 hours of the start of blast cleaning, provided blast cleaned surfaces are free from flash rust or visible contamination.

The total dry film thickness of all applications of the inorganic zinc undercoat, including the surfaces of outside existing members within the grip under bolt heads, nuts and washers, shall be not less than 75 µm nor more than 125 µm, except that the total dry film thickness on each faying (contact) surface of high strength bolted connections shall be between 25 µm and the maximum allowable dry film thickness for Class B coatings as determined by certified testing in conformance with Appendix A of the "Specification for Structural Joints Using ASTM A325 or A 490 Bolts" of the Research Council on Structural Connections (RCSC Specification). Unless otherwise stated, all inorganic zinc coatings used on faying surfaces shall meet the slip coefficient requirements for a Class B coating on blast-cleaned steel, as specified in the RCSC Specification. The Contractor shall provide results of certified testing showing the maximum allowable dry film thickness for the Class B coating from the qualifying tests for the coating he has chosen, and shall maintain the coating thickness on actual faying surfaces of the structure at or below this maximum allowable coating thickness.

SSPC-PA2 shall be modified for dry film thickness measurement. In Section 4.3.1, "Minimum Thickness," Inspection criteria which allow the lowest DFT spot as low as 80% of the specified DFT shall not apply. All measurement shall meet the minimum specified dry film thickness.

Areas where mudcracking occurs in the inorganic zinc coating shall be blast cleaned and repainted with inorganic zinc coating to the specified thickness.

Dry spray, or overspray, as defined in the Steel Structures Painting Manual, Volume 1, "Good Painting Practice," of the "SSPC: The Society for Protective Coatings," shall be removed prior to application of subsequent coats or final acceptance. Removal of dry spray shall be by screening or other methods that minimize polishing of the inorganic zinc surface. The dry film thickness of the coating after removal of dry spray shall be in conformance with the provisions for applying the single undercoat, as specified herein.

The inorganic zinc coating shall be tested for adhesion and hardness. The locations of the tests will be determined by the Engineer. The sequence of the testing operations shall be determined by the Contractor. The testing for adhesion and hardness will be performed no sooner than 72 hours after application of the single undercoat of inorganic zinc coating. At the Contractor's expense, satisfactory access shall be provided to allow the Engineer to determine the locations of the tests and to test the inorganic zinc coating hardness. The inorganic zinc coating shall pass the following tests:

Adhesion

- The inorganic zinc coating shall have a minimum adhesion to steel of 4 MPa when measured at no more than 6 locations per span on each girder using a self-aligning adhesion tester in conformance with the requirements in ASTM Designation: D 4541. The Contractor, at the Contractor's expense, shall: (1) verify compliance with the adhesion requirements, (2) furnish test results to the Engineer, and (3) repair the coating after testing.

Hardness

- The inorganic zinc coating, when properly cured, shall exhibit a solid, hard, and polished metal surface when firmly scraped with the knurled edge of a quarter. Inorganic zinc coating that is powdery, soft, or does not exhibit a polished metal surface, as determined by the Engineer, shall be repaired by the Contractor, at the Contractor's expense, by blast cleaning and repainting with inorganic zinc coating to the specified thickness.

Finish coats will not be required.

At the Contractor's option, blast cleaned surfaces shall receive a single undercoat of Carbozinc 859 organic zinc primer. Application of the primer shall be according to the manufacturer's recommendation and the following:

a) At a minimum, surface preparation shall be performed in conformance with the requirements of Surface Preparation Specification No. 6, "Commercial Blast Cleaning" of the "SSPC: The Society for Protective Coatings."

b) Non-faying surface dry film thickness shall be between 6 mils and 10 mils. Faying surface dry film thickness shall be as recommended by the manufacturer to meet Class B slip coefficient.

c) Manufacturer's certification of suitability of Carbozinc 859 without a finish coat shall be provided to the Engineer.

100% PS&E

GENERAL NOTES (Cont.)

STRUCTURAL STEEL: All steel shall be ASTM A709M, Grade 345 unless noted otherwise. Charpy V-notch testing shall use Zone 2 requirements.

Tube steel (HSS sections) shall conform to ASTM A500 Grade B or ASTM A847.

Members marked "FCM" are Fracture Critical Members. All connections to FCM's are Fracture Critical.

FASTENERS: Unless noted otherwise, all bolts used in truss superstructure shall be ASTM A490 and all bolts used in skid bents and skid beams shall be ASTM A325. Threads shall be excluded from the shear plane.

64mm D'a Bolt = 2½" Dia Bolt
51mm D'a Bolt = 2" Dia Bolt
32mm D'a Bolt = 1¼" Dia Bolt
29mm D'a Bolt = 1⅛" Dia Bolt
25mm D'a Bolt = 1" Dia Bolt
22mm D'a Bolt = ⅞" Dia Bolt
19mm D'a Bolt = ¾" Dia Bolt
16mm D'a Bolt = ⅝" Dia Bolt

All high strength ASTM A325 bolts shall be hot-dip galvanized unless noted otherwise.

All welded shear studs shall be made from cold drawn bar stock conforming to the requirements of ASTM A108.

Anchorage rods shall conform to ASTM F1554.

CONNECTIONS: Unless noted otherwise, all structural steel connections using high strength bolts ASTM A325 or ASTM A490 shall be slip-critical, Class B contact surfaces.

The number of bolts shall be the same as the number of bolt holes shown.

TRUSS, FLOOR BEAMS AND LATERAL BRACING:
Bolts = 29mm Dia (unless noted otherwise)
Bolt holes = 31mm Dia (unless noted otherwise)
Min spacing = 102mm
Min edge distance = 50mm
Min end distance = 75mm

STRINGERS:
Bolts = 25mm Dia (unless noted otherwise)
Bolt holes = 27mm Dia (unless noted otherwise)
Min spacing = 75mm (unless noted otherwise)
Min edge distance = 44mm (unless noted otherwise)
Min end distance = 65mm (unless noted otherwise)

SKID BENTS AND SKID BEAMS:
Bolts = 32mm Dia (unless noted otherwise)
Bolt holes = 34mm Dia (unless noted otherwise)
Min spacing = 96mm
Min edge distance = 56mm
Min end distance = 80mm

GENERAL:

1. All bolted connections shown are for field bolting. Shop bolting may be used subject to approval of the Engineer.
2. All welds that join at least one plate designated as fracture critical shall be considered fracture critical welds, regardless of the direction of stress. All welded flange splices in floor beams shall be considered fracture critical welds, regardless of the direction of stress.
3. For truss superstructure, primary components of main members are:
   a. Truss chord, vertical and diagonal web and flange plates, splice plates, doubler plates, vertical and horizontal stiffeners, bearing stiffeners, gusset plates and diaphragm plates.
   b. Floor beam flange and web plates, transverse and cross frame stiffeners, bearing stiffeners.
   c. Stringer and end beam flanges and webs, stiffener plates and continuity plates.
4. All members not designated as either FCMs or main members are secondary members.
5. All gusset plates and connection material, including connection plate and angles, for the connection of at least one fracture critical member shall be considered fracture critical members. This includes stiffener plates used as connection plates.
6. Dimensions shown on the plans are horizontal and vertical unless noted otherwise.
7. The truss geometry and elevations shown on these plans are given for the final condition, after camber and under full dead load. All truss vertical members shall be plumb.
8. All floor beams and stringers shall be placed with webs plumb.
9. Hand holes shown in skid bents and truss lateral bracing are approximate. Actual locations shall be established by the Contractor based on his intended assembly method. Proposed hand hole locations, including any proposed additional hand holes, shall be submitted to the Engineer for approval.
10. Gaps less than or equal to 2mm do not require filler plates.
11. Actual dimensions of gusset plates shall be developed by the Contractor based on required number of bolts, geometry, and details shown on the plans.
12. The bearings shall be positioned as shown. Shim stacks shall be plumb and level.
13. The location of all utilities shall be field verified by the Contractor prior to any construction.
14. The Contractor shall be responsible for the stability of the structure during all phases of construction.
15. Temporary supports shall be gradually released to prevent impact or undue stresses in the structure.
16. All lateral bracing HSS sections shall be capped at ends with 6mm end plate with seal weld ground smooth. Horizontal hollow structural members in skid bents shall have 25mm Dia weep holes at 2.0 meters on center at bottom of member.
17. The Contractor shall verify all controlling field dimensions before ordering or fabricating any materials.

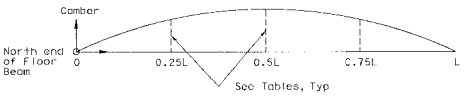
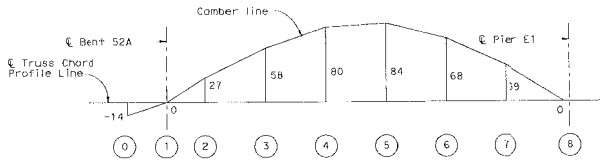
GEOMETRIC LENGTHS AND CHANGES IN LENGTH FOR CAMBER DUE TO DEAD LOAD AND SUPERIMPOSED DEAD LOAD

(North and South Truss Same)



FLOOR BEAM AND STRINGER CAMEER DIAGRAM

No Scale



TRUSS CAMBER DIAGRAM

No Scale

Notes:

1. Numbers in parentheses are truss member length changes required for camber, in mm. Positive values mean members shall be fabricated longer than geometric length between adjacent joints and negative values mean members shall be fabricated shorter.
2. The truss shall be cambered for full dead load as shown on the camber diagram.
3. Total anticipated span elongation of the lower truss chord between permanent bearings under full dead load is 28mm. The expansion bearing shall be offset in the span direction to account for elongation, see "Bearing Details" sheets. Full dead load includes steel truss, steel deck framing and bracing, concrete deck slab, wearing surface and concrete barriers.

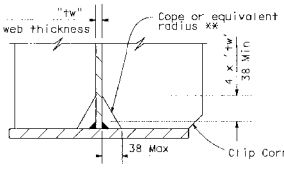
WEB COPE AT LONG GIRDER SPLICE
NO SCALE

Girder splice Notes:

1. Splices in webs and flanges of girders shall be CJP.
2. Grind welds flush at all tension flange welds, exterior weld surfaces on bottom compression flanges, and welds on the exterior face of exterior girders. Grind all surfaces of compression flanges when required for NDE.
3. Splices in webs and flanges of girders shall be at least 200 mm from stiffener.
4. All shop splices in each component part of a cover-plated beam or built-up members shall be made before the component part is welded to other component parts of the member. Splicing of long members shall conform to the details shown.
5. Web cope shall conform to the detail shown. Alternate details may be permitted subject to approval of the Engineer.



COPE DETAIL

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 140	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with provisions of the original Contract Change Order No. 140, provide compensation to the Contractor for beginning delivery of the fabrication steel of the East Tie-In truss by February 20, 2009. In consideration for the Department- caused delays to the fabrication of the truss, this delivery shall be considered to have achieved the full incentive as specified under Contract Change Order No. 140.

The Contractor will be compensated a lump sum of $300,000.00. This sum constitutes full and final compensation for the incentive payment specified under the original Contract Change Order No. 140.

Total Cost of Adjustment of Compensation at Lump Sum $300,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$300,000.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

Submitted by

Signature	Resident Engineer BILL CASEY	Date 6-9-09

Approval Recommended by

Signature	SFOBB Construction Manager MIKE FORNER	Date 6-9-09

Engineer Approval by

Signature	SFOBB Construction Manager MIKE FORNER	Date 7-6-09

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

Contractor Acceptance by

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

compensating the Contractor for achieving the full incentive payment specified under the original Contract Change Order No. 140 for the early delivery of the fabricated steel of the East Tie-In truss.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

Contract Change Order No. 140 provided compensation to the Contractor for the fabrication of approximately 1,270 metric tons of steel for the ETI steel truss. The change order also provided an incentive / disincentive clause based on the delivery of the fabricated steel to the jobsite beginning on March 8, 2009. The incentive / disincentive was specified at $10,000.00 per day with a maximum of 30 days of incentive / disincentive resulting in a maximum payment or credit of $300,000.00. The Contractor has now completed the delivery of the fabricated steel and this change order provides for the full incentive payment specified under the change order.

The Contractor began delivery of steel to the jobsite on February 20, 2009. Based on the March 8, 2009 baseline delivery date established under the original change order, this delivery would have achieved 16 days of incentive payments. This change order, however, recognizes significant Department-caused delays that were incurred by the fabricator in the shop drawing approval process. These delays were incurred over the period from August 2008 through January 2009. A preliminary time impact analysis of these delays show a minimum 1-month delay to the fabrication of the steel due to the shop drawing approval process. Recognizing this delay results in the Contractor having delivered the steel 46 days prior to the adjusted baseline delivery date. This change order provides the full 30 days of incentive payments.

Costs associated with the impacts to the steel fabrication resulting from the Department-caused delays to the work are being compensated separately under Contract Change Order No. 184.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum price of $300,000.00 which shall be financed from the contract's contingency funds. A cost and time impact analysis is on file supporting this payment.

This change order shall be processed unilaterally as this supplement was anticipated under the original Contract Change Order No. 140 and adheres to the provisions specified under that change order.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer, and Patrick Treacy - HQ Asst. Construction Coordinator. This change order was approved by the Toll Bridge Program Oversight Committee (TBPOC) on June 4, 2009.

Maintenance concurrence is not required as this is an administrative change.

CCO DESCRIPTION: Revised ETI Truss Plan Sheets	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

incorporating design revisions to the steel truss of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The original Contract Change Order No. 140 provided the plans and specifications necessary for the construction of the steel truss of the ETI structure and provided compensation for the steel fabrication of the truss. This change order incorporates numerous revisions to the originally issued plan sheets for the truss including the elimination of the upper and lower deck wearing surfaces, revised joint details, and framing details.

An assessment of cost increases and adjustments in compensation pertaining to the fabrication of the steel truss resulting from these changes is deferred pending the identification and quantification of any added or eliminated work stemming from these changes.

Any adjustment of contract time is deferred as the change may affect the controlling operation.

This change was requested by Mike Whiteside - YBI Coordination Engineer in a memorandum dated October 8, 2008 and concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 141	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide daily monitoring of the south edge as specified under this change order and as determined by the Engineer.

Perform all adjustments to the bent caps as required under Stage 5 "Bent Adjustment" of the construction staging plans in accordance with the specified "Bent Cap Adjustment Procedure" and as determined by the Engineer.

Perform final post tension lock off of the right column prestress bars in accordance with Stage 5 "Bent Adjustment" of the construction staging plans and as determined by the Engineer.

Estimated Cost of Extra Work at Force Account $500,000.00

Extra Work at Lump Sum:

Perform the following work for the construction of the West Tie-In Phase 2 superstructure of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) in accordance with the plans and specifications shown on Pages No. 3 through 68 of this change order and the specifications shown on Pages No. 3 through 203 of Change Order No. 108:

1) Construct Frame No. 1, Frame No. 2 and Frame No. 3 including all appurtenances.

2) Construct the WTI Edge Beam and the YBI Viaduct South Edge Beam Corbel including all appurtenances.

3) Construct the Bent 38 and the reinforced concrete slab supported by the bent including all appurtenances.

4) Construct all Type 60SA (Modified) and Type 732 concrete barriers including electrolier bases.

5) Furnish and install all jacking systems and load cells on the jacking corbels at the South Edge Beam and Column 46L locations and at the WTI Right Column locations as specified.

6) Place shoring towers and perform all jacking and stressing operations as specified in Stage 2 "Superstructure", Stage 3 "Jacks and Load Cell Installation and Stage 4 "Hinge Corbel Construction and Post Tensioning" of the construction staging plans.

7) Perform the bridge removal of the existing PCC roadway slab and soil nail wall and perform all structure excavation necessary for the construction of the reinforced concrete slab supported by Bent 38.

8) Perform bridge removal (portion) of the existing Columns 40, 41A, 41B and 42.

9) Provide all traffic control, excluding flagging costs as specified herein, necessary for the work of this change order.

For this work, the Contractor shall be compensated a lump sum of $12,700,000.00. Except for the items of work specifically excluded below, this sum constitutes full and final compensation, including all markups, for all costs associated with the work of this change.

All work associated with the implementation and maintenance of the Contractor's Storm Water Pollution Prevention Plan and erosion control, including concrete washouts, shall be paid by the Department separately from this change order.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 141	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

All work associated with furnishing and installing all luminaires, cable trays and strut channels for the structures lighting and utilities is excluded from this change order and shall be paid separately.

Flagging costs associated with this work shall be paid under Change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum payment made under this change order.

Should the Department require an engineered bridge removal plan for the work of this change, those costs shall be paid under a separate change order.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Total Cost of Extra Work at Lump Sum $12,700,000.00

The lump sum payment provided herein is based on the Frame 1 load transfer assurance plan beginning on July 1, 2009. The Contractor shall be paid an incentive of $30,000.00 for each calendar day prior to July 1, 2009 that this load transfer assurance plan can begin. In the event the load transfer assurance plan begins after that date, the Contractor shall credit the Department a disincentive of $30,000.00 for each calendar day after July 1, 2009 that the load transfer assurance plan begins. Any incentive payment or disincentive credit shall not exceed $1,500,000.00 and shall be provided under a supplemental change order.

For the purpose of this incentive / disincentive, the beginning of the load transfer assurance plan shall be defined as the date the Frame 1 falsework release is completed under Item No. 1 "Remove Falsework" as specified under Stage 5 "Bent Adjustment" of the construction staging plans. Release of this falsework shall not apply to falsework associated with Frame 1 east of the planned construction joint between Bent 46 and Bent 47.

All payment clauses contained within the specifications of this change order are superseded by the agreed lump sum and force account payment methods specified above.

Estimated Cost: Increase ☑ Decrease ☐ **$13,200,000.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

CONTRACT CHANGE ORDER NO. 141
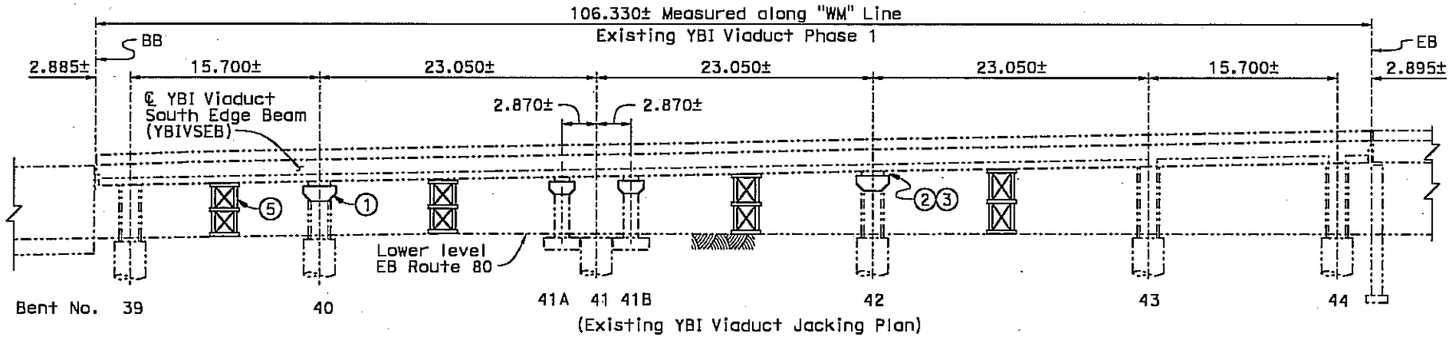
SHEET 4 OF 21



(Existing YBI Viaduct Jacking Plan)

ELEVATION
1:250

EXISTING YBI VIADUCT JACKING PLAN

Note:

Contractor shall submit a jacking and load monitoring plan to the Engineer for approval.

Jacking procedure shall be completed prior to construction of YBI Viaduct South Edge Beam Corbel and prior to post tensioning of WTI Bents 40 through 46.

① Construct Jacking Corbels, see "Column Modifications" sheet

② Place Jacks with load cells attached.

Each Jack shall be equipped with a Load Cell.

Load Cells shall be supplied by the Contractor and approved by Caltrans.

Load Cells shall be capable of continuously reporting loadings for the period the Jacks are in place.

Jacks shall be capable of being locked off and remain rigid (after desired load transfer has been accomplished) for the duration of the period they are in place. Jacks shall be approved by Caltrans.

③ Jacking Procedure, see "Jacking Load Table" for estimated dead load reactions at each jacking location

A) Bent 40

Jack YBI Viaduct South Edge Beam (YBIVSEB) until a 5 mm separation between YBIVSEB and Bearing Pads at Bent 40 has been achieved.

Assuming four Jacks per Column will be used;

Loads shall be applied in 400 kN intervals and the loads in each Jack shall never differ by more than 400 kN.

When the 5 mm separation has been achieved, the loadings in all four Jacks shall be similar within 5%. When the 5 mm separation and the balance loading has been achieved the Jacks shall be locked rigid.

B) Bent 42

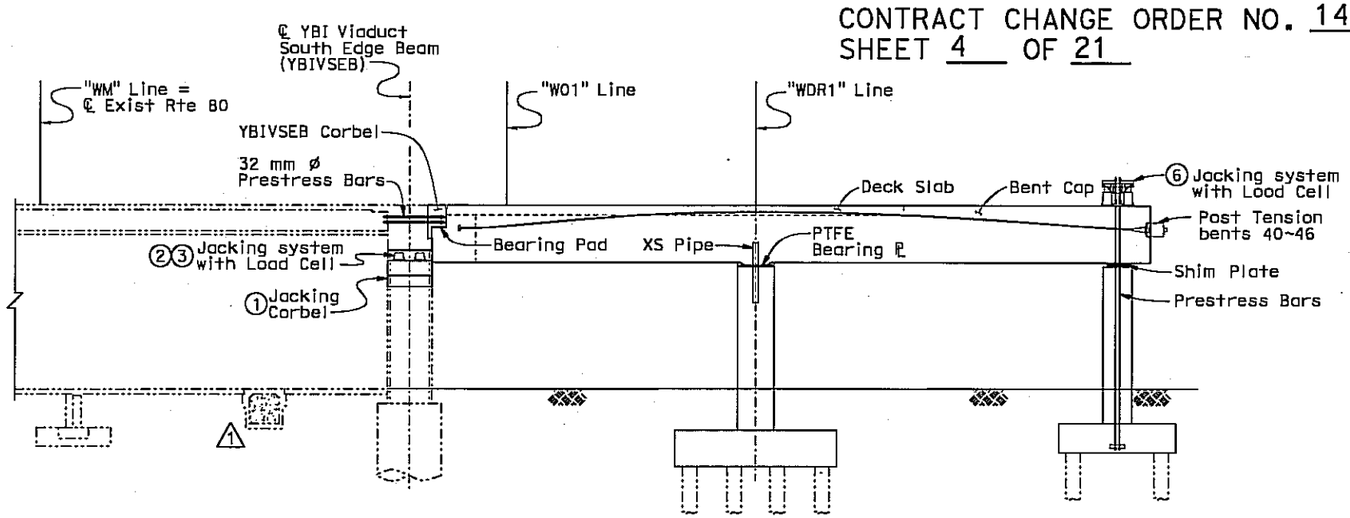
Repeat jacking procedure as outlined for Bent 40.

C) Bent 41A and 41B

Bents 41A and 41B shall be jacked simultaneously.
Repeat jacking procedure as outlined for Bent 40 with the following differences:

Loads shall be applied in 200 kN intervals and the loads in each Jack shall never differ by more than 200 kN.

④ After all Jacks have been locked rigid, Load Cells and YBIVSEB profile shall be monitored daily to assure Jacks remain rigid and profile remains consistent. Adjustment of Jacks may be required to mitigate settlement or loss of hydraulic pressure as directed by the Engineer.



TYPICAL SECTION
no scale

⑤ Place Shoring Towers under YBIVSEB at midspan in spans shown on diagram.

Preload Shoring Tower as directed in Structure Specifications.

Place Shim Plates between Shoring Towers and YBIVSEB and shim tight. Remove Jacks on Shoring Towers.

Shoring Towers shall be designed to carry 450 kN loading with no more than 3 mm of deflection.

The Shoring Tower load capacity shall be greater than 1320 kN.

⑥ Place Jacks with Load Cells at WTI Right Column locations.
Jack 25 kN of force onto Prestress Bars to remove slack.
Lock Jacks rigid.
Retighten lower anchor nuts to 425 N-m of torque to reseat the anchor plates.

⑦ Place Jacks with Load Cells at Bent 46 Left Column Jacking Corbel.
Jack to 25 kN of force on Jacking Corbels.
Lock Jacks rigid.

JACKING LOAD TABLE

YBI VIADUCT BENT	⊛ DEAD LOAD REACTION (kN)
40	4800
41A	2700
41B	2700
42	5400

⊛ Dead Load Reported is unfactored. Live Loads can be assumed to be as high as 40% of the Dead Load Reaction.

NOTE:
THE CONTRACTOR SHALL VERIFY ALL CONTROLLING FIELD DIMENSIONS BEFORE ORDERING OR FABRICATING ANY MATERIAL.

YBI Bent 42R	0

Note:

Target Loads indicate the total expected Dead Load Reaction at a particular location after post tensioning of Frame 1 has been completed.

TARGET LOADS	
LOAD CELL LOCATION	TARGET LOAD (kN)
WTI Bent 40R	450
WTI Bent 41AR	950
WTI Bent 41BR	730
WTI Bent 42AR	860
WTI Bent 42BR	660
WTI Bent 43AR	860
WTI Bent 43BR	790
WTI Bent 44AR	1230
WTI Bent 44BR	1340
WTI Bent 45AR	1100
WTI Bent 45BR	790
WTI Bent 46L	2250

Note:

Target Loads indicate the total expected Dead Load Reaction at a particular location after post tensioning of Frame 1 has been completed.

YBI VIADUCT SOUTH EDGE BEAM CORBEL CONSTRUCTION PLAN

Note:

See "Edge Beam Details" sheets

1. Place Bearing Pads, Hinge Reinforcing and Prestress Bars.
2. Concrete Placement Plan
   - A) Begin Traffic Control, Shift Westbound traffic to two north most lanes. (8 hour Traffic Control)
   - B) Place concrete for hinge Corbel, concrete shall be high early strength mix that is capable of achieving an f'_{ci}= 28 MPa or greater in three hours.
   - C) Let Hinge concrete set for one hour.
3. Remove slack from 32 mm ø Prestress Bars in Hinge Corbel. Tighten all Prestress Anchor Nuts to 300 N-m torque.
4. The Traffic Control may be lifted when all Prestress Anchor Nuts have been tightened and the concrete has been in place for at least three hours.
5. Post tension and grout all 32 mm ø Prestress Bars in Hinge Corbel.

POST TENSIONING PLAN (WTI BENT 40 THROUGH BENT 46)

Note:

See "Bent Layout" sheets.

WTI Bents shall be Post Tensioned by the following sequence:

1. Post Tension Bents 40 through 46 and Beam Footing 46L to 20% Pjack
2. Post Tension Bents 40 through 46 and Beam Footing 46L to 40% Pjack
3. Post Tension Bents 40 through 46 and Beam Footing 46L to 60% Pjack
4. Post Tension Bents 40 through 46 and Beam Footing 46L to 80% Pjack
5. Post Tension Bents 40 through 46 and Beam Footing 46L to 100% Pjack
6. Simultaneous Post tensioning of Bents is permissible within each sequence. After each sequence of post tensioning approval of the Engineer is required before proceeding to the next sequence.
7. Grout all Prestress Tendons
8. Remove all Falsework and Sharing Towers

LOAD TRANSFER ASSURANCE PLAN

1. Check Load Cells at all locations.
   - A) Compare load cell Data to target loads at each load cell location, see "Target Loads" Tables
   - B) If Load Cell readings indicate that loads are within 10% of target loads at the WTI locations and the loads on the YBIVSEB Jacks have been reduced by 90% then release and remove all YBIVSEB Jacks. Monitor the profile of YBIVSEB.
   - C) If target loads have not been achieved or if the profile of YBIVSEB is not within tolerance then adjustment of the affected WTI Bents as directed by the Engineer will be required. For bent adjustment details see "Column Details No. 2" sheet
2. Once load transfers have been achieved and accepted by the Engineer, the Load Cells and YBIVSEB shall be monitored for a period of 60 days.
3. If Load Cells and YBIVSEB indicate adequate stability after 60 day period the Contractor may proceed with the "Final Post Tensioning Procedure" of the Prestress Bars in the WTI Right Columns by adding 600 kN additional jacking force on each Tension Column, see "Column Details No. 2" sheet.
4. Grout Prestress Bars
5. Remove YBI Columns at Bents 40, 41A, 41B and 42.

NOTE:
THE CONTRACTOR SHALL VERIFY ALL CONTROLLING FIELD DIMENSIONS BEFORE ORDERING OR FABRICATING ANY MATERIAL.

WTI COLUMN 40R THROUGH 45BR FINAL POST TENSIONING PROCEDURE

1. Final Post Tensioning Procedure shall proceed only with approval of the Engineer and after the Structure has displayed adequate stability for 60 day period.
2. Record the loads on the jacks at each location.
3. Jack on additional 600 KN of Force into each Column. Lock jacks rigid and re tighten Lower Anchor Plate nuts to 425 N-m of torque.
4. Grout Prestress Bars and XS Pipe.
5. Remove Jacks.

BENT CAP ADJUSTMENT PROCEDURE (IF REQUIRED)

1. Remove required number of shim plates.
2. Adjust jacks to achieve proper load cell readings and grades as approved by the Engineer.
3. Fill in gap between shim plates and cap soffit.
4. Adjust jacks to achieve adequate bearing between shim plates and cap soffit. Bearing shall be achieved when all gaps between shim plates and soffit have been removed and all plates are snug to one another. Re tighten Lower Anchor Plate Nuts to 425 N-m of torque to reseat anchor Plates.
5. Monitor Structure Stability for 60 days.

COST: **$1,500,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: WTI Superstruc Load Transfer Incentive	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

This change provides for payment for contractor incentives for early completion of the construction work as specified in Contract Change Order 141 as related to the West Tie-In Phase 2 superstructure of the Temporary Bypass Structure (Bridge # 34-0006 (TEMP)).

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

This supplemental was anticipated by the original Contract Change Order No. 141, which has been approved and executed. Approval for this change order from the TBPOC was granted on November 14, 2008. As such it is not necessary for the Contractor to sign this supplemental, which will be processed unilaterally. Compensation for this change shall be performed as an Adjustment of Compensation at Agreed Unit Price for a total cost of $1,500,000.00, which can be financed through the Contingency Fund.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 142	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As determined by the Engineer and as shown on Sheets 4 through 5 of this change order, repair Macalla Road's pavement structural section along the existing shoreline retaining wall and at the existing abandoned utility vault, as well as construct a new drainage system to accommodate stormwater sheet flow in the area.

All preparatory and incidental work due to this repair, to include but not limited to potholing, traffic control, installing a vibration monitoring system, and installing permanent roadway features shall be coordinated with the Engineer and will be paid for under this change order.

Estimated Cost of Extra Work at Force Account $150,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$150,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

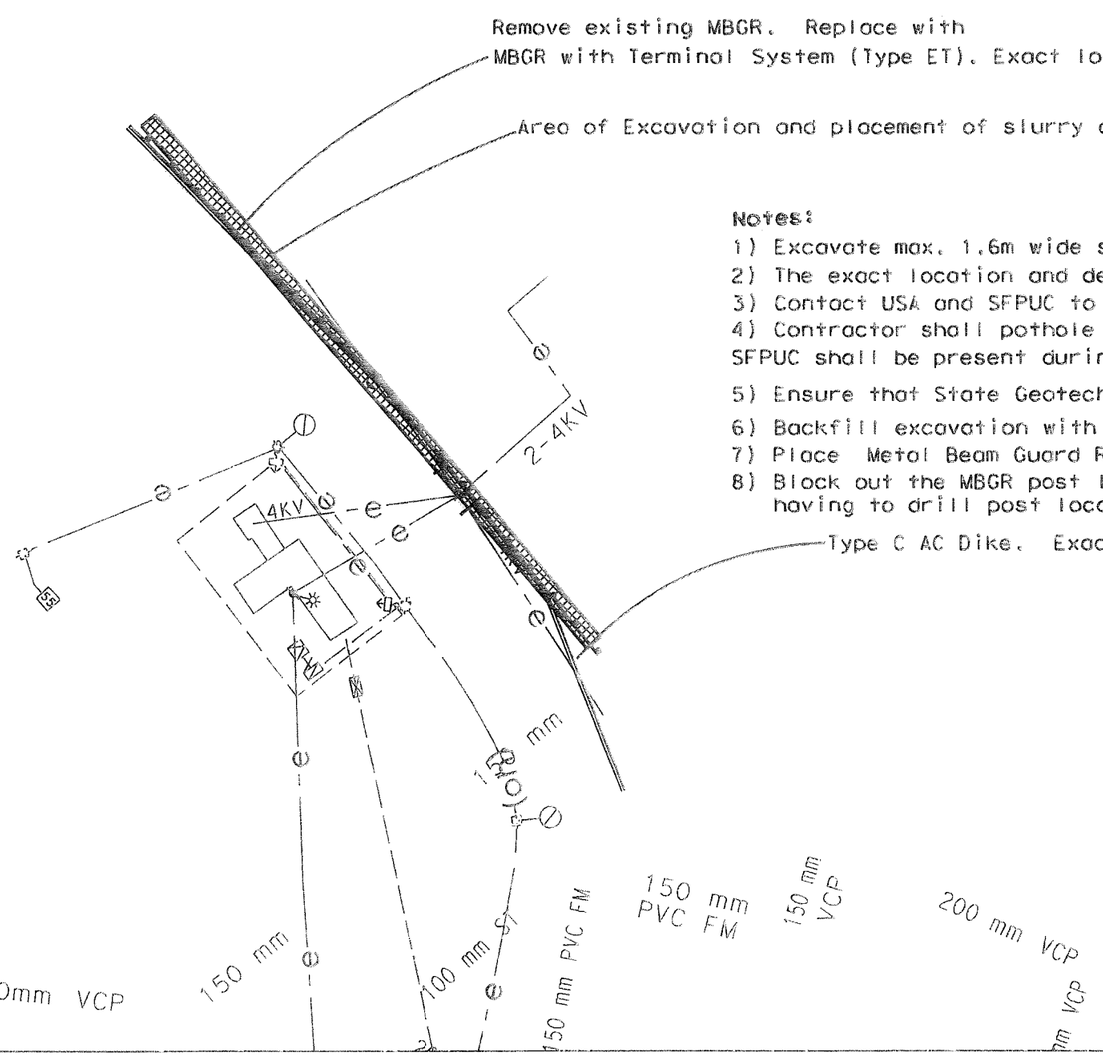
CONTRACT CHANGE ORDER NO 142



Notes:

1) Excavate max. 1.6m wide strip at the face and along the entire length of the wall to determine the extent of voids.
2) The exact location and depth of the excavation to be determined by the Engineer.
3) Contact USA and SFPUC to ascertain the location of all adjacent utilities prior to any excavation work.
4) Contractor shall pothole the location of the utilities at the direction of the Engineer. SFPUC shall be present during potholing work.
5) Ensure that State Geotech. Engr. and SFPUC Representative are on-site prior to, and during, the excavation work.
6) Backfill excavation with slurry cement, topped by 0.3m AC (Type A). See typical cross section plan.
7) Place Metal Beam Guard Railing with Terminal System (Type ET) along the entire length of the wall.
8) Block out the MBGR post location during the placement of slurry cement backfill to avoid having to drill post location later.

Change Requested by: Engineer

CCO 143	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Eliminate the following roadway work on the EM Line and WM Line and delete the contract bid items for the West Tie-In roadway as listed below:

1) Eliminate the construction of the 50 mm AC (Type A) and 200 mm Rapid Strength Concrete roadway section (Structural Section Type 2) and the 50 mm AC (Type A) and 410 mm PCC roadway section (Structural Section Type 5) from EM Line Sta. 49+78 to Sta. 50+55.

2) Eliminate the placement of the AC (Type) (Structural Section Type 4) from WM Line Sta. 49+62.80 to Sta. 51+50.80.

3) Eliminate the reconstruction of Southgate Road.

4) Delete the contract bid items for the original scope of work pertaining to the construction of the ED1 Line eastbound mainline, the EDR1 Line eastbound on ramp, the T4 eastbound on ramp detour and the WDR1 westbound off ramp roadway sections.

Estimate of Decrease in Contract Item at Contract Price:

Item No. 44: ROADWAY EXCAVATION						
-2713 M3	(–100.00%)	$60.00	/M3	=	–$162,780.00	(–200.00%)
Item No. 59: REPLACE CONCRETE PAVEMENT						
-212 M3	(–100.00%)	$600.00	/M3	=	–$127,200.00	(–100.00%)
Item No. 86: COLD PLANE ASPHALT CONCRETE PAVEMENT						
-1153 M2	(–100.00%)	$18.00	/M2	=	–$20,754.00	(–200.00%)
Item No. 87: ASPHALT CONCRETE (TYPE A)						
-2200 TONN	(–100.00%)	$100.00	/TONN	=	–$220,000.00	(–200.00%)
Item No. 93: RECONSTRUCT SOUTHGATE ROAD						
-1 LS	(–100.00%)	$100,000.00	/LS	=	–$100,000.00	(–200.00%)

Estimated total cost for Decrease in Contract Item.....($630,734.00)

Extra Work at Lump Sum:

Construct the ED1 Line eastbound mainline, the EDR1 Line eastbound on ramp, the T4 eastbound on ramp detour and the WDR1 westbound off ramp roadways and the drainage system along the ED1 Line as shown on the contract plans and as modified on Sheets No. 3 through 13 of this change order.

Modifications to the construction of these roadways and drainage systems include the following items of work:

1) Perform asphalt concrete grinding, including grinding of the concrete skid track foundations constructed under Change Order No. 84, and place asphalt concrete in order to conform the existing EM Line roadway to the ED1 Line roadway.

2) Modify the profile of the ED1 Line and EDR1 Line roadways in accordance with the grid grades as shown.

3) Modify the conform of the EDR1 Line on ramp roadway.

4) Stage the roadway construction of the ED1 Line, EDR1 Line, WDR1 Line and the T4 Line roadways as shown.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 143	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

5) Furnish and install all culvert and inlets and connect the culvert to the existing corrugated metal pipe as shown.

All revisions shown on Sheets No. 3 through 13 of this change order shall supersede the original contract plans.

For this work, the Contractor shall be compensated an agreed lump sum of $787,170.00. This lump sum constitutes full and final compensation, including all markups, for this work.

The lump sum price above excludes any costs associated with the placement of concrete barrier (Type K), signing, pavement delineation and crash cushions for the ED1 Line, EDR1 and WDR1 Lines. These costs shall be paid under a separate change order. The placement of temporary concrete barrier (Type K) and pavement delineation for the T4 Line is included in the lump sum price provided under this change order.

Compensation provided herein includes all additional traffic control costs required for the construction of the ED1 Line, EDR1 Line and the T4 Line during Stage 1 and 2 of the stage construction plans provided under this change order. Traffic control costs required for Stage 3 construction to be performed during the full closure of the mainline freeway shall be compensated under Change Order No. 186.

The revised contour grading specified under this change order shall be paid under Contract Bid Item No. 55 "Finishing Roadway". No additional compensation shall be paid for this work.

Furnishing and placing any changeable message signs required for the work of this change order shall be paid separately.

Total Cost of Extra Work at Lump Sum $787,170.00

This change order provides for a maximum of 925 tonnes of asphalt concrete to be furnished for the construction of the ED1 Line, the EDR1 Line, the WDR1 Line and the T4 Line. The Contractor shall be compensated $159.00 per tonne for any quantity of asphalt concrete furnished above 925 tonnes. Any compensation owed shall be paid through a supplemental change order.

The drainage plans shown on Sheets No. 12 and 13 of this change order shall supersede Sheets No. 2 and 3 issued under Change Order No. 117. Construction of this drainage system is included in the lump sum compensation provided under this change order and no additional work shall be performed under Change Order No. 117 pertaining to this work.

Estimated Cost: Increase ☑ Decrease ☐ **$156,436.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: WTI Phase 2 Roadway	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

Revisions to the construction of the eastbound roadway section of the West Tie-In.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon certain design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently the TBPOC that provided for the Department to assume control of the design of the WTI structure from the contractor and to provide for the seismic replacement of the a 300 lineal foot long section of the existing westbound structure directly adjacent to the WTI structure. The construction of the revised WTI structure and the seismic replacement of the existing westbound structure has been provided for under Contract Change Orders No. 61, No. 62, No. 72, No. 76, No. 84, No. 101, No. 108, and No. 141. This change order pertains to the resulting changes to the roadway portions of the WTI and the conform to the existing roadway.

This change order provides for the elimination of portions of the original contract work pertaining to the reconstruction of the existing eastbound mainline roadway and an asphalt concrete overlay on the existing westbound roadway. This work is no longer necessary due to the changes to the WTI outlined above.

This change order also provides for revisions to the construction of the WTI eastbound mainline roadway and the eastbound on ramp from Yerba Buena Island. The changes include a revised profile for the mainline roadway and revisions to the conforms for both the mainline and on ramp roadway. Revised stage construction plans are also provided that allow for the new roadway to be constructed without closing the existing on ramp and provides for the traffic switch from the existing mainline to the WTI structure.

Due to the extent of the changes to the WTI roadway and the 5 year delay that has been incurred on the project, the original contract bid items shall be eliminated and an agreed lump sum price shall be paid for the work.

This change order also provides for the construction of a drainage system incorporating 7 inlets and approximately 140 meters of culvert. This work was originally specified to be performed under Change Order No. 117 at force account. However, those plans did not account for the system having to be constructed during a full closure of the eastbound on ramp. This work is now specified under this change order to take place during the same weekend ramp closure that will allow for the new on ramp and the western portion of the new mainline freeway to be constructed. As it would be extremely difficult to segregate the construction of the roadway and drainage system, this change order includes the construction of the drainage system as part of the lump sum price paid. Accordingly, payment of the work specified under Change Order No. 117 is eliminated by this change order.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

The elimination of the contract bid items for both the existing mainline and new WTI roadway shall result in an estimated credit to the Department of $630,734.00. Compensation for constructing the revised WTI roadway and drainage system shall be paid as extra work at an agreed lump sum price of $787,170.00. The net estimated change order cost of $156,436.00 shall be financed from the contract's contingency funds. A cost analysis is on file.

The change order also includes a potential adjustment of compensation for any overrun of asphalt concrete. Any adjustment shall be paid through a supplemental change order.

Adjustment of contract time is deferred as the work may affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - CT Maintenance.

Change Requested by: Engineer

CCO 143	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with the provisions of the original Contract Change Order No. 143, provide compensation to the Contractor for the quantity of asphalt concrete furnished for the work that overran the 925 tonnes specified under the original Contract Change Order No. 143.

For this work, the Contractor shall be compensated an agreed lump sum of $62,248.50. This lump sum constitutes full and final compensation, including all markups, for the additional asphalt concrete placed.

Total Cost of Adjustment of Compensation at Lump Sum $62,248.50

RECEIVED

475 Day(s)	0 Day(s)	1600 Day(s)	337 %	0

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor for the overrun of the quantity of asphalt concrete placed under the original Change Order No. 143.

This project provides form the construction of a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original Change Order No. 143 provided for the construction of the asphalt concrete roadway for the eastbound mainline and on ramp and the westbound off ramp of the West Tie In structure. That change order specified that any asphalt concrete furnished, beyond the 925 tonnes estimated for that change, would be paid at an established price of $159.00 per tonne. The final quantity of asphalt furnished under this change totaled to 1,316.50 tonnes. Most of the additional tonnage was the result of having to extend the on ramp shoulders and the western mainline conform to match existing field conditions. This change order provides for the additional compensation that results from the 391.50 tonne overrun of the estimated 925 tonnes.

Compensation shall be paid as adjustment of compensation at an agreed lump sum price of $62,248.50. which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Minh B. Nguyen - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Perform the following work concerning the construction of the East Tie-In expansion joints of this change order:

1) Procure all material for the deck panels, masonry plate and bearing plate for the Bent 52A and Pier E1 expansion joints in accordance with Sheets No. 9 through 30 and as authorized by the Engineer.

2) Provide all labor, equipment and materials to construct the expansion joint mock up as shown on Pages No. 2 through 8 of this change order and as authorized by the Engineer .

The plan sheets and specifications provided under this change order (Sheets 9 through 16) shall be used solely for the procurement of materials and construction of the expansion joint mock up as determined by the Engineer. Final plans and specifications shall be issued under a separate change order providing for the final fabrication and installation of the expansion joints.

Any salvage value or disposal costs associated with the materials procured under this change order are deferred.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications.

Estimated Cost of Extra Work at Force Account $850,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$850,000.00**

10-1.__ EXPANSION JOINT

Expansion joints shall consist of steel deck plates, bolt boxes, support plates, sealing elements, bedding material, anchorage components and all other necessary components and shall be fabricated and installed in conformance with the details shown on the plans and as specified in the standard specifications and these special provisions.

Attention is directed to "Cooperation," of these special provisions.

Unless otherwise directed by the Engineer, prior to submitting working drawings, the Contractor shall inspect and report on the expansion joint locations in the structures adjacent to East Tie-In. The Contractor shall submit to the Engineer an inspection report for review and approval. This inspection report shall be titled "East Tie-In Expansion Joint Location Inspection Report" and shall describe the actual dimensions and details existing in these areas sufficiently to determine if any conflicts or mismatches exist that would require revision to the design and/or details of the expansion joints and/or the installation procedures. The report shall include recommendations to resolve any such issues. The Contractor shall allow the Engineer 10 days to review the "East Tie-In Expansion Joint Locations Inspection Report".

WORKING DRAWINGS

The Contractor shall submit working drawings in conformance with the provisions in "Working Drawings" of these special provisions, and the requirements specified herein.

Working drawings shall include complete details, information, and drawings of the expansion joints and anchorage components and the method, materials, equipment, and procedures for fabrication and installation that the Contractor proposes to use.

Working drawing submittals shall include the following:

A. Fabrication plans including all details, elevations, and sections of the expansion joint. All dimensions and design and installation tolerances shall be specified. Fabrication plans for the sizes of deck plates and support plates shall consider roadway super elevations and longitudinal gaps between the plates for sealing elements. Unless otherwise directed by the Engineer, fabrication plans shall take into full account all issues identified in the "East Tie-In Expansion Joint Locations Inspection Report."
B. All ASTM or other material designations.
C. Sections showing all materials comprising the expansion joint with complete details of all individual components including welded splices and connections, welding procedures, and the measures to be taken to prevent steel plate from distortion due to the heat of welding.
D. Joint installation plans including methods, materials, equipment, sequence, lifting attachments and locations, details of temporary anchorage during setting, temperature adjustment methods, method for maintaining full contact between deck plates and support plates during and after installation, installation details at curbs, seal installation details, and other procedures that the Contractor proposes to use for installation of the expansion joints including procedures to release restraint after initial set of the bedding material.
E. Bedding material selection, bedding material technical information, the results of any testing necessary to ensure that working time of the material will be adequate and that strength gain will be sufficiently rapid, and placement and material testing procedures.

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 144
SHEET 12 OF 30

F. Details and procedures of the mock-up construction to demonstrate that the expansion joint can be installed in the field within the scheduled duration submitted by the Contractor in the Roll-out Roll-in plan and to provide training for the Contractor's personnel in the installation procedures.
G. List of coating system for expansion joints identifying cleaning and painting of all steel components as specified in "Clean and Paint Structural Steel" of these special provisions.
H. Anchorage components including concrete blockout details.
I. Storage plans for manufacture storage, interim storage, and on-site storage details including temporary support for the expansion joints.
J. Shipping plans including handling of the expansion joints during transportation. Each shipment of the expansion joint materials shall be accompanied by a Certificate of Compliance in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications. The certificate shall state that the materials and fabrication involved comply in all respects to the specifications and data submitted in obtaining approval.

After complete working drawings are received by the Engineer, the Contractor shall allow the Engineer 20 working days to review the submittal. No fabrication of the expansion joint shall begin until complete working drawings are reviewed and approved, in writing, by the Engineer.

MATERIALS

Attention is directed to "Welding" and "Audits" of these special provisions. Welding of expansion joint shall conform to AWS D1.5.

Structural steel shall conform to "Steel Structures" of these special provisions. Structural steel shall conform to the requirements of ASTM Designation: A 709M, Grade 345. Bolts, nuts and washers shall conform to the requirements of ASTM Designation: A 325 or A 325M and Section 75-1.03, "Miscellaneous Bridge Metal," of the Standard Specifications.

Sealing elements shall be 2 component silicone sealant that meets the requirements of Type A and AL seal in Section, 51-1.12F(3), "Materials and Installation," of the Standard Specifications. Strip seal shall be continuous without splices within the limits of each panel as shown on the plans.

Elastomeric washers shall conform to the requirements specified in Section 51-1.12H(1), "Plain and Fabric Reinforced Elastomeric Bearing Pads," of the standard specifications.

Bedding Material

The bedding material for setting the expansion joints shall be one of the following : epoxy plus silica sand mixture; rapid set mortar (without coarse aggregate); injectable rapid setting grout. The Contractor is to investigate and test materials to the degree necessary to ensure that the bedding material will perform as required and to allow the choice of bedding material to be made at least three months prior to the Roll-In operation. Contractor is to test all three material types and to provide a recommendation as to which he considers the most suitable. The determination of which material to use will be made by the Engineer after testing is complete.

Epoxy plus Silica Sand Mixture – to be a mixture of equal parts by volume of epoxy adhesive and silica sand. The material is to have adequate working time (pot life) to allow the expansion joint plates to be installed in the wet mixture with at least 30 minutes to spare before initial set. Tests are to be made to determine the time of initial set and the time at which a cube

NTRACT NO 08-4F8201 CONTRACT CHANGE ORDER NO 144
SHEET 13 OF 36

strength of 25 MPa is achieved at the thicknesses of material anticipated and at the range of ambient temperatures expected. Contractor is to provide, if necessary, different epoxy formulations so as to cover the full range of conditions anticipated on site. The material is to achieve a compressive cube strength of at least 25 MPa before it bears traffic

Rapid Set Mortar (without coarse aggregate) – to be a rapid setting mortar using only fine aggregate. To be used at a "masonry mortar" consistency for setting the expansion joints into. The material is to have adequate working time to allow the expansion joint plates to be installed in the wet mixture with at least 30 minutes to spare before initial set. Tests are to be made to determine the time of initial set at the thicknesses of material anticipated and at the range of ambient temperatures expected. Different mixes are to be available if necessary to accommodate the full range of anticipated conditions. The material is to achieve a compressive cube strength of at least 25 MPa within 8 hours of initial set before it bears traffic.

Cementitious Grout – to be a cementitious grouting material containing fine aggregate and admixtures as necessary to ensure the required workability, flowability and early strength. Particular attention is to be paid to the suitability of the material at the maximum anticipated thickness. The material must be injectable at extremely low pressure (less than 1000 mm of head) through 19 mm diameter injection holes and must be capable of flowing freely under the embedded plates at the minimum anticipated thickness and producing 90% contact with the plate. Tests are to be made to determine the time of initial set and the time at which a cube strength of 25 MPa is achieved at the various thicknesses of material anticipated and at the range of ambient temperatures expected. Different mixes are to be available if necessary to accommodate the full range of anticipated conditions. The material is to achieve a compressive cube strength of at least 25 MPa before it bears traffic.

MOCK UP

Contractor shall construct at least one full scale mock-up prior to the commencement of fabrication of any of the expansion joints to demonstrate that the installation methods forseen are workable and that the expansion joints can be installed in the field within the time scheduled by the Contractor for the Roll-out Roll-in operation. The mock-up shall be witnessed by the Engineer. Upon completion of a successful mockup installation, fabrication of the joints may commence. At a later date the mockup is to be used to train the installation crews and to otherwise practice for the actual installation.

Further detailed mockups will also be required in order to test the effectiveness of the bedding materials and their proposed installation methods so that a final selection of bedding material can be made by the Engineer.

The full scale mock-up shall be of one full panel (approximately one lane wide) of one of the expansion joints. It shall use plates of the thicknesses shown on the plans but need not use the grade of steel specified for the actual joints. The replication of the blockout in the concrete on the sliding side is to have a depth and length equal to that of the blockout detailed on the plans and shall also incorporate cylindrical blockouts for the stud anchors. The replication of the blockout on the fixed side is to incorporate a steel plate arrangement to replicate the top plate of the bolt box shown on the plans. The mock-up shall include bedding material, seals etc. as necessary to permit the installation of the bedding material, concrete, adjustment bolts, temporary fixing bolts, and all concrete embedments as shown on the plans and approved working drawings. The mock-up shall be capable of being re-used as necessary to prove all aspects of the installation. Upon completion of a mockup and achievement of 25MPa cube strength, the mockup shall be dis-assembled and the adequacy of the bedding material verified.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 144

SHEET 14 OF 30

Acceptance criteria of the full scale mock-up shall be as follows:

A. Mock-up expansion joint is installed within horizontal and level tolerances allowed for the actual expansion joint.
B. Mock-up shall be completed in the scheduled duration.
C. Bedding material installation methods and bedding material condition are shown to be satisfactory

If the mock-up fails to meet any of the acceptance criteria as determined by the Engineer, additional mock-ups shall be constructed or the mockup shall be re-used until a satisfactory result is achieved.

Detailed mockups Detailed mockups shall be constructed to test the installation methods for the bedding material and to prove that the resulting in-situ bedding material is acceptable. These mockups are to be carried out at the earliest feasible date. The results of these mockups will be used to make a final determination of what bedding ,aterial to use in the project.

The first type of mockup shall consist of 1500 mm x 1000 mm steel plates 32 mm thick, with four leveling screws but without shear studs, that are to be set in bedding material in recesses in concrete at both the maximum and minimum anticipated bedding material thicknesses. The recesses are to have cylindrical blockouts replicating the blockouts for the shear studs. All three types of acceptable bedding materials are to be tested. Following achievement of a cube strength in the bedding material of 25 MPa, the mockup shall be disassembled and the quality of the bedding achieved determined.

The second type of mockup shall consist of 1500 mm x 540 mm x 32 thick plates with four leveling screws that are to be set on steel plates replicating the arrangement at the bolt boxes at the fixed end of the expansion joints. The mockups are to be carried out at maximum and minimum anticipated bedding material thicknesses and for all of the three potential bedding materials. Following achievement of a cube strength in the bedding material of 25 MPa, the mockup shall be disassembled and the quality of the bedding achieved determined.

The mock-ups shall not be part of the permanent structure and shall become the property of the Contractor. The mock-ups shall be removed from the work site and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

FABRICATION

The expansion joint shall be fabricated in conformance with the details, dimensions, material specifications, and procedures shown in the approved working drawings.

At the time of installation, the surface of the bearing plate shall be in contact with the surface of the masonry plate such that no gap between the two plates exceeds 2.0 mm and such that the maximum distance between points of contact does not exceed 300 mm. The Contractor shall furnish sufficient temporary assembly bolts to ensure that this fit is achieved.

All plate welds shall be ground smooth. The welds shall not protrude into the sliding surface of the deck plates or support plates.

Cleaning and painting of all new metal surfaces of the expansion joints, except where embedded in concrete, shall conform to the requirements specified in "Clean and Paint Structural Steel" of these special provisions.

Damage to the expansion joint during shipping or handling shall be cause for rejection of the expansion joint.

Damage to the corrosion protection system shall be repaired to the satisfaction of the Engineer prior to installation.

INSTALLATION

Each expansion joint shall be installed in accordance with the approved working drawings.

The expansion joint segments shall be installed in such a manner as to produce a best fit road profile across each joint. To achieve this, the thickness of the bedding material may be varied within the range shown on the Contract Plans and the thickness of the adjacent overlay at each end of each joint is also to be adjusted to blend with the pavement surfaces existing at the time of Roll In. Best fit to the theoretical profile is to be determined on site when the survey is made and confiormed when the expansion joint plates are first installed and prior to the installation of the bedding material.

In order to determine best fit, the Contractor is to survey profiles along the edge of each plate once the ETI span is installed and set on bearings (permanent or temporary). The profiles shall be surveyed at 2 meter intervals extending at least 8 meters each side of each joint plate. The profiles are to be compared to the theoretical profiles in each case. Best fit is to be proposed by the Contractor based on this survey and is to be accepted by the Engineer (who will be on site at this time) before the installation of the bedding material is commenced.

The Contractor shall protect the expansion joint from damage. The Contractor shall protect concrete blockouts and support systems from damage and construction traffic prior to installation of the expansion joints.

The bridge deck surface shall conform to the provisions in "Asphalt Concrete" of these special provisions after installation of expansion joints.

MEASUREMENT AND PAYMENT

The contract lump sum price paid for expansion joint at the locations listed in the Engineer's Estimate shall include full compensation for furnishing all labor, materials, tools, equipment and incidentals, forming blockouts, and for doing all the work involved in fabricating, furnishing, transporting, storing, and installing the expansion joints, including bedding material, anchorage components, mock-up construction, protecting, repairing, cleaning and coating, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

Furnishing and erecting expansion joints including cover plates will be measured and paid for as furnish structural steel (bridge) and erect structural steel (bridge), respectively.

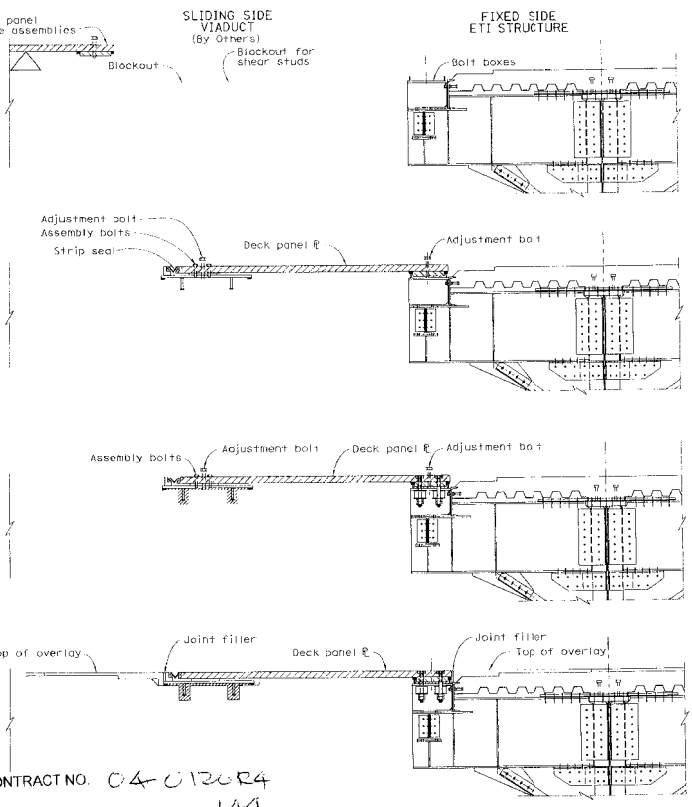
SHEET 95 OF 214

FILE = p:\sb\04-012001\efi\dgn\bkhe|d00.dgn



Note: Sequence shown for use of injected grout as bedding material.

Phase 1: - Joint situation at completion of Roll-in operation.

1. Deck on sliding side prepared with blockouts to receive the masonry plate and the vertical shear studs.
2. Bolt boxes cast in on the fixed side.
3. Deck panel plate assemblies prefabricated including prepositioned bearing and masonry plates and strip seals.
   a. Strip seal end block welded to masonry plate. Set gap for anticipated installation temperatures.
   b. Strip seals installed in each individual plate assembly.
4. Place deck panel assemblies for the Bent 52A expansion joints on the Viaduct prior to Roll-Out Roll-In operation. The assemblies consist of prefabricated and pre-positioned bearing and masonry plates, and completed strip seals.

Phase 2: - Place all five deck panel plate assemblies in position across the joint opening.
- Adjust deck panel plates to achieve best fit with plan and profile.
- Fix panel height with use of the adjustment bolts.
- Ensure that the perimeter around the areas to be grouted are properly sealed.

Phase 3: - Inject fast setting grout under low pressure on both sliding side and fixed side.
- Install bolting on the fixed side as follows:
  1. Withdraw the plastic dowels from the holes once the grout has set enough to not flow.
  2. Field drill through the opened hole into the top plate of the bolt box below.
  3. Insert and tighten the bolts using the neoprene washer assemblies and lock nuts.
  4. Complete all bolts on the fixed side

Phase 4: - After the grout has achieved initial set, extract the assembly bolts and fill the holes with sealant.
- Remove the adjustment bolts and fill the holes with sealant.
- Place joint filler strip elements on each side of the expansion joint assemblies.
- Place remainder of overlay on each side of the expansion joints feathering to the finished pavement.
- Place silicone seal between deck panel plates.
- Clean up.

Notes:

1. Construction sequence shown for the Bent 52A expansion joint in the upper deck with traffic towards San Francisco. Construction sequence for the Bent 52A expansion joint in the lower deck with traffic in direction of Oakland similar.
2. Deck panel plate assemblies weight, including bearing and masonry plates and strip seals is approximately between 7.0 tons and 8.5 tons.
3. To expedite the construction sequence and to maximize efficiency, the Contractor shall provide separate work teams, fully equipped with personnel and equipment, dedicated for each expansion joint location.
4. The Contractor to provide temporary bridges to allow equipment to cross joints during bedding material curing time without loading the expansion joint plates.

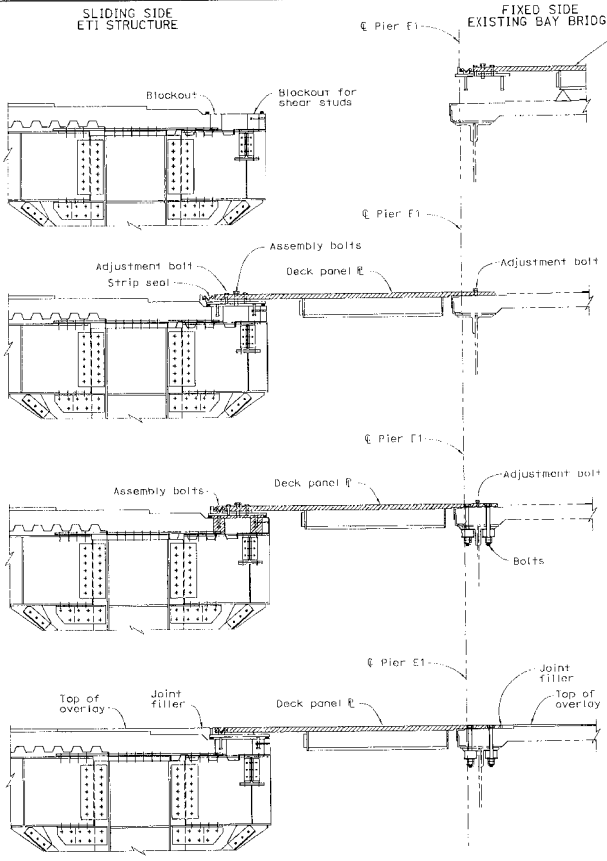
SLIDING SIDE ET1 STRUCTURE

FIXED SIDE EXISTING BAY BRIDGE



Note: Sequence shown for use of injected grout as bedding material.

Phase 1: - Joint situation at completion of Roll-in operation.
1. Deck on sliding side prepared with blockouts to receive the masonry plate and the vertical shear studs.
2. Existing expansion joint has been removed with roll-out of existing YBA span.
3. Expose concrete surface or the fixed side, cut back asphalt overlay and concrete surface.
   a. Strip seal end block welded to masonry plate. Set correct gap for anticipated installation temperatures.
   b. Strip seals installed in each individual plate assembly
4. Place deck panel plate assemblies for the Pier E1 expansion joint on the existing cantilever span side prior to Roll-Out-Roll-In operation. The assemblies consist of prefabricated and pre-positioned bearing and masonry plates and completed strip seals.

Phase 2: - Place leveling grout on the fixed side.
- Place excess thickness of grout as approved by the Engineer.
- Place all five deck panel assemblies in positon across joint opening. Lower the plates into the grout on the fixed side with adjustment bolts.
- Adjust deck panel plates to achieve best fit with plan and profile.
- Fix panel height on the sliding side with use of the adjustment bolts.
- Ensure that the perimeter around the areas to be grouted are properly sealed.

Phase 3: - Inject fast setting grout under low pressure on the sliding side.
- Install bolting on the fixed side as follows:
1. Withdraw the plastic dowels from the holes, once the grout has set enough to not flow.
2. Field drill through the holes into the existing concrete deck and flange angle below.
3. Insert and tighten the Tie-down bolts using the neoprene washer assemblies and lock nuts.
4. Complete all bolts on the fixed side. (Total 32 bolts per expansion joint)

Phase 4: - After the grout has achieved initial set, extract the assembly bolts and fill holes with sealant.
- Remove the adjustment bolts and fill holes with sealant.
- Place joint filler strip elements on each side of the expansion joint assemblies.
- Place remainder of overlay on each side of the expansion joints feathering to the finished pavement.
- Place silicone seal between deck panel plates.
- Clean up.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO. 144

SHEET 30 OF 32

Notes:

1. Construction sequence shown for the Pier E1 expansion joint in the upper deck with traffic towards San Francisco. Construction sequence for the Pier E1 expansion joint in the lower deck with traffic towards Oakland, similar.
2. Deck panel assembly weight, including bearing and masonary plates, strip seals and stiffeners is approximately between 5.0 tons and 6.0 tons.
3. To expedite the construction sequence and to maximize efficiency, the Contractor shall provide separate work teams, fully equipped with personnel and equipment, dedicated for each expansion joint location.
4. The Contractor to provide temporary bridges to allow equipment to cross during bedding material curing time without loading the expansion joint plates.

Change Requested by: Engineer

CCO 144	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Furnish, fabricate, machine, prime paint, and deliver to the project site, East Tie In expansion joints in accordance with the plans and specifications dated May 12, 2008 included herein (Sheets 2 through 23).

Payment for this work shall be in accordance with Sections 4-1.03D, Extra Work, and 9-1.03, Force Account Payment, of the Standard Specifications.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications.

Estimated Cost of Extra Work at Force Account $2,900,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$2,900,000.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

SHEET 9 OF 23

10-1.__ EXPANSION JOINT

Expansion joints shall consist of steel deck plates, bolt boxes, support plates, sealing elements, bedding material, anchorage components and all other necessary components and shall be fabricated and installed in conformance with the details shown on the plans and as specified in the standard specifications and these special provisions.

Attention is directed to "Cooperation," of these special provisions.

Unless otherwise directed by the Engineer, prior to submitting working drawings, the Contractor shall inspect and report on the expansion joint locations in the structures adjacent to East Tie-In. The Contractor shall submit to the Engineer an inspection report for review and approval. This inspection report shall be titled "East Tie-In Expansion Joint Location Inspection Report" and shall describe the actual dimensions and details existing in these areas sufficiently to determine if any conflicts or mismatches exist that would require revision to the design and/or details of the expansion joints and/or the installation procedures. The report shall include recommendations to resolve any such issues. The Contractor shall allow the Engineer 10 days to review the "East Tie-In Expansion Joint Locations Inspection Report".

WORKING DRAWINGS

The Contractor shall submit working drawings in conformance with the provisions in "Working Drawings" of these special provisions, and the requirements specified herein.

Working drawings shall include complete details, information, and drawings of the expansion joints and anchorage components and the method, materials, equipment, and procedures for fabrication and installation that the Contractor proposes to use.

Working drawing submittals shall include the following:

A. Fabrication plans including all details, elevations, and sections of the expansion joint. All dimensions and design and installation tolerances shall be specified. Fabrication plans for the sizes of deck plates and support plates shall consider roadway super elevations and longitudinal gaps between the plates for sealing elements. Unless otherwise directed by the Engineer, fabrication plans shall take into full account all issues identified in the "East Tie-In Expansion Joint Locations Inspection Report."
B. All ASTM or other material designations.
C. Sections showing all materials comprising the expansion joint with complete details of all individual components including welded splices and connections, welding procedures, and the measures to be taken to prevent steel plate from distortion due to the heat of welding.
D. Joint installation plans including methods, materials, equipment, sequence, lifting attachments and locations, details of temporary anchorage during setting, temperature adjustment methods, method for maintaining full contact between deck plates and support plates during and after installation, installation details at curbs, seal installation details, and other procedures that the Contractor proposes to use for installation of the expansion joints including procedures to release restraint after initial set of the bedding material.
E. Bedding material selection, bedding material technical information, the results of any testing necessary to ensure that working time of the material will be adequate and that strength gain will be sufficiently rapid, and placement and material testing procedures.

CONTRACT NO. 04-512084
CONTRACT CHANGE ORDER NO 149-S1
SHEET 5 OF 23

F. Details and procedures of the mock-up construction to demonstrate that the expansion joint can be installed in the field within the scheduled duration submitted by the Contractor in the Roll-out Roll-in plan and to provide training for the Contractor's personnel in the installation procedures.
G. List of coating system for expansion joints identifying cleaning and painting of all steel components as specified in "Clean and Paint Structural Steel" of these special provisions.
H. Anchorage components including concrete blockout details.
I. Storage plans for manufacture storage, interim storage, and on-site storage details including temporary support for the expansion joints.
J. Shipping plans including handling of the expansion joints during transportation. Each shipment of the expansion joint materials shall be accompanied by a Certificate of Compliance in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications. The certificate shall state that the materials and fabrication involved comply in all respects to the specifications and data submitted in obtaining approval.

After complete working drawings are received by the Engineer, the Contractor shall allow the Engineer 20 working days to review the submittal. No fabrication of the expansion joint shall begin until complete working drawings are reviewed and approved, in writing, by the Engineer.

MATERIALS

Attention is directed to "Welding" and "Audits" of these special provisions. Welding of expansion joint shall conform to AWS D1.5.

Structural steel shall conform to "Steel Structures" of these special provisions. Structural steel shall conform to the requirements of ASTM Designation: A 709M, Grade 345. Bolts, nuts and washers shall conform to the requirements of ASTM Designation: A 325 or A 325M and Section 75-1.03, "Miscellaneous Bridge Metal," of the Standard Specifications.

Sealing elements shall be 2 component silicone sealant that meets the requirements of Type A and AL seal in Section, 51-1.12F(3), "Materials and Installation," of the Standard Specifications. Strip seal shall be continuous without splices within the limits of each panel as shown on the plans.

Elastomeric washers shall conform to the requirements specified in Section 51-1.12H(1), "Plain and Fabric Reinforced Elastomeric Bearing Pads," of the standard specifications.

Bedding Material

The bedding material for setting the expansion joints shall be one of the following : epoxy plus silica sand mixture; rapid set mortar (without coarse aggregate); injectable rapid setting grout. The Contractor is to investigate and test materials to the degree necessary to ensure that the bedding material will perform as required and to allow the choice of bedding material to be made at least three months prior to the Roll-In operation. Contractor is to test all three material types and to provide a recommendation as to which he considers the most suitable. The determination of which material to use will be made by the Engineer after testing is complete.

Epoxy plus Silica Sand Mixture – to be a mixture of equal parts by volume of epoxy adhesive and silica sand. The material is to have adequate working time (pot life) to allow the expansion joint plates to be installed in the wet mixture with at least 30 minutes to spare before initial set. Tests are to be made to determine the time of initial set and the time at which a cube

CONTRACT NO. 54-012024
CONTRACT CHANGE ORDER NO 144-S1
SHEET 6 OF 23

strength of 25 MPa is achieved at the thicknesses of material anticipated and at the range of ambient temperatures expected. Contractor is to provide, if necessary, different epoxy formulations so as to cover the full range of conditions anticipated on site. The material is to achieve a compressive cube strength of at least 25 MPa before it bears traffic

Rapid Set Mortar (without coarse aggregate) – to be a rapid setting mortar using only fine aggregate. To be used at a "masonry mortar" consistency for setting the expansion joints into. The material is to have adequate working time to allow the expansion joint plates to be installed in the wet mixture with at least 30 minutes to spare before initial set. Tests are to be made to determine the time of initial set at the thicknesses of material anticipated and at the range of ambient temperatures expected. Different mixes are to be available if necessary to accommodate the full range of anticipated conditions. The material is to achieve a compressive cube strength of at least 25 MPa within 8 hours of initial set before it bears traffic.

Cementitious Grout – to be a cementitious grouting material containing fine aggregate and admixtures as necessary to ensure the required workability, flowability and early strength. Particular attention is to be paid to the suitability of the material at the maximum anticipated thickness. The material must be injectable at extremely low pressure (less than 1000 mm of head) through 19 mm diameter injection holes and must be capable of flowing freely under the embedded plates at the minimum anticipated thickness and producing 90% contact with the plate. Tests are to be made to determine the time of initial set and the time at which a cube strength of 25 MPa is achieved at the various thicknesses of material anticipated and at the range of ambient temperatures expected. Different mixes are to be available if necessary to accommodate the full range of anticipated conditions. The material is to achieve a compressive cube strength of at least 25 MPa before it bears traffic.

MOCK UP

Contractor shall construct at least one full scale mock-up prior to the commencement of fabrication of any of the expansion joints to demonstrate that the installation methods forseen are workable and that the expansion joints can be installed in the field within the time scheduled by the Contractor for the Roll-out Roll-in operation. The mock-up shall be witnessed by the Engineer. Upon completion of a successful mockup installation, fabrication of the joints may commence. At a later date the mockup is to be used to train the installation crews and to otherwise practice for the actual installation.

Further detailed mockups will also be required in order to test the effectiveness of the bedding materials and their proposed installation methods so that a final selection of bedding material can be made by the Engineer.

The full scale mock-up shall be of one full panel (approximately one lane wide) of one of the expansion joints. It shall use plates of the thicknesses shown on the plans but need not use the grade of steel specified for the actual joints. The replication of the blockout in the concrete on the sliding side is to have a depth and length equal to that of the blockout detailed on the plans and shall also incorporate cylindrical blockouts for the stud anchors. The replication of the blockout on the fixed side is to incorporate a steel plate arrangement to replicate the top plate of the bolt box shown on the plans. The mock-up shall include bedding material, seals etc. as necessary to permit the installation of the bedding material, concrete, adjustment bolts, temporary fixing bolts, and all concrete embedments as shown on the plans and approved working drawings. The mock-up shall be capable of being re-used as necessary to prove all aspects of the installation. Upon completion of a mockup and achievement of 25MPa cube strength, the mockup shall be dis-assembled and the adequacy of the bedding material verified.

CONTRACT NO. 04-012064

CONTRACT CHANGE ORDER NO 144 - S1

SHEET 7 OF 23

Acceptance criteria of the full scale mock-up shall be as follows:

A. Mock-up expansion joint is installed within horizontal and level tolerances allowed for the actual expansion joint.
B. Mock-up shall be completed in the scheduled duration.
C. Bedding material installation methods and bedding material condition are shown to be satisfactory

If the mock-up fails to meet any of the acceptance criteria as determined by the Engineer, additional mock-ups shall be constructed or the mockup shall be re-used until a satisfactory result is achieved.

Detailed mockups Detailed mockups shall be constructed to test the installation methods for the bedding material and to prove that the resulting in-situ bedding material is acceptable. These mockups are to be carried out at the earliest feasible date. The results of these mockups will be used to make a final determination of what bedding ,aterial to use in the project.

The first type of mockup shall consist of 1500 mm x 1000 mm steel plates 32 mm thick, with four leveling screws but without shear studs, that are to be set in bedding material in recesses in concrete at both the maximum and minimum anticipated bedding material thicknesses. The recesses are to have cylindrical blockouts replicating the blockouts for the shear studs. All three types of acceptable bedding materials are to be tested. Following achievement of a cube strength in the bedding material of 25 MPa, the mockup shall be disassembled and the quality of the bedding achieved determined.

The second type of mockup shall consist of 1500 mm x 540 mm x 32 thick plates with four leveling screws that are to be set on steel plates replicating the arrangement at the bolt boxes at the fixed end of the expansion joints. The mockups are to be carried out at maximum and minimum anticipated bedding material thicknesses and for all of the three potential bedding materials. Following achievement of a cube strength in the bedding material of 25 MPa, the mockup shall be disassembled and the quality of the bedding achieved determined.

The mock-ups shall not be part of the permanent structure and shall become the property of the Contractor. The mock-ups shall be removed from the work site and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

FABRICATION

The expansion joint shall be fabricated in conformance with the details, dimensions, material specifications, and procedures shown in the approved working drawings.

At the time of installation, the surface of the bearing plate shall be in contact with the surface of the masonry plate such that no gap between the two plates exceeds 2.0 mm and such that the maximum distance between points of contact does not exceed 300 mm. The Contractor shall furnish sufficient temporary assembly bolts to ensure that this fit is achieved.

All plate welds shall be ground smooth. The welds shall not protrude into the sliding surface of the deck plates or support plates.

Cleaning and painting of all new metal surfaces of the expansion joints, except where embedded in concrete, shall conform to the requirements specified in "Clean and Paint Structural Steel" of these special provisions.

Damage to the expansion joint during shipping or handling shall be cause for rejection of the expansion joint.

Damage to the corrosion protection system shall be repaired to the satisfaction of the Engineer prior to installation.

INSTALLATION

Each expansion joint shall be installed in accordance with the approved working drawings.

The expansion joint segments shall be installed in such a manner as to produce a best fit road profile across each joint. To achieve this, the thickness of the bedding material may be varied within the range shown on the Contract Plans and the thickness of the adjacent overlay at each end of each joint is also to be adjusted to blend with the pavement surfaces existing at the time of Roll In. Best fit to the theoretical profile is to be determined on site when the survey is made and confiormed when the expansion joint plates are first installed and prior to the installation of the bedding material.

In order to determine best fit, the Contractor is to survey profiles along the edge of each plate once the ETI span is installed and set on bearings (permanent or temporary). The profiles shall be surveyed at 2 meter intervals extending at least 8 meters each side of each joint plate. The profiles are to be compared to the theoretical profiles in each case. Best fit is to be proposed by the Contractor based on this survey and is to be accepted by the Engineer (who will be on site at this time) before the installation of the bedding material is commenced.

The Contractor shall protect the expansion joint from damage. The Contractor shall protect concrete blockouts and support systems from damage and construction traffic prior to installation of the expansion joints.

The bridge deck surface shall conform to the provisions in "Asphalt Concrete" of these special provisions after installation of expansion joints.

MEASUREMENT AND PAYMENT

The contract lump sum price paid for expansion joint at the locations listed in the Engineer's Estimate shall include full compensation for furnishing all labor, materials, tools, equipment and incidentals, forming blockouts, and for doing all the work involved in fabricating, furnishing, transporting, storing, and installing the expansion joints, including bedding material, anchorage components, mock-up construction, protecting, repairing, cleaning and coating, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

Furnishing and erecting expansion joints including cover plates will be measured and paid for as furnish structural steel (bridge) and erect structural steel (bridge), respectively.

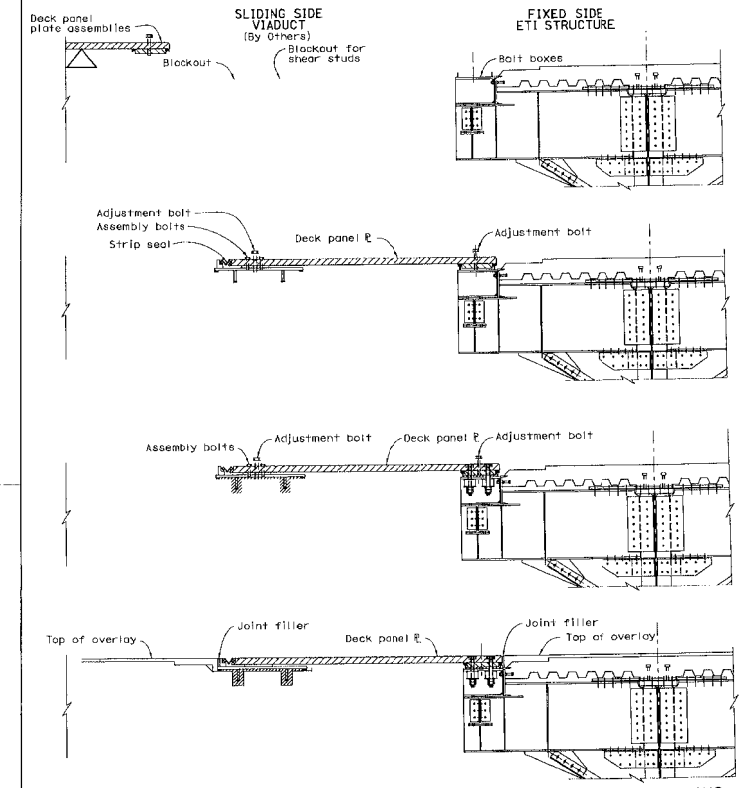
DATE PLOTTED => 5/7/2008 2:31:05 PM
USERNAME => Alex



Note: Sequence shown for use of injected grout as bedding material.

Phase 1: - Joint situation at completion of Roll-in operation.

1. Deck on sliding side prepared with blockouts to receive the masonry plate and the vertical shear studs.
2. Bolt boxes cast in on the fixed side.
3. Deck panel plate assemblies prefabricated including prepositioned bearing and masonry plates and strip seals.
   a. Strip seal end block welded to masonry plate. Set gap for anticipated installation temperatures.
   b. Strip seals installed in each individual plate assembly.
4. Place deck panel assemblies for the Bent 52A expansion joints on the Viaduct prior to Roll-Out Roll-In operation. The assemblies consist of prefabricated and pre-positioned bearing and masonry plates, and completed strip seals.

Phase 2: - Place all five deck panel plate assemblies in position across the joint opening.
- Adjust deck panel plates to achieve best fit with plan and profile.
- Fix panel height with use of the adjustment bolts.
- Ensure that the perimeter around the areas to be grouted are properly sealed.

Phase 3: - Inject fast setting grout under low pressure on both sliding side and fixed side.
- Install bolting on the fixed side as follows:
  1. Withdraw the plastic dowels from the holes once the grout has set enough to not flow.
  2. Field drill through the opened hole into the top plate of the bolt box below.
  3. Insert and tighten the bolts using the neoprene washer assemblies and lock nuts.
  4. Complete all bolts on the fixed side

Phase 4: - After the grout has achieved initial set, extract the assembly bolts and fill the holes with sealant.
- Remove the adjustment bolts and fill the holes with sealant.
- Place joint filler strip elements on each side of the expansion joint assemblies.
- Place remainder of overlay or each side of the expansion joints feathering to the finished pavement.
- Place silicone seal between deck panel plates.
- Clean up.

Notes:

1. Construction sequence shown for the Bent 52A expansion joint in the upper deck with traffic towards San Francisco. Construction sequence for the Bent 52A expansion joint in the lower deck with traffic in direction of Oakland similar.
2. Deck panel plate assemblies weight, including bearing and masonry plates and strip seals is approximately between 7.0 tons and 8.5 tons.
3. To expedite the construction sequence and to maximize efficiency, the Contractor shall provide separate work teams, fully equipped with personnel and equipment, dedicated for each expansion joint location.
4. The Contractor to provide temporary bridges to allow equipment to cross joints during bedding material curing time without loading the expansion joint plates.

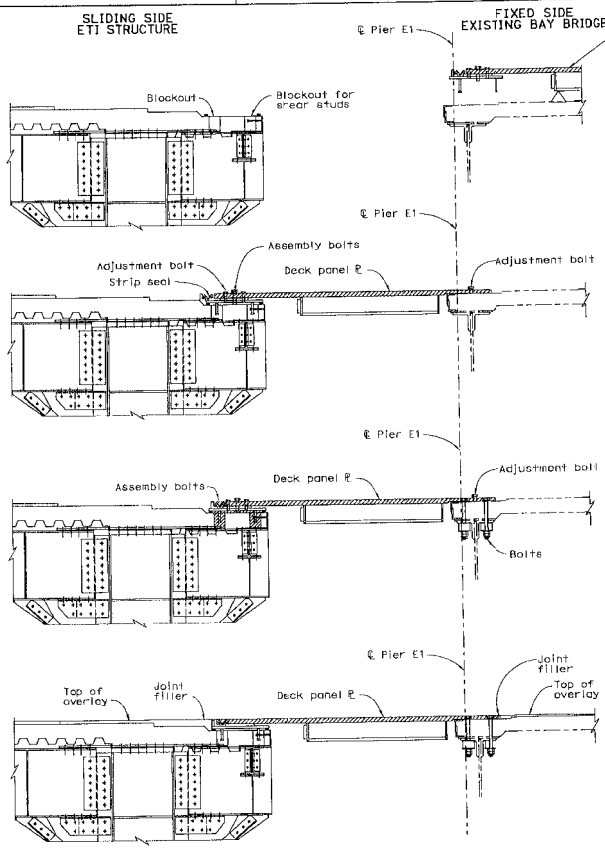
SLIDING SIDE
ETI STRUCTURE

FIXED SIDE
EXISTING BAY BRIDGE



Note: Sequence shown for use of injected grout as bedding material.

Phase 1: - Joint situation at completion of Roll-in operation.
1. Deck on sliding side prepared with blockouts to receive the masonry plate and the vertical shear studs.
2. Existing expansion joint has been removed with roll-out of existing YB4 span.
3. Expose concrete surface on the fixed side, cut back asphalt overlay and concrete surface.
   a. Strip seal and block welded to masonry plate. Set correct gap for anticipated installation temperatures. Set for each individual plate assembly.
   b. Strip seals installed in each individual plate assembly.
4. Place deck panel plate assemblies for the Pier E1 expansion joint on the existing cantilever span side prior to Roll-Out-Roll-In operation. The assemblies consist of prefabricated and pre-positioned bearing and masonry plates and completed strip seals.

Phase 2: - Place leveling grout on the fixed side.
- Place excess thickness of grout as approved by the Engineer.
- Place all five deck panel assemblies in positon across joint opening.
- Lower the plates into the grout on the fixed side with adjustment bolts.
- Adjust deck panel plates to achieve best fit with plan and profile.
- Fix panel height on the sliding side with use of the adjustment bolts.
- Ensure that the perimeter around the areas to be grouted are properly sealed.

Phase 3: - Inject fast setting grout under low pressure on the sliding side.
- Install bolting on the fixed side as follows:
1. Withdraw the plastic dowels from the holes, once the grout has set enough to not flow.
2. Field drill through the holes into the existing concrete deck and flange angle below.
3. Insert and tighten the Tie-down bolts using the neoprene washer assemblies and lock nuts.
4. Complete all bolts on the fixed side. (total 32 bolts per expansion joint)

Phase 4: - After the grout has achieved initial set, extract the assembly bolts and fill holes with sealant.
- Remove the adjustment bolts and fill holes with sealant.
- Place joint filler strip elements on each side of the expansion joint assemblies.
- Place remainder of overlay on each side of the expansion joints feathering to the finished pavement.
- Place silicone seal between deck panel plates.
- Clean up.

Notes:
1. Construction sequence shown for the Pier E1 expansion joint in the upper deck with traffic towards San Francisco. Construction sequence for the Pier E1 expansion joint in the lower deck with traffic towards Oakland, similar.
2. Deck panel assembly weight, including bearing and masonary plates, strip seals and stiffeners is approximately between 5.0 tons and 6.0 tons.
3. To expedite the construction sequence and to maximize efficiency, the Contractor shall provide separate work teams, fully equiped with personnel and equipment, dedicated for each expansion joint location.
4. The Contractor to provide temporary bridges to allow equipment to cross during bedding material curing time without loading the expansion joint plates.

STATE OF CALIFORNIA - DEPARTMENT OF TRANSPORTATION

CONTRACT CHANGE ORDER MEMORANDUM

TO: MIKE FORNER / DEANNA VILCHECK	FILE: **E.A.** 04 - 0120R4
FROM: BILL CASEY	**CO-RTE-PM** SF-80-12.6/13.2
	FED. NO. ACBRIM-080-1(097)N
CCO#: **144** SUPPLEMENT#: **1** Category Code: **CHPA**	CONTINGENCY BALANCE (incl. this change) **$72,297,134.05**
COST: **$2,900,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: ETI Fabricate Expansion Joints	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

compensation to the contractor for all costs involved in furnishing, fabricating, machining, prime painting, and delivering to the project site, East Tie In expansion joints.

This contract provides for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour will allow for the construction of the permanent structure, the Yerba Buena Island Transition Structure, which connects the signature SAS structure to Yerba Buena Island.

The detour consist of three main structures, the East Tie-In (ETI) to the bridge, the West Tie-In to the island and the Viaduct structure between the two tie ins. The contract was awarded as a performance based project with the contractor responsible for meeting the design criteria specified in the contract.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The new ETI design requires the fabrication and installation of 4 expansion joints, each approximately 18 meters long and 3 meters wide, where the upper and lower decks conform to the Viaduct structure and the existing SFOBB. These 4 joints need to be installed during the anticipated full weekend closure of the SFOBB when the existing span is rolled out and the new detour span is rolled in. This makes the installation of the expansion joints critical in avoiding a late opening of the weekend closure. The original CCO 144-S0 provided for the early procurement of the steel plate material required for the fabrication of the 4 expansion joints.

This work will be paid for as Extra Work at Force for an estimated cost of $2,900,000.00 which will be funded through the available contingency balance. A cost analysis is on file.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was requested by Mike Whiteside - YBI Coordination Engineer per memorandum dated May 13, 2008 and concurred by Hong Wong - Project Engineer, Alec Melkonians - Asst. Project Manager, and Lina Ellis - Structure Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 144	Suppl. No. 2	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Incorporate the changes to the expansion joints at Bent 52A and Pier E1 of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) as shown in the revised plan sheets of Sheets No. 2 through 14 of this change order.

All revisions to the expansion joints shown on Sheets No. 2 through 14 of this change order shall supersede the original plan sheets issued under Change Order No. 144, Supplement No. 1.

Compensation for any costs resulting from the changes incorporated under this change order shall be paid as extra work at force account as previously provided under Contract Change Order No. 144, Supplement No. 1.

RECEIVED
09 OCT -8 AM 10:03

Estimated Cost: **Increase** ☐ **Decrease** ☐ **$0.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

Submitted by		
Signature	**Resident Engineer** BILL CASEY	**Date** 6-30-09

Note: Sequence shown for use of injected grout as bedding material.

Phase 1: - Joint situation at completion of Roll in operation.

1. Deck on sliding side prepared with blockouts to receive the masonry plate and the vertical shear studs.
2. Bolt boxes cast in on the fixed side.
3. Deck panel plate assemblies prefabricated including prepositioned bearing and masonry plates and strip seals.
   a. Strip seal end block welded to masonry plate. Set gap for anticipated installation temperatures.
   b. Strip seals installed in each individual plate assembly.
4. Place deck panel assemblies for the Bent 52A expansion joints on the Viaduct prior to Roll-Out Roll-In operation. The assemblies consist of prefabricated and pre-positioned bearing and masonry plates, and completed strip seals.

Phase 2: - Place all five deck panel plate assemblies in position across the joint opening.
- Adjust deck panel plates to achieve best fit with plan and profile.
- Fix panel height with use of the adjustment bolts.
- Ensure that the perimeter around the areas to be grouted are properly sealed.

Phase 3: - Inject fast setting grout under low pressure on both sliding side and fixed side.
- Install bolting on the fixed side as follows:
  1. Withdraw the plastic dowels from the holes once the grout has set enough to not flow.
  2. Field drill through the opened hole into the top plate of the bolt box below.
  3. Insert and tighten the bolts using the neoprene washer assemblies and lock nuts.
  4. Complete all bolts on the fixed side.

Phase 4: - After the grout has achieved initial set, extract the assembly bolts and fill the holes with sealant.
- Remove the adjustment bolts and fill the holes with sealant.
- Place joint filler strip elements on each side of the expansion joint assemblies.
- (1) Place overlay on each side of the expansion joints feathering to the finished pavement.
- Place silicone seal between deck panel plates.
- Clean up.

Notes:

1. Construction sequence shown for the Bent 52A expansion joint in the upper deck with traffic towards San Francisco. Construction sequence for the Bent 52A expansion joint in the lower deck with traffic in direction of Oakland similar.
2. Deck panel plate assemblies weight, including bearing and masonry plates and strip seals is approximately between 7.0 tons and 8.5 tons.
3. To expedite the construction sequence and to maximize efficiency, the Contractor shall provide separate work teams, fully equipped with personnel and equipment, dedicated for each expansion joint location.
4. The Contractor to provide temporary bridges to allow equipment to cross joints during bedding material curing time without loading the expansion joint plates.

CONSTRUCTION SEQUENCE

Expansion Joint at Pier E1
NTS

Deck panel plate assemblies

Note: Sequence shown for use of injected grout as bedding material.

Phase 1: Joint situation at completion of Roll-in operation.

1. Deck on sliding side prepared with blockouts to receive the masonry plate and the vertical shear studs.
2. Existing expansion joint has been removed with roll-out of existing YB4 span.
3. Expose concrete surface on the fixed side, cut back asphalt overlay and concrete surface.
   a. Strip seal end block welded to masonry plate. Set correct gap for anticipated installation temperatures.
   b. Strip seals installed in each individual plate assembly.
4. Place deck panel plate assemblies for the Pier E1 expansion joint on the existing cantilever span side prior to Roll-Out-Roll-In operation. The assemblies consist of prefabricated and pre-positioned bearing and masonry plates and completed strip seals.

Phase 2:
- Place leveling grout on the fixed side.
- Place excess thickness of grout as approved by the Engineer.
- Place all five deck panel assemblies in positon across joint opening.
- Lower the plates into the grout on the fixed side with adjustment bolts.
- Adjust deck panel plates to achieve best fit with plan and profile.
- Fix panel height on the sliding side with use of the adjustment bolts.
- Ensure that the perimeter around the areas to be grouted are properly sealed.

Phase 3:
- Inject fast setting grout under low pressure on the sliding side.
- Install bolting on the fixed side as follows:
  1. Withdraw the plastic dowels from the holes, once the grout has set enough to not flow.
  2. Field drill through the holes into the existing concrete deck and flange angle below.
  3. Insert and tighten the Tie-down bolts using the neoprene washer assemblies and lock nuts.
  4. Complete all bolts on the fixed side. (Total 32 bolts per expansion joint)

Phase 4:
- After the grout has achieved initial set, extract the assembly bolts and fill holes with sealant.
- Remove the adjustment bolts and fill holes with sealant.
- Place joint filler strip elements on each side of the expansion joint assemblies.
- Place overlay on each side of the expansion joints feathering to the finished pavement. (1)
- Place silicone seal between deck panel plates.
- Clean up.

Notes:
1. Construction sequence shown for the Pier E1 expansion joint in the upper deck with traffic towards San Francisco. Construction sequence for the Pier E1 expansion joint in the lower deck with traffic towards Oakland, similar.
2. Deck panel assembly weight, including bearing and masonary plates, strip seals and stiffeners is approximately between 5.0 tons and 6.0 tons.
3. To expedite the construction sequence and to maximize efficiency, the Contractor shall provide separate work teams, fully equiped with personnel and equipment, dedicated for each expansion joint location.
4. The Contractor to provide temporary bridges to allow equipment to cross during bedding material curing time without loading the expansion joint plates.

475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

design revisions to the expansion joints of the East Tie-In (ETI) structure.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) portion of this contract. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The original Contract Change Order No. 144, along with Supplement No. 1, provided the plans and specifications necessary for the fabrication of the 4 expansion joints of the ETI structure and provided compensation for the this fabrication as extra work at force account. This change order incorporates numerous changes to the originally issued plan sheets for the expansion joints as issued by Toll Bridge Design.

It is anticipated that the current force account funding shall be adequate to compensate the contractor for any additional costs resulting from these design revisions.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was requested by Mike Whiteside - YBI Coordination Engineer per memorandum dated May 18, 2009 and concurred by Hong Wong - Project Engineer, Alec Melkonians - Asst. Project Manager, and Lina Ellis - Structure Maintenance.

SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Additional Funds for Expansion Joints	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Additional funding to provide for the fabrication of the East Tie-In (ETI) expansion joints.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. Based on these memorandums, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The original Change Order No. 144, including Supplement No. 1, provided the plans and specifications necessary for the fabrication of the 4 permanent expansion joints, each approximately 18 meters long and 3 meters wide, for the ETI structure. Those change orders also provided compensation for the actual fabrication of the expansion joints along with the fabrication of a mock up joint for testing its properties and installation method. That change order provided for the work to be performed as extra work at force account. Supplement No. 2 incorporated design changes to the originally issued plan sheets for the expansion joints as issued by Toll Bridge Design.

It is anticipated that the current force account funding shall be inadequate. Unanticipated costs will be incurred due to the revised design and delays to the fabrication stemming from these design changes. The contractor was required to perform extensive modifications to the floor beam under the joints at Pier E1 and also acted to mitigate the Department design delay by working extended hours on the fabrication. Shop drawings also had to be modified due to the design change.

The work shall be compensated as extra work at force account for an estimated cost of $1,000,000.00 which shall be financed from the contract contingency funds. A cost analysis is on file.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Minh B. Nguyen - Project Engineer. TBPOC approval pending.

Maintenance concurrence is not required as this is an administrative change.

MASS CONCRETE

Mass concrete shall conform to the requirements of Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

Components listed in the table below shall be considered mass concrete:

Location	Mass Concrete Components
Bents W3L, W4L, W5L, W6L, W3R, W4R, W5R, W6R (North), W6R (South), W7	Footing

The temperature of mixed concrete, immediately before placing, shall be not more than 85°F. Use of ice or chilled water may be necessary to satisfy the above temperature requirements.

Materials

The concrete mix shall be the previously approved mix design (Central Concrete Mix Design No. HF591212), submitted in Document No. 215-SUB.00141-00 dated May 14, 2007.

Construction

Methods of concrete consolidation shall prevent damage to any temperature monitoring and recording system that may be installed by the Engineer.

After the mass concrete pour has been topped out and finished, it shall be revibrated and refinished. Revibration shall extend below the top mat of reinforcement and shall be done as late as the concrete will again respond to vibration. For concrete pours without top reinforcement, revibration shall extend to a depth of 150 mm.

The mass concrete shall be water cured for a minimum of 3 days after placement. Exposed concrete surface shall be insulated with a minimum R-2 ½ insulation one day after placement and shall remain in place for a minimum of one day but no more than 2 days.

After curing, the Contractor shall remove all equipment and materials from the mass concrete element and clean the surface for the Engineer's inspection.

Full compensation for conforming to the above requirements shall be considered as included in the contract prices paid for the various contract items of work involved and no additional compensation will be allowed therefor.

THIS CHANGE ORDER PROVIDES FOR:

A credit to the Department for the revisions to the mass concrete specification for Bents W3R, W5L, W5R, W6R (South), W7L and W7R of the Yerba Buena Island Transition Structure (Br. No. 34-0006L/R) and Bent W7 of the YBI EB On-Ramp Structure (Br. No. 34-0006 R).

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The Department issued a December 25, 2006 strategy memo which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC that called for the advance construction of foundation work for the Yerba Buena Island Transition Structure (YBITS) under this contract.

Change Orders No. 64, 73, 75 and 77 have been issued to provide for the advanced construction of 13 footings and columns for Bents W3L, W3R, W4L, W4R, W5L, W5R, W6L, W6R and W7 of the YBITS project. These change orders provided for a thermal control plan to be implemented to the mass concrete pertaining to the footings being constructed. This thermal control plan included a mechanical cooling system which controlled the temperature of the curing concrete by circulating cooled water through the footings during its curing via cooling pipes that were installed inside the footing prior to the placement of concrete.

The original Change Order No. 145 implemented a revised mass concrete specification that calls for additional vibration of the concrete and a more typical water cure in lieu of the previously specified thermal control plan. This revision was applied to the remaining 7 footings that had not been constructed prior to the revised specification being issued. The original change order deferred any costs adjustment resulting from the specification change.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was requested by Mike Whiteside - YBI Coordination Engineer, per Memorandum dated May 23, 2008 and concurred with by Alec Melkonians - Asst. Project Manager, Jaime Gutierrez - Project Engineer, and Lina Ellis - Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 146	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer, perform tree trimming of limbs that extend out and up to 20 feet above the roadway surface along Macalla Road and any bush/shrub trimming that pose a potential fire hazard within the project limits.

All disposal of tree cuttings shall be provided and paid for under this change. The Contractor shall make his own arrangements for the disposal of tree cuttings outside the highway right of way.

Estimated Cost of Extra Work at Force Account $50,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$50,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

THIS CHANGE ORDER PROVIDES FOR:

providing additional funds for tree trimming of limbs that extend out and up to 20 feet above the roadway surface along Macalla Road and any bush/shrub trimming that pose a potential fire hazard within the project limits.

This change was originally requested by Alec Melkonians - Project Manager per memorandum dated June 3, 2008. This change order is necessary to eliminate / reduce potential fire hazards along Macalla Road and elsewhere within the project limits.

The Contractor shall be compensated for this work at Extra Work at Force Account for an estimated cost of $ 50,000.00. The tree and bush trimming work will be paid for under Section 9-1.03B, Work Performed by Special Forces or Other Special Services, of the Standard Specifications. This change can be financed by the contract's contingency funds. A cost analysis is on file and is in the project records.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

Adjustment to contract time in not warranted as this change does not affect the controlling operation.

FHWA authorzation is no longer required as federal authorization and funding for this project has been officially withdrawn.

This change was concurred by Alec Melkonians - Asst. Project Manager.

THIS CHANGE ORDER PROVIDES FOR:

Additional funding for the work defined under the original Change Order No. 146.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins. The contract was issued as a performance based contract with the contractor responsible for providing the design of the structure based on specified design criteria.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006 and both approved by Tony Anziano – Toll Bridge Program Manager, Richard land – Chief Engineer and subsequently by the Toll Bridge Program Oversight Committee (TBPOC), recommended that the Department assume the design responsibility for the ETI and WTI structures and recommended the advance construction of foundation work for the Yerba Buena Island Transition Structure (YBITS) to be added to this contract. The implementation of these strategies has led to the extension of the contract through the end of 2010 approximately 5 years past the original contract completion date.

The original Change Order No. 146 along with Supplement No. 1 provided for tree trimming of limbs that extend into the roadway that immediately services the project and any brush that may pose a potential fire hazard within the project limits. The roadway and much of the jobsite is located on a steep and heavily wooded slope which is particularly susceptible to fire risks.

The contract work has now been extended into the late fall of 2010 and it is anticipated that additional funding will be necessary to maintain the roadway and jobsite.

The work shall be compensated as extra work at force account at an estimated cost of $80,000.00 which shall be financed from the contract contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

Maintenance concurrence is not required as the work doesn't affect any permanent roadway features.

PE & PM have concurred to this change.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 149	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Perform the following work pertaining to furnishing the lead core and pot bearings for the East Tie-In structure in accordance with the plans and specifications shown on Sheets No. 2 through 55 of this change order and as determined by the Engineer:

1) Furnish 2 EA Type 1 lead rubber bearings for Pier E1, including all masonry plates, mounting plates, sole plates, stopper rings and appurtenances.

2) Furnish 1 EA Type 1 lead rubber bearings for prototype testing, including all appurtenances.

3) Furnish 2 EA pot bearing assemblies for Bent 52A, including all bearing plates, mounting plates, masonry plates, stoppers and appurtenances.

4) Furnish 2 EA pot bearing assemblies for Pier E1, including all bearing plates, restrainer plates, masonry plates and appurtenances.

5) Furnish mock up masonry plates.

6) Perform all bearing prototype and proof testing.

Estimated Cost of Extra Work at Force Account $1,600,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$1,600,000.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

SHEET 4 OF 55

10.1.__ POT BEARINGS

Pot bearings shall consist of an elastomeric disk within a steel pot, mounting plates, anchorage components, bedding materials, a PTFE/stainless steel sliding system for expansion bearings, and all other necessary components and shall be designed, fabricated, and installed in conformance with the details shown on the plans and as specified in the Standard Specifications and these special provisions.

BEARING SUPPLIERS

All pot bearings used in the work shall be from the same manufacturer. The proposed pot bearing supplier shall be selected from the following list:

BEARING SYSTEM	MANUFACTURER ADDRESS AND PHONE NUMBER
Pot Bearing	CON-SERV INC., 685 AVIATION BLVD, GEORGETOWN, SC 29440. 1-800-541-1044 D.S. BROWN, 300 EAST CHERRY STREET, NORTH BALTIMORE, OH 45872 1-419-257-3561 MAGEBA SA TEL +41-44-872 40 50 FAX +41-44-872 40 59 EMAIL INFO@MAGEBA.CH VSL INC 7455-T NEW RIDGE ROAD HANOVER, MD 21076 1-410-850-4111

GENERAL

The pot bearings shall be designed, fabricated, prototype-tested, proof-tested and installed as shown on the plans and the approved working drawings, and as specified in these special provisions. The manufacturer shall demonstrate a minimum of 5 years experience in the design and manufacture of pot style bearings and be certified under the AISC Quality Certification Program - Simple Steel Bridges. Bearings shall be fabricated at facilities owned and operated by the manufacturer; the manufacturer being the entity that designs, fabricates, and supervises the installation of the bearing assemblies.

Attention is directed to the as-built plans for Bridge No. 33-0025 and "Project Information" of these special provisions regarding location of existing anchorage steel in Pier E1.

DOCUMENTATION

The Contractor shall provide at least the following documents:

CONTRACT NO. 03-012004

CONTRACT CHANGE ORDER NO 149

SHEET 5 OF 55

A. Working drawings
B. Supplemental calculations
C. Quality control program
D. Test reports
E. Installation manual
F. Inspection and maintenance manual

Each working document, including each sheet of the calculations, shall be signed by an Engineer who is registered as a Civil Engineer in the State of California.

WORKING DRAWINGS

Working drawings and supplemental calculations for pot bearings shall conform to the requirements in "Working Drawings" of these special provisions.

Attention is directed to subsections "Testing," and "Mock-Up," of this section. After testing and mock-up, the Contractor shall revise and resubmit the working drawings for the Engineer's approval. Approval of working drawings will be contingent on Engineer's approval of prototype testing and mock-ups. The Contractor shall revise and resubmit to the Engineer for approval working drawings affected by changes required for successful completion of prototype testing and mock-ups, unless otherwise approved by the Engineer.

Working drawings shall include all components and assemblies, shall show both general arrangements and large-scale details, and shall include tables showing load capacity and movement rating, if applicable, of each bearing, including any initial offset required.

The working drawings shall contain all information required for the proper fabrication and installation of the bearings, including, but not limited to, the following:

A. Complete details of the bearing system, including material properties and dimensions of all bearing components.
B. Evaluation and confirmation that adequate space is available for coring and installation equipment.
C. Details of connecting plates, grout pads, anchor bolts, nuts, protective skirt, pintles, and any required revisions or additions to new and existing structural steel, concrete reinforcement or other components of the structure necessary to accommodate the bearings proposed for use.
D. Welding and inspection procedures .
E. Details of adapter plates needed for testing.
F. Details of temporary restraint assembly device
G. Details of temporary clamping device.
H. Surfaces to be painted or metalized.
I. Grout mix design(s).
J. Construction schedule for pot bearing installation.

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 6 OF 55

K. Information on the initial vertical displacement and long-term vertical displacement under anticipated service loading.

Supplemental Calculations

The Contractor shall submit design calculations that supplement the working drawings and show conformance of the bearings to the design loadings, movements and other specified requirements. Calculations shall be prepared by an engineer who is registered as a Civil Engineer in the State of California.

QUALITY CONTROL PROGRAM

The Contractor shall submit to the Engineer fabrication quality control program procedures that address at a minimum the following:

A. Incoming materials and storage
B. Machining tolerances and finishes
C. Welding procedures
D. Elastomer compound mixing
E. Vulcanization
F. Materials testing procedures
G. Marking and identification
H. Shipping and handling
I. Documentation

The Contractor shall submit 6 copies of the Quality Control Program for review and approval in accordance with the schedule described in sub-section "Submissions and Scheduling" of this section.

MATERIALS

Steel elements of pot bearings shall conform to "Steel Structures" of these special provisions. Attention is directed to "Welding" and "Audits" of these special provisions. Welding of pot bearings shall conform to AWS D1.5.

Steel Plate shall be ASTM A36, A572 or A709/709M grade 50.

Stainless steel surfacing shall conform to the following:

A. Stainless steel sheet (min 3 mm thick) ASTM A167, Type 304 or ASTM A240, Type 304 with a finish equal to or better than 0.2 micro-meters rms.
B. Solid stainless steel ASTM A240, Type 304 or 304L with a finish equal to or better than a 0.2 micro-meters rms.
C. Stainless steel weld overlay, a minimum of 2.4 mm thick after surfacing, with a finish equal or less than 0.2 micro-meters rms.

Brass for Sealing Rings shall conform to the requirements in ASTM Designation: B 36, half-hard alloy 260.

Polytetrafluoroethylene (PTFE) shall be manufactured from pure virgin unfilled TFE resin conforming to ASTM Designation: D 1457. Reprocessed material will not be permitted. PTFE shall be resistant to acids, alkalis and petroleum products; non-

CONTRACT NO. 64-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 7 OF 55

absorbing of water; stable from -217.8°C to +260°C; non-flammable; and meet the following test requirements:

Physical Property	ASTM Test Method	Requirement, minimum
Ultimate tensile strength	D 1457	19.3 MPa
Ultimate elongation	D 1457	200%
Specific Gravity	D 792	2.12

Adhesive shall conform to the following:

A. Adhesive used for bonding sheet PTFE shall be an epoxy material stable from -17.8°C to +121.1°C and recommended for the purpose by the manufacturer of the PTFE.

Pot bearing elastomer shall be 100% virgin polychloroprene (Chloroprene Rubber or CR) or 100% virgin polyisoprene (Natural Rubber or NR) and shall satisfy the requirements for Temperature Grade 2 rubber. The elastomer shall be plain, not laminated or fiber reinforced, and shall meet the following test requirements:

Physical Property	ASTM Test Method	Requirement (CR)	Requirement (NR)
Hardness, Shore A Durometer	D 2240	50±5	50±5
Tensile strength, min. MPa	D 412	17	17
Ultimate elongation, min.	D 412	400%	450
Aged properties after 70 hours	D 573		
Temperature		100°C	70°C
Hardness change, max.		+ 15	+10
Tensile strength change, max.		- 15%	-25%
Ultimate elongation change, max.		- 40%	-25%
Compression set after 22 hours	D395 (Method B)		
Temperature		100°C	70°C
Compression set, max.		35%	25%

Pot bearing elastomeric disk shall be lubricated with a silicone grease conforming to MIL-S-8660, or an equal that has been approved in writing by the Engineer.

Paint shall conform to the requirements in "Clean and Paint Structural Steel" of these special provisions

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 149

SHEET 8 OF 55

Grout used for installing the fixed pot bearings at Bent 52A and for the expansion pot bearings at Pier E1 shall satisfy the following requirements:

Location	Bent 52A	Pier E1	
Bearing	Fixed pot	Expansion pot	
Application	Bedding	Bedding	Pintle holes
REQUIREMENT			
To be proposed by the Contractor, and subject to the approval of the Engineer.	X	X	X
To be suitable for exterior use.	X	X	X
To have zero drying/curing shrinkage in conformance with ASTMC827.	X	X	X
To have proven history in similar applications.	X	X	X
To be suitable for the bedding thickness used	X	X	X
To pre-packaged, non-metallic, cementitious material containing no chlorides.	X		
To contain fine aggregate.	X		
To be suitable for installation by injection at very low pressure (20 kPa) or by pouring.	X		
To have a minimum working time of 45 min. in the thickness and temperature to be used.		X	X
To be a 3-component, 100% solids, solvent-free epoxy grout containing fine aggregate.		X	X
To develop sufficiently little heat that it does not set up prematurely when used in the required volume.			X
To exhibit low creep (< 0.0025 mm/mm)		X	

Grout strength shall be measured by cube strength in compression, in accordance with ASTM C109, and shall satisfy the following:

A. At fixed pot bearings at Bent 52A:
1. 30 MPa at time of loading with the new ETI truss.
2. 40 MPa at 28 days.

B. At expansion pot bearings at Pier E1 - Bedding material:
1. 20 MPa at time of loading with the new ETI truss (approximately 6 hours maximum).
2. 40 MPa at 28 days.

At expansion pot bearings at Pier E1 - Pintle hole material:
40 MPa at 28 days.

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 9 OF 55

The same material may be used for the fixed pot bearings at Bent 52A and the lead–rubber bearings at Pier E1, provided that it satisfies the requirements for both applications. In place of the specified cementitious grout, the Contractor may propose alternative materials, including epoxy grouts, for approval by the Engineer, provided that they have strength at least equal to the value specified for the application and that they satisfy all other relevant requirements given in the table above.

The same material may be used for bedding the masonry plates and filling the pintle holes at the expansion pot bearings at Pier E1, provided that it satisfies the requirements for both applications. It is suggested that Five Star HP epoxy grout, or similar material, be investigated for this application. If different grouts are used for filling pintle holes and bedding, they shall be compatible with each other.

Ultra High Molecular Weight Polyethylene (UHMWPE) shall be manufactured with a maximum 50 percent regenerated or recycled material; and with a molecular weight of 3,000,000 to 6,000,000 in accordance with the requirements in ASTM D4020, compression molded, stress relieved, and include an ultraviolet stabilizer. The UHMWPE shall be approved by the Engineer. Physical characteristics shall conform to the following requirements:

A. Static coefficient of friction to steel shall be less than 0.10.
B. Specific gravity shall be greater than 0.92 (ASTM D 792)
C. No water absorption shall be shown under long term immersion (ASTM D 510)
D. The minimum tensile stress capacity shall be 25 MPa and the minimum impact shear capacity shall be 10 MPa.

DESIGN

The manufacturer shall design the bearings for the loads and movements and performance criteria shown on the plans. The bearings shall also satisfy the design requirementsof the AASHTO LRFD Specifications, Third Edition (2004).

Bearings shall be supplied with temporary clamping devices that will safely hold the assembled bearing during storage, shipping, and when it is transported hanging from the truss.

Bearings shall be designed to have a static friction coefficient not greater than 0.10 and kinetic friction coefficient not greater than 0.07.

Compatibility with Engineer's Plans

The bearings shall be compatible with the dimensional clearances and tolerances shown on the plans. The Contractor shall verify all dimensions required for installation of the bearings.

The Contractor shall check the mounting plates and bolts based on the bearing system proposed for use and redesign the mounting plate and bolts, if necessary. The anchorage strength of the mounting plate and bolt system shall not be less than the strength of the system shown on the plans. The total height of the bearing system shown on the plans shall not be modified without the approval of the Engineer. Any re-design of the anchorage system or the bearing connection details shall be subject to the approval of the Engineer.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 149
SHEET 10 OF 55

The bearings shall be capable of operating as specified for an ambient air temperature range of +0°C to +40°C. Bearing design criteria shall include a minimum rotation of 0.02 radians, which includes rotations due to all applicable service loads and movements, maximum rotations caused by fabrication and installation tolerances, and allowance for uncertainty. Designs shall be based on the assumption that maximum vertical and horizontal loads and rotations occur simultaneously. The design of the bearings shall meet the following requirements:

A. **Steel Bearing Components**

1. **Pot.** The inside diameter of the pot cavity shall be nominally equal to the diameter of the elastomeric pad. The pot shall be deep enough to permit the seal and piston rim to remain in full contact with the vertical face of the pot wall under all design loads, movements, and rotations. The pot walls shall be designed to withstand both the internal pressures caused by the vertical loads (considering the elastomer to behave as a fluid) and the design lateral loads. The thickness of the pot wall shall not be less than 0.05 times the pot internal diameter.

2. **Piston.** The piston thickness shall be sufficient to provide at least 3 mm vertical clearance between rotating and non-rotating components of the bearing at maximum compressive load and rotation. The radial clearance between the piston and the pot wall shall be sufficient to prevent binding at maximum rotation. For bearings carrying horizontal loads, the piston face width shall be designed assuming a contact area with the pot wall of one-third the pot circumference and allowable compressive stress not exceeding $0.8 \times F_y$. These limits shall apply to the as-built, rather than the nominal, dimensions.

B. **Sole and Masonry Plates.** The sole and masonry plates shall be designed to distribute the bearing loads into the surrounding substructure and/or superstructure and shall satisfy the geometric constraints shown on the plans. The allowable bending stress in sole and masonry plates shall be $0.63 \times F_y$, and the thickness shall not be less than 20 mm. Service or installation considerations, such as weldability and bearing height, may require thicker masonry and sole plates than needed for strength considerations alone.

C. **PTFE Sheets.** PTFE sheets shall be a minimum of 3 mm thick.

D. **Elastomeric Disk for Pot Bearings.** The area of the disk shall be selected to limit the average bearing pressure on the disk to 24 MPa under the design loads.

E. **Brass Sealing Rings for Pot Bearings**. The sealing system shall be designed to prevent leakage of elastomer past the seal under maximum compressive load and cyclic rotations. Sealing rings shall be flat brass, not less than 9.5 mm wide and

CONTRACT NO. 04-012084
CONTRACT CHANGE ORDER NO 149
SHEET 11 OF 55

2.3 mm deep. A minimum of 3 rings shall be used. Alternative sealing ring systems may be used with the written approval of the Engineer.

F. **Protective Skirt.** The manufacturer shall provide a protective skirt for each expansion pot bearing at Pier E1. The protective skirt shall protect the stainless steel surface from dust, water, and other foreign materials. The protective skirt shall not restrict movement or rotation of the bearing and shall have an expected life cycle equal to that of the bearing.

MOCK-UPS

The Contractor shall prepare mock-ups that demonstrate the suitability of the proposed materials and construction sequences. Mock-ups shall conform to the manufacturer's recommendations and these special provisions.

The mock-ups shall not be part of the permanent structure and shall become the property of the Contractor. The mock-ups shall be removed from the work site and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Grouting Mock-up (Fixed pot bearing at Bent 52A)

The proposed grout material and installation procedure shall be tested in a mock-up of a masonry plate. The purpose of the grouting mock-up is to verify the installation methods proposed and the suitability of the materials for the installation methods needed, and to demonstrate that the necessary work can be accomplished by the Contractor within the working time of the bedding and/or grouting materials. The Contractor's ability to completely fill the bedding space under the large masonry plate is of particular importance.

The grouting mock-up shall conform to the following:

A. A steel masonry plate shall be used with dimensions at least 1740 mm x 1740 mm in plan x 38 mm thick, with leveling screws. Inclusion of anchor bolts in the mockup is not necessary.
B. The thickness of bedding material shall be 25 mm.
C. The underside of the steel plate shall be covered with a bond breaker to ensure removal of the plate from the bedding material.
D. The mockup masonry plate shall be grouted with at least 15 minutes remaining before the bedding material becomes unworkable.
E. When the bedding material has reached a strength of 20 MPa, the mockup shall be disassembled and the adequacy of the installation procedure shall be verified. The grout shall be free from cracking and exhibit zero shrinkage in situ. The area of any air voids in the grout shall be less than 20% of the area of the plate. Depth of air pockets shall not exceed 4 mm.

If in the opinion of the Engineer acceptable installation results are not achieved, the process and/or the grouting material shall be modified and the mock-up repeated until successful results are achieved.

CONTRACT NO. 04-0120Q4
CONTRACT CHANGE ORDER NO 149
SHEET 12 OF 55

Pintle Grout and Bedding Grout Installation Mock-up (Expansion pot bearings at Pier E1)

The grouting materials proposed shall be tested in a mock-up of a masonry plate with pintles in holes, of the sizes shown on the plans. The purpose of the grouting mock-up is to verify the installation methods proposed, suitability of the materials to the installation methods needed, and demonstrate that the necessary work can be accomplished by the Contractor within the working time of the bedding and grouting materials. In particular, the installation procedures developed shall ensure that no air is trapped in the grout in the pintle holes or within the pintle pipes.

The pintle grout material, once cured, shall be free from cracking and exhibit zero shrinkage in situ. Verification shall be provided that the mass of grout in the pintle hole does not cause premature setting of the material due to heat generation.

The grouting mock-up shall include the following:

A. A steel masonry plate at least 1670 mm x 1670 m x 38 mm min. with leveling screws, locating lugs, and four pintles. This plate shall be set onto a concrete base containing four pintle holes using the hole diameter and pintle pipe size shown on the plans.
B. The pintles shall be attached to the steel plate in such a way that they can be disconnected and the plate can be lifted after the bedding material has set.
C. The thickness of bedding material shall be the minimum shown on the plans.
D. The underside of the steel plate shall be covered with a bond breaker to ensure removal of the plate from the bedding material.
E. The mockup masonry plate shall be set and leveled with at least 15 minutes remaining before the bedding material becomes unworkable.
F. When the grout has reached a strength of 20 MPa, the mockup shall be disassembled and the adequacy of the installation procedure shall be verified. The area of any air voids in the bedding material grout shall be less than 20% of the area of the plate. Depth of air pockets shall not exceed 4 mm.
G. If in the opinion of the Engineer acceptable installation results are not achieved, the process and/or the grouting material shall be modified and the mock-up repeated until successful results are achieved.

Pintle Grout and Bedding Grout Material Mockup (Pintle holes at Pier E1)

The behavior of the pintle hole grout shall be proven in a separate mockup test. The elements to be tested are: the exothermic behavior of the grout material in the pintle holes and the shrinkage behavior after curing

The mockup shall consist of the following:

A. A tube of the diameter and length of the pintle holes as shown on the plans.
B. A pipe of the size of the pintle pipes as shown on the plans with a removable closed top and air vent holes as are to be used on actual pintles.
C. The proposed pintle hole grout.

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 13 OF 55

The mockup shall be conducted as follows:

A. Grout shall be mixed in accordance with the manufacturer's instructions and then placed in the tube.
B. The pintle pipe shall be inserted fully into the grout.
C. The set time (point at which it becomes impossible to insert the pintle into the grout) shall be determined by means to be proposed by the Contractor.
D. After the grout has set, the removable top of the pintle pipe shall be removed and the adequacy of filling determined.
E. The whole assembly shall then be cut apart at mid height and examined for evidence of shrinkage.

If in the opinion of the Engineer acceptable results are not achieved, the process and/or the grouting material shall be modified and the mock-up repeated until successful results are achieved.

INSTALLATION MANUAL

The Contractor shall prepare a pot bearing installation manual. The Contractor shall submit 6 copies of the installation manual for the bearings for review and approval by the Engineer. Final copies of the installation manual, revised to address review comments, if any, by the Engineer, shall be provided in accordance with these special provisions. The schedule for submission shall conform to the requirements of sub-section "Submissions ands Scheduling" of this Section. Attention is directed to "Construction Surveying" of these special provisions. Schedule and durations identified in the installation manual shall conform to the schedule required in "Move Bridge" of these special provisions.

Installation sequence shown on the plans is for reference only. The Contractor shall be responsible for developing the installation sequence to be used.

The installation manual shall include, but not be limited to, the following:

A. Step-by-step procedures describing all aspects of bearing installation, including removal of unsound concrete, coring, installation sequence and setting diagrams, durations, materials and procedures for leveling, aligning and attaching the bearing system to the substructure and superstructure. The procedures for grouting and bedding of the masonry plates shall use the methods developed in the grouting and bedding mock-ups.
B. Requirements for storage of the bearings and details of temporary protection and support of the bearings during shipping, handling and installation.
C. Temporary clamping device details, installation, and removal. Temporary clamping device shall prevent separation of bearing components during transport and installation. The Contractor shall verify that adequate space is available for removal of temporary clamping device after installation is complete.
D. Grout installation methods for Bent 52A bedding material, Pier E1 pintle holes, and Pier E1 bedding material. The Contractor shall propose methods to allow air to escape as the masonry plate is lowered onto bedding material and into pintle

CONTRACT NO. 64-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 14 OF 55

holes so that complete filling, without air voids, of the space within the pintle pipes and under the masonry plate is achieved.

E. Methods for correcting mis-matches in elevation and level of the bearings. The Contractor shall propose methods for correcting the angle between the uppermost surface of the bearing and the masonry plate, and the level of the bearing plate of the truss, in the event that those dimensions should lie outside the permitted range.

FABRICATION REQUIREMENTS

Flatness and Tolerances

Flatness of bearings after fabrication shall be determined by the following method:

A. A precision straight edge that is longer than the nominal dimension to be measured shall be placed in contact with the surface to be measured.
B. A feeler gauge shall be selected with a thickness corresponding to the flatness tolerances in Item D below. An attempt shall be made to insert it under the straightedge.
C. Flatness is acceptable if the feeler does not pass under the straightedge.
D. Flatness tolerances are arranged in the following classes:

1. Class A: 0.001 x Nominal Dimension
2. Class B: 0.002 x Nominal Dimension
3. Class C: 0.005 x Nominal Dimension

E. Nominal Dimension is defined as the actual dimension of the plate under the straightedge.

Bearing Components

Bearing components shall conform to the following tolerances:

A. Overall bearing height shall not vary from nominal dimension by +3 mm, -0.0 mm.
B. The inside diameter of pots shall be machined to a tolerance of ±0.15 mm. The tolerance on the depth of the pot cavity shall be +0.635 mm, -0 mm. The tolerance on the thickness of the pot base shall be +0.635 mm, -0 mm.
C. The outside of the pot base shall be machined parallel to the inside to a Class "A" tolerance.
D. Elastomeric disk tolerances shall be:
   1. Diameter, -1.5 mm, + 0.0 mm
   2. Thickness, -0 mm, +3 mm
E. Piston tolerances shall be:
   1. Diameter, ± 0.15 mm
   2. Thickness +0.635 mm, - 0 mm
   3. Sliding side, Class "A" tolerance; elastomer side, Class "C" tolerance.
   4. Depth of PTFE recess, 0.1 mm. Diameter of PTFE recess, 0.5 mm.

CONTRACT NO. 64-D1201R4
CONTRACT CHANGE ORDER NO 149
SHEET 15 OF 55

5. Piston flanges (if any): thickness +0.635 mm, -0 mm; diameter +3 mm, -0.8 mm.

Mounting Plates

Mounting plates, including masonry and sole plates and shims, and plates used in the temporary lateral restraining system, shall conform to the following tolerances:

A. Masonry and sole plate tolerances shall be:

1. Dimensions:
   a. Plan dimensions, ±6 mm.
   b. Thickness, ±1.6 mm
2. Flatness:
   a. Face in contact with bearing components, Class A; Opposite face, Class C.

Structural Steel Components

Structural steel elements shall conform to the following fabrication requirements:

A. The pot shall be machined from a single piece of steel.
B. The piston shall be machined from a single piece of steel.

Finish of structural steel components shall conform to the following:

A. All specified machined surface finish tolerances shall be verified using a calibrated profilometer provided by the Contractor and approved by the Engineer.
B. All steel surfaces in contact with elastomer, PTFE, or other steel surfaces, shall be finished to a smoothness of 5 micro-meters (rms) or less.
C. The inside of the pot wall shall be finished to a smoothness of 2.5 micro-meters (rms) or less.
D. No coatings other than silicone grease shall be applied to the surfaces of the pot or piston that are in contact with the elastomer and sealing system.
E. Surfaces within the grip of high strength bolted connections shall be cleaned and painted before assembly in accordance with the requirements for bolted connections in "Steel Structures," of these special provisions.

Elastomeric Disk

Fabrication of elastomeric disk shall conform to the following:

A. Each elastomeric disk shall be individually molded in one piece. No layering or stacking of disks will be permitted.
B. Cuts, gouges or nicks from machine cutting or flash trimming will because for rejection.
C. If brass sealing rings are used, the groove in the elastomeric disk for the sealing system shall be integrally molded. It shall not be cut after molding. It shall be square to the pad top surface and have the same nominal dimensions as the brass sealing rings.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 149
SHEET 16 OF 55

Sealing Ring

Fabrication of sealing rings shall conform to the following:

A. If brass sealing rings are used, they shall be finished to a smoothness of 1.6 μm(rms) or less.
B. The gap between the ring and the wall shall not exceed 0.25 mm.
C. Each ring shall have one vertical cut at 45° to the tangent with a maximum gap of 1.5 mm. The gaps shall be staggered a minimum of 90° relative to one another when the rings are in place.

PTFE Sliding Sheet

Fabrication of PTFE sliding sheet shall conform to the following:

A. PTFE sheet shall be bonded into a square-edged recess in the piston. The depth of the recess shall be equal to one-half the PTFE sheet thickness, and its shoulders shall be sharp and square.
B. The sheet shall be etched by the sodium naphthalene or sodium ammonia etching process and then epoxy-bonded into the recess. After completion of the bonding operation the PTFE surfaces shall be smooth and free from blisters or bubbles.

Stainless Steel Sheet

Fabrication of stainless steel sheet shall conform to the following:

A. Stainless steel sheet shall be attached to backing plates by continuous fillet welding along the edges, including edges of holes for bolts and other purposes. Bonding and/or mechanical fastening of sheets will not be permitted. The weld shall form a complete seal against ingress of moisture and other contaminants.
B. Welding shall be in accordance with AWS D1.5.
C. The backing plates shall extend beyond the edge of the stainless steel sheet to accommodate the welds and the welds shall not protrude above the stainless steel sheet. At any hole, the weld around the edge shall be recessed by grinding or machining so that the PTFE will not be damaged by sliding over the edge.
D. Stainless steel sheet shall remain in contact with base metal throughout their service life such that interface corrosion cannot occur.

PAINTING OR METALIZING

Metal surfaces of bearings exposed to the atmosphere and in contact with the structure of the completed work, except stainless steel surfaces, shall be cleaned and painted in conformance with "Clean and Paint Structural Steel" of these special provisions or zinc metalized in accordance with AWS C2.18-93. Galvanizing will not be permitted. The surfaces to be painted or metalized shall be shown in the working drawings. The pot cavity and all surfaces covered by stainless steel or PTFE sheet shall not be painted or metalized.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 149
SHEET 17 OF 55

MARKING, IDENTIFICATION AND STORAGE.

A. **Identification.** Each bearing shall be permanently marked with the manufacturer's name, date of fabrication, contract number, lot number, bearing type or model number, bearing identification number, and the installed location. The marking shall be on a surface visible after installation in the bridge.

B. **Storage.** All bearings, whether in the fabrication shop or an independent warehouse, shall be stored in a clean, dry, covered facility. When in storage, the bearings shall be kept banded, wrapped, and secured in a condition suitable for shipment.

INSPECTION AND MAINTENANCE MANUAL

The Contractor shall prepare an inspection and maintenance manual for the pot bearings, and shall submit 6 copies of the draft for review and approval by the Engineer in accordance with the schedule specified in "Submissions and Scheduling" of these special provisions. The inspection and maintenance manual shall include, but not be limited to, the following:

A. Inspection requirements for the pot bearings, including the recommended frequency of inspection. The manual shall include the specific observations to be made, and the acceptable range of values.
B. Maintenance requirements for the bearings, including the recommended frequency of maintenance.
C. Contact and telephone number for maintenance questions.

TESTING

General

Full sized fixed potbearings shall be proof tested, and full sized expansion pot bearings shall be prototype tested and proof tested, to verify compliance with the requirements shown on the plans. All testing shall be performed in the presence of the Engineer.

Prototype testing may be performed by the Contractor at the SRMD Test Facility at the University of California, San Diego, or other suitable location as approved by the Engineer. Proof testing may be performed either at the SRMD Test Facility or at the manufacturer's plant. If tests can not be performed at the specified load, the Contractor shall submit to the Engineer for review and approval an alternative testing plan. These alternative tests shall demonstrate that all the requirements for testing at the specified load are satisfied.

The manufacturer shall coordinate with the test facility for the design and manufacturing of the adapter plates to be used to attach the bearings to the test apparatus. After testing, all adapter plates will become the property of the State.

The Contractor shall coordinate with the test facility to schedule the testing. As a minimum:

CONTRACT NO. 64-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 18 OF 55

A. The Contractor shall notify in writing the test facility and the Engineer at least eight weeks prior to the shipping of bearings to be tested.
B. For prototype testing, the Contractor shall allow four weeks for the test facility to perform the prototype tests on each type of pot bearing.
C. For proof testing, the Contractor shall allow one week for the test facility to perform the proof tests on each pot bearing.

Pot bearings for prototype and proof testing shall be marked in accordance with the requirements in these Special Provisions for marking and identification of production bearings. Prior to testing, the accessible bearing surfaces shall be cleaned and the test specimens shall be conditioned for 12 hours at 21°±8°C {70±15°F}. Unless otherwise determined by the Engineer, all testing shall follow the numerical sequences listed.

Pot bearings that have been prototype tested, have met all the acceptance criteria, and have experienced no damage, may be installed in the bridge, provided that they are equipped with a new elastomeric pad, new seals and new PTFE.

Prototype Testing Procedures

A complete series of prototype tests shall be performed on at least one full-sized specimen for each expansion pot bearing size and type designated on the plans.

For all prototype tests and for each cycle of test, the time, axial load, axial displacement, shear force and shear displacement of the prototype specimen(s) shall be continuously recorded.

Prototype testing of pot bearings shall conform to the following requirements:

A. Prototype testing shall be performed on expansion pot bearings.
B. The prototype tests required shall be as follows:
   1. A test for compression.
   2. A test for compression and coefficient of friction.

C. Test for compression: The bearing shall be tested by holding it at the design rotation or 0.02 radians, whichever is greater, for one hour at 1.5 times the maximum vertical load shown on the plans for the bearing.

D. Tests for coefficient of friction: The tests shall be performed at the minimum vertical load shown on the plans for the bearing, at a rotation of 1%. Prior to testing, the bearing shall be held at the test rotation at the test load continuously for 6 hours. The following conditions shall apply:

   1. All prototype friction tests shall be performed using continuous sawtooth displacement (constant velocity) input at a rate of loading to be approved by the Engineer.
   2. The tests shall be arranged to allow measurement of the "breakaway" coefficient of friction on the first movement of the bearing.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 149
SHEET 19 OF 55

3. The first movement "breakaway" coefficient of friction and the dynamic coefficient of friction shall be measured at a sliding speed not exceeding 25 mm per minute
4. The test bearings shall be subjected to a minimum of 100 cycles of sliding displacement with peak-to-peak amplitude of at least 50 mm, at a sliding speed not exceeding 300 mm per minute. After cycling, the first movement "breakaway" coefficient of friction and dynamic coefficients of friction shall be measured again at a sliding speed not exceeding 25 mm per minute.

Proof Testing Procedures

Prototype testing of pot bearings shall conform to the following requirements:

A. Prior to installation, all pot bearings shall be proof tested.

B. The proof tests required shall be as follows:
   1. All bearings shall be proof tested for compression.
   2. Expansion bearings shall also be proof tested for coefficient of friction.
   3. Fixed type and guided bearings shall also be proof tested for horizontal load on the bearing.

C. Proof tests for compression: proof tests for compression shall conform to the requirements for prototype tests for compression.

D. Proof tests for coefficient of friction: proof tests for coefficient of friction shall conform to the requirements for prototype tests for coefficient of friction.

E. Proof test for horizontal load on the bearing: On fixed and guided bearing assemblies, the bearing shall be loaded simultaneously to 100 percent of the vertical design load and 100% of the design rotation while a horizontal load equal to 125% of the horizontal load shown on the plans is applied to the assembly.

Acceptance Criteria

The following acceptance criteria shall apply to the prototype and proof tests:

A. **Compression tests.** The bearings shall show no visible sign of:

   1. Metal-to-metal contact under full rotation.
   2. Damage to the sealing system
   3. Leakage of the elastomeric disk past the sealing system.
   4. Wear or damage to the elastomeric disk.
   5. Separation or lift-off of plates from each other or from PTFE surfaces,
   6. Flow of the PTFE out of its recess,
   7. Damage to the PTFE or
   8. Damage to the elastomeric disk.
   9. Other defects as determined by the Engineer.

The vertical deflection of the bearing, measured between 50% and 100% of the full test load, shall not exceed 3 mm.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 149

SHEET 20 OF 55

B. **Coefficient of friction tests.** The breakaway and dynamic coefficients of friction shall lie within the limits specified on the plans, but not more than 10% and 6% respectively.

C. **Horizontal load tests on the bearing.** The bearing shall show no visible signs of:
   1. Damage to the sealing system.
   2. Leakage of the elastomeric disk past the sealing system.
   3. Damage to the piston or pot wall.
   4. Slip or damage of the anchorage system.
   5. Damage to the elastomeric disk.
   6. Other defects as determined by the Engineer.

D. **Failure to comply.** If a prototype bearing fails to meet any of these criteria, the Contractor shall modify the design as necessary, submit revised working drawings including these modifications, and prototype test another bearing that is fabricated according to the modified design.
   If a proof tested bearing fails to meet these acceptance criteria, it shall be rejected.

E. **Certification.** All test results shall be certified correct and signed by the testing laboratory personnel who conducted the test and interpreted the test results. All test results shall include the identification numbers of the bearings tested.

Test Reports

The Contractor shall submit test reports that include the following:

A. A certified copy of the results of all component material tests.
B. A copy of the results of each prototype and proof bearing test. This report shall include at least a continuous record of vertical load vs. time for each compression test and lateral force/vertical force vs. displacement of the bearing for all other tests, and notes and photographs of any damage sustained during the testing. The report shall be certified by an authorized representative of the test facility.

SHIPPING AND HANDLING

Pot bearings shall be assembled at the factory and suitable temporary assembly ties shall be provided so that the entire assembly is shipped as a unit and remains intact when uncrated and installed. Pot bearings shall be delivered to the testing facility and to the job site in protective packaging for freight and handling purposes. Any damaged or scratched bearings shall be replaced by new bearings of the same type

INSTALLATION

Bearings and all mounting plates, including masonry plates, shall be installed in accordance with the procedures, and using the materials, specified in the approved Installation Manual and all requirements on the plans. Attention is drawn to the suggested installation sequence shown on the plans.

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 21 OF 55

A qualified technical representative of the manufacturer shall be present available for consultation during the installation of all bearings. The bearing shall be prevented from undergoing rotations during construction that are larger than the maximum design rotation.

Removal of Unsound Concrete (Pier E1 only)

Unsound concrete shall be removed as shown on the plans and to the limits designated by the Engineer. The Engineer will determine the soundness of all concrete. Unsound concrete is generally that concrete which emits a relatively dead or hollow sound when a chain is dragged over its surface or its surface is tapped with a metal tool. For removal of unsound concrete, equipment and tools shall not be used that, in the opinion of the Engineer, cause the removal of excess quantities of sound concrete along with the unsound concrete, or that will damage the existing reinforcement. Equipment used shall be fitted with suitable traps, filters, drip pans, or other devices to prevent oil or other deleterious matter from being deposited outside of the bearing installation area.

After the removal of unsound concrete has been completed, any existing reinforcing steel which has been exposed shall be restored to position and blocked and tied in conformance with the provisions in Section 52, "Reinforcement," of the Standard Specifications.

Reinforcing steel that has been damaged to the extent that the steel's usefulness is destroyed as a result of the Contractor's operations shall be repaired or replaced by the Contractor at the Contractor's expense.

Removing unsound concrete will be paid for as extra work as provided in Section 4-1.03D of the Standard Specifications.

Coring (Pier E1 only)

Coring locations and depths shall be as shown on the approved working drawings. Coring shall conform to the provisions in "Core Concrete" of these special provisions. The Contractor shall that ensure existing anchorage structural steel in Pier E1 is not damaged in any way by coring. If anchorage structural steel is encountered during coring, the Engineer shall be notified immediately and coring operations at the affected location shall be discontinued pending direction from the Engineer. It is expected that some reinforcing bars within the Pier E1 concrete will be cut by the coring and they need not be repaired. It is the structural steel anchor components for the cantilever span that must not be disturbed.

Cored holes within the group associated with one bearing shall be located with respect to each other to a tolerance of ± 10 mm within the core hole pattern. The core hole pattern associated with each bearing shall be located within ± 12 mm of the location shown on the plans.

Pintle and anchor bolt holes at Pier E1 shall be cored before the date of roll in.

When a roughened concrete surface is shown on the plans, the existing concrete surface shall be roughened to a full amplitude of approximately 6 mm by abrasive blasting, water blasting, or mechanical equipment.

Installation of Grout and Bedding Materials

Procedures for installing grout and bedding materials shall conform to the following:

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 149

SHEET 22 OF 55

A. The installation procedures and bedding and grouting materials to be used shall be those developed by the Contractor, and approved as suitable by the Engineer, for the relevant mockup. Damage to stainless steel surface on the masonry plate will not be permitted.
B. At Bent 52A, vent holes and grout injection ports through the thickness of the masonry plate will be acceptable, subject to the approval of the Engineer. At Pier E1, no holes that penetrate the stainless steel on the masonry plate will be permitted.
C. Grout installation shall be performed by personnel experienced in the work.
D. Contractor shall provide containment for grout around the perimeter of the masonry plate.
E. Grout shall be mixed, placed and cured in accordance with the manufacturer's recommendations.
F. Vibration of the masonry plate to remove air pockets will be permitted, provided that no damage is inflicted on the stainless steel.
G. Grout shall be cured in accordance with the manufacturer's recommendations.

Masonry Plates

The masonry plate shall be installed within ± 6 mm from the elevation shown on plans, ± 0.5% from dead level, and ± 20 mm from plan location.

Bearings

Bearings shall be placed so that the angle between the uppermost surface of the bearing and the masonry plate does not exceed 1.0% after the self-weight of the truss has been transferred to the bearing. If the angle is greater than 1.0%, then the Contractor shall reduce the angle to less than 1.0% using the approved methods in the Installation Manual.

Temporary clamping devices

Temporary clamping devices shall not inhibit rotation of the bearing during set-down of the truss. The temporary clamping devices shall be removable once the bearing has been permanently secured to the masonry plate.

Temporary Restraint Assembly Devices (Pier E1 only)

The temporary restraint assembly devices for the expansion pot bearings at Pier E1 shall be removable once installation of the lead-rubber bearings is complete.

Protective Skirts (Pier E1 only)

The protective skirts for the expansion pot bearings at Pier E1 shall be installed, at the latest, directly after removal of the Temporary Restraint Assembly Device.

SUBMISSIONS AND SCHEDULING

The Contractor shall submit to the Engineer documentation according to the following schedule:

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 23 OF 55

Part 1

Part 1 of the documentation shall consist of, working drawings, calculations, draft Quality Control Program, draft Inspection and Maintenance Manual, proof of five years' experience in design and manufacture of pot bearings, and descriptions of the prototype and proof testing programs.

Part 1 documentation shall be submitted to the Engineer at least 39 weeks prior to the start of bearing installation. The Contractor shall allow three weeks for the Engineer's initial review. If modifications are needed, they shall be submitted no later than the submission of the prototype test results.

Part 2

Part 2 of the documentation shall consist of the draft Installation Manual. The procedures contained therein shall conform to the methods developed during the mockups, and approved by the Engineer.

Part 2 documentation shall be submitted to the Engineer after successful completion of the mockups, but at least 27 weeks prior to the start of bearing installation. The Contractor shall allow two weeks for the Engineer's initial review. If modifications are needed to the draft manual, they shall be submitted within one week after the Engineer's initial review. The Contractor shall allow two weeks for the Engineer's review and approval of the final Installation Manual.

The Contractor shall not start fabrication of prototype test specimens until the Engineer has approved the corrected versions of the Part 1 submissions and has provided initial review of the Part 2 submissions. The prototype test specimens shall conform to the approved working drawings and the approved Installation Manual.

Part 3

Part 3 of the documentation shall consist of the reports of the prototype tests.

Part 3 documentation shall be submitted to the Engineer at least 17 weeks prior to the start of bearing installation. The Contractor shall allow two weeks for the Engineer's review and approval. The Contractor shall not start fabrication of the production bearings until the Engineer has approved the prototype test results.

Part 4

Part 4 of the documentation shall consist of the reports of the proof tests.

Part 4 documentation shall be submitted to the Engineer at least 7 weeks prior to the start of bearing installation. The Contractor shall allow two weeks for the Engineer's review and approval. The Contractor shall not start installation of the bearings in the bridge until the Engineer has approved the proof test results.

Should the Engineer fail to review the complete Part 1 submittal within the time specified and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in reviewing the working drawing submittal, an extension of time commensurate with the delay in completion of the work thus caused will be granted in accordance with Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

CONTRACT NO. 03-0Y204

CONTRACT CHANGE ORDER NO 149

SHEET 24 OF 55

The Contractor shall provide the Engineer with at least 14 days' written notice of the start of the mockups, the start of fabrication of the prototype bearings, and the start of fabrication of the production bearings.

No bearing shall be installed until the Engineer has determined that the Contractor has successfully completed and has approved, in writing, the working drawings, the prototype testing and the proof testing for the seismic isolation bearing to be used.

Within 3 weeks after approval of the final working drawings, the Contractor shall submit to the Engineer one complete set of corrected prints ofall working drawings for the pot bearings.

MEASUREMENT AND PAYMENT

The contract unit price paid for pot bearing shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, shipment to and from the testing facility, storage of all pot bearings and for doing all the work involved in designing, fabricating, any re-testing, if required, and installing the pot bearing, complete in place, including mock-ups, coring of holes, roughening concrete, grouting, temporary supports, and cleaning and painting of pot bearings, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

With the exception of any re-testing, all prototype and proof testing will be paid for by the State. The cost of any special mounting plates or adapter plates needed for testing shall be borne by the Contractor.

Any bearing that fails to meet the acceptance criteria shall be re-designed and re-tested at the Contractor's expense. The Contractor shall be responsible for all costs associated with manufacturing, shipping, storing and testing if any re-testing is required. Payment to the Contractor for pot bearings shall be reduced $5,400.00 for each prototype bearing re-tested, and $1,800.00 for each proof bearing re-tested.

Full compensation for modifications to the bridge structure or other existing facilities made necessary by the use of a particular bearing shall be considered as included in the contract unit price paid for pot bearing and no separate payment will be made therefor.

Full compensation for providing Installation Manuals and Inspection be considered as included in the contract unit price paid for pot bearing and no separate payment will be made therefor.

No payment will be made for bearings that fail to meet one or more of the acceptance criteria.

If a portion or all of bearings are manufactured at a site more than 100 miles from Sacramento additional shop inspection expenses will be sustained by the State. Payment to the Contractor for bearings will be reduced by $5,000 for each manufacturing site located more than 100 miles from Sacramento, or in the case of each manufacturing site located more than 1,000 miles from Sacramento, payment will be reduced by $8,000.

10.1.__ LEAD RUBBER BEARINGS

The lead rubber bearing system shall consist of a lead core rubber bearing, sole plates, masonry plates, stopper ring, bedding materials and anchorage components and all other necessary components and shall be designed, fabricated, and installed in conformance with the details shown on the plans and as specified in the Standard Specifications and these special provisions.

A lead core rubber bearing shall be an elastomeric bearing with one or more lead core(s). It shall consist of alternate layers of rubber and steel plates vulcanized together, with one or more preformed hole(s), each of which contains a tight-fitting lead plug.

BEARING SUPPLIERS

All lead rubber bearings used in the work shall be from the same manufacturer. The proposed lead rubber bearing supplier shall be selected from the following list:

BEARING SYSTEM	MANUFACTURER ADDRESS AND PHONE NUMBER
Lead Core/Rubber	DYNAMIC ISOLATION SYSTEM, INC. 885 DENMARK DR, SUITE 101 MCCARRAN, NV 89434 USA

GENERAL

The lead rubber bearings shall be designed, fabricated, prototype-tested, proof-tested and installed as shown on the plans and the approved working drawings, and as specified in these special provisions.

Attachments of the lead rubber bearing sole plate to the new truss shoe and the base plate shall be constructed as shown on the plans and shall conform to Section 55, "Steel Structures," of the Standard Specifications and "Steel Structures," of these special provisions.

All new metal surfaces of the bearings exposed to the atmosphere in the completed work, except stainless steel and anchorages embedded in concrete, shall be cleaned and painted. Cleaning and painting shall be in accordance with "Clean and Paint Structural Steel," of these special provisions.

Acceptance of the lead rubber bearings shall be contingent on approval of the working drawings and the Quality Control Program and on successful completion of the lead rubber prototype and proof tests. Development and approval of working drawings and any re-testing, if required, shall be at the Contractor's expense.

The manufacturer shall provide the Engineer with a Certificate of Compliance in accordance with the provisions of Section 6-1.07, "Certificates of Compliance," of the Standard Specifications. The certificate shall certify that the lead rubber bearings conform to the pre-qualified design and material requirements, and were manufactured in accordance with the approved fabrication quality control program. The certification shall be supported by a copy of the results of all prototype and proof tests performed on the bearings and bearing materials.

Attention is directed to the sections entitled "Order of Work," and "Temporary Supports," elsewhere in these special provisions.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 149

SHEET 26 OF 55

Attention is directed to the as-built plans for Bridge No. 33-0025 and "Project Information" of these special provisions regarding location of existing anchorage steel in Pier E1.

DOCUMENTATION

The Contractor shall provide at least the following documents:

A. Working drawings
B. Supplemental calculations
C. Quality control program
D. Test reports
E. Installation manual
F. Inspection and maintenance manual

Each working document, including each sheet of the calculations, shall be signed by an Engineer who is registered as a Civil Engineer in the State of California.

WORKING DRAWINGS

Working drawings and supplemental calculations for lead rubber bearings shall conform to "Working Drawings" of these special provisions.

The working drawings shall list the components that will be permanently deformed during prototype or proof testing.

Attention is directed to subsections "Testing," and "Mock-Up," of this section. Approval of working drawings will be contingent on Engineer's approval of prototype testing and mock-ups. The Contractor shall revise and resubmit to the Engineer for approval working drawings affected by changes required for successful completion of prototype testing and mock-ups, unless otherwise approved by the Engineer.

The working drawings shall contain all information required for the proper fabrication and installation of the lead rubber bearings, including, but not limited to, the following:

A. Complete details of the lead rubber bearing system, including material properties and dimensions of all bearing components.
B. Evaluation and confirmation that adequate space is available for coring and installation equipment.
C. Details of connecting plates, concrete pedestals, grout pads, anchor bolts, nuts, reinforced concrete pedestal heights and any required revisions or additions to new and existing structural steel, concrete reinforcement or other components of the structure necessary to accommodate the lead rubber bearings proposed for use.
D. Welding and inspection procedures. For any weld that is within 150 mm of rubber, the Contractor shall develop and use a procedure for monitoring the temperature of the rubber and ensure the rubber does not exceed 100°C.
E. Details of adapter plates needed for testing.
F. Details of stopper ring.
G. Details of temporary clamping device.

CONTRACT NO. 04-0120P4
CONTRACT CHANGE ORDER NO 149
SHEET 27 OF 55

H. Surfaces to be painted or metalized.
I. Grout mix design(s).
J. Construction schedule for lead rubber bearing installation.
K. Information on the initial vertical displacement and long-term vertical displacement under anticipated service loading, and design lateral displacement due to seismic loading.

Supplemental Calculations

The Contractor shall submit design calculations that supplement the working drawings and show conformance of the bearings to the design loadings, movements and other specified requirements. Calculations shall be prepared by an engineer who is registered as a Civil Engineer in the State of California. The calculations shall include, but are not limited to, the following:

A. A proposed fully defined performance hysteresis loop for each bearing type.
B. Analysis using lead rubber bearing design criteria shown on the plans, and elsewhere in these special provisions, for the design of the lead rubber bearings. The analysis results shall include as a minimum, the anticipated energy dissipated per cycle (EDC) for each bearing, fully defined hysteresis loop for each bearing, initial bearing stiffness, bearing yield point, secondary bearing stiffness after yield, maximum design displacement, maximum design lateral force transmitted through each bearing, and anticipated maximum and minimum downward seismic bearing loads.

QUALITY CONTROL PROGRAM

The Contractor shall submit to the Engineer fabrication quality control program procedures that address at least the following:

A. Incoming materials and storage;
B. Elastomer compound mixing;
C. Metals preparation; bearing build-up;
D. Procedures for alignment of steel plates;
E. Vulcanization
F. Materials testing procedures;
G. Marking and identification;
H. Shipping and handling
I. Documentation.

The Contractor shall submit 6 copies of the Quality Control Program for review and approval in accordance with the schedule described in sub-section "Submissions and Scheduling" of this section.

MATERIALS

Steel components of lead rubber bearings shall conform to "Steel Structures" of these special provisions. Anchor bolts not designated on the plans as high strength (HS) or stainless steel shall conform to the requirements in ASTM Designation: F

CONTRACT NO. 04-0D0R4
CONTRACT CHANGE ORDER NO 149
SHEET 28 OF 55

1554, Grade 36. High strength anchor bolts shall conform to the requirements in ASTM Designation: F 1554, Grade 105. Attention is directed to "Welding" and "Audits" of these special provisions. Welding of bearings shall conform to AWS D1.5.

Internal steel plates shall conform to the requirements of ASTM A 1011 and be Grade 36.

Base plates shall conform to ASTM A36, A709/709M, Grade 50, A 572 or A 588.

Surfaces within the grip of high strength bolted connections shall be cleaned and painted before assembly in accordance with the requirements for bolted connections in "Steel Structures," of these special provisions.

The materials in the elastomeric bearings shall conform to the following requirements:

The alternate layers of rubber and steel plates vulcanized together shall conform to the provisions for steel-laminated elastomeric bearings in ASTM Designation D 4014. Internal steel laminates shall be a minimum of 11 gage thick and shall not be galvanized. The lead core shall be a minimum of 99 percent pure lead.

Elastomer shall be Type NR and shall satisfy the low-temperature requirements of Grade 2, and the following:

TEST	ASTM TEST	REQUIREMENT
Shear modulus (kPa)	D 4014	689
Tensile Strength [kPa minimum]	D 412	13790
Elongation at Break (EB) [percent minimum]	D 412	500
Compression Set 22 hrs at 70°C [percent maximum]	D 395 Method B	40
Rubber-to-Metal Tear Strength [N/mm minimum]	D 624 Die C	31.5
Ozone Resistance ozone partial pressure of 25pphm	specimen - D 518A test - D 1149	no cracks visible with a 7X lens

The elastomer used for the circular ring pad on the stopper ring shall be unreinforced 60 durometer Neoprene or Natural Rubber, and shall conform to the material requirements of the AASHTO Construction Specifications.

Circular elastomeric ring pad on stopper ring shall be bonded with adhesive conforming to Federal Specification MMM-A-121, where shown on the plans.

Grout used for installing the lead rubber bearings at Pier E1 shall satisfy the following requirements:

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 149

SHEET 29 OF 55

Location	Pier E1
Bearing	Lead rubber
Application	Bedding and pintles
REQUIREMENT	
To be proposed by the Contractor, and subject to the approval of the Engineer.	X
To be suitable for exterior use.	X
To have zero drying/curing shrinkage in conformance with ASTMC827.	X
To have proven history in similar applications.	X
To be suitable for the bedding thickness used	X
To pre-packaged, non-metallic, cementitious material containing no chlorides.	X
To contain fine aggregate.	X
To be suitable for installation by injection at very low pressure (20 kPa) or by pouring.	X

Grout strength shall be measured by cube strength in compression, in accordance with ASTM C109, and shall satisfy the following:

At lead-rubber bearings at Pier E1:

A. 25 MPa when the leveling screws are disengaged.
B. 40 MPa at the time of removal of the temporary restraining devices at the expansion pot bearings at Pier E1.

The same material may be used for the fixed pot bearings at Bent 52A and the lead-rubber bearings at Pier E1, provided that it satisfies the requirements for both applications. In place of the specified cementitious grout, the Contractor may propose alternative materials, including epoxy grouts, for approval by the Engineer, provided that they have strength at least equal to the value specified for the application and that they satisfy all other relevant requirements given in the table above.

DESIGN

The lead rubber bearings shall be designed by the Contractor to satisfy the bearing design criteria for the loading conditions, maximum lateral forces and displacements, rotations, hysteretic behavior and performance criteria shown on the plans. The bearing design shall be confirmed by the certified prototype test results for the bearings. In addition, if the plans or these special provisions indicate limiting parameters for a bearing system, the bearings shall conform to those parameters. The Contractor shall verify the integrity of the bearings during shipping and handling, including and when they are transported into position hanging from the truss, and shall supply temporary clamping devices as necessary.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 149
SHEET 30 OF 55

Compatibility with Engineer's Plans

The lead rubber bearings shall be compatible with the dimensional clearances and tolerances shown on the plans. The Contractor shall determine the required thickness of the external steel plates, subject to the dimensional constraints shown on the plans, the concrete bearing pedestal height, the bearing pedestal reinforcement and the thickness of the non-shrink grout pad at each lead rubber bearing, and shall verify all dimensions required for installation of the lead rubber bearings.

The Contractor shall check the adequacy of the mounting plate and bolts based on the lead rubber bearing system proposed for use and redesign the mounting plate and bolts, if necessary. The anchorage strength of the mounting plate and bolt system shall not be less than the strength of the system shown on the plans. The bearing height as shown on the plans may also be modified to accommodate installation. Installation of lead rubber bearings shall not alter the final bridge profile grade. Any re-design of the anchorage system or the bearing height shall be subject to the approval of the Engineer.

Design Criteria

The isolation bearings shall comply with all applicable provisions of the American Association of State Highway and Transportation Officials (AASHTO) "Guide Specifications for Seismic Isolation Design," latest edition. In the case of any conflict of requirements between the AASHTO Guide Specifications and this document, the requirements of these special provisions shall take precedence.

The lead rubber bearings shall be capable of operating as specified for an ambient air temperature range of 0°C to +40°C. The steel laminates shall be covered at the sides of the bearing with a minimum thickness of 13 mm of the same elastomer as specified for the elastomeric bearing.

The ratio of bonded area to lead plug area in plan shall be equal to or greater than 9.0 for bearings.

GROUTING MOCK-UP

The Contractor shall construct and test a grouting mock-up in accordance with the approved installation manual. The purpose of the grouting mock-up is to verify the installation methods proposed, suitability of the materials to the installation methods needed, and demonstrate that the necessary work can be accomplished by the Contractor within the working time of the bedding and grouting materials. Mock-up shall demonstrate that complete filling of space within pintle and anchorage rebar holes will be attained.

The mock-up shall not be part of the permanent structure and shall become the property of the Contractor. The mock-ups shall be removed from the work site and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

The grouting mock-up shall conform to the following:

A. A steel bearing plate 1740 mm x 1740 mm x 38 mm min. with leveling screws, locating lugs, and three removable pintles in pintle holes using the hole diameter and pintle pipe size shown on the plans. Three anchorage rebar shall be included

CONTRACT NO. 62-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 31 OF 55

as part of the mock-up. Anchorage rebar shall use the hole diameter and bar size shown on the plans.

B. Pintles and anchorage rebar shall be attached to the steel plate such that the pintles and anchorage rebar can be disconnected and the plate can be lifted after the bedding material is set.
C. The thickness of bedding material shall be the minimum shown on the plans.
D. The underside of the steel plate shall be covered with an adhesive-backed plastic membrane or other material to ensure debonding of the plate from the bedding material.
E. The mockup masonry plate shall be set and leveled as necessary and grouted with at least 15 minutes remaining before the bedding material becomes unworkable.
F. When the bedding material has reached a strength of 20 MPa, the mockup shall be disassembled and the adequacy of the installation procedure shall be verified. The grout shall be free from cracking and exhibit zero shrinkage in situ. The area of any air voids in the grout shall be less than 20% of the area of the plate. Depth of air pockets shall not exceed 4 mm.

If in the opinion of the Engineer acceptable installation results are not achieved, the process and/or the grouting material shall be modified and the mock-up repeated until successful results are achieved. If the same grout material is used for both the lead-rubber bearings at Pier E1 and the fixed pot bearings at Bent 52A, and subject to the approval of the Engineer, a single grouting mockup may be used for both applications, provided that the mockup demonstrates the adequacy of the procedures for both applications.

INSTALLATION MANUAL

The Contractor shall prepare a lead rubber bearing installation manual. The Contractor shall submit 6 copies of the draft installation manual for the bearings for review and approval by the Engineer. Final copies of the installation manual, revised to address the Engineer's review comments, shall be furnished in accordance with these special provisions. The schedule for submission shall conform to the requirements of sub-section "Submissions ands Scheduling" of this Section. Attention is directed to "Construction Surveying" of these special provisions. Schedule and durations identified in the installation manual shall conform to the schedule required in "Move Bridge" of these special provisions.

Installation sequence shown on the plans is for reference only. The Contractor shall be responsible for developing the installation sequence to be used.

The installation manual shall include, but not be limited to, the following:

A. Step-by-step procedure describing all aspects of lead rubber bearing installation, including installation sequence and setting diagrams, materials and procedures for leveling and alignment and attachment to the substructure and superstructure. The procedures for grouting and bedding of the masonry plates shall use the methods developed in the grouting and bedding mock Materials for the anchorage system shall conform to the requirements in Section 55-3.19, "Bearings and Anchorages," of the Standard Specifications and these special provisions. When

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 32 OF 55

the Standard Specifications are not fully applicable, the section(s) shall be cited and the exceptions noted on the working drawings. If no applicable Standard Specification is available, ASTM or other industry standard specifications shall be referenced. Attention is drawn to the suggested installation sequence shown on the plans.

B. Requirements for storage of the lead rubber bearings and details of temporary protection and support of the isolators during shipping, handling and installation.

C. Details of temporary clamping devices, if needed to maintain the integrity of the bearing during transportation and installation of the bearings, and procedures for their installation and removal. The Contractor shall verify that adequate space is available for removal of any temporary clamping devices after installation is complete.

FABRICATION

Procedures

Each bearing shall be molded as single unit, and shall be bonded and vulcanized under heat and pressure. Individually laminated pads shall not be stacked or cold bonded to create an isolation bearing.

Internal steel laminates shall be sand-blasted and cleaned of all surface mill-scale, rust, surface coatings and dirt before bonding. Their outer edges shall be rounded so that they are free from sharp corners and burrs.

Fabrication Tolerances

Bearing dimensions and permissible variations shall satisfy the requirements of ASTM D 4014-03, Sections 7.5 and 7.6. The permissible tolerance in flatness for any external plates shall conform to Section 55-3.05 "Flatness of Faying and Bearing Surfaces," of the Standard Specifications, but shall not vary more than 1.6 mm from a straightedge placed in any direction across the area.

MARKING, IDENTIFICATION AND STORAGE

A. **Identification.** Each lead rubber bearing shall be marked in indelible ink or flexible paint. The marking shall consist of the manufacturer's name, date of fabrication, contract number, lot number, bearing identification number, elastomer type and grade, and the installed location. The marking shall be on a surface visible after installation in the bridge.

B. **Storage.** All bearings, whether in the fabrication shop or an independent warehouse, shall be stored in a clean, dry, covered facility. When in storage, the bearings shall be kept banded, wrapped, and secured in a condition suitable for shipment.

INSPECTION AND MAINTENANCE MANUAL

The Contractor shall prepare an inspection and maintenance manual for the lead rubber bearings, and shall submit 6 copies of the inspection and maintenance manual for review and approval by the Engineer in accordance with the schedule specified in

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 149

SHEET 33 OF 55

"Submissions and Scheduling" of these special provisions. The inspection and maintenance manual shall include, but not be limited to, the following:

A. Inspection requirements for the lead rubber bearings, including the recommended frequency of inspection. The manual shall include the specific observations to be made, and the acceptable range of values.
B. Maintenance requirements for the bearings, including the recommended frequency of maintenance.
C. Contact and telephone number for maintenance questions.

TESTING

General

Full sized lead rubber bearings shall be prototype and proof tested to verify compliance with the physical characteristics and energy requirements shown on the plans. Testing may be performed at the "Seismic Response Modification Device Test System (SRMD)" on the University of California, San Diego campus, or other suitable location as approved by the Engineer. All tests shall be performed in the presence of the Engineer.

The Contractor shall coordinate with the testing facility for the design and manufacturing of the adapter plates to be used to attach the bearings to the test apparatus. After testing, all adapter plates will become the property of the State.

The Contractor shall coordinate with the test facility to schedule the testing. As a minimum:

A. the Contractor shall notify in writing the test facility and the Engineer at least eight weeks prior to the shipping of bearings to be tested;
B. For prototype testing, the Contractor shall allow four weeks for the test facility to perform the prototype tests on each type of lead rubber bearing.
C. For proof testing, the Contractor shall allow one week for the test facility to perform the proof tests on each lead rubber bearing.

Lead rubber bearings for prototype and proof testing shall be marked in accordance with the requirements in these Special Provisions for marking and identification of production bearings.

The test specimens shall be conditioned at 21°C ±8°C for at least 12 hours prior to testing. The ambient temperature of the testing facility shall be 21°C ±8°C during the testing. The test specimens shall be allowed to cool between tests.

All prototype and proof tests shall be performed using continuous sinusoidal input at the period as shown on the plans for each device, or at a period as determined by the Engineer.

Unless otherwise determined by the Engineer, all testing shall follow the numerical sequences listed.

Prototype Testing Procedures

A complete series of prototype tests shall be performed on at least one full-sized specimen for each lead rubber bearing size and type designated on the plans.

CONTRACT NO. 64-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 34 OF 55

Specimens that have been subjected to prototype testing shall not be used in the finished work and shall become the property of the State.

A complete series of prototype tests shall be performed on each bearing designated for testing in each of 2 directions, which are at 0° and 90° relative to the primary axis of the lead rubber bearings for circular bearings, and at 0° and 45° relative to the primary axis of the lead rubber bearings for square bearings.

For all prototype tests and for each cycle of test, the time, axial load, axial displacement, shear force and shear displacement of the prototype specimen(s) shall be continuously recorded.

Prototype Test 1

A 5-minute sustained compression load test on each prototype bearing shall be conducted. The compressive load for the test shall correspond to a compressive stress of 8 MPa on the bonded area of the bearing.

Prototype Test 2

The vertical load shall be equal to the dead load plus seismic live load shown on the plans and shall remain constant during the test. The horizontal loading shall consist of twenty fully-reversed continuous sinusoidal cycles of loading at the maximum non-seismic lateral force shown on the plans.

Prototype Test 3

The vertical load shall be equal to the dead load plus seismic live load shown on the plans and shall remain constant during the test. If the total vertical load shown on the plans is zero, the test shall be carried out under constant axial displacement. The displacement shall be the value occurring when the platens of the test machine are in contact with the bearing but the axial and lateral loads are zero.

The horizontal loading shall consist of four fully reversed continuous sinusoidal cycles of loading at each of the following multiples of the maximum seismic lateral displacement (D_T) shown on the plans: 1.0, 0.25, 0.50, 0.75, and 1.0. The loadings shall be applied in the order stated here.

Prototype Test 4

The vertical load shall be equal to the dead load plus seismic live load shown on the plans, and shall remain constant during the test.

The horizontal loading shall consist of 15 fully-reversed sinusoidal cycles of loading to a displacement equal to the maximum seismic lateral displacement (D_T) shown on the plans.

Prototype Test 5

The vertical load shall be equal to the dead load plus seismic live load plus seismic overturning force shown on the plans, and shall remain constant during the test.

The horizontal loading shall consist of three fully reversed continuous sinusoidal cycles of loading at 1.1 times the maximum seismic lateral displacement (D_T) shown on the plans.

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 35 OF 55

Prototype Acceptance Test Criteria

Prototype specimens shall remain stable and without splits, fractures or lack of rubber to steel bond under all loading and displacement conditions. The hysteretic behavior of the specimens for the prototype tests shall remain stable at all loading conditions. Anchorage components shall show no signs of distress.

Bearings shall be inspected for uniformity of rubber layer thickness, lack of parallelism of the internal steel plates and surface cracking in accordance with ASTM D4014 Sections 9.1.3.1 and 9.1.3.2. The steel plates shall be located within 3mm of the positions specified on the approved working drawings.

In addition, specific tests shall satisfy the requirements of this section.

Prototype Test 2

A. The tangent stiffness for horizontal force-displacement shall be positive at all points on the curve.
B. The displacement produced by the force specified in Prototype Test 1 shall be less than or equal to the maximum non-seismic displacement due to maximum non-seismic lateral force as shown on the plans.

Prototype Test 3

A. The tangent stiffness for horizontal force-displacement shall be positive at all points on the curve.
B. At each displacement increment specified in Prototype Test 3, the effective stiffness, K_{eff}, shall be computed as the secant stiffness between points of (minimum displacement, minimum force) and (maximum displacement, maximum force). This definition shall be used even if the maximum force and displacement do not occur simultaneously. For the last required three cycles of the test, the value of K_{eff} for an individual cycle shall not differ from the average by more than 15%.
C. For the first series of testing at 1.0 times D_T, the average K_{eff} for the last 3 required cycles shall be within 15% of the value of K_{eff} shown on the plans.
D. For the first series of testing at 1.0 times D_T, the energy dissipated per cycle (EDC) for each of the last three required cycles shall be equal to or greater than 85% of the value of EDC shown on the plans.

Prototype Test 4

A. The tangent stiffness for horizontal force-displacement shall be positive at all points on the curve.
B. For each cycle, the EDC shall be equal to or greater than 90% of the value of EDC shown on plans.

Prototype Test 5

A. The tangent stiffness for horizontal force-displacement shall be positive at all points on the curve.

If the Engineer determines that a lead rubber bearing that is prototype tested fails to meet any of the foregoing acceptance criteria, then that bearing will be rejected and the

CONTRACT NO. 04-0120P4
CONTRACT CHANGE ORDER NO 149
SHEET 36 OF 55

Contractor shall modify the design as necessary, submit revised working drawings including these modifications, and prototype test another bearing that is fabricated according to the modified design.

Lead rubber bearing prototype testing operations shall not begin until the Engineer has approved the revised working drawings in writing. No extension of time or compensation will be made for modifying working drawings or supplemental calculations, for resubmittal and review of working drawings and supplemental calculations, for rejection of a bearing, and for designing and testing additional bearings.

Proof Test Procedures

The manufacturer may change the lead core diameter by ±10% without the need for new prototype tests in order to satisfy the proof test acceptance criteria.

Prior to installation, all lead rubber bearing types shall be proof tested as follows:

Proof Test 1 Proof Compression Test

A five-minute sustained proof load test on each production bearing shall be conducted. The compressive load for the test shall be 8 MPa on the bonded area of the bearing.

Proof Test 2 Proof Combined Compression and Shear Test

Each production bearing shall be tested at a constant vertical load of 1.0 times the total of dead load plus seismic live load shown on the plans and 4 full reversed continuous sinusoidal horizontal cycles of loading at 1.0 times the maximum seismic lateral displacement (D_T) shown on the plans. If the total vertical load shown on the plans is zero, the test shall be carried out under constant axial displacement. The displacement shall be the value occurring when the platens of the test machine are in contact with the bearing but the axial and lateral loads are zero. For each cycle of the test, the time, axial load, axial displacement, shear force and shear displacement of the specimen shall be continuously recorded.

Proof Testing Acceptance Criteria

The proof tests results shall satisfy the following:

A. Proof test specimens shall remain stable and without splits, fractures or lack of rubber to steel bond under all loading and displacement conditions. The hysteretic behavior of the specimens for the proof tests shall remain stable at all loading conditions. Anchorage components shall show no signs of distress.
B. Proof test bearings shall be inspected for uniformity of rubber layer thickness, lack of parallelism of the internal steel plates and surface cracking in accordance with ASTM D4014 Sections 9.1.3.1 and 9.1.3.2.

In addition, specific tests shall satisfy the following:

Proof Test 2

A. The tangent stiffness for horizontal force-displacement shall be positive at all points on the curve.

CONTRACT NO. 64-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 31 OF 55

B. The effective stiffness, K_{eff}, shall be computed as the secant stiffness between the points of (minimum displacement, minimum force) and (maximum displacement, maximum force). This definition shall be used even if the maximum force and displacement do not occur simultaneously. For the last required three cycles of the test, the value of K_{eff} for an individual cycle shall not differ from the average by more than 15%.
C. The average K_{eff} for the last 3 required cycles shall be within 15% of the value of K_{eff} shown on plans.
D. For the first series of testing at 1.0 times DT the energy dissipated per cycle (EDC) for each of the last three required cycles shall be equal to or greater than the value of EDC shown on the plans

If the Engineer determines that a bearing that is proof tested fails to meet one or more of the acceptance criteria for testing, then that bearing will be rejected. No extension of time or compensation will be made for re-testing additional bearings due to rejection of a bearing.

Test reports

Within 14 days after completion of prototype and proof testing, the Contractor shall submit to the Engineer six (6) copies of the complete test results for the bearings tested. Tests results shall be certified correct and signed by the testing laboratory personnel who conducted the tests and interpreted the test results.

The test reports shall include, but not be limited to the following:

A. Key personnel, location of tests, test equipment, type and identifying mark of each bearing tested.
B. A certified copy of the results of all component material tests.
C. A copy of the results of each bearing test conducted in that program. This report shall include at least a continuous record of compressive force and compressive displacement, shear force and shear displacement of the bearing for each load or displacement level used in the test program, and notes and photographs of any damage sustained during the testing.

SHIPPING AND HANDLING

Lead rubber bearings shall be assembled at the factory and suitable temporary assembly ties shall be provided so that the entire assembly is shipped as a unit and remains intact when uncrated and installed. Lead rubber bearings shall be delivered to the testing facility and to the job site in protective packaging for freight and handling purposes. Any damaged or scratched bearings shall be replaced by new bearings of the same type.

INSTALLATION

Each lead rubber bearing and all mounting plates, including masonry plates, shall be installed in accordance with the procedures, and using the materials, specified in the

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 38 OF 55

approved installation manual and all requirements on the plans. Attention is drawn to the suggested installation sequence shown on the plans.

A qualified technical representative of the manufacturer shall be present and available for consultation during installation.

Remove Unsound Concrete

Unsound concrete shall be removed as shown on the plans and to the limits designated by the Engineer. Unsound concrete is generally that concrete which emits a relatively dead or hollow sound when a chain is dragged over its surface or its surface is tapped with a metal tool. Concrete encasing corroded reinforcing steel beyond the limits identified by the sound may be considered as unsound concrete. The Engineer will determine the soundness of all concrete.

Equipment and tools shall not be used to remove unsound concrete which, in the opinion of the Engineer, cause the removal of excess quantities of sound concrete along with the unsound concrete. Equipment used shall be fitted with suitable traps, filters, drip pans, or other devices to prevent oil or other deleterious matter from being deposited outside of the bearing installation area.

After the removal of unsound concrete has been completed, any existing reinforcing steel which has been exposed shall be restored to position and blocked and tied in conformance with the provisions in Section 52, "Reinforcement," of the Standard Specifications.

Reinforcing steel that has been damaged to the extent that the steel's usefulness is destroyed as a result of the Contractor's operations, shall be repaired or replaced by the Contractor at the Contractor's expense.

Removing unsound concrete will be paid for as extra work as provided in Section 4-1.03D of the Standard Specifications.

Coring

Coring locations and depths shall be as shown on the approved working drawings. Coring shall conform to the provisions in "Core Concrete," of these special provisions. The Contractor shall ensure that existing anchorage structural steel in Pier E1 is not damaged in any way by coring. If anchorage structural steel is encountered during coring, the Engineer shall be notified immediately and coring operations at the affected location shall be discontinued pending direction from the Engineer. Reinforcing bars within Pier E1 may be cut by coring and need not be repaired.

Cored holes within the group associated with one bearing shall be located with respect to each other to a tolerance of ± 12 mm within the core hole pattern. The core hole pattern associated with each bearing shall be located within ± 12 mm of the location shown on the plans.

Pintle and anchor bolt holes at Pier E1 shall be cored before the date of roll in.

When a roughened concrete surface is shown on the plans, the existing concrete surface shall be roughened to a full amplitude of approximately 6 mm by abrasive blasting, water blasting, or mechanical equipment.

Installation of Grout and Bedding Materials

Procedures for installing grout and bedding materials shall conform to the following:

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 149

SHEET 39 OF 55

A. The installation procedures and bedding and grouting materials to be used shall be those developed by the Contractor, and approved as suitable by the Engineer, for the relevant mockup.
B. Bearings shall be firmly supported throughout grouting and curing to ensure no movement is allowed relative to the top of Pier E1. Use of leveling screws to support loads from the floorbeam during grouting and curing will be allowed.
C. Grout installation shall be performed by personnel experienced in the work.
D. Contractor shall provide containment for grout around the perimeter of the masonry plate.
E. Grout shall be mixed, installed, and cured in accordance with the manufacturer's recommendations.
F. Grooves up to 6 mm deep in the underside of the masonry plate to remove air pockets will be permitted. Vibration of the masonry plate to remove air pockets will be permitted, provided that it causes no permanent movement of the masonry plate relative to the pier.

Bearings

Bearings, including external plates, shall be installed in continuous and firm contact with the underside of the truss floor-beam. The truss floor-beam underside shall be flat and planar with a maximum deviation from plane of 3 mm allowed.

Masonry Plates

The masonry plate shall be set so that it is in continuous and firm contact with the lower external plate of the bearing, prior to welding. The maximum gap between the two shall be less than 3 mm.

Temporary Clamping Devices

Bearings shall be supplied with temporary clamping devices that will safely hold the assembled bearing during storage, shipping, and when it is transported hanging from the truss. The temporary clamping devices shall be removable once the masonry plate has been grouted.

SUBMISSIONS AND SCHEDULING

The Contractor shall submit to the Engineer documentation according to the following schedule:

Part 1

Part 1 of the documentation shall consist of, working drawings, calculations, draft Quality Control Program, draft Inspection and Maintenance Manual, proof of five years' experience in design and manufacture of lead rubber bearings, and descriptions of the prototype and proof testing programs.

Part 1 documentation shall be submitted to the Engineer at least 39 weeks prior to the start of bearing installation. The Contractor shall allow three weeks for the Engineer's

CONTRACT NO. 04-0120P4
CONTRACT CHANGE ORDER NO 149
SHEET 40 OF 55

initial review. If modifications are needed, they shall be submitted no later than the submission of the prototype test results.

Part 2

Part 2 of the documentation shall consist of the draft Installation Manual. The procedures contained therein shall conform to the methods developed during the mockups, and approved by the Engineer.

Part 2 documentation shall be submitted to the Engineer after successful completion of the mockups, but at least 27 weeks prior to the start of bearing installation. The Contractor shall allow two weeks for the Engineer's initial review. If modifications are needed to the draft manual, they shall be submitted within one week after the Engineer's initial review. The Contractor shall allow two weeks for the Engineer's review and approval of the final Installation Manual.

The Contractor shall not start fabrication of prototype test specimens until the Engineer has approved the corrected versions of the Part 1 submissions and has provided initial review of the Part 2 submissions. The prototype test specimens shall conform to the approved working drawings and the approved Installation Manual.

Part 3

Part 3 of the documentation shall consist of the reports of the prototype tests.

Part 3 documentation shall be submitted to the Engineer at least 17weeks prior to the start of bearing installation. The Contractor shall allow two weeks for the Engineer's review and approval. The Contractor shall not start fabrication of the production bearings until the Engineer has approved the prototype test results.

Part 4

Part 4 of the documentation shall consist of the reports of the proof tests.

Part 4 documentation shall be submitted to the Engineer at least 7 weeks prior to the start of bearing installation. The Contractor shall allow two weeks for the Engineer's review and approval. The Contractor shall not start installation of the bearings in the bridge until the Engineer has approved the proof test results.

Should the Engineer fail to review the complete working drawing submittal within the time specified and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in reviewing the working drawing submittal, an extension of time commensurate with the delay in completion of the work thus caused will be granted in accordance with Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

The Contractor shall provide the Engineer with at least 14 days' written notice of the start of the mockups, the start of fabrication of the prototype bearings, and the start of fabrication of the production bearings.

No bearing shall be installed until the Engineer has determined that the Contractor has successfully completed and has approved, in writing, the working drawings, the prototype testing and the proof testing for the lead rubber bearing to be used.

Within 3 weeks after approval of the final working drawings, the Contractor shall submit to the Engineer one complete set of corrected prints of all working drawings for the lead rubber bearings.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 149

SHEET 41 OF 55

MEASUREMENT AND PAYMENT

The contract unit price paid for lead rubber bearings shall include full compensation for furnishing all labor, materials, tools, equipment and incidentals, for the following:

A. Design. All design procedures, including but not limited to supplemental calculations and preparation of working drawings.
B. Fabrication. Fabrication of all components of the bearing, including but not limited to the lead rubber bearing units, mounting plates, stopper rings, and all attachment devices.
C. Mockups. Preparation and execution of mockups, and modification and re-execution of the procedures as necessary to achieve results that satisfy the requirements of these special provisions.
D. Testing. The cost for all prototype testing shall be borne by the Contractor. With the exception of any re-testing, all proof testing will be paid for by the State. Any bearing that fails to meet the acceptance criteria shall be redesigned and re-tested at the Contractor's expense. The cost of any special mounting plates or adapter plates needed for testing shall be borne by the Contractor.
E. Shipping and storage. All costs of shipping to and from the test facility, and storage, shall be borne by the Contractor.
F. Installation. All procedures for installing the bearings complete in place, including but not limited to cleaning and painting of lead rubber bearings, coring of holes, roughening concrete, provision of temporary supports, grouting, attachment of the lead rubber bearings to the pier and superstructure, and having the manufacturer present during installation and available for consultation,.

All work shall be performed as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

Any bearing that fails to meet the acceptance criteria shall be redesigned and re-tested at the Contractor's expense. The Contractor shall be responsible for all costs associated with manufacturing, shipping, storing and testing if any re-testing should be required. Payment to the Contractor for lead rubber bearings shall be reduced $5,400.00 for each prototype bearing re-tested, and $1,800.00 for each proof bearing re-tested.

Full compensation for modifications to the bridge structure or other existing facilities made necessary by the use of a particular lead rubber bearing, shall be considered as included in the contract unit price paid for lead rubber bearing and no separate payment will be made therefor.

Full compensation for providing installation manuals and inspection and maintenance manuals shall be considered as included in the contract price unit paid for lead rubber bearing and no separate payment will be made therefor.

No payment will be made for lead rubber bearings that fail to meet one or more of the acceptance criteria.

CONTRACT NO. 64-0120R4
CONTRACT CHANGE ORDER NO 149
SHEET 42 OF 55

If a portion or all of lead rubber bearings are manufactured at a site more than 100 miles from Sacramento additional shop inspection expenses will be sustained by the State. Payment to the Contractor for lead rubber bearings will be reduced by $5,000 for each manufacturing site located more than 100 miles from Sacramento, or in the case of each manufacturing site located more than 1,000 miles from Sacramento, payment will be reduced by $8,000.

BEARING PERFORMANCE CRITERIA TABLE

PIER E1	Value	Units
Quantity	2	(-)
Effective lateral stiffness at DLS	4.2	kN/mm
Energy dissipation per cycle at DLS displacement	780	kN-m
Lateral displacement under maximum non-seismic force	75	mm

DESIGN LOADS & DISPLACEMENTS

PIER E1	Value	Units
Vertical dead load	0	kN
Vertical live load	0	kN
Vertical seismic live load	0	kN
Vertical seismic load	0	kN
Maximum vertical load combination	0	kN
Minimum vertical load combination	0	kN
Lateral non-seismic force	300	kN
Lateral thermal displacemnt	0	mm
Lateral seismic displacement under DEE	200	mm
Lateral seismic displacement under DLS	450	mm

Notes:

1. The Contractor shall verify all controlling field dimensions before ordering or fabricating material.
2. The Contractor shall develop for the Engineer's approval a written grouting plan that will assure grout completely fills all voids under the masonry plate and in and around the pintles. The Contractor to provide air venting to underside of masonry plate as part of grouting plan to prevent air pocketing during grouting. Smooth grooves 6 mm deep may be made on underside of masonry plate. Vents shall also be provided at the top of pipe pinteis to prevent air pockets within the pipes. See Special Provision for other grouting plan requirements.
3. Dimensions to be designed/approved by bearing Manufacturer.
4. For stopper details and cored hole locations, see "Bearing Details No. 2" sheet.
5. LRB bearing to be supplied with temporary clamping device to prevent distortion during transport and erection. To be removed after installation is complete.
6. Leveling screws may be used to prevent vertical movement of LRB during grout installation and curing. Must be capable of supporting minimum vertical service load of 750kN per LRB.

SUGGESTED INSTALLATION SEQUENCE - POT BEARINGS AT PIER E1

GENERAL:

1. The Contractor shall develop and demonstrate an installation plan, including a grouting plan, for Engineer approval prior to beginning any work that could be affected by the plan. See the Special Provisions for further requirements.
2. The holes for the pintles are to be cored into the top of Pier E1 prior to roll-out roll-in date.
3. The pot bearing assembly including the lower piston will be attached to the new ETI truss prior to moving the truss.
4. After existing Truss YB4 has moved away, remove bearing shoes and cut all anchor bolts to top of concrete level and prepare concrete surface for the new bearings.
5. Remove any loose or spalled concrete in the plan area of the bearings.

SUGGESTED INSTALLATION STEPS:

1. Position and install bearing masonry plate according to approved installation plan. The designers envision the following procedure:
   a. Place the masonry plate onto the concrete complete with the fixed retainer ring. Adjust it for location in plan. Level the masonry plate using leveling bolts. See the Special Provisions for masonry plate installation tolerances.
   b. Drill into the concrete for locating pins at minimum two locations. Set locating pins into the drilled holes (light driving fit).
   c. Set plastic plugs in holes drilled into the concrete around the perimeter of the masonry plate. Set screws into the plug, set screw tops to 4mm above the underside of the masonry plate to establish screed level for the bedding material.
   d. Build a dam around the perimeter of the masonry plate.
   e. Remove the masonry plate temporarily.
   f. Mix pintle filling material: material to be suitable for large volumes.
   g. Partally fill the pintle holes leaving room for the displacement volume of the pintles.
   h. Mix bedding material: trowelable consistency.
   i. Place bedding material up to height of screws (Item 1c above). Screed off bedding material to level.
   j. Re-install the masonry plate using the pins (Item 1b above) as guides. Force masonry plate down to displace bedding material until leveling screws attain contact with the top of pier.
2. Bring the new ETI truss into position with the remaining bearing components attached to the truss.
3. Position the new ETI truss at the correct plan location and lower it at Bent 52A to set it on its bearings at the west end (see suggested installation sequence for pot bearings at Bent 52A on "Bearing Details No. 6" sheet).
4. Lower the east end of the new ETI truss until the pot bearings on Pier E1 are approximately 10mm from contact with the masonry plates.
5. Allow the bedding material to attain a minimum cube strength of 20 MPa. The strength of the material in the pintle holes is not an issue at this time.
6. Set the east end of the new ETI truss down onto the pot bearings. Maintain the transport gear in contact with the truss to provide north-south restraint until the bearings have been locked up. Note: The pot bearing will move eastward approxmately 35 mm in the process.
7. Install the temporary restrainer plates on the pot bearings and weld these to the fixed retainer ring.
8. Release the transport gear.

CONTRACT NO. 64-0120R4

CONTRACT CHANGE ORDER NO 149

SHEET 54 OF 55

SUGGESTED INSTALLATION SEQUENCE - LEAD RUBBER BEARINGS AT PIER E1

GENERAL:

1. The Contractor shall develop and demonstrate an installation plan, including a grouting plan, for Engineer approval prior to beginning any work that could be affected by the plan. See the Special Provisions for further requirements.
2. The holes for the pintles are to be cored into the top of Pier E1 prior to roll-out roll-in date.
3. The complete bearing, with the exception of the masonry plate will be attached to the new ETI truss prior to moving the truss.
4. The lead rubber bearings will eventually resist all lateral loadings but will not carry vertical loads. Until they are completely installed, lateral loadings will be resisted by temporarily locking the pot bearings at pier E1.
5. Lead rubber bearings to be vertically supported to top of pier E1 to prevent vertical displacements due to live load during grouting and grout curing of these bearings.

SUGGESTED INSTALLATION STEPS:

1. Core holes in pier top for the pintles. See the Special Provisions for coring tolerances.
2. Roll out existing YB4 truss.
3. Set the masonry plates into the cored holes. See the Special Provisions for masonry plate placement tolerances.
4. Roll in the new ETI truss carrying the lead rubber bearing with the truss.
5. Set the new ETI truss onto the pot bearings on Pier E1. (See suggested installation sequence for pot bearings at pier E1).
6. Temporarily lock up the pot bearings to resist lateral and longitudinal movements at pier E1.
7. Remove the transport gear.
8. Grouting of lead rubber bearings may take place after bridge is opened to traffic.
9. Raise the masonry plate for LRB to be parallel to the bottom surface of the bearing and in tight contact with it. Use the leveling screws for this purpose.
10. Weld the masonry plate to the bottom plate in the bearing.
11. Inject grout under masonry plate and into and around pintles according to approved grouting plan. The designers envision the following procedure.
    a. Build a containment dam around the masonry plate.
    b. Inject grout under the masonry plate, filling also the pintle holes. Inject using a hose to deliver grout to the center of the masonry plate. Work grout outwards from the center (See General Note 4).
12. When the grout has attained a cube strength of of 30 MPa, release the temporary restraint assembly on the pot bearings.

THESE SEQUENCES HAVE BEEN DEVELOPED FOR SAKE OF COMPLETENESS OF DESIGN CONCEPT AND HAVE NOT BEEN DEVELOPED IN DETAIL AND ARE CONCEPTUAL IN NATURE. THE CONTRACTOR SHALL DEVELOP PROCEDURES IN DETAIL TO SATISFY THE REQUIREMENTS SPECIFIED IN THE PLANS AND THE SPECIAL PROVISIONS AND SUBMIT IT TO THE ENGINEER FOR APPROVAL.

SUGGESTED INSTALLATION SEQUENCE - POT BEARINGS AT BENT 52A

GENERAL:

1. The Contractor shall develop and demonstrate an installation plan, including a grouting plan, for Engineer approval prior to beginning any work that could be affected by the plan. See the Special Provisions for further requirements.
2. The masonry plates are to be pre-set grouted in place on Bent 52A before roll-out roll-in date.
3. The bearings shall be bolted to the ETI truss before roll-out roll-in date.

SUGGESTED INSTALLATION STEPS:

1. After Bent 52A is constructed, template the as built anchor bolt locations and use these templates to drill the holes in the masonry plates.
2. Install and grout bearing masonry plate according to approved installation plan. The designers envision the following procedure:
   a. Provide grout vent holes in the masonry plate.
   b. Provide grout injection ports, quantity as required, to sufficiently grout the masonry plates.
   c. Set the masonry plate onto the anchor bolts. Shim to level and grade the plate. See the Special Provisions for masonry plate installation tolerances.
   d. Construct a dam around the masonry plates to top of masonry plate elevation.
   e. Inject grout through the injection ports starting at the middle of each plate and working towards the perimeter.
   f. When grout has set, clean up the surface of the masonry plate.
3. Move the ETI truss into place once the grout has attained a minimum cube strength of 30 MPa, carrying the bearings with the truss, and adjust its location.
4. Set the truss down so that weight is carried fully through the bearings.
5. Release the transport gear at the west end of the ETI truss.
6. At this point welding down the bearing to the masonry plate may commence. However it is not necessary to weld the pot bearings at Bent 52A down before lowering the truss at Pier E1.
7. Install and weld the stoppers at Bent 52A.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 149	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Incorporate the changes to the bearing details of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) as shown in the revised plan sheets of Sheet No. 2 of this change order.

All revisions to the bearing details shown on Sheet No. 2 of this change order shall supersede the original plan sheet issued under the original Change Order No. 149.

Extra Work at Force Account:

Provide compensation for additional costs incurred resulting from the revisions to the East Tie-In Bearings incorporated under this change order and provide additional funding for the work specified as extra work at force account under the original Change Order No. 149.

Estimated Cost of Extra Work at Force Account $400,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$400,000.00**

By **reason of this order the time of completion will be adjusted as follows:** 0 days

Engineer Approval by

Signature	SFOBB Construction Manager	Date
	MIKE FORNER	11/17/09

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

THIS CHANGE ORDER PROVIDES FOR:

Minor design revisions to the bearing details of the East Tie-In (ETI) structure.

This contract provides for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour will allow for the construction of the permanent structure, the Yerba Buena Island Transition Structure, which connects the signature SAS structure to Yerba Buena Island.

The detour consist of three main structures, the East Tie-In (ETI) to the bridge, the West Tie-In to the island and the viaduct structure between the two tie ins. The contract was awarded as a performance based project with the contractor responsible for meeting the design criteria specified in the contract.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The original Change Order No. 149 provided the plans and specifications necessary for the fabrication of the 6 permanent bearings for the ETI structure and provided compensation for the fabrication of a prototype bearing to be used in testing. That change order provided for the work to be performed as extra work at force account. This change order incorporates minor changes to the originally issued plan sheets for the bearing details as issued by Toll Bridge Design.

It is anticipated that the current force account funding shall be inadequate to compensate the contractor for the additional costs resulting from these design revisions and for the work specified under the original change order. The cost of the fabrication of the bearings, the prototype testing and the field inspection of the condition of the existing pier that will support 4 of the 6 permanent bearings is expected to exceed the original cost estimate.

The work shall be compensated as extra work at force account at an estimated cost of $400,000.00 which shall be financed from the contract contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Structure Maintenance. TBPOC Approval pending.

475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Compensate the Contractor for the additional costs incurred in the construction of the sewer line at Bent 52 (Final Utility Plan Sheet U-4) pursuant to Section 5-1.116, Differing Site Conditions, of the Standard Specifications.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco-Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

The Final Utility Design Plans called for the existing sewer line at Bent 52 to be relocated due to a conflict with the Bent 52 footing. The Contractor proceeded with the sewer line relocation work and subsequently uncovered a pre-existing leak in the sewer line. The Contractor claimed a differing site condition and filed a notice for additional compensation on June 30, 2005 in accordance with Section 5-1.116, Differing Site Conditions, of the Standard Specifications in order to manage the contaminated soil. The Department investigated this request and found it to be reasonable and justified.

The Contractor shall be compensated in Extra Work at Lump Sum price of $ 242,330.88, which shall be financed from the contract's contingency funds. A cost analysis was submitted by the Contractor, reviewed by the Department and verified to be reasonable for payment. This analysis is on file.

No adjustment of contract time is warranted since this change does not affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 151 | Suppl. No. 0 | Contract No. 04 - 0120R4 | Road SF-80-12.6/13.2 | FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Modify the tenth paragraph of Section 5-1.04, "Public Safety," of the Special Provisions to add the following:

" With the approval of the Engineer, allow the Contractor to safely clear the traffic queue on Macalla Road and allow traffic to pass beneath a crane's boom in the event that work activities cannot be completed as planned within the 15 minute blocked access restriction as stated in the United States Coast Guard license agreement issued to the Department."

The following procedure shall be followed due to this change:

1. The Contractor shall submit a request for approval to the on-site Lead Engineer to allow public traffic to pass underneath a crane boom.
2. Cease all crane operation work.
3. The Lead Engineer will assess the area for hazards prior to approval and if present, the Contractor shall remedy the situation immediately to the satisfaction of the Lead Engineer.
4. The Lead Engineer will provide written approval to the Contractor before public traffic is allowed to pass underneath the crane boom on Macalla Road.
5. Resume crane operation work with a new start time of the USCG agreed upon 15 minutes block access restriction.
6. The Contractor shall submit a letter to the Engineer stating all the facts that necessitated the equipment to be positioned over traffic and what measures are to be taken to prevent the occurrence of such an incident in the future.

For this work the contractor will be paid the lump sum of $0.00. This sum constitutes full compensation, including all markups, for this change. Any additional work or related costs to this change shall be born by the Contractor.

Total Cost of Adjustment of Compensation at Agreed Lump Sum.....$0.00

Estimated Cost: Increase ☐ Decrease ☐ $0.00

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 153	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform all work shown on the revised plan sheets of Sheets No. 2 through 20 of Change Order No. 140, Supplement No. 2 and the original plan sheets and specifications as shown on Sheets No. 3 through 84 of Change Order No. 140 for the construction of the concrete deck for the steel truss of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

For this work, the Contractor shall be compensated a lump sum of $2,389,940.00. Except for the items of work specifically excluded below, this sum constitutes full and final compensation, including all markups, for all costs associated with the work of this change.

Compensation paid under this change order is based on a 4-stage pour sequence as defined by the Department's response to Request for Information No. 000150.

All work associated with furnishing and installing the joint seal assemblies for the expansion joints at the center of the uppe and lower concrete decks is included in the lump sum compensation provided under this change order.

All work associated with constructing the Type 732 concrete barrier (including all barrier reinforcing steel both in the barrier and the concrete deck), furnishing and installing the Bent 52A and Pier E1 expansion joints, expansion joint steel barriers, and permanent bearings, is excluded from this change order. Any costs associated with these items of work shall be paid under separate change orders.

All work associated with the implementation and maintenance of the Contractor's Storm Water Pollution Prevention Plan and erosion control, including concrete washouts, shall be paid by the Department separately from this change order.

Flagging costs associated with this work shall be paid under Change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum compensation provided under this change order.

The compensation provided under this change order is based on the construction of the concrete decks being performed under a daily double shift schedule in an effort to support the placement of traffic on the Temporary Bypass Structure by September 8, 2009.

The Engineer shall establish lines and grades required for the completion of this work in accordance with Section 5-1.07 of the Standard Specifications.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Total Cost of Extra Work at Lump Sum $2,389,940.00

THIS CHANGE ORDER PROVIDES FOR:
the construction of the concrete decks of the East Tie-In structure.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the Toll Bridge Program Oversight Committee. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

The new design of the ETI structure provides for a roll-out / roll-in concept with a new double deck steel truss span being erected adjacent to the existing span and then rolled into place after the existing span is rolled out.

Contract Change Order No. 90 provided for the elimination of the planned ETI structure that was covered under a lump sum contract bid item and Contract Change Orders No. 112, No. 129, and No. 140 provided for the fabrication and erection of the ETI truss. This change order provides for the construction of the upper and lower concrete decks of that steel truss.

The work encompassed under this change includes the placement of approximately 940 cubic meters of concrete, 310,000 kilograms of reinforcing steel, and 2 joint seal assemblies that provide flexibility in the center of the deck in order to alleviate excessive stresses during the roll in of the structure. The work will take place approximately 150 feet in the air with limited access to the structure and will be performed on a double shift schedule in order to help meet the planned roll in date during Labor Day Weekend of 2009.

Compensation shall be paid as extra work at an agreed lump sum price of $2,389,940.00, which shall be financed from the contract's contingency funds. A cost analysis is on file.

The cost of constructing the concrete barrier, expansion joints, and bearings at the Bent 52A and Pier E1 supports shall be paid under separate change orders as costs associated with these items of work have not been determined to date.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, Lina Ellis - Maintenance, and Patrick Treacy - HQ Asst. Construction Coordinator. TBPOC Approval granted on June 4, 2009.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 154	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Pursuant to Section 10-1, "General", subsection "Piling" of Contract Change Order No. 90 Special Provisions, the Contract will credit the Department $2183.17 for the anomaly found at East Tie-In Footings A6W West Pile and Bent 52A South Pile #1.

The A6W West Pile anomaly representing 17% of the cross section area between elevations -9.6 meters to -24.9 meters accredits the Department $1183.02.

The Bent 52A South Pile #1 anomaly representing 20% of the cross section area between elevations -5.3 meters to -16.00 meters accredits the Departments $1000.15.

The $2183.17 credit to the Department constitutes full and complete credit, including mark-ups, for the above mentioned pile anomalies.

Estimated cost of Adjustment of Compensation at Lump Sum .....($2,183.17)

Estimated Cost: Increase ☐ Decrease ☑ **($2,183.17)**

By **reason of this order the time of completion will be adjusted as follows:** 0 days

This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer, provide for the transportation and off-site disposal of excess soil from the footing excavations pertaining to Bents W7L and W7R of the Yerba Buena Island Transition Structure (Br. No. 34-0006 L/R) and Bent 52A and the skid bents of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

Off-haul and disposal of excess soil pertaining to the work under Change Orders No. 64 Supplement No. 1, No.73 and No. 77 at Bent W3L, W3R, W4L, W4R, W5L, W5R, W6L, W6R of YBITS (Br. No. 34-0006 L/R) and Bent W7 of the Yerba Buena Island Eastbound On Ramp Structure (Br. No. 34-0006 R) shall be compensated under the lump sum payments provided under those change orders.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications.

Estimated Cost of Extra Work at Force Account $500,000.00

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 156	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor for all outstanding costs associated with the following items of work pertaining to the installation of the falsework towers for the steel erection of Span 49 of the Viaduct portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) due to the conflicts with existing utilities:

1) Relocate the southern falsework bents due to the conflict with utilities adjacent to the US Coast Guard frontage road. Compensation provided includes all costs associated with the redesign and construction of the falsework foundation bracing (grillage) associated with the required relocation of the foundation piles.

2) Repair the sewer line damaged by the installation of falsework piles for Span 49. Compensation provided includes all costs associated with the sewer line repair, exploratory excavation of the sewer line and all labor and equipment idle time incurred due to the sewer line conflict.

For this work, the Contractor will be compensated a lump sum of $180,820.00. This sum constitutes full and final compensation for all outstanding costs, including all markups, associated with the work of this change.

Total Cost of Adjustment of Compensation at Agreed Lump Sum $180,820.00

Estimated Cost: Increase ☑ Decrease ☐ **$180,820.00**

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 157	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Design a staircase for the United States Coast Guard from the main base access road up to Quarters 9. The plans and specifications shall comply with all applicable codes and regulations, and shall be prepared and submitted for review and approval by the Department. In addition, the Contractor shall use the previously transmitted preliminary design files (Transmittal No. 05.03.02-001257) as a guide in designing the staircase. If revisions are required, as determined necessary by the Engineer, the Contractor shall revise and resubmit for Department's review and approval.

Additionally, conduct a geotechnical engineering investigation to support the Contractor-designed staircase. This includes but is not limited to jobsite investigations, soil sampling, and preparation of a report to be submitted to the Department.

Construction of the staircase shall be handled in a separate Contract Change Order.

The design and geotechnical work for the staircase shall be paid for by invoice pursuant to Section 9-1.03, Force Account Payment, of the Standard Specifications.

Estimated Cost of Extra Work at Force Account $150,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$150,000.00**

TEST SOIL NAIL ASSEMBLY

NO SCALE

TEST NAIL ASSEMBLY NOTES:

1. Diameter of test soil nail and drilled hole shall be same diameter as adjacent production nails.
2. Embedment length shall be 2/3 the embedment length of adjacent production soil nail assemblies, but not less than 6100 mm.
3. Total length of test soil nail assembly shall be embedment length plus the length required for jacking equipment.
4. The inclination of test soil nail assembly shall be the same as adjacent production soil nail assemblies.
5. The pullout test load for 200mm diameter drilled hole shall be 340 kN.
6. See other sheets for test nail locations. Number of test nails shall be not less than 5 percent of the total number of production nails and each row of each wall shall have at least two test nails. Provide at least 2 test nails for each diameter of production nail.

CONTRACT CHANGE ORDER MEMORANDUM

TO: MIKE FORNER / DEANNA VILCHECK	FILE: **E.A.** 04 - 0120R4
FROM: BILL CASEY	**CO-RTE-PM** SF-80-12.6/13.2
	FED. NO. ACBRIM-080-1(097)N
CCO#: **159** SUPPLEMENT#: **0** Category Code: **CMTX**	CONTINGENCY BALANCE (incl. this change) **$3,188,279.12**
COST: **$916,280.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Redesign Bent W7 Soil Nail Wall	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

the revised design and reconstruction of the temporary soil nail wall that allows for the construction of Bent W7.

This contract provides for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour will allow for the construction of the permanent Yerba Buena Island Transition Structure (YBITS) that connects the signature SAS structure to Yerba Buena Island.

In order to advance the completion of the YBITS project and potentially allow for an early opening of the new SFOBB, the Department issued a December 25, 2006 memorandum recommending a portion of the YBITS foundation work be performed under this contract by change order. The memorandum was approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer.

Based on this Department memorandum, the contract now provides for the construction of the permanent footing and column for Bent W7 of the YBITS project. This work was added under the previously approved Change Order No. 75. As part of that work, the plans call for the construction of a 27 meter high soil nail retaining wall held in place by 275 soil nails. The soil nail wall acts as temporary shoring for the construction of the 3 permanent footings for Bent W7. The wall was designed asymmetrical with a width of 19 meters at the base that widens to 34 meters at the mid-height and then narrows back to 5 meters at the top. The slope of the wall varies from 1:10 to 1:6 as it climbs up the compound slope that it supports.

After clearing and grubbing of the slope was performed, the Department provided survey staking for the soil nail walls construction. This survey was unusually complex in that it had to be placed on a steep slope (approximately 1:1) that fell off in two directions with the stakes having to be placed 30 meters above the planned base of the wall that controlled the layout. The designed slope of the wall, varying from 1:10 to 1:6, and the wall's bench further complicated the layout that required working from the base of the wall and up the existing slope. The placement of the stakes was also complicated due to the existing grade not matching the planned grade at the top of the wall by several feet.

Once the survey was placed, construction of the wall proceeded. Approximately 75% of the wall had been constructed when it was recognized that the Department survey had been placed in error. This resulted in the wall being constructed to the point where its base encroached into the center of the permanent footings for Bent W7. Construction was then suspended pending a revised design.

A revised design has now been provided that allows for the utilization of approximately 20% of the completed wall with the remaining portion of the wall steepened in order to clear the permanent footings and allow for their construction. This change order provides for the revised wall design and compensates the contractor for the additional costs to reconstruct the wall.

It is anticipated that the pending changes to the contract stemming from Change Order No. 75 shall result in a minimum of 6 additional change orders being issued as theses changes are identified and costs are agreed to. Change Orders No. 118, Supplement No. 1, No. 124, No. 126, No. 145, No. 155 and No. 159 have been identified to date. Individual change orders are being assigned as the costs are being quantified and agreed to in order to facilitate the tracking of these items of work. The cost of furnishing and placing cement modified structural backfill and imported topsoil that were deferred under Change Order No. 75 shall be paid under a supplemental change order as specified in Change Order No. 75.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

Compensation shall be paid as extra work at an agreed lump sum of $916,280.00 which shall be financed from the contract's contingency funds. A force account cost analysis is on file.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was requested by Mike Whiteside - YBI Coordination Engineer per memorandum dated September 18, 2008 and concurred by Hong Wong - Project Engineer and Alec Melkonians - Project Manager.

Maintenance concurrence for this change order is not required, as the wall is a temporary structure and does not affect any permanent roadway.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 160	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Furnish, fabricate, and deliver material required to implement truss modifications as shown on Sheets 2 through 16 of this change order, at existing Spans YB1, YB3 and YB4.

Payment for this work shall be made in accordance with Sections 4-1.03D, Extra Work, and 9-1.03, Force Account Payment, of the Standards Specifications, as revised and/or amended by the Special Provisions.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Estimated Cost of Extra Work at Force Account $350,000.00

Estimated Cost: Increase ☑ Decrease ☐ $350,000.00

By reason of this order the time of completion will be adjusted as follows: Deferred

Submitted by		
Signature	Resident Engineer BILL CASEY	Date 3-13-09
Approval Recommended by		
Signature Deanna Vilcheck	Area Construction Manager DEANNA VILCHECK	Date 3/20/09
ngineer Approval by		
nature Deanna Vilcheck	Area Construction Manager DEANNA VILCHECK	Date 4/8/09

The undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all ıment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept payment therefor the prices shown above.

If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to ding with the ordered work and filing a written protest within the time therein specified.

or Acceptance by

SHEET 126 OF 214

FILE => p:\bb\04-012001\et1\jackpt_det_exist 01-07-09\aetd05.dgn

Procedure for Installation of Stiffeners

1. Prior to installation of bolts or stiffeners at the jacking points at L29 and L33, sand blast clean all paint at the jacking locations and lower flange of the floor beams as shown in "Existing Truss Details" sheets.
2. All stiffener installation shall be completed prior to roll out roll in.
3. Install all bolts in chords that do not require removal of rivets. Use long erection bolts (A490) and nuts at stiffener locations with heads installed on the outside face of the chords.
4. Once Step 3 is complete, replace rivets in the chords (except those at the stiffeners) as follows: Remove a maximum of 2 rivets at any time, ream holes and install bolts. Repeat this process until all bolt replacements in the chords have been installed.
5. Repeat the process described in Step 4 to replace rivets at the stiffeners. At stiffener locations use long erection bolts and nuts with the heads installed on the outside face of the chords.
6. Cut an opening in the bottom gusset as shown. The Contractor shall ensure that no element of the truss is damaged.
7. Install two short L 102x102 and two short L 102x203 and connecting web plate directly above area for jacking plate at L33N, L33S
8. Cut out the eight rivets in the bottom flange angles for connecting the jacking plate.
9. Lift and install the jacking plate with spacer plates with 8 countersunk bolts to the flanges of the truss.
10. Install T-stiffeners at each side of the post web bearing directly onto the jacking plate below. Drill holes and install bolts to the jacking plate and the post web.
11. Install brackets on outside of bottom chord with spacer plates, bearing onto jacking plate. Remove rivets, ream rivet holes, drill new holes, and install bolts.
12. Install strut to floor beam on inside of bottom chord with spacer plates using the following procedure:
    a. Remove rivets, ream rivet holes and drill new holes at the bottom chord connection.
    b. Replace rivets with bolts, one at a time, at each end of the bracket area along the lower flange of the floor beam (Stage 1 and 2).
    c. Extract 6 rivets at front end of the bracket area (Stage 3). Replace with spacer plate and half of the bracket assembly. Tighten bolts to the floor beam above.
    d. Extract 6 rivets at back end of the bracket area (Stage 4). Replace with spacer plate and half of the bracket assembly. Tighten bolts to the floor beam above.
    e. Install splice plates on each side of the bracket web.
    f. Install strut with shims and bolt to lower chord end.
    g. Complete strut connection to floor beam bracket with shims and bolts.
13. Install the 51 mm vertical stiffener plates on each side of the post. Install only one stiffener at a time as follows:
    a. Install stiffener bearing directly onto the jacking plate below.
    b. Provide a positive means to retain the heads of the erection bolts.
    c. Remove nuts from all the long erection bolts at the stiffener being replaced. In the earlier operations, all the nuts were installed on the inside face of the chord.
    d. Once the stiffener is in place, tighten all nuts for the bolts at that stiffener.
    e. Remove erection bolts one by one and replace with new bolts with bolt head installed towards the inside of the chord.
    f. Completely install all four stiffener plates, one by one, at each jacking point.
14. Install connector plate between the stiffener plates.

COST: **$350,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: ETI Existing Truss Retrofit	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

compensating the contractor for furnishing, fabricating, and delivering all material and structural steel members required to implement truss modifications at existing Spans YB1, YB3 and YB4.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended the design of the ETI and WTI structures and enhancement of the Viaduct be assumed by the Department as opposed to the as-bid performance based contractor design . Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

This work is required by the designer in order to provide additional stability to existing spans YB-1, YB-2 and YB-3 once Span YB-4 is rolled out, and to strengthen Span YB-4 to permit the planned roll out during the Labor Day traffic switch to the temporary bypass structure.

Compensation for this change shall be performed as Extra work at force account for an estimated cost of $350,000.00 which can be financed through the Contingency Fund. A cost analysis is in the project files.

Time impacts to the project schedule as a result of this change are unknown at this time and as such an assessment of said impacts will be deferred until such time as they can be appropriately determined in accordance with the Contract Documents.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was requested by Mike Whiteside, YBI Coordination Engineer, on January 22, 2009 and concurred by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

18-JUN 9L0310

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 161	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

As authorized by the Engineer and as shown on Sheets 2 and 3 of this change, construct a temporary Eastbound I-80 on-ramp on the T7 alignment line station of the West Tie-In Temporary Bypass Structure (TBS) at Hillcrest Road.

For this work, the Contractor shall be compensated a lump sum of $ 403,965.00. The work includes but is not limited to placing aggregate base and asphalt concrete, installing temporary k-rails and striping, grinding and removing existing pavement and concrete, and all moving of k-rail for access purposes. This sum constitutes full and final compensation, including markups, for all costs associated with the work of this change.

Total Cost of Extra Work at Lump Sum $403,965.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$403,965.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 162	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Provide, install, engineer, and maintain temporary shoring for the slope at the northern end of the excavation at Skid Bent Foundations A3W and A3E as shown on Sheets 2, 3, and 4 of this Change Order. This temporary shoring is in addition to the excavation, sloping, and temporary shoring included under Contract Change Order No. 90.

For this work, the contractor will be compensated a lump sum of $268,235.00. The sum includes full compensation for all additional mobilization, demobilization, and remobilization costs necessary to perform this work, and includes all associatec fine grading, excavation, and hauling costs. Any excavated soil, including drill soils from the soil nail / rock dowels, will be either stored on site, or at the Contractor's stockpile site in accordance with the provisions of Contract Change Order No. 90.
The sum also includes full compensation for all additional mobilization, demobilization, and remobilization costs necessary to complete the Skid Bent foundation work in this area.

This sum constitutes full and final compensation for all costs, including all markups, associated with the work of this change

Total Cost of Adjustment of Compensation at Lump Sum $268,235.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$268,235.00**

UNLESS NOTED OTHERWISE, BLCE WILL NOT SUPERVISE, DIRECT, CONTROL, OR HAVE AUTHORITY OVER OR BE RESPONSIBLE FOR CONTRACTORS' SEQUENCES OR PROCEDURES OF CONSTRUCTION.
3. CONTRACTOR SHALL VERIFY ALL DIMENSIONS AND ELEVATIONS PRIOR TO ORDERING, FABRICATING OR INSTALLING ANY OF THE ITEMS SHOWN ON THESE DRAWINGS.
4. EXCAVATE AND INSTALL SOIL NAILS/ROCK DOWELS IN LIFTS. EXCAVATE NO MORE THAN 2 FEET BELOW ELEVATION OF NEXT ROW OF SOIL NAILS/ROCK DOWELS PRIOR TO INSTALLING DOWELS.
5. AFTER EACH EXCAVATION LIFT IS COMPLETED, ALL LOOSE MATERIAL SHALL BE SCALED FROM THE CUT FACE PRIOR TO INSTALLING SOIL NAILS/ROCK DOWELS.
6. ADDITIONAL SPOT DOWELS MAY BE NEEDED TO SUPPORT POTENTIALLY UNSTABLE ROCK BLOCKS EXPOSED BETWEEN PATTERNED DOWELS.
7. A REPRESENTATIVE OF BLCE SHALL MAKE A SITE VISIT WHEN THE EXCAVATION REACHES 15' DEEP IN ORDER TO CONFIRM THAT THE SOIL NAILS/ROCK DOWEL EXCAVATION SUPPORT IS SUITABLE FOR THE EXPOSED GEOTECHNICAL CONDITIONS.

MATERIALS

1. SHOTCRETE: f'c = 4000 PSI.
2. NAIL/DOWEL TENDONS: DYWIDAG THREADBAR CONFORMING TO ASTM A615, GRADE 75 OR AN APPROVED EQUIVALENT PRODUCT WITH HEX NUTS AND SPHERICAL SEAT WASHERS.
3. BEARING PLATE: FABRICATED OF ASTM A572, GRADE 50 MATERIAL OR BETTER.
4. NEAT CEMENT GROUT: 5 GALLONS OF WATER PER 94 POUND SACK OF PORTLAND CEMENT.
5. CENTRALIZERS SHALL BE MADE OF PVC.
6. WELDED WIRE REINFORCEMENT: ASTM A185. MIN LAP SPLICE = 8".
7. GEOCOMPOSITE DRAIN STRIP: MIRADRAIN 6000 OR EQUAL.

SOIL NAIL/ROCK DOWEL INSTALLATION

1. DRILL HOLE OF THE SPECIFIED LENGTH AND DIAMETER. HOLES SHALL BE CASED IF NECESSARY.
2. INSERT NAIL/DOWEL TENDON WITH CENTRALIZERS.
3. TREMIE GROUT DRILLHOLE USING A GROUT TUBE INSTALLED TO THE BOTTOM OF THE DRILLHOLE.
4. INSTALL WELDED WIRE FABRIC AND SHOTCRETE.
5. INSTALL BEARING PLATE WHILE FACING SHOTCRETE IS PLASTIC. TIGHTEN NUT TO ASURE 100% BEARING BETWEEN PLATE AND SHOTCRETE.

SOIL NAIL/ROCK DOWEL TESTING

1. CONTRACTOR SHALL PROVIDE 2 SACRIFICIAL PROOF TEST NAILS/DOWELS AT ROW 1 AND ONE SACRIFICIAL PROOF TEST NAIL AT ROW 2. PROOF TEST NAIL LOCATIONS SHALL BE PROPOSED BY THE CONTRACTOR AND APPROVED BY BLCE. TEST NAILS/DOWELS SHALL BE A MINIMUM OF 15 FEET LONG WITH ONLY THE BOTTOM 5 FEET OF THE NAIL/DOWEL ANCHORED WITH CEMENT GROUT.
2. TESTING SHALL BE PERFORMED AGAINST A TEMPORARY BEARING YOKE WHICH BEARS ON THE SHOTCRETE FACING. NO PART OF THE YOKE SHALL BEAR WITHIN 6 INCHES OF THE HEAD OF THE SOIL NAIL/ROCK DOWEL AND THE SHOTCRETE FACING SHALL BE BLOCKED OUT SO THE NAIL/DOWEL TENDON IS NOT BONDED TO FACING.
3. MONITOR AND RECORD TOTAL MOVEMENT OF THE NAIL/DOWEL HEAD DURING TESTING. MOVEMENTS OF THE NAIL/DOWEL HEAD, RELATIVE TO AN INDEPENDENT FIXED REFERENCE POINT, SHALL BE MEASURED AND RECORDED TO THE NEAREST 0.001-INCH AT EACH INCREMENT OF LOAD.
4. APPLIED TEST LOADS SHALL BE DETERMINED USING A CALIBRATED PRESSURE GAGE.
5. THE JACK AND PRESSURE GAGE SHALL HAVE A PRESSURE RANGE NOT EXCEEDING TWICE THE ANTICIPATED MAXIMUM TEST PRESSURE.
6. JACK RAM TRAVEL SHALL BE SUFFICIENT TO ALLOW THE TEST TO BE DONE WITHOUT RE-SETTING THE EQUIPMENT.
7. PROOF TESTS SHALL BE PERFORMED BY INCREMENTALLY LOADING THE PROOF TEST NAIL/DOWEL TO THE MAXIMUM TEST LOAD IN ACCORDANCE WITH THE FOLLOWING LOADING SCHEDULE:

LOAD SCHEDULE (M = 47 KIPS)	
AL (0.10M)	4.7 KIPS
0.25M	11.8 KIPS
0.50M	23.5 KIPS
0.75M	35.3 KIPS
1.00M	47.0 KIPS - MAX TEST LOAD
AL (0.10M)	4.7 KIPS

9. EACH INCREMENT OF LOAD SHALL BE APPLIED IN LESS THAN ONE MINUTE AND BE HELD FOR AT LEAST ONE MINUTE BUT NOT MORE THAN 2 MINUTES, EXCEPT THAT THE MAXIMUM TEST LOAD SHALL BE HELD FOR 10 MINUTES. DURING THE 10 MINUTE LOAD HOLD, THE MOVEMENT OF THE HEAD OF THE NAIL/DOWEL SHALL BE MEASURED AT 1, 2, 3, 4, 5, 6, AND 10 MINUTES. IF CREEP MOVEMENT MEASURED BETWEEN ONE MINUTE AND 10 MINUTES EXCEEDS 0.04 INCHES, THE MAXIMUM TEST LOAD SHALL BE MAINTAINED AN ADDITIONAL 50 MINUTES AND MOVEMENTS SHALL BE RECORDED AT 15, 20, 25, 30, 45, AND 60 MINUTES.
10. ACCEPTANCE CRITERIA:
    A. TOTAL CREEP MOVEMENT BETWEEN ONE AND 10 MINUTES IS LESS THAN 0.04 INCHES OR LESS THAN 0.08 INCHES BETWEEN 6 AND 60 MINUTES AND THE CREEP RATE IS LINEAR OR DECREASING THROUGHOUT THE CREEP TEST LOAD HOLD PERIOD.
    B. A PULLOUT FAILURE DOES NOT OCCUR AT THE MAXIMUM TEST LOAD.

CCO DESCRIPTION: Bent A3 Shoring	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

This change compensates the contractor for all additional costs involved in engineering, providing, installing, and maintaining temporary shoring at Skid Bent Footing A3, in accordance with Sheets 2, 3, and 4 of this contract change order.

This contract calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie -In to the island, and the Viaduct structure between the two tie ins.

The Department's December 14, 2006 Strategy memo called for the ETI structure to be constructed by rolling out the existing structure and rolling in the new detour structure in lieu of the contractor's plan to incorporate the existing structure as part of the new detour. The roll out/roll in design requires the construction of a steel skid bent structure that supports the ETI structure as it is rolled into place and the existing structure as it is rolled out.

Skid Bent foundations (SBF) are being installed under contract change order (CCO) 90. CCO 90 was approved on April 14, 2008, with the design anticipating a bench being excavated for SBF's A3W and A3E at a level 6.12 meters (20 feet) in elevation below the next work area to the north. The construction of Skid Bent A3 is currently on the project's critical path and as such cannot be delayed without affecting the overall project schedule. Due to the existence of various obstructions including newly constructed bents, staging areas, and access roads in the area north of Bent A3, the A3 excavation cannot be sloped back as originally planned until this area is cleared out, and this would cause a delay to the A3 construction. This CCO provides for a revised staging plan design that enlarges the available flat work area on the above level by 35 feet laterally by steepening the slope at the north side of the A3 excavation from 2 vertical to 1 horizontal (2:1) to 1:4. The steeper slope will require temporary shoring (ground stabilization) to support the heavy crane loads anticipated. The proposed temporary shoring provided under this CCO can proceed now, and allow A3 construction to proceed without a delay, thus mitigating the possible delay.

The Contractor's engineer (Berti-Lindquist Consulting Engineers) has prepared drawings to provide for a temporary wall to shore the slope. The construction of the temporary wall includes a 29 lineal meter section of soil nail / rock dowel wall. Excavation costs associated with the construction of the wall are included.

This work will be performed as an Adjustment of Compensation at Agreed Lump Sum for the amount of $268,235.00. The agreed lump sum will be funded through the contract's contingency funds. A cost analysis is in the project files.

It is anticipated that the identified costs excluded from Change Order No. 90 shall result in a minimum of 7 to 8 additional change orders being issued as the design is completed, and the costs are quantified and agreed to. CCOs No. 45, 149, 112, 123, and 155 have been executed to date, and CCOs 180 and 162 are pending. These individual change orders have been assigned as the costs are being quantified and agreed to in order to facilitate the tracking of the excluded items.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change has been concurred by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required, as the work does not affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 163	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Construct the steel decking in accordance with the revised grades as established by the Engineer.

Work includes furnishing and installing of additional decking hanger assemblies, bolts and fasteners, and angle iron as required; and reusing the previously installed steel decking to complete the work per all applicable plans and specifications for the Viaduct Span 49.

For this work, the Contractor will be compensated a lump sum of $83,202.00. This sum constitutes full compensation for all costs, including markups, by reason of this change.

Total Cost of Extra Work at Lump Sum $83,202.00

Estimated Cost: Increase ☑ Decrease ☐ $83,202.00

By reason of this order the time of completion will be adjusted as follows: 0 days

SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: VIA Span 49 Deck Grade Conflict	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

the revised reconstruction of the metal decking for the Viaduct lower deck Span 49.

This contract provides for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour will allow for the construction of the permanent Yerba Buena Island Transition Structure (YBITS) that connects the signature SAS structure to Yerba Buena Island.

As part of that work, the plans call for the construction of a double deck viaduct structure, consisting of a concrete slab being supported by metal decking, which in turn is supported by a steel truss and floor beam system. The metal deck acts as shoring and formwork for the construction of the reinforced concrete viaduct roadway. Span 49 deck is on a horizontal curve, with a length of 84.337 meters on the south side and 71.347 meters on the north side. The slope of the deck varies, with the superelevation changing as the deck turns this curve.

After installation of the floor beams was completed, the Department provided survey staking for the metal decking construction. Once the survey was placed, construction of the steel decking proceeded. Approximately 95% of the steel decking had been constructed when it was recognized that the Department survey had been placed in error. Construction was then suspended, the grades were reset to the correct elevations. The system to support the decking allows for the reutilization of metal decking sections, but the suspending straps and angle iron had to be replaced. This change order compensates the contractor for the additional costs to reconstruct the decking.

Compensation shall be paid as extra work at an agreed lump sum of $83,202.00 which shall be financed from the contract's contingency funds. A force account cost analysis is on file.

There is no adjustment of contract time specified in this change as it does not affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence for this change order is not required, as the viaduct is a temporary structure and does not affect any permanent roadway.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 164	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Design, provide, install, and remove temporary trestle system, including survey layout, earthwork, pile driving, steel members, deck, and handrails as required to construct a crane runway in accordance with sheets 2 through 7 of this change order and BCDC Permit 8-01 Amendment 22 for the Crane Runway Platform. The system shall provide access for cranes as required to construct the skid bent and truss system for the East Tie In (ETI).

This change order price includes full compensation for removal of and any required legal disposal of materials used during the work.

For this extra work, the Contractor will be compensated $2,770,000.00. This lump sum constitutes full compensation, including markups, for furnishing all labor, material, tools, equipment, and incidentals for doing the work involved in this change.

Prior to driving piles, a preliminary 500-meter radius safety zone for marine mammals (harbor seals, California sea lions, harbor porpoises and gray whales) will be established around the pile driving site. The Department of Transportation will have National Marine Fisheries Service approved marine mammal observers on site to establish and conduct monitoring of the safety zone. Once pile-driving begins, the safety zone radius for marine mammals will then be enlarged or reduced by the Department of Transportation, depending on monitored sound pressure levels.

If one or more marine mammals are observed within the safety zone, pile-driving shall be delayed until the mammals all move out of the area. If a marine mammal is seen above water and then dives below within the safety zone, the contractor shall wait 15 minutes, and if no marine mammals are observed within the safety zone, at that time it will be assumed that the animal has moved beyond the safety zone. If a marine mammal enters the safety zone after the driving of a pile has commenced, the driving of that pile can proceed until it has reached the prescribed tip elevation.

If pile driving of the current pile ceases for 30 minutes or more and a marine mammal is sighted within the designated safety zone prior to resumption of pile driving, the observer must notify the Engineer immediately and direct the Contractor to follow the mitigation requirements as outlined in the above paragraph.

If the pile driving work is delayed due to the marine mammal mitigation requirements, in addition to the agreed lump sum, the actual delay cost will be paid for as extra work. The equipment that is involved in such a delay will be paid for in accordance with Standard Specification Section 8-1.09 RIGHT OF WAY DELAYS and shall be compensated under a separate change order.

Contractor shall take measures, including working overtime and committing additional resources as required, to complete pile driving before December 1, 2008, and complete all work to allow trestle to be usable in a timely fashion as required to construct the skid bent and truss system for the ETI.

All work associated with the implementation and maintenance of the Contractor's Storm Water Pollution Prevention Plan and erosion control, including concrete washouts, shall be paid by the Department separately from this change order.

Flagging costs associated with this work shall be paid under change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum payment made under this change order.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 164	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

There will be no adjustment in contract time for this change order.

Total Cost of Extra Work at Lump Sum $2,770,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$2,770,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 165	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 8-1.09 "Right of Way Delays" of the contract Standard Specifications, compensate the Contractor for delay costs associated with their subcontractor, Condon Johnson & Associates, pertaining to the delays to the construction of the soil nail wall at Bent W7. These delays were incurred from May 5 to May 23, 2008 and July 28 to October 10, 2008 due to survey conflicts.

For these delay costs, the Contractor will be compensated a lump sum of $71,720.00. This sum constitutes full compensation for all costs, including markups, by reason of this change.

Provide compensation to the Contractor for all costs incurred in removing the constructed W7 soil nail wall and in the backfilling of the wall's excavation. Backfilling shall be performed up to approximate elevation 25.0 as determined by the Engineer.

For these wall removal and backfilling costs, the Contractor will be compensated a lump sum of $80,560.00. This sum constitutes full compensation for all costs, including markups, by reason of this change.

Total Cost of Adjustment of Compensation at Lump Sum $152,280.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$152,280.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 166	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor for costs to be incurred in order to improve the fabrication delivery schedule of the skid bent and skid beam of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)). Costs include but are not limited to leasing additional shop space, leasing additional lay down and storage yards, providing additional fabrication equipment and providing additional and extended labor resources.

For this work, the Contractor shall be compensated an agreed lump sum price of $2,028,950.00 which constitutes full and final compensation, including all markups, for the work specified under this change order.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Total Cost of Adjustment of Compensation at Lump Sum $2,028,950.00

The lump sum payment provided herein is based on the shipment of the southern portion of the fabricated steel skid bent and skid beam to the project by February 23, 2009. In the event the fabricated steel is shipped prior to that date, the Contractor shall be paid an incentive of $42,860.00 for each calendar day prior to February 23, 2009 that the steel is shipped. Any incentive payment shall not exceed $900,000.00 and shall be provided under a supplemental change order.

For the purpose of this incentive, the shipment of the fabricated steel shall be defined as the date the last barge carrying the last skid beam segments and skid bent cross beam assemblies of the southern portion of the skid bent and beam departs from the fabricator's facilities in Vancouver, WA. The southern portion of the skid bent and beam shall be defined as Bent 3 through Bent 6 of both Skid Bent A and Skid Bent B, Skid Beams Segments A2 through A4 and Skid Beam Segments B2 through B3.

	FED. NO. ACBRIM-080-1(097)N
CCO#: **166** SUPPLEMENT#: **1** Category Code: **BZZZ**	CONTINGENCY BALANCE (incl. this change) **$58,308,143.60**
COST: **$900,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Thompson Metal Fab Incentive	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

compensation for contractor incentives for early completion of the fabrication of the skid bent and skid beam of the East Tie-In portion of the Temporary Bypass Structure (Bridge # 34-0006 (TEMP)).

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

This supplemental was anticipated by the original Contract Change Order No. 166, which has been approved and executed. Approval for this change order from the TBPOC was granted on December 23, 2008. As such it is not necessary for the Contractor to sign this supplemental, which will be processed unilaterally. Compensation for this change shall be performed as an Adjustment of Compensation at Agreed Unit Price for a total cost of $900,000.00, which can be financed through the Contingency Fund.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

CCO DESCRIPTION: Thompson Metal Fab. Shop Drawing Delay	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

compensation for delay costs incurred by the Contractor's steel fabricator due to shop drawing approval delays pertaining to the fabrication of the steel skid beams and towers of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. That memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

The Department directed new design of the ETI structure provides for a roll-out / roll-in concept with a new double deck steel truss span being erected adjacent to the existing span and then rolled into place after the existing span is rolled out. The existing and new trusses will be rolled out and rolled in on top of a 2 temporary steel skid beams each supported by 6 steel towers up to 46 meters in height. Change Order No. 116 provided for the fabrication of this skid beams and towers which is comprised of approximately 3,000 metric tons of steel.

Under terms agreed to between the contractor and the Department, the shop drawings for the skid beams and towers were to be created and approved by the Department and then issued to the contractor for fabrication. These shop drawings were to be created by a design consultant employed by the Office of Structure Contract Management (OSCM) who would work in concert with the OSCM design consultant in charge of the entire ETI structure.

It was originally anticipated that the tower and skid beam shop drawings would be approved for fabrication by June 16, 2008 and June 30, 2008 respectively. The approved tower shop drawings were not actually issued until September 10, 2008 with the approved skid beam shop drawings issued on September 30, 2008. This represented a 13 and 14 week delay to the fabricator's start of fabrication. This change order provides compensation to the steel fabricator of the tower and skid beam due to this 13 to 14 week delay to the start of fabrication.

Costs resulting from the shop drawing approval delay include unabsorbed labor and shop time during the delay period. The fabricator was able to mitigate a majority of the 13 to 14 week delay by absorbing their as-planned labor and shop space on other on-going projects. However, the fabricator was constrained by the uncertainty of shop drawing approval that was being projected by the Department to be approved within weeks throughout the entirety of the delay period.

The contractor shall be compensated for the inefficiencies related to this redistribution of labor and shop space. Compensation is based on an established shop labor rate which is supported by 2 separate Department audits pertaining to fabricator delays on other SFOBB projects. The affected as-plan labor is supported by the labor component of the agreed price provided under Change Order No 116.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write

Compensation for these costs shall be paid as an adjustment of compensation at an agreed lump sum price of $632,670.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

Adjustment of contract time is deferred as the work may affect the controlling operation.

This change was concurred by Mike Whiteside - YBI Coordination Engineer, Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as the work doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 168	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Incorporate the changes to the West Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) as shown in the revised plan sheets of Sheets No. 2 through 21 of this change order.

Adjustment of Compensation at Lump Sum:

For all costs associated with the changes incorporated into the West Tie-In structure under this change order, the Contractor shall be compensated an agreed lump sum of $147,390.00. This lump sum constitutes full compensation, including all markups, for all costs associated with this change.

Estimated cost of Adjustment of Compensation at Lump Sum $147,390.00

RECEIVED
JUN 23 10
04-0120R4

Estimated Cost: Increase ☑ Decrease ☐ **$147,390.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

WTI COLUMN 40R THROUGH 45BR FINAL POST TENSIONING PROCEDURE

1. Final Post Tensioning Procedure shall proceed only with approval of the Engineer and after the Structure has displayed adequate stability for 60 day period.
2. Record the loads on the jacks at each location.
3. Jack an additional 600 KN of Force into each Column. Lock jacks rigid and re tighten Lower Anchor Plate nuts to 425 N-m of torque.
4. Grout Prestress Bars and XS Pipe.
5. Remove Jacks.

BENT CAP ADJUSTMENT PROCEDURE (IF REQUIRED)

1. Remove required number of shim plates.
2. Adjust jacks to achieve proper load cell readings and grades as approved by the Engineer.
3. Fill in gap between shim plates and cap soffit.
4. Adjust jacks to achieve adequate bearing between shim plates and cap soffit. Bearing shall be achieved when all gaps between shim plates and soffit have been removed and all plates are snug to one another. Re tighten Lower Anchor Plate Nuts to 425 N-m of torque to reseat anchor Plates.
5. Monitor Structure Stability for 60 days.

NOTE:
THE CONTRACTOR SHALL VERIFY ALL CONTROLLING FIELD DIMENSIONS BEFORE ORDERING OR FABRICATING ANY MATERIAL.

TO: MIKE FORNER / DEANNA VILCHECK	FILE: **E.A.** 04 - 0120R4
	CO-RTE-PM SF-80-12.6/13.2
FROM: BILL CASEY	**FED. NO.**
CCO#: **168** SUPPLEMENT#: **0** Category Code: **CHPT**	CONTINGENCY BALANCE (incl. this change) **$41,450,322.59**
COST: **$147,390.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☐ YES ☑ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: WTI Rebar & Prestressing Changes	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**0**

THIS CHANGE ORDER PROVIDES FOR:
Design revisions to the reinforcing steel, shim plates and stressing rods of the West Tie-In (WTI) structure.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon certain design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently the TBPOC that provided for the Department to assume control of the design of the West Tie-In structure from the contractor.

This change order provides for numerous changes to the structure's reinforcing steel, shim plates and stressing rods as issued by Toll Bridge Design.

Major costs associated with the work include increasing the size of stressing rods for the south edge beam hinge corbel from 32 mm to 36 mm and specifying that these rods be galvanized and adding additional reinforcing steel to the bent caps.

Compensation for this work shall be paid as an adjustment of compensation at an agreed unit price of $147,390.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Jaime Gutierrez - Project Engineer, and Lina Ellis - Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 169	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform the following work pertaining to the handling and jobsite transportation of fabricated steel for the skid bent and skic beam of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)):

1) Provide for a lay down yard at Mare Island to receive and handle all steel shipped by barge from the Contractor's fabrication facility in Vancouver, Washington.
2) Unload 4 EA barge shipments comprised of 7 EA skid beam segments and 12 EA skid bent cross beam assemblies at Mare Island.
3) Load steel at Mare Island for marine transport, ship to the project site and unload steel at the project site.
4) Unload all steel delivered by truck directly to the project site.

For this work, the Contractor shall be compensated an agreed lump sum price of $1,095,020.00 which constitutes full compensation, including all markups, for the work specified under this change order.

This change order provides full compensation for Item No. 9 of the 9 items of work excluded from the lump sum price paid under Change Order No. 129 and no additional compensation shall be paid for that item of work.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Total Cost of Extra Work at Lump Sum $1,095,020.00

Change Requested by: Engineer

CCO 170	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform the following work pertaining to the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP))

Perform the retrofit work for the steel truss modifications at existing YB4 span north and south truss panel points L29 and L33 in accordance with Plan Sheets No. 2 through 3 of Change Order No. 160, and Sheets 3 through 8 of this change order. All revisions to the work shown on Sheets No. 3 through 8 of this change order shall supersede the original plan sheets issued under Change Order No. 160 Sheets 4 through 9. Work includes: all necessary layout; unloading and handling material at the site; removal of existing rivets, nuts and bolts as required; steel drilling and reaming; steel erection and installation; bolt installation, testing, and inspection.

Flagging costs associated with this work shall be paid under Contract Change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum payment made under this change order.

The compensation provided under this change order is based on the work being done on a 10-hour day, 6 days per week schedule in an effort to support the placement of traffic on the Temporary Bypass Structure by September 8, 2009.

For this work, the Contractor will be compensated a lump sum of $413,600.00. This sum constitutes full and final compensation for all costs, including all markups, for the work specified herein.

Compensation for the following items of work pertaining to the erection of the ETI existing steel truss reinforcement have not been addressed by this change order and shall be paid under separate change orders:

1. Fabrication and delivery to the jobsite of all steel plates, brackets, stiffeners and bolts.

2. Costs associated with any work at Pier YB1 or pier YB3.

3. Costs associated with welding inspection; lead abatement; touchup or finish painting; providing access or access platform for the work.

Total Cost of Extra Work at Lump Sum $413,600.00

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 170	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

RECEIVED
09 OCT -8 A10:05

Estimated Cost: Increase ☑ Decrease ☐ **$413,600.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

Procedure for Installation of Stiffeners

1. Prior to installation of bolts or stiffeners at the jacking points at L29 and L33, sand blast clean all paint at the jacking locations and lower flange of the floor beams as shown in "Existing Truss Details" sheets.
2. All stiffener installation shall be completed prior to roll out roll in.
3. Install all bolts in chords that do not require removal of rivets. Use long erection bolts (A490) and nuts at stiffener locations with heads installed on the outside face of the chords.
4. Once Step 3 is complete, replace rivets in the chords (except those at the stiffeners) as follows: Remove a maximum of 2 rivets at any time, ream holes and install bolts. Repeat this process until all bolt replacements in the chords have been installed.
5. Repeat the process described in Step 4 to replace rivets at the stiffeners. At stiffener locations use long erection bolts and nuts with the heads installed on the outside face of the chords.
6. Cut an opening in the bottom gusset as shown. The Contractor shall ensure that no element of the truss is damaged.
7. Install two short L 102x102 and two short L 102x203 and connecting web plate directly above area for jacking plate at L33N, L33S. Install bolt with heads installed on the inside face to receive brackets at a later stage.
8. Cut out the eight rivets in the bottom flange angles for connecting the jacking plate.
9. Lift and install the jacking plate with spacer plates with 8 countersunk bolts to the flanges of the truss.
10. Install T-stiffeners at each side of the post web bearing directly onto the jacking plate below. Drill holes and install bolts to the jacking plate and the post web.
11. Install brackets on outside of bottom chord with spacer plates, bearing onto jacking plate. Remove rivets, ream rivet holes, drill new holes, and install bolts.
12. Install the 51 mm vertical stiffener plates on each side of the post. Install only one stiffener at a time as follows:
    a. Install stiffener bearing directly onto the jacking plate below.
    b. Provide a positive means to retain the heads of the erection bolts.
    c. Remove nuts from all the long erection bolts at the stiffener being replaced. In the earlier operations, all the nuts were installed on the inside face of the chord.
    d. Once the stiffener is in place, tighten all nuts for the bolts at that stiffener.
    e. Remove erection bolts one by one and replace with new bolts (Type A) with bolt head installed towards the inside of the chord except at locations where the 100 mm plate for strut is connected. See "Long Bolt Details".
    f. Completely install all four stiffener plates, one by one, at each jacking point.
13. Install strut to floor beam on inside of bottom chord with spacer plates using the following procedure:
    a. Remove rivets, ream rivet holes and drill new holes at the bottom chord connection.
    b. Replace rivets with bolts, one at a time, at each end of the bracket area along the lower flange of the floor beam (Stage 1 and 2).
    c. Extract 6 rivets at front end of the bracket area (Stage 3). Replace with spacer plate and half of the bracket assembly. Tighten bolts to the floor beam above.
    d. Extract 6 rivets at back end of the bracket area (Stage 4). Replace with spacer plate and half of the bracket assembly. Tighten bolts to the floor beam above.
    e. Install splice plates on each side of the bracket web.
    f. Remove only the erection bolts left previously at locations where the 100 mm plate for strut is connected to 51 mm stiffener plate. Install strut with shims and new bolts to lower chord end using Type B and Type C bolts. See "Long Bolt Details".
    g. Complete strut connection to floor beam bracket with shims and bolts.
14. Install connector plate between the stiffener plates.

THIS CHANGE ORDER PROVIDES FOR:

Compensating the contractor for the erection of structural steel materials required to reinforce the existing Truss YB-4 for the East Tie-In (ETI) structure.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins. The contract was awarded as a performance-based project with the contractor responsible for meeting the design criteria specified in the contract.

The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

In January 2009, Toll Bridge design provided design drawings to provide additional stability to existing spans YB1, YB2, and YB4 to permit the planned roll out during the Labor Day traffic switch to the YBID. CCO No. 160 was issued to provide compensation for the fabrication and delivery of the materials, and CCO NO. 93-S1 was issued to provide compensation for the lead paint abatement for this work. The design drawings were modified May 6, 2009. This CCO will provide compensation to the contractor for the field erection required at span YB4.

Compensation for this change shall be for an agreed lump sum cost of $413,600.00, which will be financed through the Contingency fund. A cost analysis is in the project files.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was requested by Mike Whiteside - YBI Coordination Engineer, per Memoranda dated January 22, 2009 and May 7, 2009 and concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 171	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform all work shown on the plan sheets and specifications of Pages No. 3 through 23 of this change order for the roll out of the Span YB4 steel truss of the existing structure (Bridge No. 33-0025) and the roll in of the steel truss of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

Compensation paid under this change order includes all costs associated with the following 4 items of work:

1) Furnishing, installing, and removing all equipment and material necessary to perform the roll out and roll in operations in accordance with the plans and specifications of this change order and the approved shop drawings (Listed as SAP No: 7000043592; Project No: 0010026943-P038-D) pertaining to the roll out and roll in operations as issued by Mammoet USA Inc. and as authorized by the Engineer. This work includes but is not limited to furnishing and installing the skid shoes, skid tracks, and skid assembly; push pull units; tow bars; hydraulic jacks; and all appurtenances.

2) Furnishing and installing the 8 structural steel supports installed between the bottom chord and the skid beam for both the YB4 and ETI trusses necessary for the roll out and roll in operations in accordance with the plans and specifications of this change order and the approved shop drawings (Listed as SAP No: 7000043592; Project No: 0010026943-P038-D) pertaining to the roll out and roll in operations as issued by Mammoet USA Inc. and as authorized by the Engineer. This work includes but is not limited to furnishing and installing all distribution, stability, transverse and haunch beams; all pot bearings, plates and shims; all support brackets; and all appurtenances.

3) Performing the actual roll out and roll in operations of the YB4 and ETI steel truss spans except for any costs specifically excluding in this change order.

4) All costs incurred by Mammoet USA Inc. concerning the roll out of the existing Span YB4 and the roll in of the new steel truss of the East Tie-In.

For this work, the Contractor shall be compensated a lump sum of $10,147,370.00. Except for the items of work specifically excluded in this change order, this sum constitutes full and final compensation, including all markups, for all costs associated with the work of this change.

All costs associated with the following 7 items of work are excluded from this change order:

1) Support costs concerning work to be performed by C.C. Myers Inc. and their steel erection subcontractor Danny's Construction Co., Inc. during the actual roll in and roll out operations of the YB4 and ETI steel truss spans to be performed during the extended weekend closure of the San Francisco Oakland Bay Bridge.

2) The removal of the 8 structural steel supports installed between the bottom chord and the skid beam for both the YB4 and ETI trusses as defined by Item 2 in the above section.

3) Furnishing and installing concrete barrier and placing pavement delineation for the ETI truss after the structure is rolled into its permanent alignment.

4) Furnishing and installing the Bent 52A and Pier E1 expansion joints and expansion joint steel barriers.

5) Furnishing and installing the Bent 52A and Pier E1 permanent bearings.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 171	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

6) Any costs associated with the actual closure of the San Francisco Oakland Bay Bridge.

7) Work associated with the implementation and maintenance of the Contractor's Storm Water Pollution Prevention Plan and erosion control, including concrete washouts.

Any costs associated with these 7 items of work shall be paid under separate change orders.

Flagging costs associated with this work shall be paid under Change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum compensation provided under this change order.

The compensation provided under this change order is based on the roll out and roll in operations being performed over during the full closure of the San Francisco Oakland Bay Bridge beginning at 8:00 PM on September 3, 2009 and ending no later than 5:00 AM on September 8, 2009.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Total Cost of Extra Work at Lump Sum $10,147,370.00

All payment clauses contained within the specifications cited under this change order are superseded by the agreed lump sum payment method specified above.

Estimated Cost: Increase ☑ Decrease ☐ **$10,147,370.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

Submitted by

Signature	Resident Engineer BILL CASEY	Date 6-4-09

Approval Recommended by

Signature	SFOBB Construction Manager MIKE FORNER	Date 6-5-09

Engineer Approval by

Signature	SFOBB Construction Manager MIKE FORNER	Date 6-9-09

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: **If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.**

Contractor Acceptance by

Signature	(Print name and title) DANIEL E. HAMICK, PRESIDENT	Date 6/08/09

10-1.__ MOVE BRIDGE

Move bridge shall consist of rolling-out the existing bridge superstructure and rolling-in the new bridge superstructure. This shall include jacking, moving and lowering bridge superstructure to new support locations in conformance with the details shown on the plans and these special provisions.

The roll-out roll-in system comprises all elements from the top of the skid beam top flange to the underside of the truss structures including but not limited to pickup systems, longitudinal translation system and provision of appropriate tolerances.

The Contractor shall design, furnish, operate, monitor and remove the jacking and support system with appurtenant items as necessary to jack, move and lower the structure in a controlled manner.

The Contractor's roll-out roll-in system shall conform to the controlling dimensions as shown on the plans. The roll-out roll-in system shall move the bridge superstructure such that the distance between the top flange of the skid beam and the bottom chord of the superstructure does not exceed the dimension shown on the plans.

The Contractor shall ensure that the roll-out roll-in system does not create eccentricities of loading on any element of the new structure, the existing structure or the skid beams that exceeds the allowable limits shown on the plans.

The construction sequence and application of jacking loads shall be as shown on the plans. Proposed changes to the construction sequence and application of jacking loads shall be subject to the Engineer's approval.

Proposed changes shall be coordinated with the Engineer to ensure that all elements required by the roll-out roll-in system are incorporated in a timely manner into the skid beam, permanent structure and existing YB4 span designs.

Attention is directed to Section "Maintaining Traffic" and "Falsework" of these special provisions.

The Contractor shall provide a designated field engineer who is registered as a Civil Engineer in the State California. The Contractor's designated field engineer shall be present at the jobsite throughout the moving operations.

INTEGRATED PROCEDURE MANUAL

The Contractor shall submit to the Engineer an integrated procedure manual for moving the bridge. The manual shall be signed by a representative of the Contractor and each subcontractor involved in the roll-out roll-in operation. The Contractor shall submit 6 copies of the draft manual for review and approval by the Engineer 6 months prior to the roll-out roll-in date. Final copies of the integrated procedure manual, revised to address the Engineer's review comments, shall be furnished in accordance with these special provisions. The integrated procedure manual shall incorporate all installation manuals produced for other items of work related to the roll-out roll-in. Attention is directed to "Pot Bearings," and "Lead Rubber Bearings," of these special provisions regarding bearing installation manuals.

The integrated procedure manual shall include a detailed schedule of activities, location of activities, personnel, communication plan, equipment, structure tolerance, risk management plan, and access for the Engineer to construction activities. Attention is directed to Section 5-1.08, "Inspection," of the Standard Specifications.

The integrated procedure manual shall include, but is not limited to the following:

Personnel

Personnel involved in the roll-out roll-in shall be listed with duties and responsibilities described.

Training plans shall be prepared for specific roll-out roll-in activities. Personnel involved in each training activity shall be listed. Dates and locations of training activities shall be listed. The Engineer may attend training activities.

Communication Plan

The communication plan shall include contact information for project personnel, an organizational chart, and correspondence protocols. Persons of responsible charge for specific activities shall be identified and the scheduled periods of their activities during roll-out roll-in operation.

The communication plan shall outline how the Contractor and all subcontractors will coordinate and remain in contact with each other and the Engineer during the roll-out roll-in operation. Division of work shall be identified, including lead and contact personnel for each activity.

Equipment

Equipment to be utilized during roll-out roll-in shall be identified. The Contractor shall provide the following:

A. Equipment list, function, and location during the roll-out roll-in.
B. Transportation and placement of equipment. Mobilization and movement during roll-out roll-in shall be described (example: how to get it up on/under the structure)
C. Equipment tolerance.
D. Methods to determine measurements (indexing)
E. Accuracy of all measurements
F. Methods to determine differential displacements, including thermal movements of the East Tie-in truss.
G. Methods of assuring synchronized movements.
H. Methods of ensuring equipment is in tolerance or approaching out-of-tolerance
I. Storage and transport of equipment on site prior to roll-out roll-in.
J. Available spare parts and equipment. Storage and use shall be identified.
K. Method of moving spare parts and equipment if needed during roll-out roll-in (example: Procedures for change a skid shoe if it becomes necessary)
L. Restrictions on the placement of the jacking shoes under the trusses so as to avoid excess eccentricities

Structure Tolerance

The Contractor shall coordinate with the Engineer to determine the maximum allowable differential displacements of the existing span YB4 and the East Tie-In truss. The Contractor shall identify corrective measures to be used when differential displacements exceed the maximum allowed. Attention is directed to "Construction Surveying," of these special provisions.

Risk Management Plan

A comprehensive risk management plan shall be a prepared for the roll-out roll-in operation. The risk management plan shall identify technical, schedule, and resource risks that could

jeopardize the roll-out roll-in schedule, quality of finished product, or safety. The Contractor shall describe how the highest priority items identified will be managed to reduce risk.

A partial list of risks include, but is not limited to the following:

A. Adverse weather conditions during roll-out roll-in. Conditions that would prohibit proceeding with the roll-out roll-in shall be identified, including a warning system for when conditions approach levels which would prohibit the roll-out roll-in.
B. Equipment failure.
C. Extreme temperature immediately prior to or during roll-out roll-in which would affect materials or equipment to be used.
D. Serious injury or loss of life.
E. Excessive differential displacements.

The integrated procedure manual shall be in the possession of each representative throughout the roll-out roll-in operation.

BRIDGE MOVE WORKING DRAWINGS

The Contractor shall submit to the Engineer working drawings and design calculations for moving bridge. Such drawings and design calculations shall be signed by an engineer who is registered as a Civil Engineer in the State of California.

In addition to the requirements in Section 51-1.06A, "Falsework Design and Drawings," of the Standard Specifications, bridge move working drawings shall include the following:

A. Complete description and details of methods, equipment and sequence for jacking, moving and lowering the structure in a safe and controlled manner.
B. Complete details of methods, equipment and sequence of operations to achieve final lines and grades relative to the existing structure as shown on the plans
C. Complete scheduling of all aspects of the roll-out roll-in operations
D. Description, location, and value of all loads including construction equipment loads
E. Details for:

    1. Connections between the jacking system and the structure, including anchor bolt layouts
    2. Jacking system with appurtenant items
    3. Vertical and horizontal displacement monitoring system, control points, and schedule for taking measurements
    4. Modification to the falsework for the jacking and moving operation
    5. Restoration of the structure after removal of the jacking system.

F. Contingency plans for the roll-out roll-in system to ensure that the work will be successfully completed in the required time period.
G. Design calculations for:

    1. Connections between the jacking system and the structure
    2. Stresses in the structure due to jacking and moving operations
    3. Lateral stiffness of the jacking and moving system
    4. Modification to the falsework for the jacking operation

H. Name of the Contractor's designated field engineer

After complete working drawings and all supporting data are submitted, the Contractor shall allow 4 weeks for the Engineer's review of each submittal.

The design load for jacking bridge shall consist of the largest combined load demand from the following:

A. The dead load of the superstructure, horizontal loads, and loads shown on the plans
B. The proposed jacking forces
C. The dead loads and live loads due to the Contractor's equipment and operations

Approval by the Engineer of the bridge move working drawings or bridge move inspection performed by the Engineer will in no way relieve the Contractor of full responsibility for moving bridge.

The Contractor's registered engineer shall be present at the bridge site at all times when jacking operations or adjustments are in progress. Should an unplanned event occur, the Contractor's registered engineer shall submit immediately to the Engineer for approval, the procedure or proposed operation to correct or remedy the occurrence.

The Contractor shall perform an initial survey as part of the displacement monitoring system to record the location of the superstructure at control points prior to commencement of moving operations. Two copies of the survey shall be signed by an engineer, who is registered as a Civil Engineer in the State of California, and submitted to the Engineer.

MOVING OPERATIONS

Jacking and moving operations shall be carefully controlled and monitored to ensure that the jacking loads are applied simultaneously to prevent distortion and excessive stresses that would damage the structure.

A redundant system of supports shall be provided during the entire jacking and moving operations for backup should any of the jacks fail. The redundant support system shall permit the bridge superstructure to be set down at any point along the skid beams and permit the removal of a failed jack and its replacement with a new jack.

Adequate means shall be employed to prevent unplanned lateral and longitudinal movement of the superstructure. The jacking and support system and the superstructure shall be stable during all phases of the operation.

The Contractor shall perform a test lift of the superstructure to verify uniform lifting at all lift points. The differential displacements between lifting points shall not exceed 25 mm during the lift and during moving operations. The Contractor shall use a displacement measurement system that will provide continuous real time monitoring of vertical and horizontal displacements of the superstructure during jacking and moving operations. This information shall be continuously displayed on a monitor hooked up to the displacement measurement system. The records of vertical and horizontal displacement shall be signed by an engineer who is registered as a Civil Engineer in the State of California and available to the Engineer at the jobsite, and a copy of the record shall be delivered to the Engineer at the completion of the work.

Should unanticipated displacements, cracking or other damage occur, the operation shall be discontinued until corrective measures satisfactory to the Engineer are performed. Damage to the structure as a result of the Contractor's operations shall be repaired by the Contractor in conformance with the provisions in Section 7-1.11, "Preservation of Property," of the Standard Specifications.

Manufactured Assemblies

Manufactured assemblies shall conform to the provisions in Section 51-1.06A(2), "Design Stresses, Loadings, and Deflections," of the Standard Specifications and these special provisions.

Each jack shall be equipped with either a pressure gage or a load cell for determining the jacking force. Pressure gages shall have an accurately reading dial at least 150 mm in diameter. Each jack shall be calibrated by a private laboratory approved by the Transportation Laboratory within 6 months prior to use and after each repair. Each jack and its gage shall be calibrated as a unit with the cylinder extension in the approximate position that it will be at final jacking force and shall be accompanied by a certified calibration chart. Load cells shall be calibrated and provided with an indicator by which the jacking force is determined.

When no longer needed, attachments shall be removed from the structure and concrete surfaces restored to original conditions, except where permanent alterations are shown on the plans.

When jacking assemblies are no longer needed, they shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

PAYMENT

The contract lump sum price paid for move bridge shall include full compensation for furnishing all labor, materials, tools, equipment and incidentals, and for doing all the work involved in moving bridge including designing, constructing, maintaining, and removing the bridge moving system including surveying superstructure and columns and monitoring displacements, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

T.Y. LIN / MOFFATT & NICHOL
Two Harrison Street, Suite 500
San Francisco, CA 94105

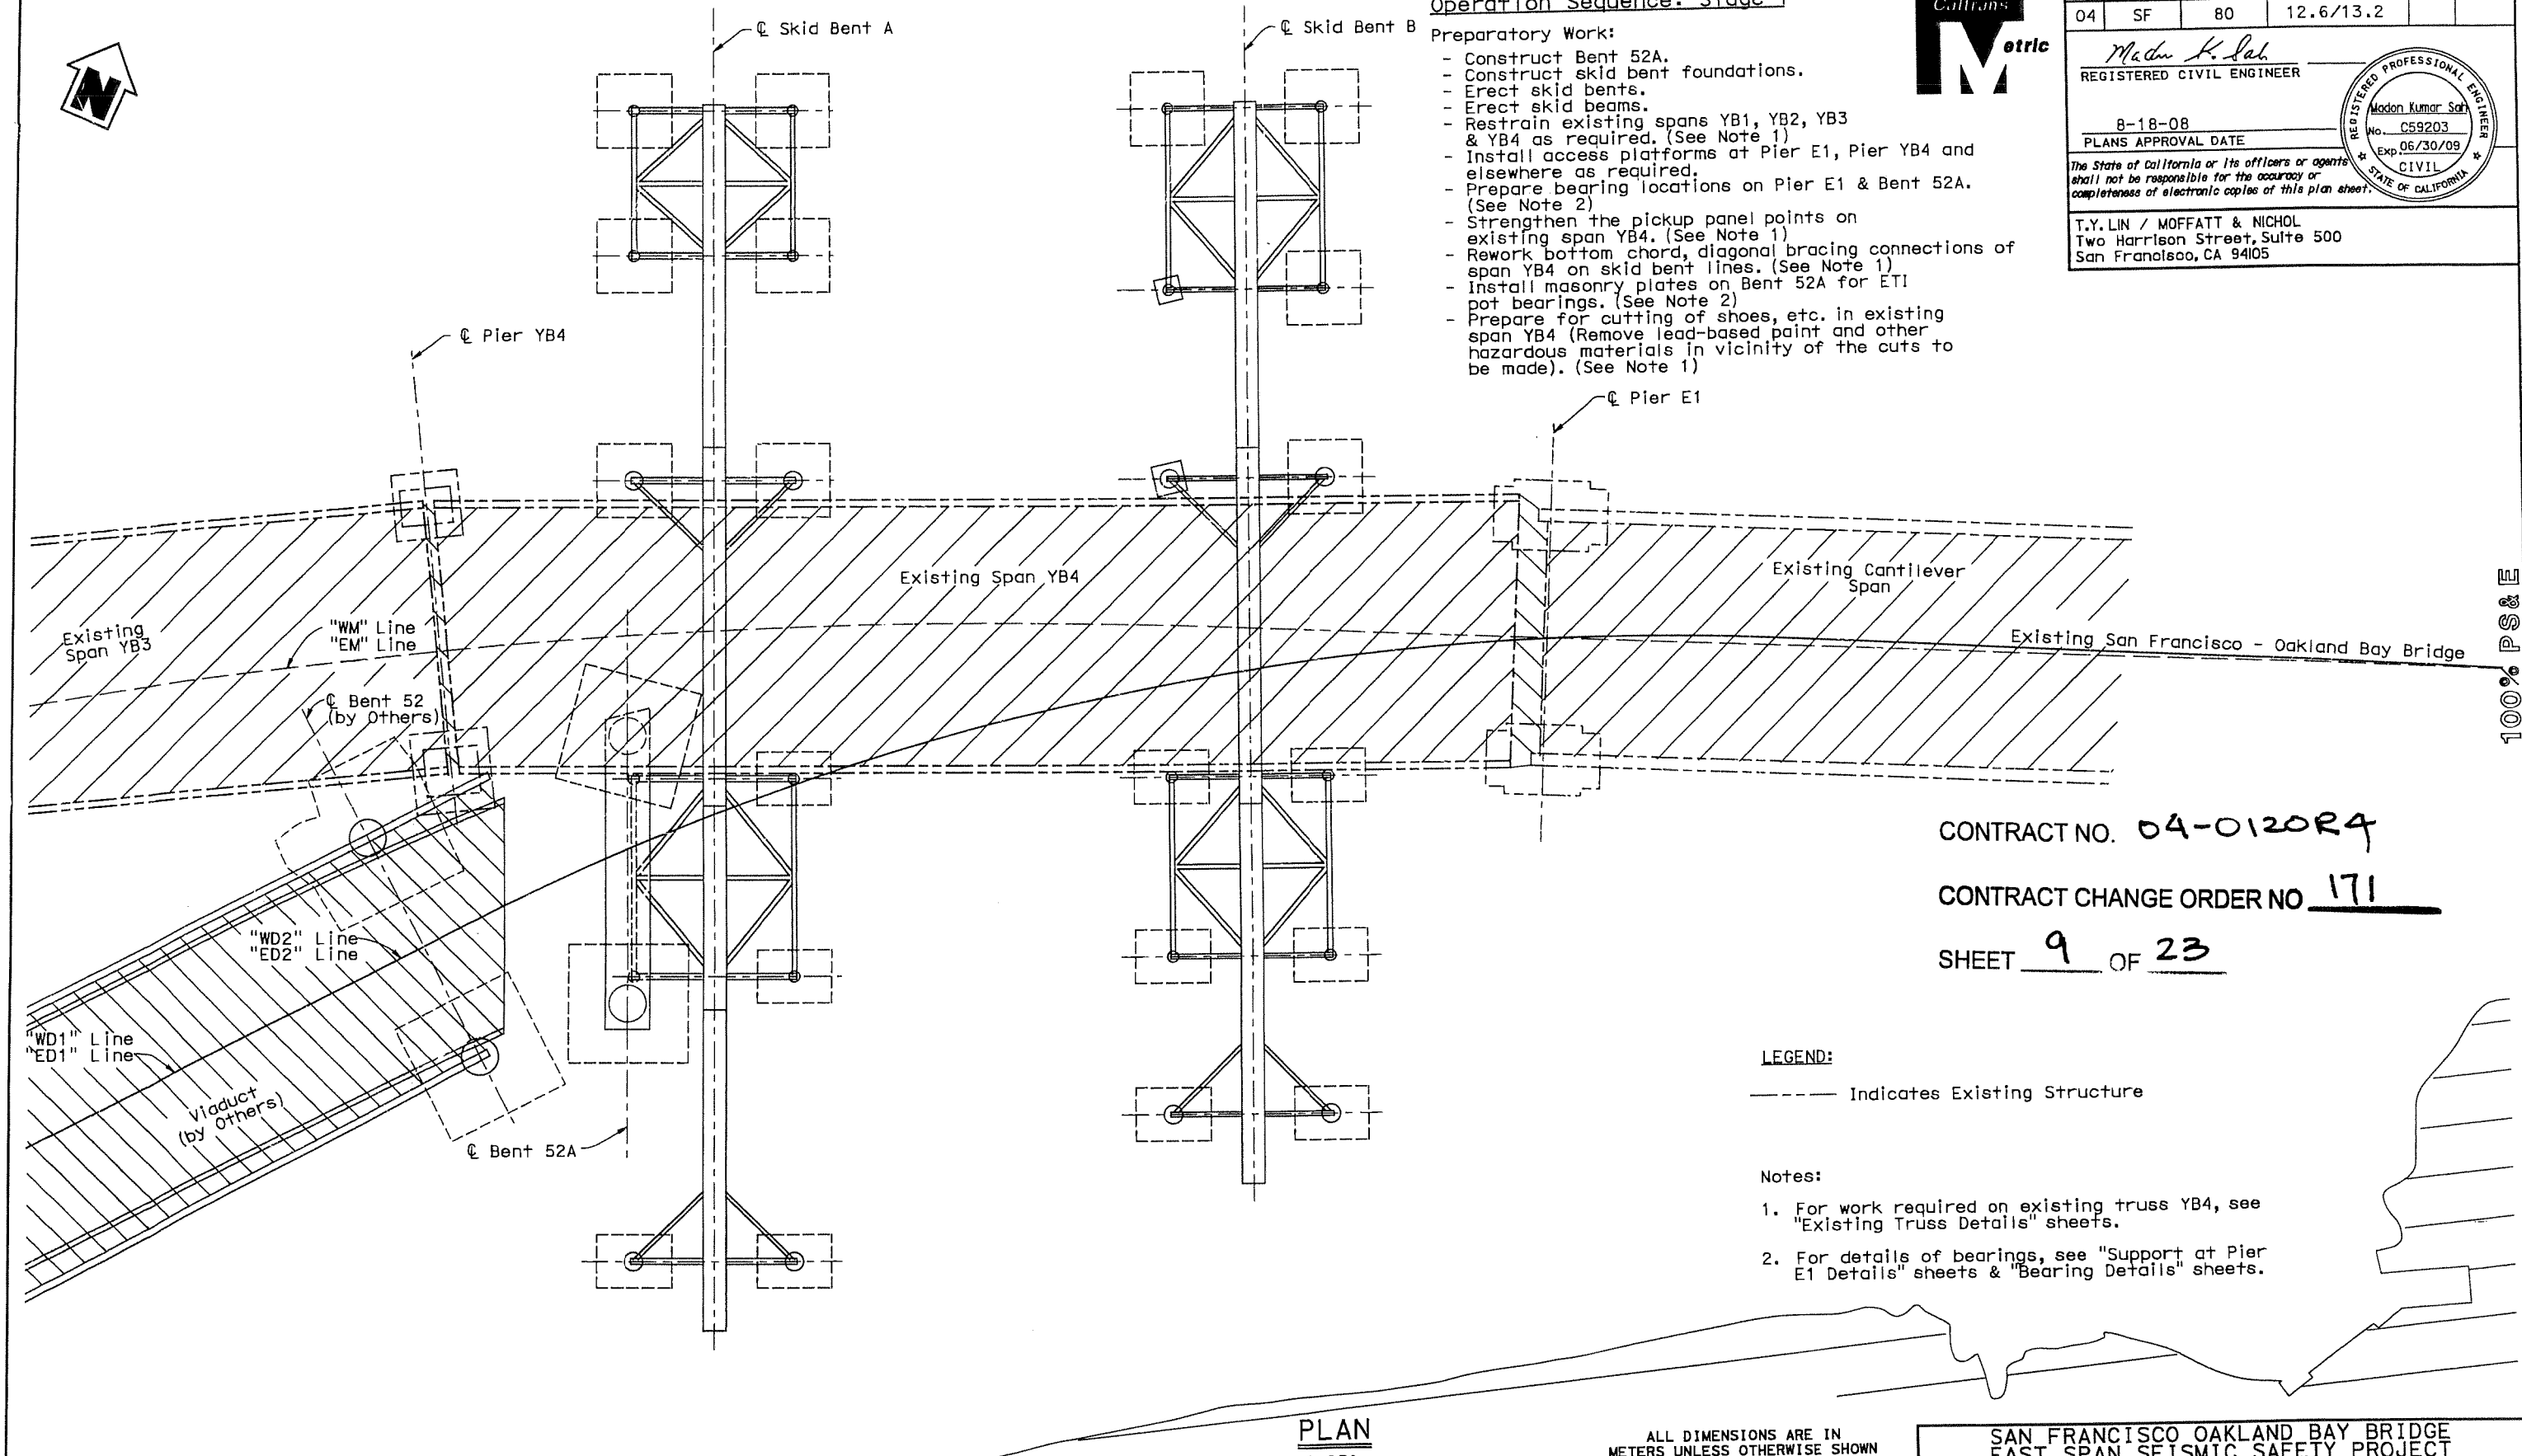
Operation Sequence: Stage 1

Preparatory Work:

- Construct Bent 52A.
- Construct skid bent foundations.
- Erect skid bents.
- Erect skid beams.
- Restrain existing spans YB1, YB2, YB3 & YB4 as required. (See Note 1)
- Install access platforms at Pier E1, Pier YB4 and elsewhere as required.
- Prepare bearing locations on Pier E1 & Bent 52A. (See Note 2)
- Strengthen the pickup panel points on existing span YB4. (See Note 1)
- Rework bottom chord, diagonal bracing connections of span YB4 on skid bent lines. (See Note 1)
- Install masonry plates on Bent 52A for ETI pot bearings. (See Note 2)
- Prepare for cutting of shoes, etc. in existing span YB4 (Remove lead-based paint and other hazardous materials in vicinity of the cuts to be made). (See Note 1)



PLAN
1:250

ALL DIMENSIONS ARE IN METERS UNLESS OTHERWISE SHOWN

LEGEND:

——— Indicates Existing Structure

Notes:

1. For work required on existing truss YB4, see "Existing Truss Details" sheets.
2. For details of bearings, see "Support at Pier E1 Details" sheets & "Bearing Details" sheets.

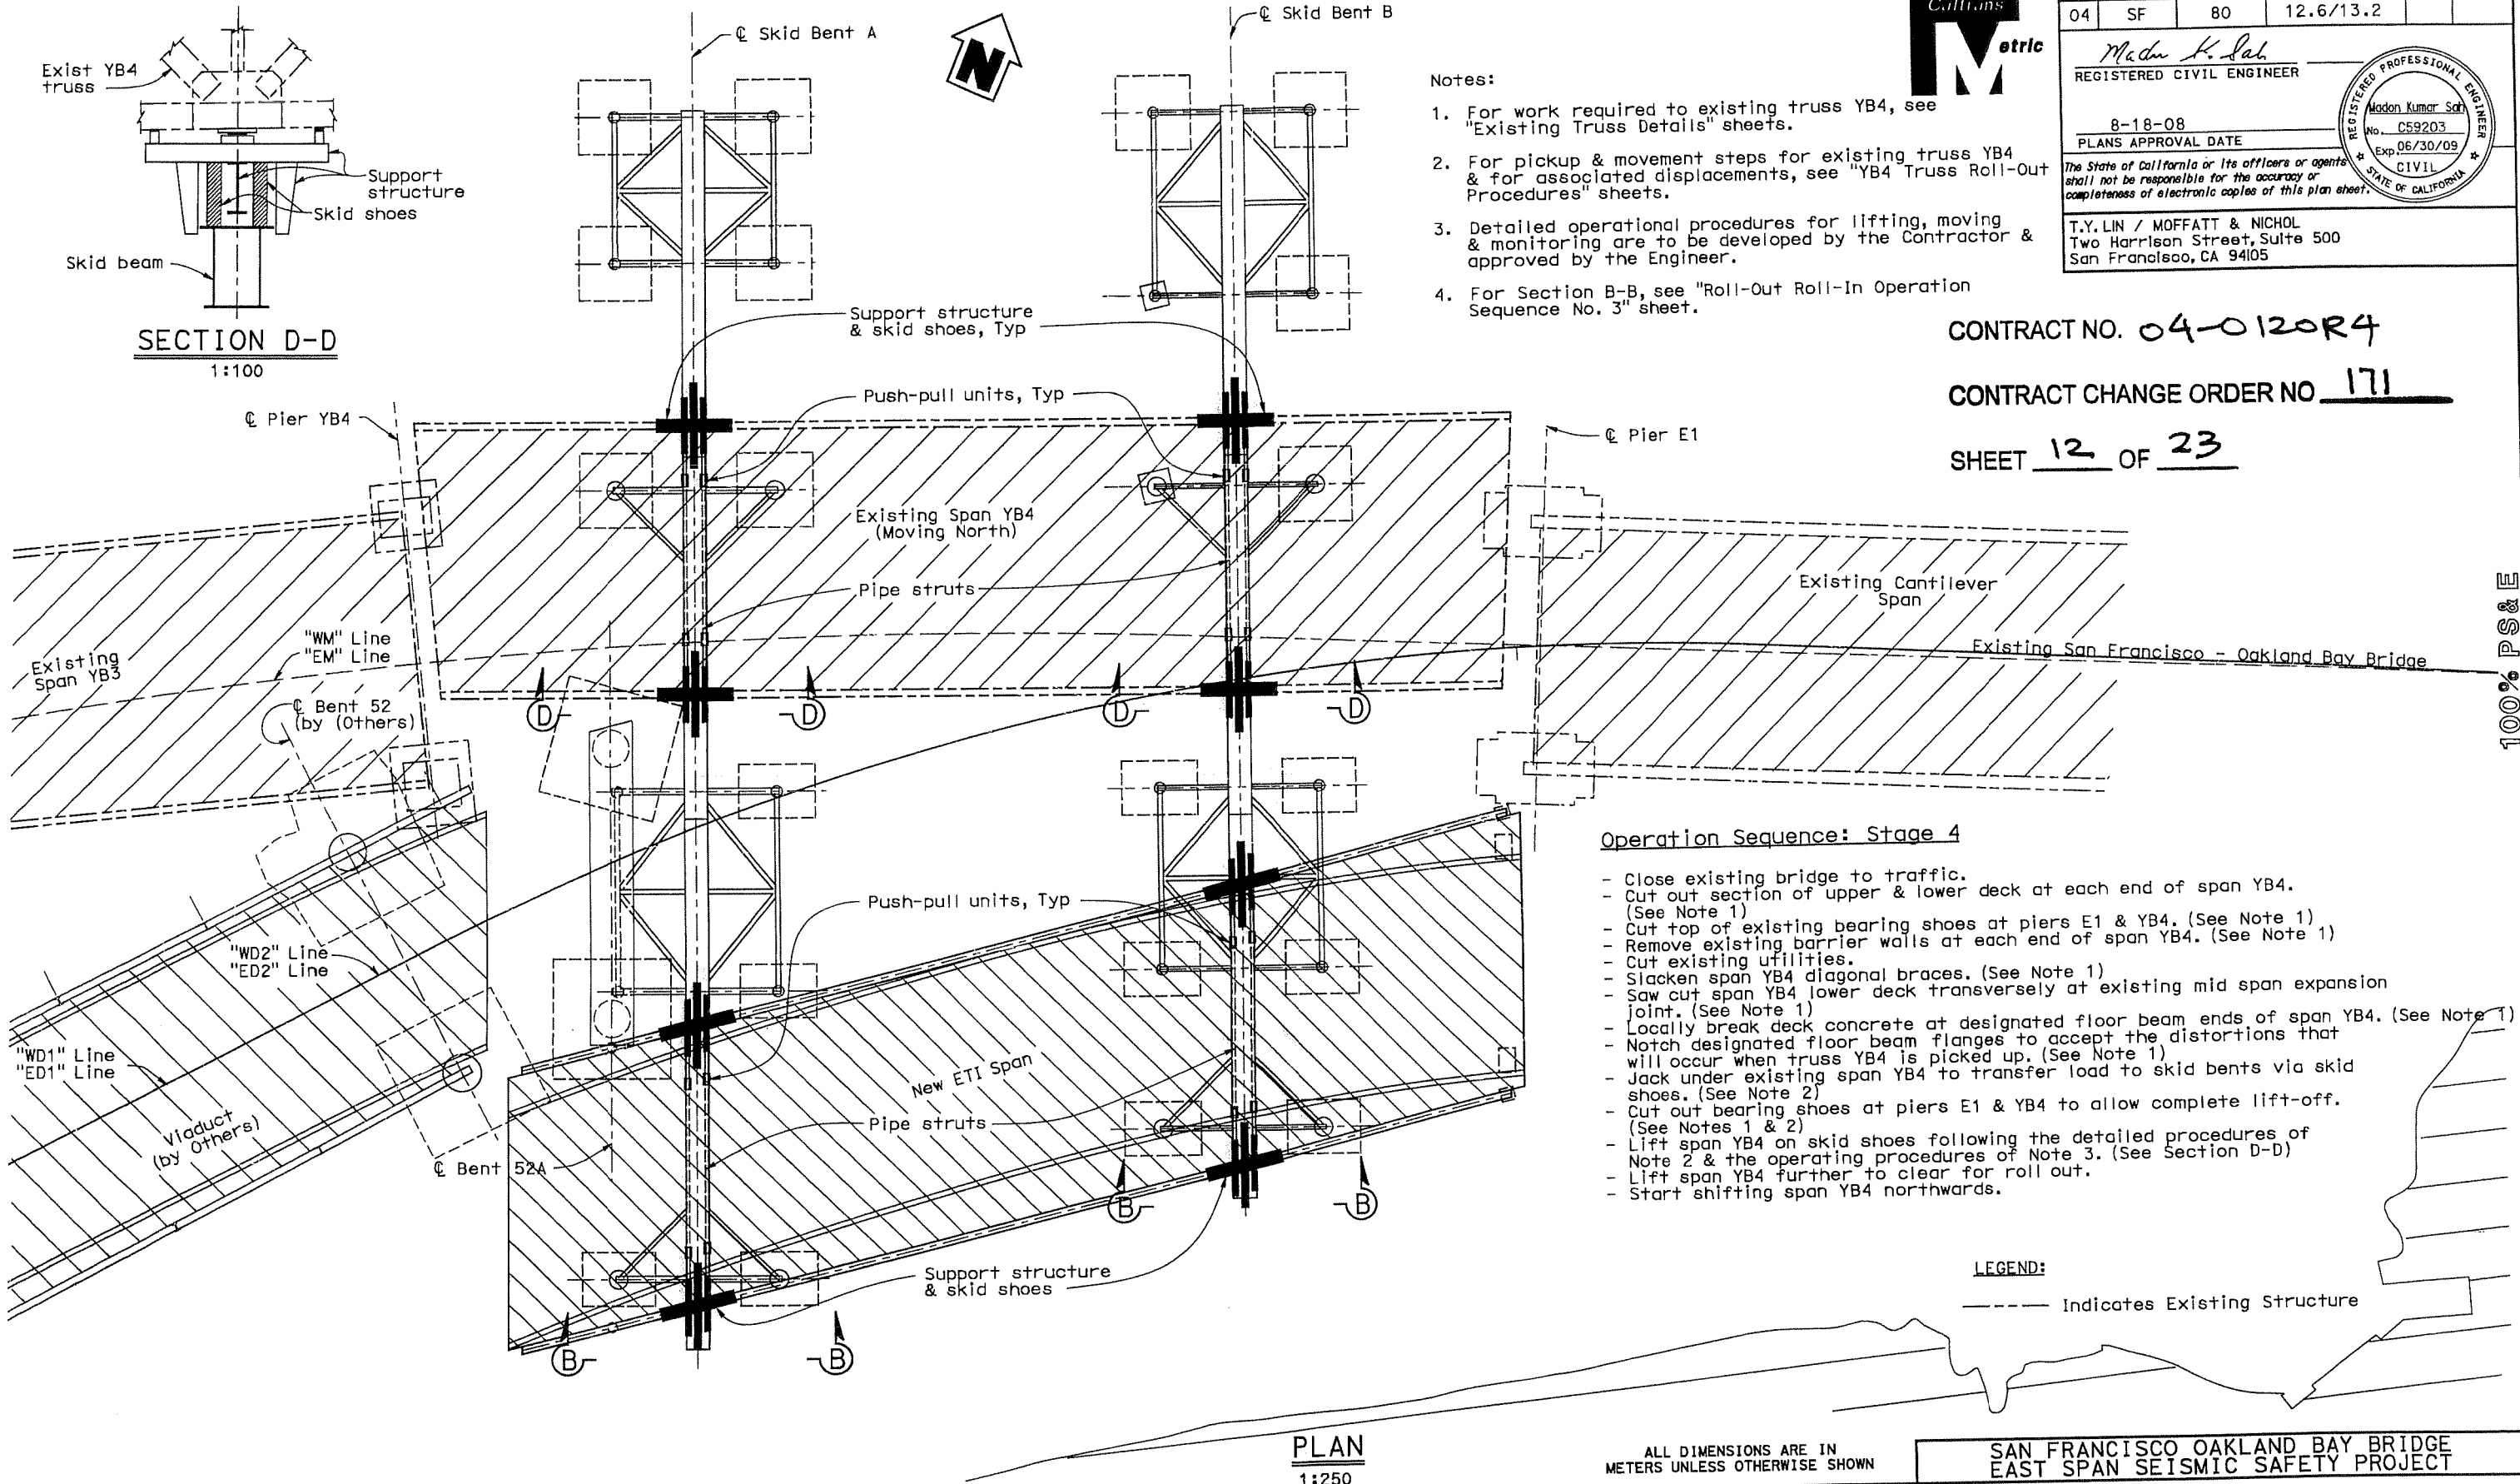
SECTION D-D
1:100



PLAN
1:250

Notes:

1. For work required to existing truss YB4, see "Existing Truss Details" sheets.
2. For pickup & movement steps for existing truss YB4 & for associated displacements, see "YB4 Truss Roll-Out Procedures" sheets.
3. Detailed operational procedures for lifting, moving & monitoring are to be developed by the Contractor & approved by the Engineer.
4. For Section B-B, see "Roll-Out Roll-In Operation Sequence No. 3" sheet.

Operation Sequence: Stage 4

- Close existing bridge to traffic.
- Cut out section of upper & lower deck at each end of span YB4. (See Note 1)
- Cut top of existing bearing shoes at piers E1 & YB4. (See Note 1)
- Remove existing barrier walls at each end of span YB4. (See Note 1)
- Cut existing utilities.
- Slacken span YB4 diagonal braces. (See Note 1)
- Saw cut span YB4 lower deck transversely at existing mid span expansion joint. (See Note 1)
- Locally break deck concrete at designated floor beam ends of span YB4. (See Note 1)
- Notch designated floor beam flanges to accept the distortions that will occur when truss YB4 is picked up. (See Note 1)
- Jack under existing span YB4 to transfer load to skid bents via skid shoes. (See Note 2)
- Cut out bearing shoes at piers E1 & YB4 to allow complete lift-off. (See Notes 1 & 2)
- Lift span YB4 on skid shoes following the detailed procedures of Note 2 & the operating procedures of Note 3. (See Section D-D)
- Lift span YB4 further to clear for roll out.
- Start shifting span YB4 northwards.

* Dimensions assumed.
The Contractor to determine and confirm final dimensions.

PLAN
1:250

Operation Sequence: Stage 6

- Move existing span YB4 towards demolition position. (See Notes 2 and 3)
- Grout the masonry plates for the new pot bearings at pier E1.
- Place masonry plates for new lead rubber bearings at pier E1. Do not grout.
- Skid new ETI span into final position. (See Notes 3 and 4)
- Lower new ETI span onto the bearings at Bent 52A. Lower east end to almost make contact between pot bearings and masonry plates at pier E1. (See Notes 1 and 4)
- Start expansion joint installation. (See Note 5)
- When masonry plate grout for pot bearings at pier E1 reaches required strength, transfer east end weight to those bearings. (See Note 1)
- Install temporary restraint assembly onto pot bearings at pier E1. (See Note 1)
- Remove the skid shoes from the ETI truss.
- Tighten stringer bolts at all slotted holes on new ETI span.
- Connect utilities on new ETI span.
- Complete expansion joint installation. (See Note 5)
- Install barrier wall closures at expansion joint or use temporary barriers. (See Note 6)
- Open the structure to traffic.

PLAN
1:250

⚠1

Operation Sequence: Stage 7

- Set existing YB4 truss down onto support brackets on skid beam.
- Remove skid shoes from under existing YB4 truss.
- Install wire mesh screen to protect new ETI span from demolition debris.
- Grout lead rubber bearings at pier E1. (See Note 1)
- Remove temporary restraint assembly from pot bearings at pier E1.
- Install stoppers for pot bearings at Bent 52A.
- Demolish and remove existing span YB4.
- Demolish and remove skid beams and skid bents.

Notes:

1. For details regarding bearings and bearing installation, see "Support on Pier E1 Details" sheets and "Bearing Details" sheets.

REGISTERED PROFESSIONAL ENGINEER — Madan Kumar Sah — No. C59203 — Exp. 06/30/09 — CIVIL — STATE OF CALIFORNIA

The State of California or its officers or agents shall not be responsible for the accuracy or completeness of electronic copies of this plan sheet.

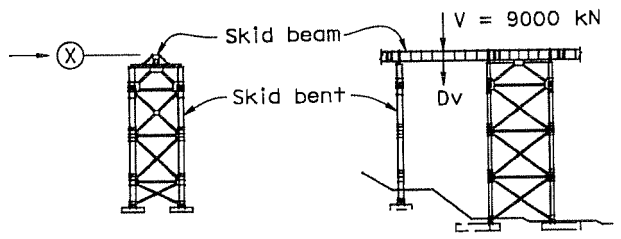
T.Y. LIN / MOFFATT & NICHOL
Two Harrison Street, Suite 500
San Francisco, CA 94105

CALCULATED WEIGHTS (kN) AT ROLL-OUT/ROLL-IN

ITEM	YB4 TRUSS	ETI TRUSS
STRUCTURAL STEEL	10,381	11,823 *
BARRIER WALL	552	2,911
BEARINGS ETC.	94	220
CONCRETE DECK	13,580	13,930
OVERLAY	1,779	0
UTILITIES	643	643
SUB TOTAL (BARE)	27,029	29,527
ALLOWANCES		
5% ON STRUCTURAL STEEL	519	591
10% ON CONCRETE	1,358	1,393
10% ON OVERLAY	178	0
GRAND TOTAL	29,084	31,511

* The Contractor to verify this value from shop drawings using accurate as-assembled weights.

SKID BEAM/SKID BENT STIFFNESSES



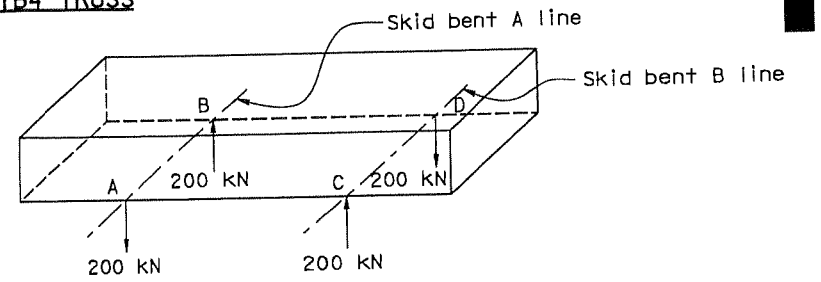
1) $D_{v,max}$ from a vertical load of 9000 kN = 40 mm in longest span of skid beam (beam deflection only).

2) Maximum axial shortening of skid bent plus foundation settlements due to roll-out roll-in operation = 15 mm.

3) Lateral stiffness at level Ⓧ varies from 75 kN/mm to 20 kN/mm depending on location along the skid beam.

COMPUTED TORSIONAL STIFFNESS OF TRUSSES

EXIST YB4 TRUSS



1) For point A to drop 25 mm out of the plane of points B, C and D, The resultant computed reactions are shown.

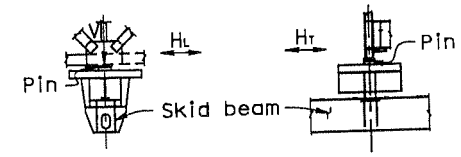
2) For design of the transport gear allow a variation of -50% to +100% in the truss stiffness.

NEW ETI TRUSS

New ETI truss is much stiffer and must, therefore, be transported in "Three Point" mode. This requires either that the reactions at A and B or else the reactions at C and D be hydraulically equalized during transport, raising and lowering. The Contractor to select which reaction points are to be equalized.

REQUIRED LATERAL DESIGN LOADS

a) During truss erection and demolition



i) V=Vertical Load - See "YB4 Truss Roll-Out Procedures" sheets and "ETI Truss Roll-In Procedures" sheets.

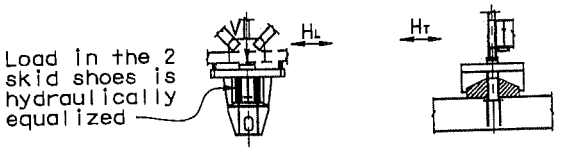
ii) Seismic horizontal loadings

$\sqrt{H_L^2 + H_T^2} = 0.2V$ $\quad 0 < H_L < 0.2V$ $\quad 0 < H_T < 0.2V$

iii) Wind horizontal loadings
25 Years return period wind per West Wind Laboratories Report & Tests

$\sqrt{H_L^2 + H_T^2} = 300$ kN $\quad 0 < H_L < 300$ kN $\quad 0 < H_T < 300$ kN

b) During truss movement



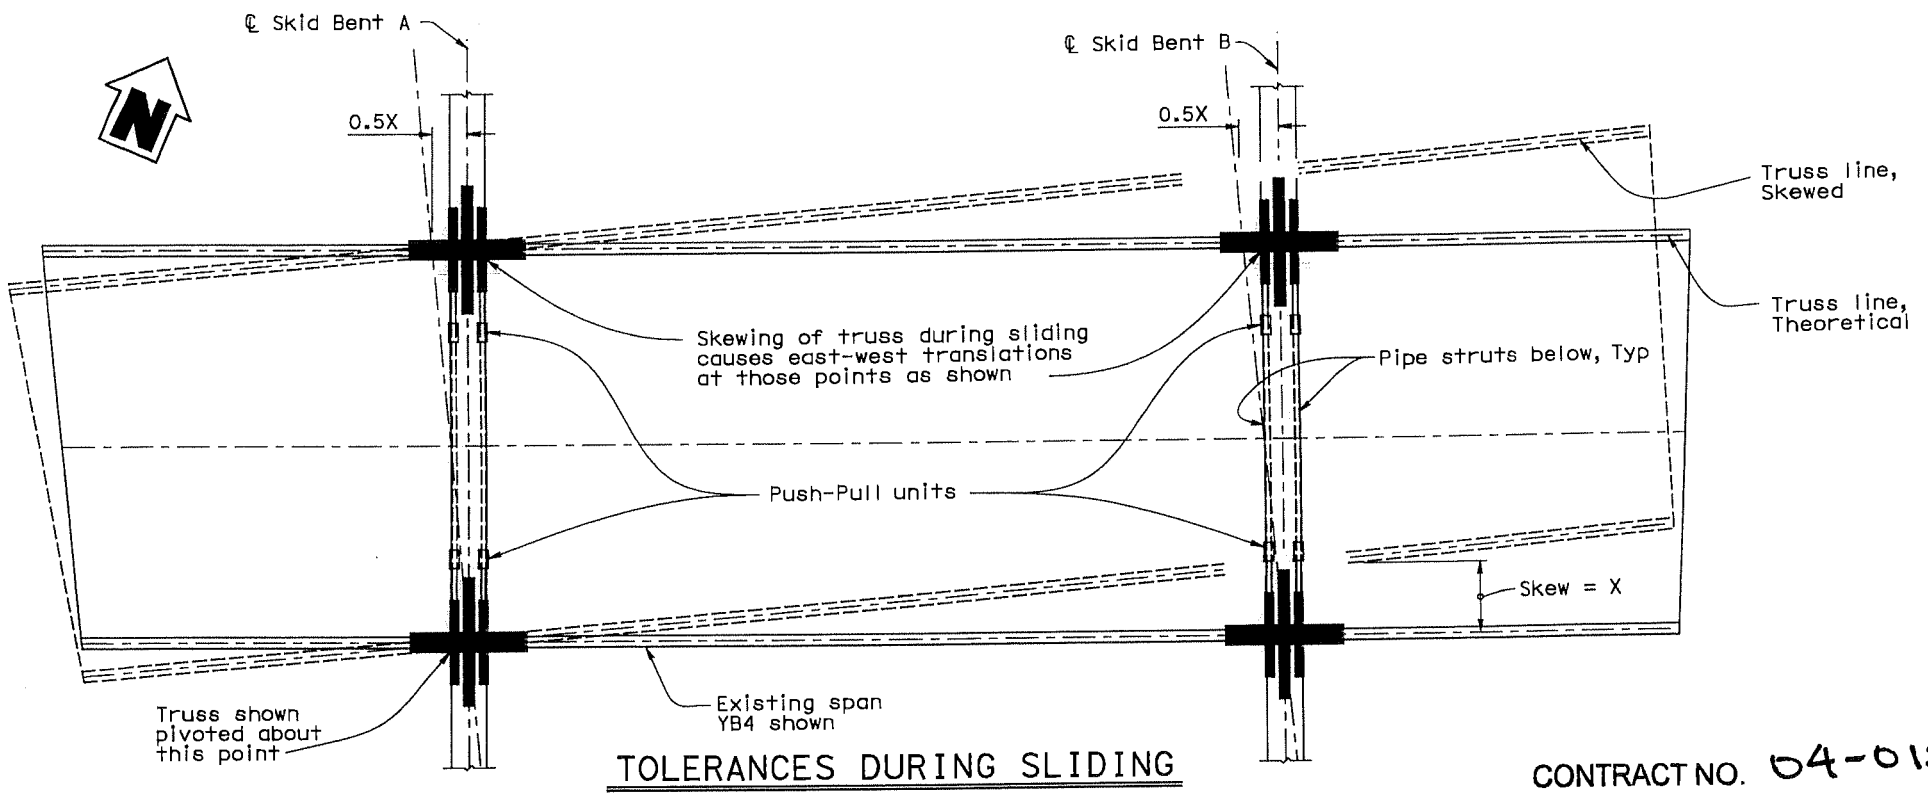
i) V=Vertical Load - See "YB4 Truss Roll-Out Procedures" sheets and "ETI Truss Roll-In Procedures" sheets.

ii) Lateral loads

$\sqrt{H_L^2 + H_T^2} = 0.1V$ $\quad 0 < H_L < 0.1V$ $\quad 0 < H_T < 0.1V$

Notes:

1. The horizontal load value during truss movement accommodates wind loadings due to peak 3 second gust speeds of 116 kph (72mph).
2. Treat all horizontal loads as service-level loads.
3. H_L and H_T are the horizontal loads at each pickup point.



TOLERANCES DURING SLIDING

NTS

Existing span YB4 shown, ETI span similar

Notes:

1. The Contractor's truss movement system is to be able to accomodate the east-west translations shown during the moving operation.
2. The Contractor to determine the maximum acceptable skew (dimension X) accounting for available range of east-west translations in the skidding system, possible misplacements of the skid beams, clearances to adjacent structures, etc.
3. The Contractor to monitor the skew throughout truss moves and to control skew to within the acceptable limits.

PLANS APPROVAL DATE

Madan Kumar Sah, No. C59203, Exp. 06/30/09, CIVIL, REGISTERED PROFESSIONAL ENGINEER, STATE OF CALIFORNIA

The State of California or its officers or agents shall not be responsible for the accuracy or completeness of electronic copies of this plan sheet.

T.Y. LIN / MOFFATT & NICHOL
Two Harrison Street, Suite 500
San Francisco, CA 94105

Phase 1: (Prepare to jack-up)

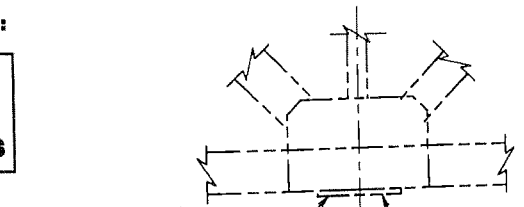
- Initial position. All preparation work on span YB4 is completed. (See Note C)**
- Restraints at pier YB3 are installed with 50 mm slack, tie back of span YB1 to abutment is installed.

After road is closed:

A. Remove portions of upper & lower decks as noted. (See Note C)**
B. Cut tops of bearing shoes at pier E1 & pier YB4 to allow pins to lift out.
C. Release bottom chord horizontal bracing at lift points (4 Locations-slacken bolts). (See Note C)**
D. Break out concrete at top deck shear brackets. (See Note C)**
E. Notch flanges of floor beams. (See Note C)**
F. Saw cut or break out midspan joint in the bottom deck. (See Note C)**

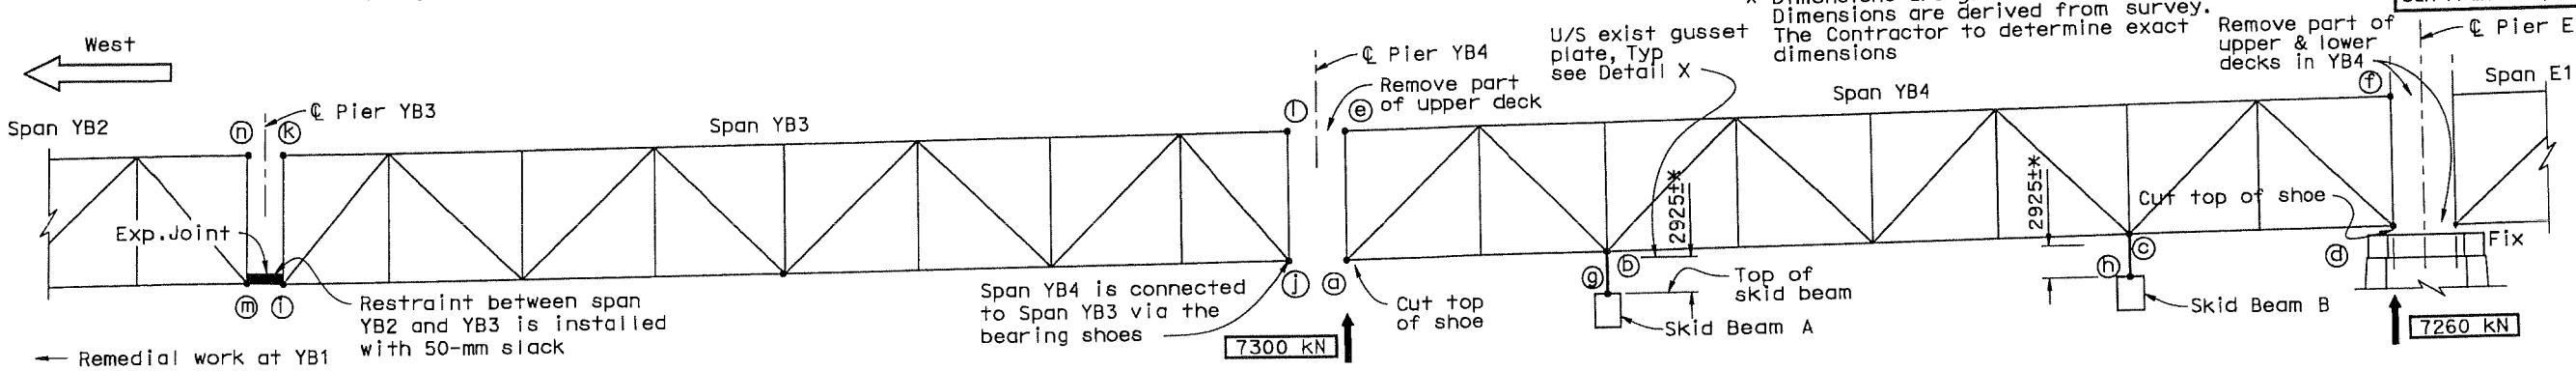
Loads & Reactions Are Based On:

TRUSS WEIGHT ESTIMATE
AT ROLL-OUT = 29,000 kN
= 6,600 kips



DETAIL X
NTS

* Dimensions are given for convenience only. Dimensions are derived from survey. The Contractor to determine exact dimensions

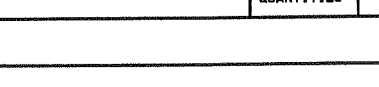


Phase 2: (Take-up 75% load)

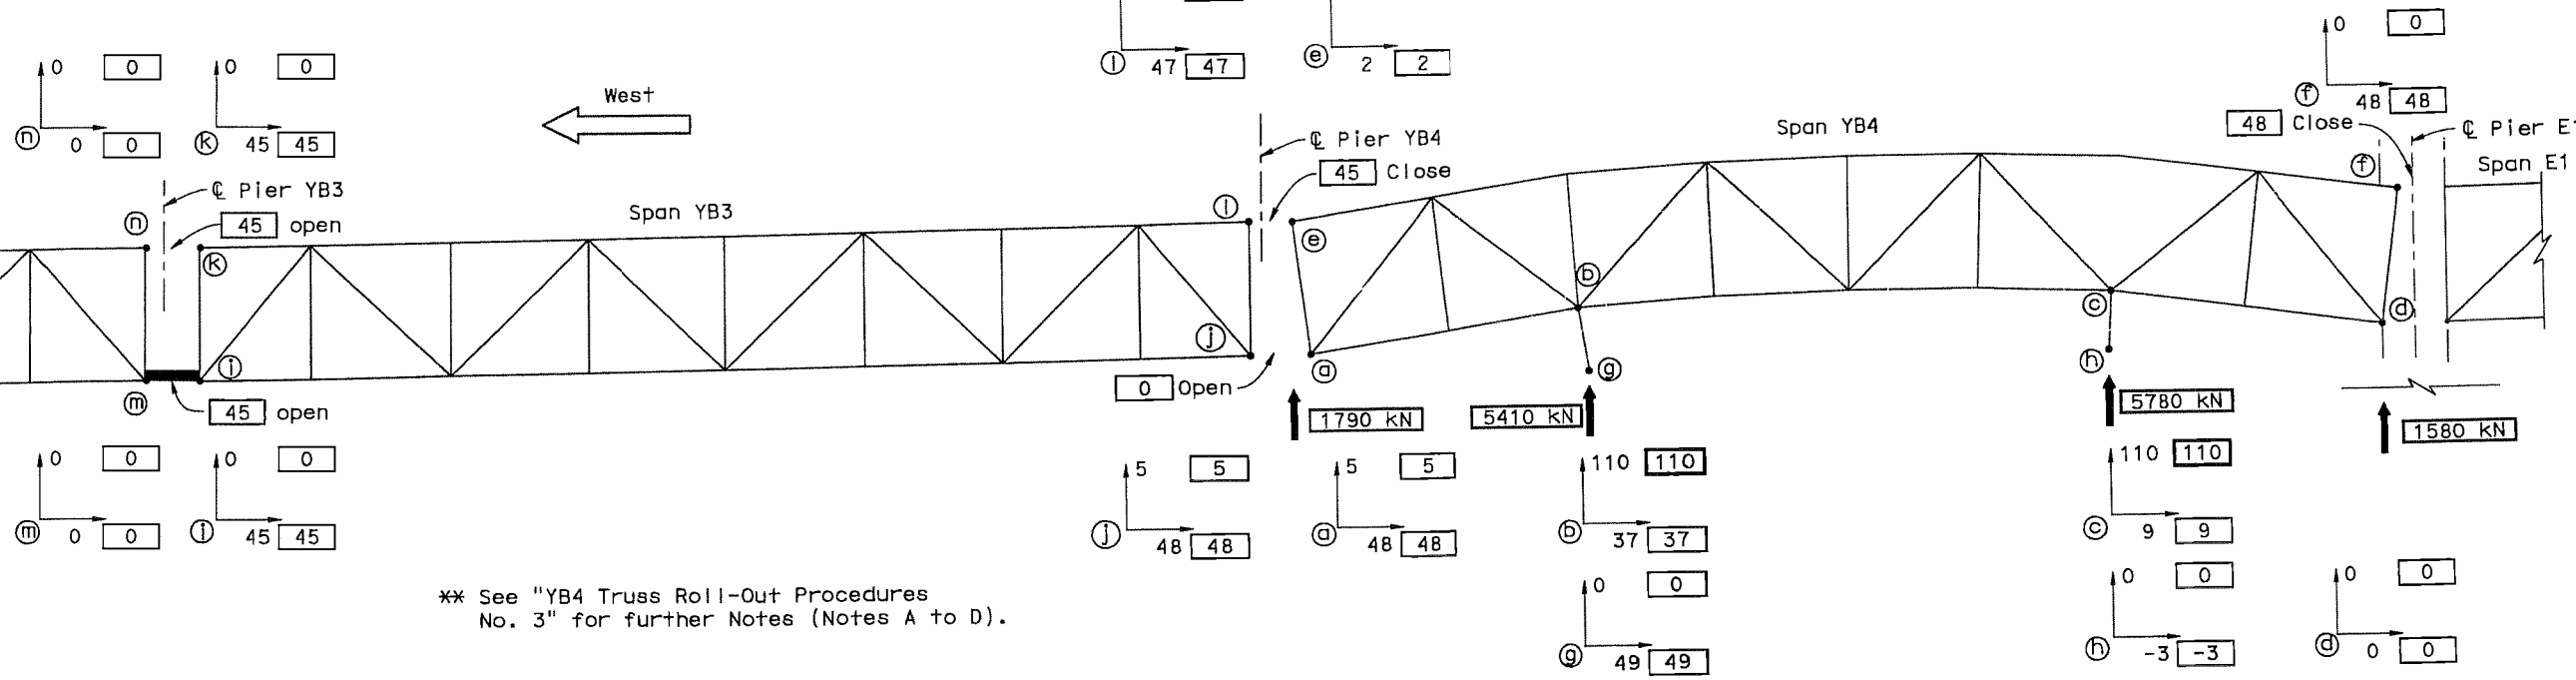
A. Engage East & West skid units (can be done earlier). (See Note B)**
B. Fasten to Truss YB4. (See Note B)**
C. Pick up load on east & west skid units simultaneously until each unit is carrying 5500 KN (approximately 75% of its anticipated maximum load). (See Note 4 & Note B)**

Notes:

1. All displacements are with respect to the initial position of the truss nodes before any jacking operations have taken place.
2. The displacement notation is as following



3. Point of east-west restraint is the bearing on Pier E1.
4. Maximum differential between loads at East & West Skid bents not to exceed 1800 kN during lifting.
5. Maximum differential extension of skid shoe jacks on any one skid beam not to exceed 50 mm.
6. Reactions are given per pick-up location and are as calculated. Add 5% contingency to all reactions.
7. Jacks will have to extend further than the displacements shown to accommodate skid beam and skid bent deflections. Allow maximum 50 mm for the total of the two.
8. Displacements given are as calculated. Allow ±33% variation on all displacements.
9. For the purpose of design of skidding system, increase all reactions by a further 8% to allow for the load redistributions that will occur due to skid beam deflections etc. while truss is being carried in four point mode.
10. It is presumed that the existing YB4 truss will be transported in a "four point support" mode, i.e. no hydraulic equalization between any of the four reaction points.



** See "YB4 Truss Roll-Out Procedures No. 3" for further Notes (Notes A to D).

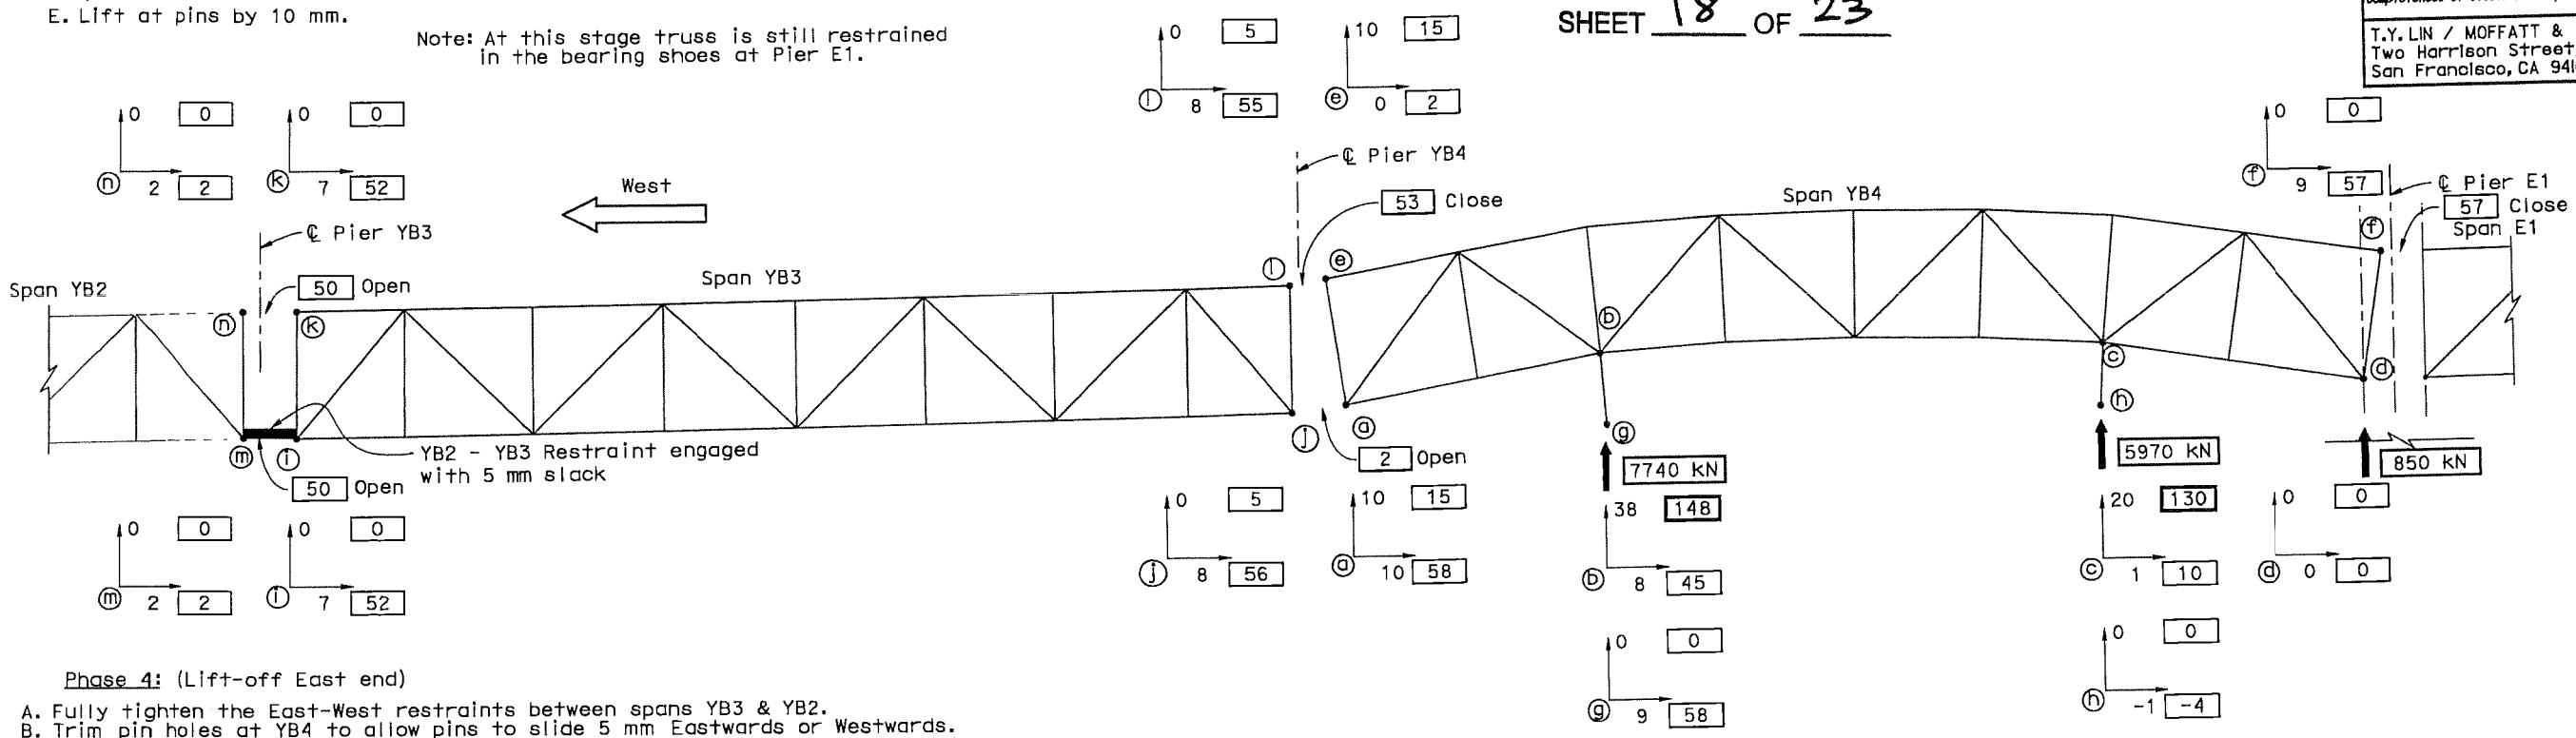
T.Y. LIN / MOFFATT & NICHOL
Two Harrison Street, Suite 500
San Francisco, CA 94105

Phase 3: (Lift-off West end)

A. Adjust slack in the East-West restraints between spans YB3 & YB2. Leave 5 mm slack.
B. Extend jacks at Skid Bent B by 20 mm.
C. Start to increase load at Skid Bent A & monitor pins within the shoes at YB4.
D. Continue to increase load at Skid Bent A until the pins start to lift at YB4.
E. Lift at pins by 10 mm.

Note: At this stage truss is still restrained in the bearing shoes at Pier E1.



Phase 4: (Lift-off East end)

A. Fully tighten the East-West restraints between spans YB3 & YB2.
B. Trim pin holes at YB4 to allow pins to slide 5 mm Eastwards or Westwards.
C. Increase load at Skid Bent B to 100% of anticipated value & monitor the pins within the shoes at Pier E1.
D. When pins start to lift off, cut the bearing shoes at pier E1.
E. Cut the bearing shoes at pier YB4.
F. Re-tighten bolts in bottom chord horizontal bracing for transport (4 locations).

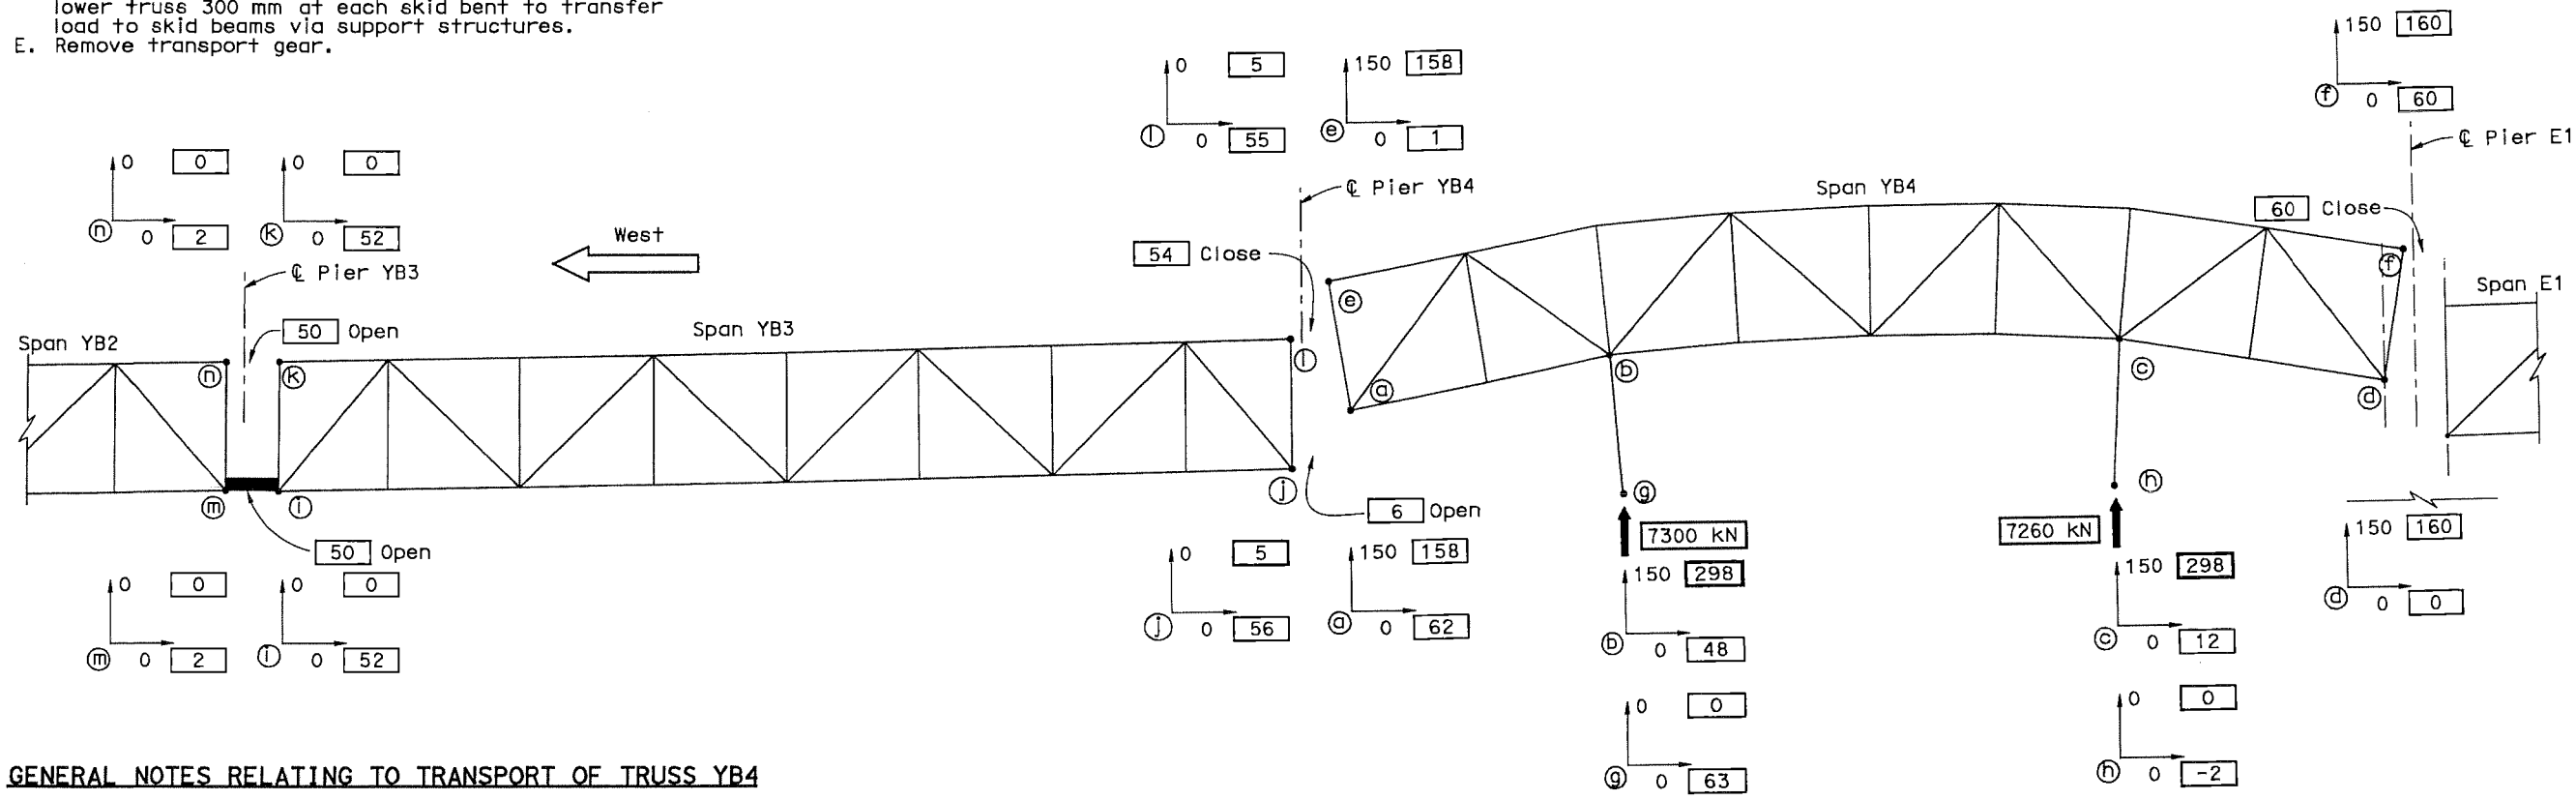
T.Y. LIN / MOFFATT & NICHOL
Two Harrison Street, Suite 500
San Francisco, CA 94105

Phase 5: (Roll-out)

A. Lift Truss a further 150 mm, lifting simultaneously at all 4 lift points.
B. Control the lift to within ± 25 mm maximum differential extension of all jacks.
C. Roll out to the North.
D. Set down truss on demolition supports- lower truss 300 mm at each skid bent to transfer load to skid beams via support structures.
E. Remove transport gear.



Note: All displacements shown are for end of phase 5A

GENERAL NOTES RELATING TO TRANSPORT OF TRUSS YB4

A. The Contractor is to prepare a detailed, step by step, procedure for the operation incorporating and fully integrating the steps shown on these drawings with the detailed operating procedures, steps and other requirements associated with work by the Contractor. These procedures are to be submitted to the Engineer for approval.

B. Detailed operational procedures for executing, controlling and monitoring the lifting and moving of the truss are to be developed by the Contractor and submitted to the Engineer for approval. It is the responsibility of the Contractor to implement, control and monitor these procedures during moving operations.

C. For details of work to be done to the existing truss YB4, see "Existing Truss Details" sheets.

D. Transport gear & the support structures for truss demolition are to be designed and supplied by the Contractor. The Contractor to submit plans and calculations for approval.

T.Y. LIN / MOFFATT & NICHOL
Two Harrison Street, Suite 500
San Francisco, CA 94105

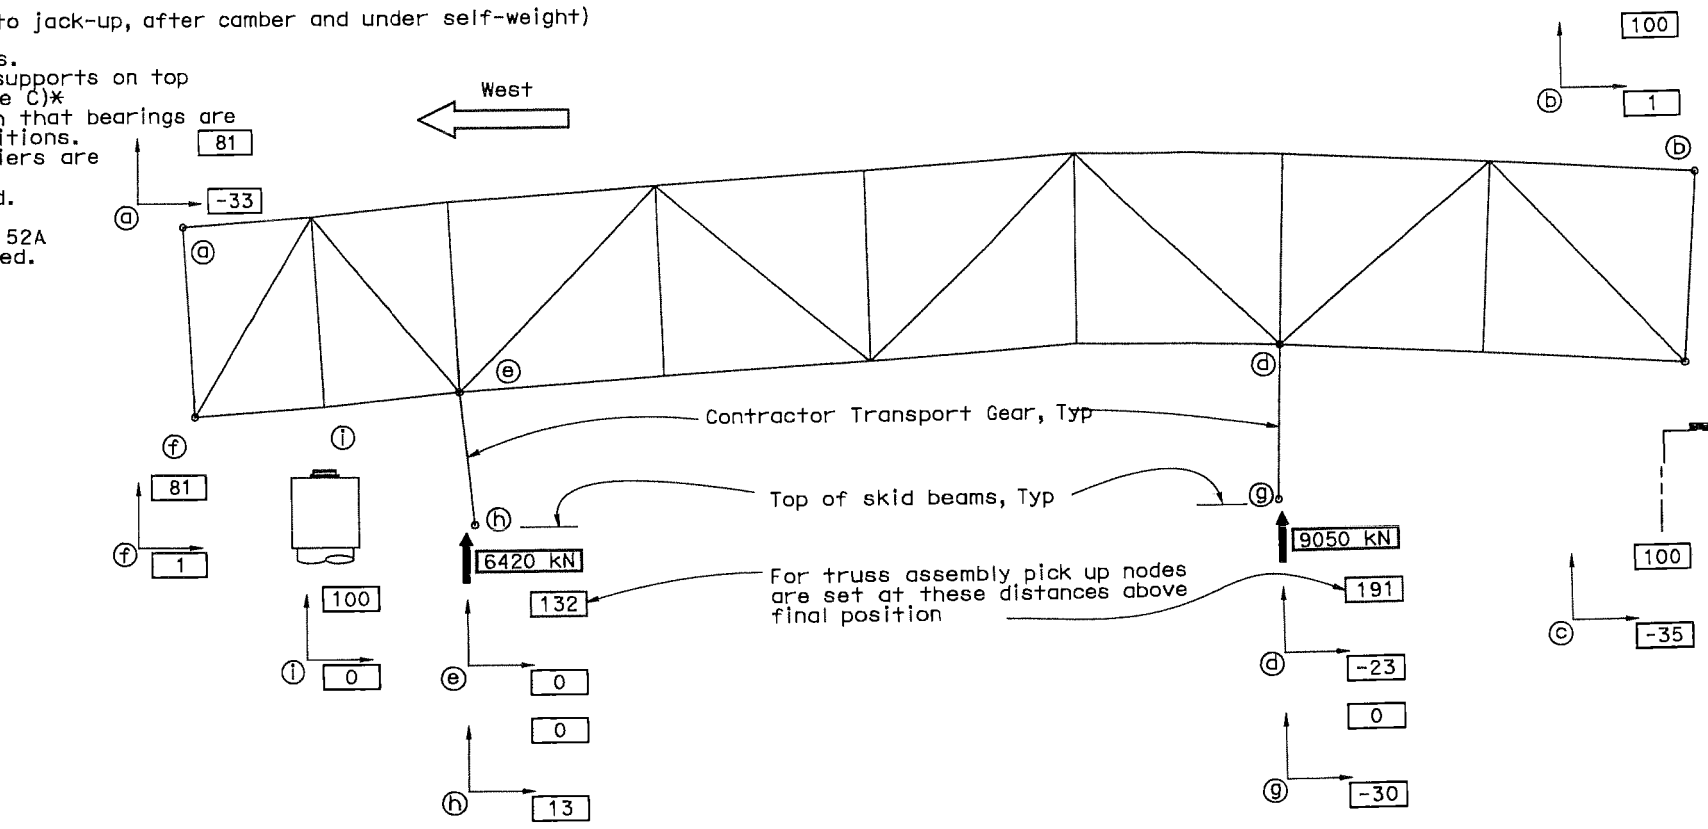
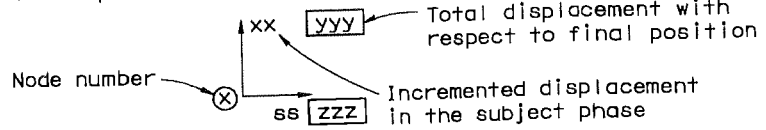
Phase 1: (Just prior to jack-up, after camber and under self-weight)

Assembly of the new truss.
- Truss is assembled on supports on top of skid beams. (See Note C)*
- Truss is assembled such that bearings are 100 mm above final positions.
- Concrete deck and barriers are cast.
- Overlay is not installed.
- Utilities are in place.
- Masonry plates on Bent 52A are installed and grouted.



Notes:

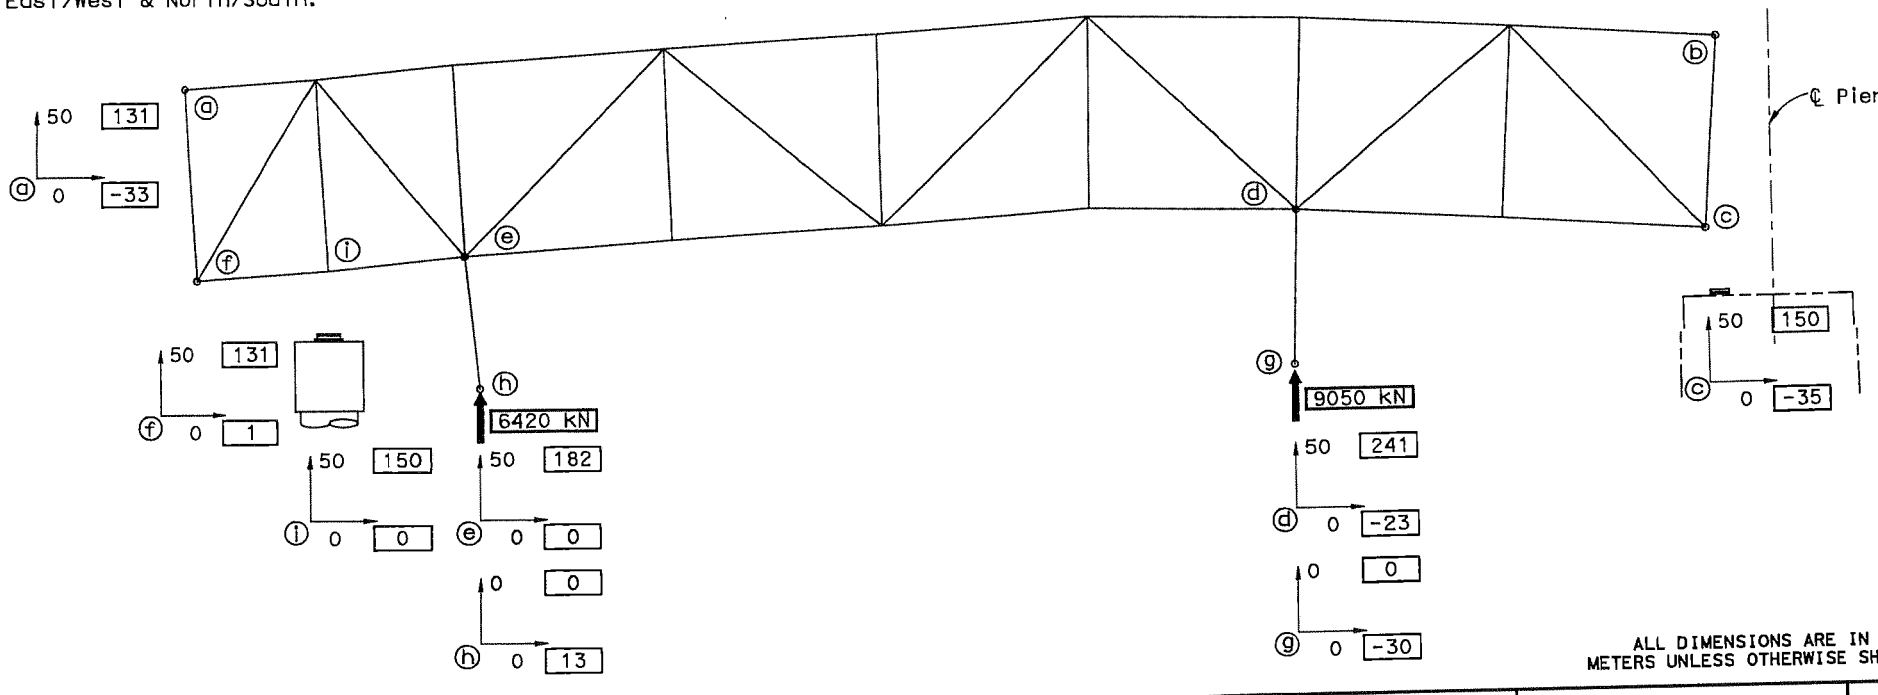
1. All displacements are with respect to the final position of the truss, as shown in shadow lines.
2. The displacement notation is as following



3. Reactions are given for each pickup point.
4. Displacements are as calculated. Allow for ±33% variation in actual displacements.
5. Add 7.5% contingency to all reactions.
6. Truss is to be transported in " Three Point Support" mode. Because truss will be carried as 3-point support system there will be no load increase due to skid beam deflections.
7. The choice of which skid bent line is to have its skid shoes hydraulically coupled is to be made by the Contractor.

Phase 2: (Raise truss to 150 mm above both East and West Bearings)

A. Install, level and grout masonry plates for pot bearings on Pier E1 after existing truss YB4 has moved north.
B. Install masonry plates for Lead Rubber Bearings in place. Do not grout.
C. Raise truss 50 mm at each skid bent for transport. (See Notes A, B, and C)*
D. Advance truss northward until positioned above East and West Bearings. (See Notes A, B and C)*
E. Adjust Truss position East/West & North/South.



* See "ETI Truss Roll-In Procedures No. 4" sheet for further Notes (Notes A to E).

1

Phase 5: (East set-down)

A. Maintain vertical load and north-south restraint at east skid bent (skid bent B) skid shoes until the grout below the masonry plates for the pot bearings at Pier E1 is strong enough to bear weight. (See Note D)

B. Start installation of the east expansion joints. (See Note E)

C. When masonry plate grout for the pot bearings at Pier E1 has achieved the required strength, lower further at skid Bent B to transfer almost all load to the Pier E1 pot bearings. Maintain the skid shoe jacks snug (600 kN per jack) and maintain the push pull units in place to provide north-south horizontal support to the E1 end of truss.

D. Install the temporary restraint assembly on the pot bearings at Pier E1.

E. Release the skid shoes at skid Bent B.

F. Remove the skid shoes and support structures at all four transport points.

G. Install barrier wall closures.

H. When the expansion joint grout reaches the specified strength, the bridge may be re-opened to traffic.

I. At a later date, raise masonry plates to be snug against lead rubber bearings at pier E1. Weld bearings to the masonry plates. Grout masonry plates.

GENERAL NOTES RELATING TO TRANSPORT OF ETI TRUSS

A. The Contractor is to prepare a detailed, step by step, procedure for the operation incorporating and fully integrating the steps shown on these drawings with the detailed operating procedures, steps, and other requirements associated with work by the Contractor. These procedures are to be submitted to the Engineer for approval.

B. Detailed operational procedures for executing, controlling and monitoring the lifting and moving of the trusses are to be developed by the Contractor and submitted to the Engineer for approval. It is the responsibility of the Contractor to implement, control and monitor these procedures during moving operations.

C. Transport gear and the support structures for ETI truss erection are to be designed and supplied by the Contractor. The Contractor to submit plans and calculations for approval.

D. For details of bearings and bearing installation, see "Support at Pier E1 Details" sheets and "Bearing Details" sheets.

E. For details of expansion joints and expansion joint installation, see "Pier E1 Expansion Joint Details" sheets and "Bent 52A Expansion Joint Details" sheet.

CCO#: 171 SUPPLEMENT#: 0 Category Code: CHXX	CONTINGENCY BALANCE (incl. this change) $48,845,213.59
COST: $10,147,370.00 INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: ETI Roll Out / Roll In	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

the roll out of the existing steel truss and the roll in of the new steel truss of the East Tie-In structure.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

The new design of the ETI structure provides for a roll-out / roll-in concept with a new double deck steel truss span being erected adjacent to the existing span and then rolled into place after the existing span is rolled out. This change order provides for the actual operations concerning the roll out of the existing structure and the roll in of the new structure.

The work encompassed under this change includes furnishing and erecting the 8 separate steel support structures that distribute the weight of the 2 trusses to the skid bent support system during the roll out and roll in (RORI) operations along with furnishing, installing and removing the 8 skid assemblies, including push pull units and hydraulic jacks, which will provide for the actual roll out and roll in of the structures.

The RORI operations are currently scheduled to be performed over a planned 4-day closure of the San Francisco Oakland Bay Bridge during Labor Day Weekend of 2009. Support costs associated with this work during the actual weekend along with the removal of the 8 structural steel supports and numerous other operations indirectly associated with the RORI operations and weekend closure are deferred and shall be paid under separate change orders. The complete scopes of many of these deferred items of work have not been clearly defined to date. Other items of work have been paid under separate change orders as those scopes of work have been defined and compensation has been agreed to.

Compensation for the work of this change shall be paid as extra work at an agreed lump sum price of $10,147,370.00, which shall be financed from the contract's contingency funds. A cost analysis is on file.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Patrick Treacy - HQ Asst. Construction Coordinator. TBPOC Approval granted on June, 4, 2009.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 172	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

The Engineer will require stair and scaffold access for several months after erection, until the Engineer authorizes its removal. In addition to the agreed lump sum, the Contractor will be paid on a Force Account basis for the scaffold platform system equipment rental. The removal work is included in the above lump sum price.

Estimated Cost of Extra Work at Force Account $30,000.00

Extra Work at Lump Sum:

Clean and paint existing structural steel in accordance with the attached Special Provisions (Sheets 3 through 7) and Contract Plans (Sheets 8 through 11) of this change order.

Design, provide, install, and remove scaffolding access platform system, including handrails and toe boards in accordance with attached Special Provisions. Provide and install an extra 19 mm (3/4 inch) thick covering layer of plywood decking on the platforms to provide a firm, smooth, trip-hazard free work surface suitable for containment of dust and debris. Provide and post signs in conspicuous locations to show the maximum intended working load for each scaffold. The system shall be designed to allow access to accomplish all cleaning and painting for this change order, and to continue to provide a contiguous access system for the Engineer and Contractor to conduct examinations and further work on the existing bridge at the cleaned and painted areas. One complete stair tower access from the ground to the platform is included under this change order.

This change order includes full compensation for any required testing and legal disposal of rinse water and blasting debris materials generated during the work.

For this extra work, the Contractor will be compensated $210,450.00. This lump sum constitutes full compensation, including markups, for furnishing all labor, material, tools, equipment, and incidentals for doing the work involved in this change.

Total Cost of Extra Work at Lump Sum $210,450.00

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 172	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

Estimated Cost: Increase ☑ Decrease ☐ $240,450.00

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 172

SHEET 3 OF 11

10-1.__ CLEAN AND PAINT EXISTING STRUCTURAL STEEL

Metal surfaces of the existing structure shall be cleaned and painted in conformance with the provisions in Section 59-2, "Painting Structural Steel," Section 59-3, "Painting Galvanized Surfaces," and Section 91, "Paint," of the Standard Specifications and these special provisions.

The limits of steel surfaces to be cleaned and painted shall be as shown on the plans.

The existing paint systems consist of materials listed in "Existing Highway Facilities" of these special provisions.

Prior to performing any painting or paint removal, the Contractor shall submit to the Engineer, in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications, 3 copies of a separate Painting Quality Work Plan (PQWP) for each item of work for which painting or paint removal is to be performed. As a minimum, each PQWP shall include the following:

A. The name of each Contractor or subcontractor to be used.
B. One copy each of all current ASTM and "SSPC: The Society for Protective Coatings" specifications or qualification procedures applicable to the painting or paint removal to be performed. These documents shall become the permanent property of the Department.
C. A copy of the coating manufacturer's guidelines and recommendations for surface preparation, painting, drying, and curing of painted structural steel, including testing methods and maximum allowable levels for soluble salts.
D. Proposed methods and equipment to be used for any paint application.
E. Proof of each of any required certifications, SSPC-QP 1 or SSPC-QP 2.

    1. In lieu of certification in conformance with the requirements in SSPC-QP 1 for this project, the Contractor may submit written documentation showing conformance with the requirements in Section 3, "General Qualification Requirements," of SSPC-QP 1.

F. Proposed methods to control environmental conditions in accordance with the manufacturer's recommendations and these special provisions.
G. Proposed methods to protect the coating during the curing period.
H. Proposed rinse water collection plan.
I. A detailed paint repair plan for the repair of damaged areas.
J. Procedures for containing blast media and water during application of coatings and coating repair of erected steel.
K. Examples of proposed daily reports for all testing to be performed, including type of testing, location, lot size, time, weather conditions, test personnel, and results.

Prior to submitting the PQWP, a prepainting meeting between the Engineer, the Contractor, and a representative from each entity performing painting for this project shall be held to discuss the requirements for the PQWP.

The Engineer shall have 3 weeks to approve the PQWP submittal after a complete plan has been received. No painting or paint removal shall be performed until the PQWP for that work is approved by the Engineer. Should the Engineer fail to complete the review within this time allowance and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in approving the PQWP, the delay will be considered a right of way delay in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

It is understood that the Engineer's approval of the Contractor's PQWP shall not relieve the Contractor of any responsibility under the contract for the successful completion of the work in conformity with the requirements of the plans and specifications.

The Contractor shall provide enclosures to permit cleaning and painting during inclement weather. Provisions shall be made to control atmospheric conditions inside the enclosures within specified limits during cleaning and painting operations, drying to solvent insolubility, and throughout the curing period in accordance with the manufacturer's recommendations and these special provisions. Full compensation for providing and maintaining such enclosures shall be considered as included in the prices paid for the various contract items of work requiring paint and no additional compensation will be allowed therefor.

Fresh, potable water with a maximum chloride content of 75 mg/L and a maximum sulfate content of 200 mg/L shall be used for water rinsing or pressure washing operations. No continuous recycling of rinse water will be permitted. If rinse water is collected into a tank and subsequent testing determines the collected water conforms to the specified requirements, reuse may be permitted by the Engineer if no collected water is added to the tank after sample collection for determination of conformance to specified requirements.

CLEANING

Metal surfaces shall be blast cleaned in conformance with the provisions in Section 59-2.03, "Blast Cleaning," of the Standard Specifications. Blast cleaning shall not be performed until the surfaces are thoroughly dry.

Mineral and slag abrasives used for blast cleaning steel surfaces shall conform to the requirements for Class A, Grade 2 to 3 abrasives contained in SSPC-AB 1, "Mineral and Slag Abrasives," of the "SSPC: The Society for Protective Coatings," and shall not contain hazardous material.

Steel abrasives used for blast cleaning steel surfaces shall comply with the requirements of SSPC-AB 3, "Ferrous Metal Abrasive," of the "SSPC: The Society for Protective Coatings." If steel abrasive is recycled through shop or field abrasive blast cleaning units, the recycled abrasive shall conform to the requirements of SSPC-AB 2, "Specification for Cleanliness of Recycled Ferrous Metallic Abrasive," of the "SSPC: The Society for Protective Coatings."

A Certificate of Compliance conforming to the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications and a Material Safety Data Sheet shall be furnished prior to use for each shipment of blast cleaning material for cleaning existing steel.

Abrasive blast cleaned surfaces shall be tested by the Contractor for soluble salts using a Class A or B retrieval method as described in Technology Guide 15, "Field Methods for Retrieval and Analysis of Soluble Salts on Steel and Other Nonporous Substrates," of the "SSPC: The Society for Protective Coatings," and cleaned so the maximum level of soluble salts does not exceed the lesser of the coating manufacturer's written recommendations or 10 micrograms per square centimeter. Areas of abrasive blast cleaned steel shall be tested at the rate of 3 tests for the first 100 square meters prepared per day, and one test for each additional 100 square meters or portion thereof, at locations selected by the Engineer. When less than 100 square meters of surface area is prepared in a shift, at least 2 tests shall be performed. If levels of soluble salts exceed the maximum allowed by these special provisions, the entire area represented by the testing will be rejected. The Contractor shall perform additional cleaning and testing of rejected areas until soluble salt levels conform to these requirements.

PAINTING

Paint shall be applied to existing metal surfaces in conformance with the following provisions:

A. Precede each specified undercoat by a stripe coat on all edges, corners, seams, crevices, interior angles, junctions of joining members, weld lines, and similar surface irregularities. This stripe coat shall be of sufficient thickness to completely hide the surface being covered and shall be followed as soon as practical by the application of the full undercoat to its specified thickness.
B. Blast cleaned areas shall be coated with the following undercoat paint system in the order listed:

1. The first undercoat paint conforming to the requirements for Red Primer Paint-Waterborne, Formula PWB 145D shall be applied in one or more applications to a dry film thickness of not less than 50 µm nor more than 75 µm.
2. The second undercoat paint conforming to the requirements for Pink Primer Paint-Waterborne, Formula PWB 146D shall be applied in one or more applications to a dry film thickness of not less than 50 µm nor more than 75 µm.
3. The total dry film thickness of all undercoats shall be not less than 100 µm nor more than 150 µm.

A minimum of 12 hours drying time shall be allowed before applying the succeeding undercoat.

The 2 undercoats shall be applied within 30 days of blast cleaning of existing metal surfaces.

MEASUREMENT AND PAYMENT

Dry spot blast cleaning and undercoat painting of blast cleaned areas of existing surfaces will be measured by the square meter of spot blast cleaned areas, and will be paid for as spot blast clean and paint undercoat.

The contract price paid per square meter for spot blast clean and paint undercoat shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in dry spot blast cleaning and painting undercoat on the existing surfaces complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 172

SHEET 6 OF 11

SCAFFOLDING

Scaffolding shall be defined in accordance with and shall conform to the Construction Safety Orders of the Division of Occupational Safety and Health and these special provisions.

If scaffolding is constructed for this project over or adjacent to traffic, or suspended from the traveled way, the Contractor shall submit to the Engineer working drawings for scaffolding systems in conformance with Section 5-1.02, "Plans and Working Drawings'" of the Standard Specifications, and these special provisions.

Scaffolding working drawings shall include the following:

A. Descriptions, calculations, and values for all loads anticipated during the erection, use, and removal of scaffolding.
B. Methods and equipment for erecting, moving, and removing scaffolding.
C. Design details including bolt layouts, welding details, and any connections to existing structures.
D. Stress sheets including a summary of computed stresses in the (1) scaffolding, (2) connections between scaffolding and any existing structures and (3) existing load supporting members. The computed stresses shall include the effects of erection, movement, and removal of the scaffolding.

If manufactured scaffolding is used, the manufacturer's name, address, and phone number shall be shown on the working drawings.

The working drawings shall be stamped and signed by an engineer who is registered as a Civil Engineer. In addition, prior to submitting the working drawings to the Engineer, the working drawings shall be stamped and signed by an independent reviewer who is registered as a Civil Engineer in the State of California. The independent reviewer shall not be employed by the same entity preparing the working drawings.

The Contractor shall allow 21 days for the review of a complete submittal for scaffolding working drawings. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

Welding for the manufacturing and erection of scaffolding shall conform to the requirements in AWS D1.1 or D1.2 for steel or aluminum construction respectively.

Full compensation for conforming to the above requirements shall be considered as included in the contract prices paid for the various contract items of work, and no additional compensation will be allowed therefor.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 173	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, provide compensation for additional costs incurred by the Contractor on the 3 items of work listed below due to all Department delays to the work of the Viaduct portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)):

1)Construction of the Viaduct concrete footings, columns, decks and barrier rails.

2)Providing stairway and elevator access to the Viaduct during the work.

3)Providing all design support during the construction of the Viaduct.

For this work, the Contractor will be compensated a lump sum of $740,890.00. This sum constitutes full and final compensation for all outstanding escalation costs incurred on the Viaduct structure due to all Department delays to the work.

Cost of Adjustment of Compensation at Lump Sum $740,890.00

Estimated Cost: Increase ☑ Decrease ☐ **$740,890.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Viaduct Concrete Escalation	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	0

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor for escalation costs associated with the construction of the concrete columns, decks and railing and for providing marine and worksite access to the Viaduct structure due to Department delays to the work.

This contract calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the east tie-in (ETI) to the bridge, the west tie-in (WTI) to the island and the Viaduct structure between the two. The contract was awarded as a performance based project with the contractor responsible for meeting the design criteria specified in the contract.

The Viaduct consists of 4 spans of a double deck steel truss approximately 20 meters wide and 320 meters long with a weight of over 4,300 metric tons. Due to extensive Department ordered changes and delays to the project, the contract completion date has been extended by approximately 4 and a half years with the work on the Viaduct structure delayed between 2 to 4 years. Due to these delays, the contractor has incurred considerable escalation costs pertaining to the construction of the concrete columns, decks and railing and for providing marine and worksite access to the structure. This change order provides compensation for these additional costs.

The concrete work compensated under this change includes the construction 8 column each 3 meters in diameter and approximately 50 meters tall, 8 concrete decks approximately 80 meters by 20 meters in area and approximately 650 meters of concrete barrier. Stair towers and elevators were required to provide access up to the deck. Compensation provided under this change order is based on an as-planned verses actual costs analysis for the affected concrete work.

Compensation is also included for the escalation costs pertaining to the contractor design support of the construction of the Viaduct. As the design of the Viaduct was a performance based design, the contractor provided design support during construction to provide quality control and to resolve design conflicts encountered in the field. The original contract provided a separate contract bid item for the design of the detour structure.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $740,890.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as this change will not affect the controlling operation.

This change was concurred with by Ken Terpstra - Project Manager, and Jaime Gutierrez - Project Engineer.

Maintenance concurrence is not required as this is an administrative change and doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 174	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Furnish, fabricate, coat and deliver four (4) expansion joints barrier plates for Bent 52A and four (4) expansion joint Barrier plates for Pier E1 as shown on Sheets 2 through 14 of this change. Payment for this work shall be made in accordance with Sections 4-1.03D, Extra Work, and 9-1.03, Force Account Payment, of the Standards Specifications.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Estimated Cost of Extra Work at Force Account $350,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$350,000.00**

By **reason of this order the time of completion will be adjusted as follows:** Deferred

STATE OF CALIFORNIA - DEPARTMENT OF TRANSPORTATION

CONTRACT CHANGE ORDER MEMORANDUM

TO: MIKE FORNER / DEANNA VILCHECK	FILE: E.A. 04 - 0120R4
	CO-RTE-PM SF-80-12.6/13.2
FROM: BILL CASEY	FED. NO. ACBRIM-080-1(097)N
CCO#: 174 SUPPLEMENT#: 0 Category Code: CHPA	CONTINGENCY BALANCE (incl. this change) $59,316,492.60
COST: $350,000.00 INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: ETI Expansion Joint Barrier Plates	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

compensating the Contractor for all costs associated with furnishing, fabricating, coating and delivering four (4) expansion joints barrier plates for Bent 52A and four (4) expansion joint barrier plates for Pier E1.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The new ETI design requires the fabrication and installation of 4 expansion joints where the upper and lower decks conform to the new Viaduct structure and the existing SFOBB. The expansion joint barrier plates are needed to connect the concrete barriers between the new Viaduct structure and the existing SFOBB.

This work will be paid for as Extra Work at Force for an estimated cost of $350,000.00 which can be funded through the available contingency balance. A cost analysis is on file.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was requested by Mike Whiteside - YBI Coordination Engineer, per Memorandum dated October 7, and October 31, 2008.

Alec Melkonians - Asst. Project Manager, Toll Bridge Program, Hong Wong - Project Engineer, and Lina Ellis - Structure Maintenance, concurred with this change.

STATE OF CALIFORNIA - DEPARTMENT OF TRANSPORTATION

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 174	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC **MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Incorporate the changes to the expansion joints barrier plates at Bent 52A and Pier E1 of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) as shown in the revised plan sheets of Sheets No. 2 through 8 of this change order.

All revisions to the expansion joints barrier plates shown on Sheets No. 2 through 8 of this change order shall supersede the original plan sheets issued under Change Order No. 174.

Compensation for any additional costs associated with the fabrication of the expansion joint barrier plates resulting from the changes incorporated under this change order shall be paid as extra work at force account as previously provided under Change Order No. 174.

Estimated Cost: Increase ☐ Decrease ☐ **$0.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

Submitted by		
Signature	Resident Engineer BILL CASEY	Date 9-31-09
Approval Recommended by		
Signature Deanna Vilcheck	Area Construction Manager DEANNA VILCHECK	Date 9/1/09
Engineer Approval by		
Signature Deanna Vilcheck	Area Construction Manager DEANNA VILCHECK	Date 11/4/09

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 174	Suppl. No. 2	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds.

Estimated cost of Extra Work at Force Account $150,000.00

RECEIVED
01 55 I FEB -3 10

Estimated Cost: Increase ☑ Decrease ☐ **$150,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Submitted by

Signature	Resident Engineer BILL CASEY	Date 10-3-09

Approval Recommended by

Signature Deanna Vilcheck	Area Construction Manager DEANNA VILCHECK	Date 10/7/09

Engineer Approval by

Signature Deanna Vilcheck	Area Construction Manager DEANNA VILCHECK	Date 11/9/09

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

Additional funds.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The original contract change calls for compensating the Contractor for all costs associated with furnishing, fabricating, coating and delivering four (4) expansion joints barrier plates for Bent 52A and four (4) expansion joint barrier plates for Pier E-1. This change order is necessary due to expedited fabrication costs incurred in order to meet the 2009 Labor Day Weekend Roll In and to pay all outstanding bills in the holding file.

The Contractor shall be compensated under Extra Work at Force Account with an estimated cost of $150,000.00, which can be financed on the contract's contingency fund, bringing the total cost to be $500,000.00.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders, therefore, this change order is being issued unilaterally.

No adjustment of contract time is warranted as this change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer,

CCO 175	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform the retrofit work for the steel truss modifications at existing Pier YB3 in accordance with Plan Sheets No. 2 through 3 and 10 through 13 of Contract Change Order No. 160.

Work includes: all necessary layout; unloading and handling material at the site; removal of existing rivets, nuts and bolts as required; steel drilling and reaming including cutting slots to allow passage of high strength rods; steel erection and installation; bolt and rod installation; bolt testing and inspection, field welding and welding inspection;

Flagging costs associated with this work shall be paid under Change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum payment made under this change order.

The compensation provided under this change order is based on the work being done on a 10-hour day, 6 days per week schedule in an effort to support the placement of traffic on the Temporary Bypass Structure by September 8, 2009.

For this work, the Contractor will be compensated a lump sum of $311,144.00. This sum constitutes full and final compensation for all costs, including all markups, for the work specified herein.

Compensation for the following items of work pertaining to the erection of the ETI existing steel truss reinforcement have not been addressed by this change order:

1. Fabrication and delivery to the jobsite of all permanent materials to be incorporated into the work.
2. Providing access or access platform for the work at Pier YB3.
3. Work to be done on the roll out / roll in weekend including installing wedge shim plates, tensioning wedge bolts, tensioning high strength rods.
4. Costs associated with any work at Span YB4 or at Pier YB1.
5. Costs associated with lead abatement; touchup or finish painting.

Compensation for the 5 items of work specified above shall be paid under separate change orders.

Total Cost of Extra Work at Lump Sum $311,144.00

CCO DESCRIPTION: ETI Pier YB3 Steel Retrofit- Erection	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

Compensating the Contractor for erection of structural steel materials required to reinforce the existing truss at Pier YB3 for the East Tie-In (ETI) structure.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

In January 2009, Toll Bridge Design provided design drawings to provide additional stability to existing spans YB1, YB2, YB3, and YB4 to permit the planned roll out during the Labor Day traffic switch to the YBID. Contract Change Order No. 160 was issued to provide compensation for the fabrication and delivery of the material. Contract Change Order No. 93 - Supplement No.1 was issued to provide compensation for the lead paint abatement for this work. Contract Change Order Nos. 170 and 204 will be issued to provide compensation for the field erection at Span YB4 and Pier YB1. This change order will provide compensation to the Contractor for the field erection required at Pier YB3.

Compensation for this change shall be for an agreed lump sum cost of $311,144.00 which will be financed through the contingency fund. A cost analysis is in the project files.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages" of the Standard Specifications and Section 10-1.20 "time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was requested by Mike Whiteside - YBI Coordination Engineer per memorandum dated December 9, 2008 and concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

CCO DESCRIPTION: Construction Staking	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

This change compensates the contractor for all costs involved in providing construction staking services as authorized by the Engineer.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

This change is necessary in order mitigate potential delays and/or decrease overall activity duration by augmenting existing State surveying resources at critical junctions.

This work will be paid for as Extra Work at Force for an estimated cost of $100,000 which can be funded through the available contingency balance.

Maintenance concurrence is not required as this change order doesn't affect any permanent roadway features.

Alec Melkonians - Asst. Project Manager, Toll Bridge Program and Hong Wong - Project Engineer concurred with this change.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 177	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Eliminate the bridge removal of the existing Route 80 steel truss span YB4 (Bridge No. 33-0025), between Pier YB-4 and Pier E-1, and portions of Pier E-1 as originally contemplated and bid by the Contractor.

Estimate of Decrease in Contract Item at Contract Price:

Item No. 42: BRIDGE REMOVAL (PORTION) LOCATION B
-1 LS (-100.00%) 1,460,000.00 /LS = -$1,460,000.00 (-100.00%)

In accordance with Section 4-1.03B(3), "Eliminated Items," of the Standard Specifications, the adjustment due to the elimination of Item No. 42 Bridge Removal (Portion), Location B, is zero.

Total Cost for Decrease in Contract Item.....($1,460,000.00)

RECEIVED
01 552 FEB 3 10

Extra Work at Lump Sum:

Perform all work as specified within this change order pertaining to the demolition of the Span YB4 steel truss of the existing structure (Bridge No. 33-0025) after the span has been rolled out and replaced by the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

Compensation paid under this change order includes but is not limited to all costs associated with the following 6 items of work:

1) Performing the lowering of the Span YB4 truss including furnishing, installing, and removing all equipment and material necessary to perform the lowering of the truss in accordance with the plans submitted (Document No: 215-SUB.00378-00) by Mammoet USA Inc. including any subsequent revisions to this plan as required for approval by the Engineer. This work includes but is not limited to furnishing and installing the gantry system including all strand jacks; all lifting towers; all foundations; all lifting beams, strandjack beams, gantry beams and cross beams; all bracing; all mid-span frames and all appurtenances.

2) Performing the transport of Bent 1 and Bent 2 towers of both Skid Bent A and Skid Bent B of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) including furnishing, installing, and removing all equipment and material necessary to remove the obstruction these bents present to the lowering of the Span YB4 truss as specified under Item No. 1 above. This work shall be performed in accordance with the plans submitted (Document No: 215-SUB.00432-00) by Mammoet USA Inc. including any subsequent revisions to this plan as required for approval by the Engineer.

3) Disconnecting Skid Beam Segment A1 and Segment B1 of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) to allow for these segments to be lowered with the Span YB4 truss as specified under Item No. 1 above and then disconnecting the segments from the Span YB4 truss after it has been lowered.

4) Provide for the furnishing, installation and removing all falsework to support the Span YB4 truss after it has been lowered as specified under Item No. 1 above and in accordance with the plans submitted (Document No: 215-SUB.00399-02) by the Contractor including any subsequent revisions to this plan as required for approval by the Engineer.

5) Performing all bridge removal work associated with the demolition and disposal of the Span YB4 truss after it has been lowered onto falsework as specified under Item No. 1 above in accordance with the plans submitted (Document No: 215-SUB.00384-00) by the Contractor including any subsequent revisions to this plan as required for approval by the Engineer.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 177	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

6) Performing all earthwork, grading and backfilling of foundations necessary for the work of Item No. 1 through 5 above.

For this work, the Contractor shall be compensated a lump sum of $12,709,560.00. Except for the items of work specifically excluded in this change order, this sum constitutes full and final compensation, including all markups, for all costs associated with the work of this change.

All costs associated with the following 3 items of work are excluded from this change order:

7) Performing all bridge removal work associated with the demolition and disposal of the skid bents and beams of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) including for the demolition and disposal of Skid Beam Segment A1 and Segment B1 that are lowered with the Span YB4 truss.

8) Performing the demolition and disposal of all concrete foundations pertaining to the lowering of the Span YB4 truss (Item No. 1 above) and all concrete foundations pertaining to the falsework that supports the Span YB4 truss after it has been lowered (Item No. 4 above).

9) Performing any backfill of the ETI area beyond that specified under Item No. 6 above.

Any costs associated with these 3 items of work shall be paid under separate change orders.

Flagging costs associated with the work of this change shall be paid under Change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum compensation provided under this change order.

The compensation paid under this change order includes all engineering and survey costs associated with the work of this change order and no additional compensation shall be paid.

The compensation provided under this change order is based on traffic being placed on the Temporary Bypass Structure no later than 5:00 AM on September 8, 2009. Should this traffic placement be delayed beyond this time, the Contractor may be compensated for any additional costs incurred due to this delay.

Total Cost of Extra Work at Lump Sum.....$12,709,560.00

Estimated Cost: Increase ☑ Decrease ☐ **$11,249,560.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Span YB4 Lowering & Demolition	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

The demolition and disposal of the Span YB4 steel truss.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the Contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

The new design of the ETI structure provides for a roll-out / roll-in concept with a new double deck steel truss span being erected adjacent to the existing span and then rolled into place after the existing span is rolled out. This change order provides for the demolition and disposal of the existing steel truss span (Span YB4) that is rolled out.

Span YB4 is a double deck steel truss roughly 80 meters long and 25 meters wide. It sits approximately 50 meters in the air and is comprised of approximately 1,400 metric tons of steel and 950 cubic meters of concrete. The condition of the truss after it has been lifted and rolled out along with the potential delays associated with demolishing this compromised structure in the air has prompted the method of lowering the span prior to demolition that is being enacted under this change order. Headquarters Construction has performed a risk management analysis of this work and concurs with this change.

The work encompassed under this change includes constructing a temporary gantry system that will support and lower the rolled out span to the ground, relocating two 150 foot high skid bent towers that are located under the roll out span so that they do not obstruct the lowering of the span, constructing falsework for the lowered span to sit on and performing the actual demolition and disposal of the steel truss.

The change order also deletes the original contract item pertaining to the removal of the YB4 span. The scope of work bid by the Contractor for this item entailed only a partial removal of the span as the majority of the span was to be incorporated into the new detour structure. This method was originally accepted by the Department prior to the award of the contract but was abandoned after the December 14, 2006 strategy memo (referenced above) called for the roll out / roll in concept to be implemented.

The deletion of the contract bid item to remove Span YB4 shall result in a $1,460,000.00 credit to the Department. Compensation for the revised method of lowering and demolition of the span shall be paid as extra work at an agreed lump sum price of $12,709,560.00 The net change order cost of $11,249,560.00 shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as this change will not affect the controlling operation.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write

This change was concurred by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Patrick Treacy - HQ Asst. Construction Coordinator. TBPOC Approval provided on September 2, 2009.

Maintenance concurrence is not required as the work will not affect and permanent roadway items.

FHWA authorzation is no longer required as federal authorization and funding for this project has been officially withdrawn.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 178	Suppl. No. 2	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Furnish and install the Type 7 chain link fence, as shown on sheets 2 and 3 of this Change Order, on top of the Type 732 concrete barrier at the following locations:

1. South side of the eastbound deck from WD1 Line Sta. 54+20 to Sta. 54+58.
2. North side of the eastbound deck from WD1 Line Sta. 53+82 to Sta. 54+43.
3. North side of the westbound deck from WD2 Line Sta. 54+06 to Sta. 54+67

All work shall be performed in accordance with the plans and specifications as provided under the original Change Order No. 178.

For this work, the Contractor shall be compensated an agreed lump sum of $207,690.00. Excluding the cost of providing lane closures for this work, this lump sum constitutes full and final compensation, including all markups, for all costs associated with this work.

Any lane closures required for the work of this change shall be provided under Change Order No. 240. The costs of these lane closures are excluded from this change order.

Extra Work at Agreed Lump Sum $207,690.00

Estimated Cost: Increase ☑ Decrease ☐ **$207,690.00**

COST: **$312,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Truss Falsework Foundations	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

compensating the Contractor for all costs associated with furnishing and placing steel piles required for the falsework tower foundations necessary to erect the East Tie-In steel truss of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

This work is necessary in order to complete the East Tie-In truss erection as contemplated under CCO 129. Said CCO 129 deferred an assessment of compensation for the costs of furnishing and placing the steel piles associated with the East Tie-In falsework foundations. It was anticipated that the identified costs excluded from CCO No. 129 would result in additional change orders being issued as the work is completed and the costs are quantified and agreed to. These individual change orders have been assigned as the costs are being quantified and agreed to in order to facilitate the tracking of the excluded items.

Compensation for this change shall be performed as Adjustment of Compensation at Agreed Lump Sum for a total cost of $312,000.00, which can be financed through the Contingency Fund. A cost analysis is on file.

No adjustment of contract time is warranted, as the work will not affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 180	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Place structural backfill at East Tie-In skid bent footings A4 to A6 and B4 to B6 as shown in Contract Change Order 90. The Contractor agrees to accept the lump sum payment of $237,000.00 as full and complete compensation to perform this work including markups and profit. No further compensation shall be allowed.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Total Cost of Extra Work at Lump Sum $237,000.00

RECEIVED

CCO DESCRIPTION:
Skid Bent Footing Backfill A4-A6/B4-B6

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

compensating the Contractor for all costs associated with placing structural backfill at East Tie-In skid bent footings A4 to A6 and B4 to B6 as shown in Contract Change Order 90.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The structural backfill work was specifically excluded from Contract Change Order 90 since that work cannot be performed until the construction of the skid bent substructure had been completed.

Compensation for this change shall be as Extra Work at Agreed Lump Sum for a total cost of $237,000.00, which can be financed through the contingency fund. . A cost analysis is on file.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Provide compensation to the Contractor for all outstanding costs incurred in association with the following items of work pertaining to the erection of the steel truss and skid bents of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)):

1)Constructing the foundation for the temporary access elevator at Bent 52A.
2)Providing crane access for the steel erection.
3)Constructing the grout leveling pads at the skid bent footing and tower leg interfaces.

For this work, the Contractor shall be compensated an agreed lump sum of $49,200.00 which constitutes full and final compensation, including all markups, for all outstanding costs incurred.

Extra Work at Agreed Lump Sum $49,200.00

Estimated Cost: Increase ☑ Decrease ☐ **$49,200.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Additional Parking Space for USCG	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

The construction of a parking area for the adjacent United States Coast Guard facility.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins. The original contract completion date was July 2005.

Two separate Department strategy memorandums issued on December 14, 2006 entitled 'Strategy for South-South Detour Contract Completion' and December 25, 2006 entitled 'Recommendation to Construct Select Yerba Buena Island Transition Structure Foundations by Contract Change Order' were approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

The contract has now been extended to December of 2010 due to over 5 years of Department delay. This delay has had significant impacts on the adjacent U.S. Coast Guard facility whose main access runs directly through the project work site and who also vacated certain parking areas in order to provide access to the site. Project Development has now requested that an additional parking area be constructed for the Coast Guard in order to mitigate the disruptions caused by the extensive delay to the project.

The work includes the construction of 2 small hot mix asphalt parking areas along with the construction of concrete sidewalks that connect the parking areas to the U.S. Coast Guard base. The work also includes grading of the lots, the placement of temporary k-rail, AC dike and chain link fencing, and the maintenance of the parking areas over the remaining duration of this project.

Compensation for the cost of constructing the parking areas shall be paid as an extra work at force account at an estimated cost of $180,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was requested by Alec Melkonians - Asst. Project Manager per Memorandum dated May 27, 2009 and concurred with by Minh B. Nguyen - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 182	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide for the construction of the additional parking area south of the West Tie-In structure and modify the parking area provided under the original Change Order No. 182 between Hillcrest Road and the westbound I-80 off ramp as shown on Sheets No. 2 through 6 of this change order and as determined by the Engineer.

Estimated cost of Extra Work at Force Account $220,000.00

475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**0**

THIS CHANGE ORDER PROVIDES FOR:

The construction of an additional parking area for the adjacent US Coast Guard facility and revisions to the parking area added under the original Change Order No. 182.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins. The original contract completion date was July 2005.

Two separate Department strategy memorandums issued on December 14, 2006 entitled 'Strategy for South-South Detour Contract Completion' and December 25, 2006 entitled 'Recommendation to Construct Select Yerba Buena Island Transition Structure Foundations by Contract Change Order' were approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

The contract has now been extended to December of 2010 due to over 5 years of Department delays. This delay has had significant impacts on the adjacent US Coast Guard facility whose main access runs directly through the project work site and who also vacated certain parking areas in order to provide access to the site. Project Development has now requested that an additional parking area be constructed for the Coast Guard in order to mitigate the disruptions caused by the extensive delay to the project.

Project Development has now issued revised plan sheets for this work. The original change order provided for the construction of 2 parking areas along with the construction of concrete sidewalks that connect the parking areas to the Coast Guard base. This change provides revised plan sheets for these 2 areas and adds an addition parking area. The work also includes grading of the lots, the placement of temporary k-rail, AC dike and chain link fencing and the maintenance of the parking areas over the remaining duration of this project.

Compensation for the additional cost of constructing the parking areas due to the revisions provided under this supplement shall be paid as an extra work at force account at an estimated cost of $220,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was requested by Alec Melkonians - Asst. Project Manager per Memorandum dated May 27, 2009 and concurred with by Minh B. Nguyen - Project Engineer, and Lina Ellis - Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 182	Suppl. No. 2	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Furnish and install all concrete barrier (Type K) and signing, an electric pedestrian gate with a card reader to access the parking lot, a manual pedestrian gate to access the Q8 housing, and power to all the electrical gates as shown on Sheet No. 2 of this change order and as determined by the Engineer.

Estimated cost of Extra Work at Force Account $100,000.00

Extra Work at Lump Sum:

Furnish and install the chain link fence (Type CL-3.0) with 3 strands of barbed wire, furnish and install the vehicle swing gate (6M) with opener and card reader, furnish and install the pedestrian swing gate to access the electrical vault and remove and place all pavement delineation on Hillcrest Road as shown on Sheet No. 2 (Plan Sheet C-2) of this change order.

Furnish and install the adiem crash cushion adjacent to the parking lot between Hillcrest Road and the westbound I-80 off ramp as shown on Sheet No. 2 (Plan Sheet C-2) of this change order.

Furnish and install all lighting including all appurtenances for the stairway accessing the parking lot between Hillcrest Road and the westbound I-80 off ramp as shown on Sheet No. 3 through 6 (Plan Sheets E-1 through E-4) of this change order.

For this work, the Contractor shall be compensated a lump sum of $150,950.00. Except for providing any traffic control required for this work, this sum constitutes full and final compensation, including all markups, for the work specified. Traffic control required for this work shall be paid as extra work at force account under this change order.

Extra Work at Agreed Lump Sum $150,950.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$250,950.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

GENERAL NOTES

1. A light must be located at each landing and run of stair risers. The lighting layout shown in sheets E-1 and E-2 are typical and must be adjusted to actual field conditions. Lights are to be spaced 4 feet apart along stair risers. At stair landings, fixtures can be spaced 8 feet apart. Layout should be verified in field by Engineer prior to installation. A total of 90 wall mount fixtures are estimated for the project. Exact quantity and mounting detail to be confirmed by field layout. One power supply will provided for each 22 fixtures. Power supply to be hard wired. Fixtures can be connected to power supply using SO cord.

SYMBOLS

(See Caltrans standard plans ES-1A and ES-1B for additional symbols)

ABBREVIATIONS

(See Caltrans standard plans ES-1A and ES-1B for additional standard abbreviations)

NOTES:

1. Reference:

   -for Stairway lighting diagram, see E-3.

SHEET NOTES:

1. Install and route new 41C (type 1 conduit) with 2 #8, T (120 V Lighting) along the outside face of existing stringer. Provide conduit support every 1.5 M (maximum).
2. Not used.
3. Existing 91c, 3 #2/0 (120/240 V, Lighting)
4. Not used.
5. Not used.
6. Install shoebox light pole with rectilinear arm-mounted luminaire on 7.6 M high, 102 mm straight square steel pole with flat lens for full cutoff performance, type III distribution. 100 watt pulse start metal halide lamp with electronic ballast. Provide with locking photo control receptacle with photocontrol. Fixture dimensions are 214mm high x 457mm square. (120)volts. Fixture equal to EMCO MECA1B-1T-3M-100PSE-120/SRP-PCT. Pole equal to EMCO #355-20-4-11-D1-BRP. See mounting detail on E-4.
7. Furnish and install with spacing per general note 1, 102 mm diameter surface mounted low voltage LED step light with aluminum housing and satin etched tempered soda lime diffuser. 1.5 watts, 12 V. Finish color to be selected by USCG. Similar to "Kichler #15764AZT. Coordinate with USCG and the Engineer exact mounting height and mounting detail.
8. Furnish and install 318 mm(L) x 140mm(W) x 133mm(D) 300 W, (120) V-12 V outdoor rated transformer with textured bronze finish. Similar to "Kichler #15TPE300AZT. Locate transformer equally spaced along the length of the stairs.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 182	Suppl. No. 3	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Construct lighting improvements for the additional parking area south of the West Tie-In structure, which was provided under the original Change Order No. 182, and Supplements 1 and 2. Price includes all labor, equipment, and material costs to construct all conduits, conductors, light fixtures, pull boxes, and other items as shown on Sheets No. 2 through 3 of this change order.

For this work, the Contractor shall be compensated an agreed lump sum of $62,250.00 which constitutes full compensation, including all markups, for all costs associated with this change.

Cost of Extra Work at Agreed Lump Sum $62,250.00

Estimated Cost: Increase ☑ Decrease ☐ **$62,250.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO 184	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor for additional costs, incurred by the Contractor's fabricator Stinger Welding Inc., during the fabrication of the steel truss of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) due to Department delays, changes and impacts to the fabrication process.

For these costs, the Contractor shall be compensated a lump sum of $3,000,000.00. In the event the Contractor document additional costs incurred due to Department delays, changes or impacts to the truss fabrication, a supplemental change order shall be issued to provide compensation for those costs.

Total Cost of Adjustment of Compensation at Lump Sum $3,000,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$3,000,000.00**

475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

partial compensation of additional costs incurred by the Contractor due to Department impacts to the steel fabrication of the East Tie-In truss.

This project, the Temporary Bypass Structure (TBS), provides for the construction of a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) portion of this contract. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

Contract Change Order No. 140 was issued in the amount of $10,920,525.00 to provide for the fabrication of the steel truss of the ETI portion of the structure. During the fabrication of this truss, the contractor incurred considerable impacts due to Department delays associated with the approval of truss shop drawings and various Department changes to the design of the truss. Based on these delays and changes, the contractor has requested approximately $8,500,000.00 in compensation.

A review of these submitted costs has determined significant compensation owed to the contractor based on entitlement. However, additional analysis remains to be performed based on further documentation of impacts and actual costs incurred.

This change accounts for partial compensation of the contractor's total incurred costs pending final resolution and verification of said costs.

The contractor shall be paid the lump sum of $3,000,000.00, which accounts for partial compensation due the contractor, in order to mitigate incurring further interest, loan fees, and miscellaneous bank charges resulting from these Department impacts. Further compensation due the contractor is currently under discussion and is contingent upon the contractor providing additional information regarding this issue including but not limited to independent overhead audits, detailed cost analyses, fabrication timelines, and planned versus actual production rates. Further compensation will be provided under a separate supplemental change order once the final compensation package has been agreed to.

Compensation shall be paid as an adjustment of compensation at a lump sum of $3,000,000.00.and shall be funded through the contract's contingency funds. A cost analysis is on file.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

STATE OF CALIFORNIA - DEPARTMENT OF TRANSPORTATION

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 184	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, provide compensation to the Contractor for all outstanding costs incurred by the Contractor's steel fabricator Stinger Welding Inc., during the fabrication of the steel truss of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) due to a Department caused delays, changes and impacts to the steel fabrication.

For this work, the Contractor will be compensated a lump sum of $4,393,420.00. This sum, in addition to the compensatio paid under the original Change Order No. 184, constitutes full and final compensation, including all markups, for all direct, indirect and impact costs, both past and future, pertaining to all work performed by Stinger Welding Inc. on the ETI steel truss and no additional compensation shall be paid.

Total Cost of Adjustment of Compensation at Lump Sum $4,393,420.00

This change order excludes any additional costs incurred by the Contractor's subcontractor Danny's Construction Company, Inc. (DCCI) during the erection of the steel truss that were incurred due to the expedited fabrication of the truss by Stinger Welding Inc. in their efforts to mitigate the Department caused delays to the steel fabrication.. Any compensation associated with these additional steel erection costs shall be compensated under Change Order No. 214.

This change order includes compensation for all costs associated with the design changes incorporated under Change Order No. 140, Supplement No. 2 as they pertain to the fabrication of the ETI truss.

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$4,393,420.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

Submitted by:		
Signature	**Resident Engineer** BILL CASEY	**Date** 7-28-09
Approval Recommended by:		
Signature Mike Forner	**SFOBB Construction Manager** MIKE FORNER	**Date** 7-29-09
Engineer Approval by:		
Signature Mike Forner	**SFOBB Construction Manager** MIKE FORNER	**Date** 8-11-09

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

CCO DESCRIPTION:
ETI Truss Fabrication Impacts

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

Final compensation to the Contractor for additional costs incurred due to Department-caused delays and impacts to the steel fabrication of the East Tie-In truss.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins. The contract was awarded as a performance-based project with the Contractor responsible for meeting the design criteria specified in the contract.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, Richard Land, Chief Engineer, and subsequently by the Toll Bridge Program Oversight Committee recommended that the Department assume the design responsibility for the East Tie-In portion of the detour. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge into the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

Contract Change Order No. 140 was issued in the amount of $10,920,525.00 to provide for the fabrication of the steel truss of the ETI portion of the structure (the roll in structure). The change order was priced with an aggressive fabrication schedule that was required in order to meet the Department's planned roll in of the ETI truss during Labor Day Weekend of 2009. That change order provided an incentive payment for the Contractor to improve upon an agreed upon March 8, 2009 steel delivery date with a matching disincentive for a late delivery.

During the fabrication of this truss, the Contractor incurred considerable impacts due to Department delays associated with the approval of the truss shop drawings and various Department changes to the design of the truss. The design changes to the truss were incorporated under Contract Change Order No. 140 - Supplement No. 2 with compensation deferred for any additional costs resulting from these changes. Based on these delays and changes, the Contractor submitted a request, dated April 2, 2009, for approximately $8,022,000.00 in compensation. A subsequent request, dated May 15, 2009, has now been submitted for $8,968,628.00.

The original Contract Change Order No. 184 provided partial compensation of $3,000,000.00 based on costs that had been documented at the time that change order was issued. The Contractor has now submitted documentation that supports additional compensation of $4,393,420.00 to resolve all costs associated with the steel fabrication of the truss. This contract change order provides for this compensation.

This contract change order recognizes significant Department delays that were incurred by the fabricator in the shop drawing approval process. These delays were incurred over the period from June 2008 through February 2009. Contract Change Order No. 140 did not address any time allowance for the shop drawing review process. However, the Contractor was verbally notified that a 10-day review should be anticipated. Based on this notification, the Contractor anticipated approval of the shop drawing for the north truss, south truss, and beams and stringers over the period from August 14, 2008 to September 11, 2008. The final approval of the drawings was actually received between December 30, 2008 and February 18, 2009. This represents a 4-½ to 5-½ month delay.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

The shop drawing approval delay had 3 significant impacts to the Contractor's operations. These impacts are described below:

1) Unabsorbed Shop and Labor Resources (August through November 2008):

By the summer of 2008, the Contractor had dedicated approximately half of their fabrication shop to the ETI truss and had increased their labor force in anticipation of starting the work. The 4-½ to 5-½ month delay to the work resulted in the Contractor having to absorb over 50,000 man-hours that were planned to be employed on the truss into other projects. In an effort to mitigate these man-hours without further delaying the ETI work, the Contractor set up a temporary fabrication yard in a vacant lot adjacent to their permanent shop facilities and employed their work force on other projects. Considerable costs were incurred in setting up the temporary fabrication yard and considerable labor inefficiencies were incurred on these projects.

2) Impacts to the ETI Truss Fabrication (October 2008 through April 2009):

During the fall of 2008 the Contractor began fabrication of the truss in a piecemeal fashion due to the delays in the shop drawing approval. While this work was highly inefficient, the Contractor performed this work in an effort to mitigate Department delays and the risk of not meeting the planned 2009 Labor Day Weekend roll in of the truss. Once shop drawings were approved by the winter of 2008/2009, the Contractor dedicated all of their available resources to the truss. This culminated in over 6,000 man-hours per week being employed on the truss fabrication by late February of 2009 compared to the as-planned peak man-hours of 3,000 per week. Over 23,400 hours of overtime was also expended on this work.

3) Impacts to Concurrent Projects (December 2008 through July 2009):

The Contractor's as-planned schedule anticipated that by December of 2009 the resources required for the fabrication of the ETI truss would have peaked and man power could begin to be redirected to other planned fabrication projects. Due to the delays to the work, just the opposite occurred. Between December 2008 and April of 2009, the Contractor employed approximately 38,000 unplanned man-hours on the ETI truss. This resulted in considerable delays to these other projects. In addition, the ETI truss occupied the majority of the fabrication shop at a time when it was anticipated the work would have been completed. This resulted in additional fabrication work being performed on other projects in the temporary fabrication facility set up adjacent to the permanent facility.

Both the piecemeal work performed in the fall of 2008 and the increased resources employed during the winter and spring of 2009 resulted in extensive inefficiencies being incurred to the actual ETI truss fabrication. An as-planned verses actual cost analysis shows an additional 26,200 man-hours were expended on the truss fabrication. Additional costs were incurred in working extended overtime, labor escalation and employee retention along with additional costs related to design changes incorporated into the truss under Contract Change Order No. 140 - Supplement No. 2. A total cost of $3,365,040.00 has been determined to be compensable for these impacts.

Concerning impacts to other projects, the Contractor acted to mitigate Department delay costs by absorbing over 50,000 as-planned man-hours into other projects during the summer and fall of 2008. Additionally, the Contractor incurred significant impacts to their as-planned operations on other projects during the winter and spring of 2009 due to the approximately 38,000 unplanned man-hours employed on the ETI truss. These impacts include performing fabrication work in the vacant lot adjacent to their actual fabrication facilities. Costs associated with this work include labor inefficiencies, costs associated with the set up and rental equipment required to support the temporary fabrication facility and overtime the Contractor incurred during the winter and spring of 2009 in an effort to maintain their delivery schedules on these other projects. The Contractor has produced detailed labor reports and as-planned bid documentation to support these additional costs. A total cost of $3,384,480.00 has been determined to be compensable for these impacts.

The Contractor has also documented financing costs associated with significant costs overruns and revenue shortfalls resulting from these Department impacts to their operations. Compensation of $643,900.00 shall be paid for these costs.

The total compensation of $7,393,420.00 shall be off set by the $3,000,000.00 compensated under the original Contract Change Order No. 184. Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $4,393,420.00, which shall be financed from the contract's contingency funds. A detailed cost estimate is on file.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

The Toll Bridge Program Oversight Committee (TBPOC) provided approval of this change on August 7, 2009.

Maintenance concurrence is not required as this is an administrative change and doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 185	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds for the work specified under the original Change Order No. 185 as determined by the Engineer.

Estimated cost of Extra Work at Force Account $60,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$60,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Eliminate the as-planned furnishing and operation of the portable changeable message signs as shown on the Contract Plans and as defined by Contract Bid Item No. 32.

Estimate of Decrease in Contract Item at Contract Price:

Item No. 32: PORTABLE CHANGEABLE MESSAGE SIGN
-49 EA (–100.00%) $5,000.00 /EA = –$245,000.00 (–100.00%)

Total cost for Decrease in Contract Item.....($245,000.00)

In accordance with Section 4-1.03B(3), "Eliminated Items," of the Standard Specifications, the adjustment due to the elimination of Item No. 32 - Portable Changeable Message Sign, is zero.

Extra Work at Force Account:

Provide miscellaneous additional changeable message (beyond the 160 EA provided for under this change order) and detour signing, in addition to that shown on Sheet 3 through 12 of this change order, as determined by the Engineer.

Estimated Cost of Extra Work at Force Account $200,000.00

Extra Work at Lump Sum:

Perform the following work pertaining to the full closure of the San Francisco Oakland Bay Bridge (SFOBB) over the 2009 Labor Day Weekend:

1) Furnish, install and maintain a maximum of 160 (EA) programmable changeable message signs at the designated locations as shown on Sheet 3 through 12 of this change order and as determined by the Engineer. All signs shall be placed in accordance with the dates and messages as shown.

2) Furnish and install all temporary signing as shown on Sheet 3 through 7 of this change order prior to the implementation of the Labor Day Weekend SFOBB closure and remove all signing after the closure is completed.

3) Provide all traffic control necessary to implement the SFOBB Labor Day weekend closure in accordance with Sheet 3 through 7 of this change order. The closure shall begin at 8:00 PM on September 3, 2009 and shall end no later than 5:00 AM on September 8, 2009 or as determined by the Engineer. Traffic control shall include providing access to Yerba Buena Island and Treasure Island from the City of San Francisco as determined by the Engineer.

For this work, the Contractor shall be compensated an agreed lump sum of $2,435,910.00. This lump sum constitutes full and final compensation, including all markups, for the work specified under this change order.

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Total Cost of Extra Work at Lump Sum $2,435,910.00

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 186	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$2,390,910.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

Submitted by

Signature	Resident Engineer	Date
	BILL CASEY	7-27-09

Approval Recommended by

Signature	SFOBB Construction Manager	Date
Mike Forner	MIKE FORNER	7-28-09

Engineer Approval by

Signature	SFOBB Construction Manager	Date
Mike Forner	MIKE FORNER	8-25-09

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

Contractor Acceptance by

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 187	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Fabricate and furnish temporary bracing for the East-Tie In as shown on Sheets 2 and 3 of this change. Costs incurred to field-drill bolt holes will be compensated for on this change order.

Payment for this work shall be made in accordance with Sections 4-1.03D, Extra Work, and 9-1.03, Force Account Payment, of the Standard Specifications.

Estimated Cost of Extra Work at Force Account $150,000.00

RECEIVED

THIS CHANGE ORDER PROVIDES FOR:

compensating the Contractor for all costs associated with furnishing and fabricating temporary steel bracing for the East-Tie In.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

Numerous furnish and fabrication costs associated with the ETI steel truss had been excluded from Contract Change Order Nos. 129 and 140, including the furnishing and fabrication of temporary bracing, because the design of these bracings were not made available until after CCO 129 and CCO 140 needed to be executed. The bracing is required during concrete placement to provide lateral stability to the truss stringers. Erection of the bracing shall be paid for under CCO No. 129 except for field adjustments, such as magnetic drilling of bolt hole connections, which shall be paid for under this change order.

Compensation for this change shall be performed asExtra Work at Force Account for a total cost of $150,000.00, which can be financed through the contingency fund. A cost analysis is on file.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was requested by Mike Whiteside - YBI Coordination Engineer, per Memorandum dated April 8, 2008 and concurred with by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Structure Maintenance.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 188	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Section 5-1.26 "Sound Control Requirements" of the Contract Special Provisions shall be superseded by the provisions as defined on Sheet No. 2 of this change order.

Any additional costs associated with providing for the sound control measurements specified under this change order or for cost impacts to the Contractor's operations resulting from the implementation of these provisions shall be compensated under a supplement to this change order.

Estimated Cost: **Increase** ☐ **Decrease** ☐ **$0.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

5-1.26 SOUND CONTROL REQUIREMENTS

Sound control shall conform to these special provisions.

Attention is directed to "Supplemental Project Information," of these special provisions for reference to the USCG License DTCG-Z71111-03RP-002L, Amendment No. 1, Maintenance and Logistic Command Pacific.

The noise level from the Contractor's operations, between the hours of 7:00 p.m. and 7:00 a.m., shall not exceed 78 dBa at a distance of 15 m from the source. Impact-type mechanical operations, such as jack-hammering shall not be conducted between the hours of 7:00 p.m. and 7:00 a.m. Pile-driving shall not be conducted between the hours of 7:00 p.m. and 12:00 p.m. At all times, the Contractor shall be responsible for complying with local ordinances regulating noise levels as well as the sound requirements of this section.

Noise monitoring activities will be conducted by the Department. The Contractor shall coordinate with the Department monitors and allow them access to noise monitoring locations.

The Contractor shall provide one "Type 1" sound level meter and one acoustic calibrator, which will be used by the Department during the life of the contract, at least 30 days prior to the construction start. The Contractor shall provide training by a person trained in noise monitoring to one Department employee designated by the Engineer. The sound level meter shall be calibrated and certified by the manufacturer or other independent acoustical laboratory prior to delivery to the Department. The Contractor shall provide annual recalibration by the manufacturer or other independent acoustical laboratory. All equipment shall be capable of taking measurements using the A-weighting network and the "slow" response of the sound level meter. The measurement microphone shall be fitted with an appropriate windscreen. All equipment shall be returned to the Contractor at the acceptance of the contract. Equipment damaged by actions of the Department or the public shall be paid for as extra work as provided in Section 4-1.03D for the Standard Specifications.

Each internal combustion engine, used for any purpose on the job or related to the job, shall be equipped with a muffler of a type recommended by the manufacturer. No internal combustion engine shall be operated on the project without the muffler.

The noise level requirement shall apply to the equipment on the job or related to the job, including but not limited to trucks, transit mixers or transient equipment that may or may not be owned by the Contractor. The use of loud sound signals shall be avoided in favor of light warnings except those required by safety laws for the protection of personnel.

Full compensation for conforming to the requirements of this section shall be considered as included in the prices paid for the various contract items of work involved and no additional compensation will be allowed therefor.

475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

replacing the current Section 5-1.26 Sound Control Requirements of the Special Provisions with a revised version.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

The Department issued a December 25, 2006 strategy memo which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer), and subsequently by the Toll Bridge Program Oversight Committee (TBPOC) that called for the advance construction of foundation work for the Yerba Buena Island Transition Structure (YBITS) under this contract by change order. This strategy has been implemented under this contract in order to advance the completion of the YBITS project and potentially allow for an early opening of the new San Francisco - Oakland Bay Bridge.

Due to excessive noise levels at the United States Coast Guard (USCG) facility associated with the contract's pile driving activities, it was necessary to revise the Special Provisions to limit the hours to which the Contractor may drive piles. Currently, the Special Provisions do not allow impact-type mechanical operations such as pile driving between the hours of 7:00 p.m and 7:00 a.m. The revised hours to which pile driving will not be allowed will be between the hours of 7:00 p.m. and 12:00 p.m.

This change order shall be processed at no costs to the Department. Any adjustment of compensation for the implementation of the provisions of this change order or for impacts to the Contractor's operations resulting from this change is deferred and shall be provided for under a supplemental change order once the extent of these costs has been determined.

No time adjustment is warranted for this change, as it does not affect the controlling operation.

This change was requested by Alec Melkonians - Asst. Project Manager per Memorandum dated March 31, 209 and concurred with by Hong Wong - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

Per Your Submittal Dated: 6/17/2009 **CCO Category Code:** C - X - S - A

MODIFY SECTION 5-1.26, "SOUND CONTROL REQUIREMENTS," OF THE SPECIAL PROVISIONS TO CHANGE THE PILE-DRIVING OPERATIONS TIME RESTRICTIONS FROM "7PM - 7AM" TO "7PM TO 12PM."

NOTE: THIS RNA TELECOPY SUPERSEDES THE PREVIOUS TELECOPY. IT IS NOTED THAT THE PILE-DRIVING OPERATIONS TIME WAS SHORTENED FROM 12 TO 7 HOURS EACH DAY.

REVISE: IT APPEARS THIS CHANGE RESTRICTS THE PILE-DRIVING OPERATIONS FROM 12 TO 7 HOURS A DAY. ALSO, IT APPEARS THIS CHANGE CAUSES CHANGE IN CHARACTER OF WORK, SINCE THE ORIGINAL CONTRACTOR'S BID PRICE IS BASED ON 12 HOURS PILE-DRIVING OPERATIONS, INSTEAD OF 7 HOURS, EACH DAY. THIS CHANGE MAY SHOW NO COST AND NO TIME ADJUSTMENT FOR NOW - BUT IT SEEMS THIS CHANGE MAY POTENTIALLY AFFECT THE CONTROLLING OPERATIONS, ESPECIALLY SINCE THE ALLOWED TIME FOR PILE-DRIVING OPERATIONS SHRINKS DOWN TO 58% (7 / 12) EACH DAY. HAVE THE CALTRANS FUNCTIONAL UNITS, THAT MAY BE AFFECTED BY THE POSSIBLE RAMIFICATIONS (MONEY AND TIME) OF THIS CHANGE, GEARED UP FOR WHAT SEEMS INEVITABLE POSSIBILITY OF DEPARTMENT-CAUSED DELAY? PLEASE ADDRESS THIS ISSUE IN THE MEMO.

NO COST AND NO TIME ADJUSTMENT FOR THIS CHANGE.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 188	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, provide compensation to the Contractor for additional costs incurred in driving the steel piles at Bent W5, Bent W6 and Bent W7 of the Yerba Buena Island Transition Structure (Br. No. 34-0006L/R) due to the revised sound control requirements implemented under the original Change Order No. 188.

For this work, the Contractor will be compensated a lump sum of $142,500.00. Except for any costs associated with providing sound control measurements, this sum constitutes full and final compensation for all additional costs, including all markups, due to the revised sound control requirements implemented under the original Change Order No. 188.

Estimated cost of Adjustment of Compensation at Lump Sum $142,500.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$142,500.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Submitted by		
Signature	**Resident Engineer** BILL CASEY	**Date** 1-29-10
Approval Recommended by		
Signature Deanna Vilcheck	**Area Construction Manager** DEANNA VILCHECK	**Date** 1/29/10

CCO DESCRIPTION: Sound Control Impacts to Pile Driving	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**0**

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor for additional pile driving costs incurred due to the revised sound control specification implemented under the original change order.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The Department issued a December 25, 2006 strategy memo which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC that called for the advance construction of foundation work for the Yerba Buena Island Transition Structure (YBITS) under this contract.

The revised sound control requirement issued under the original Change Order No. 188 limited pile driving operations to a 7-hour window from 12:00 p.m. to 7:00 p.m. in lieu of the 12-hour window provided under the original contract. This restriction resulted in decreased production during the pile driving operations at the Bent W5, W6 and W7 foundations being constructed under this contract. Driven piles for the temporary shoring used at Bents W5 and W6 were also affected. This change order provides compensation for these additional costs.

The contractor had been working 10-hour pile driving shifts in order to maximize production. The revised sound control requirement being implemented reduced the work shift to 7 hours. An as-planned verses actual costs analysis was performed based upon actual 10-hour shift production verses the 7-hour shift production.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $142,500.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

Any costs associated with providing sound control measurements as specified under the original change order are deferred. At this time there have been no costs incurred for this work.

No adjustment of contract time is warranted as this change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Project Manager and Jaime Gutierrez - Project Engineer.

Maintenance concurrence is not required as this is an administrative change and doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 192	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Compensate the Contractor for all additional labor, equipment, and material costs incurred to install and remove the cable bracing system at the upper deck during the removal of the existing structure from Bent YB1 to Bent YB4.

The Contractor agrees to accept the lump sum of $111,540.00 as full compensation, including all markups, surcharges and profit, for all additional costs necessary to complete this work unless otherwise delineated in this change. Work shall be done in accordance with the engineering design done by the Contractor's engineer and approved by the Department. The aforementioned lump sum shall include compensation for all labor, equipment and material escalation costs.

It is expressly understood and agreed to that the following work shall be compensated as provided for under various existing and / or anticipated Contract Change Orders:

1. Flagging.
2. Traffic control.
3. Engineering associated with temporary support design.

Estimated Cost of Extra Work at Lump Sum $111,540.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$111,540.00**

CCO DESCRIPTION: ETI Cable Bracing for YB1-YB3 Truss Demo	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

compensating the Contractor for all additional labor, equipment, and material costs incurred to install and remove the cable bracing system at the upper deck during the removal of the existing structure from Bent YB1 to Bent YB4.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums issued on December 14, 2006 entitled 'Strategy for South-South Detour Contract Completion' and December 25, 2006 entitled 'Recommendation to Construct Select Yerba Buena Island Transition Structure Foundations by Contract Change Order' were approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), which recommended the design of the ETI and WTI structures and enhancement of the Viaduct be assumed by the Department as opposed to the as-bid performance based contractor design and that a portion of the YBITS foundation work be performed under this contract by change order.

The Contractor will demolish and remove the existing double deck section of the bridge under the original contract and CCO 65 - Supplement No.1. CCO 65S1 excluded the installation or removal of any cable bracing system. The Engineer now requires installation and removal of a temporary cable bracing system at the upper deck during the demolition. This change is necessary in order to compensate the Contractor for the additional costs associated with the temporary support system.

Compensation for this change shall be made as Extra Work at Agreed Lump Sum in the amount of $111,540.00, which can be financed through the contingency fund. A cost analysis is in the project files.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

CCO DESCRIPTION: Skid Beam Fabrication Mill to Bear Costs	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

compensation to the Contractor for additional fabrication costs incurred by Thompson Metal Fab, Inc. associated with the steel fabrication of the East Tie-In skid bent system.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The contract calls for the fabrication of a steel skid bent system that will provide the support for the planned roll out of the YB4 steel truss span of the existing bridge and roll in of the new ETI steel truss span necessary to place traffic on the new TBS. These skid bents are comprised of approximately 3,000 metric tons of steel members. This change order acts to close out all outstanding costs associated with the fabrication of these members.

During the shop fabrication process the Contractor incurred additional costs associated with the pre-assembly of box members into the cross frames. The design provided zero tolerance for this fit up and caused the Contractor to have to machine 1.5 mm to 3mm of each end of the box members to allow the fit up into the cross frame gusset plates. This machining is usually specifically called for as a mill to bear connection but was not specified under the skid bent plan sheets. The Contractor was also required to match face the bottom of the cross beam to the top of the skid beam and required custom made machined shims to be fabricated. In addition, both the pipe to pipe connections and the pipe to box beam connections required machining and or shims in order to meet the required fit up tolerances. This machining and shimming was not specified under the skid bent plan sheets.

Compensation for these fabrication modifications to the skid bent shall be paid as an adjustment of compensation at an agreed lump sum price of $256,140.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features. FHWA concurrence is not required as they are no longer providing funds for this project.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 195	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide for the construction of the stairway, including CIDH piers, concrete landings, timber posts, stringers, joists, decking handrails, and all appurtenances as shown on Sheets No. 2 through 8 of this change order and as authorized by the Engineer.

Estimated Cost of Extra Work at Force Account $500,000.00

Stairway shall be constructed in conformance with Sections 57 and 58 of the Standard Specifications.

On Drawing L-1, Notes 1 and 2 are deleted (this eliminates the redwood fence and lights).

Do not paint the structure (in lieu of any paint called for in the Standard Specifications).

Contractor to provide galvanized metal pipe handrail with approved brackets per detail on Sheet 2 of 8. Provide standard pipe cap at each end of the handrail sections.

Contractor to provide samples of the wood railing (2x4 and 2x6 PT DF1 as shown on Drawing ST-5), treads (4x12 PT DF2 as shown on Drawing ST-3) and decking at landings (2x6 RDWD decking as shown on Drawing ST-3) for the Engineer's authorization prior to purchasing.

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$500,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: USCG Stairway @ WTI	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

the construction of a pedestrian stairway for the adjacent United States Coast Guard (USCG) base in order to mitigate access constraints incurred over construction activities of this project.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums issued on December 14, 2006 entitled 'Strategy for South-South Detour Contract Completion' and December 25, 2006 entitled 'Recommendation to Construct Select Yerba Buena Island Transition Structure Foundations by Contract Change Order' were approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), which recommended the design of the ETI and WTI structures and enhancement of the Viaduct be assumed by the Department as opposed to the as-bid performance based contractor design and that a portion of the YBITS foundation work be performed under this contract by change order.

The construction of the YBID spans directly over Macalla Road which provides sole access to the main USCG base located on Yerba Buena Island. At the time of the contract award, the project was anticipated to be completed by the summer of 2005. Due to considerable Department-ordered changes to the contract, the project is currently expected to be completed by December of 2010. This extension has had considerable adverse effects on access to the USCG base.

In an effort to mitigate the Department access constraints brought about by the extended contract duration, Project Development in conjunction with the Division of Right of Way has requested the construction of a stairway that will provide pedestrian access from the main USCG base to the USCG quarters. These quarters are located on top of a steep hillside approximately 40 meters above the main base with the stairway being constructed directly adjacent to the WTI structure.

The stairway spans approximately 82 meters in length and includes the construction of 49 each 16-inch CIDH piles spanning the entire 40 meter high slope, along with pressure treated timber posts, stringers, joists and decking with hand railing and appurtenances.

Compensation shall be paid as extra work at force account at an estimated cost of $500,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was requested by Alec Melkonians - Asst. Project Manager per memorandum dated June 26, 2009 and concurred with by Hong Wong - Project Engineer.

Maintenance concurrence is not required as the stairway is a temporary structure that will be maintained by the on going construction contract.

475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**0**

THIS CHANGE ORDER PROVIDES FOR:
Additional funds for the work specified under the original change order.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums issued on December 14, 2006 entitled 'Strategy for South-South Detour Contract Completion' and December 25, 2006 entitled 'Recommendation to Construct Select Yerba Buena Island Transition Structure Foundations by Contract Change Order' were approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), which recommended the design of the ETI and WTI structures and enhancement of the Viaduct be assumed by the Department as opposed to the as-bid performance based contractor design and that a portion of the YBITS foundation work be performed under this contract by change order.

The original Change Order No. 195 provided for the construction of a stairway spanning approximately 82 meters in length including the construction of 49 each 16-inch CIDH piles spanning the entire 40 meter high slope, along with pressure treated timber posts, stringers, joists and decking with hand railing and appurtenances.

The construction of the stairway, particularly the construction of the drilled CIDH piles, has proven to be more difficult than anticipated due to the difficult work conditions of working on an uneven hillside at an approximate 1 to 1 slope. Based on these conditions, it is now anticipated that additional force account funding shall be required.

Compensation shall be paid as extra work at force account at an estimated cost of $450,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was concurred with by Ken Terpstra - Project Manager and Jaime Gutierrez - Project Engineer

Maintenance concurrence is not required as the stairway is a temporary structure that will be maintained by the on going construction contract.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

ONTRACT CHANGE ORDER

Change Requested by: Engineer

O: 195	Suppl. No. 2	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

: CC MYERS INC

u are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and ecifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

scription of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and ce account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be ide for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

tra Work at Force Account:

Provide additional funds for the work specified to be performed at force account under the original Change Order No. 195 and as determined by the Engineer.

Estimated cost of Extra Work at Force Account $35,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$35,000.00**

reason of this order the time of completion will be adjusted as follows: 0 days

Recommended by		
gnature J Balderrama	**Resident Engineer** JEANNIE BALDERRAMOS	**Date** 9-30-10
Recommended by		
gnature Michael Fraser	**Area Construction Manager** for DEANNA VILCHECK	**Date** 10-1-10
Approved by		
gnature Deanna Vilcheck	**Area Construction Manager** DEANNA VILCHECK	**Date** 10/7/10

e the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all uipment, furnish the materials, except as may otherwise be noted above. and perform all services necessary for the work above specified, and will accept full payment therefor the prices shown above.

OTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to oceeding with the ordered work and filing a written protest within the time therein specified.

ntractor Acceptance by

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 196	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

As authorized by the Engineer and as shown on Sheets 2 to 12 of this change order, furnish and install soffit lighting in the lower deck of the Temporary Bypass Structure.

For this work, the Contractor will be paid the sum of $ 59,906.00, which constitutes full compensation, including markups and incidentals, for the work of this change.

Total Cost of Extra Work at Lump Sum $59,906.00

Estimated Cost: Increase ☑ Decrease ☐ **$59,906.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Submitted by		
Signature	Resident Engineer BILL CASEY	Date 6-25-09
Approval Recommended by

NOTES:

1. Reference:

   -for TB-23E connection diagram, see Sheet E-23.

   -for 600 V cable block diagram, see Sheet E-9.

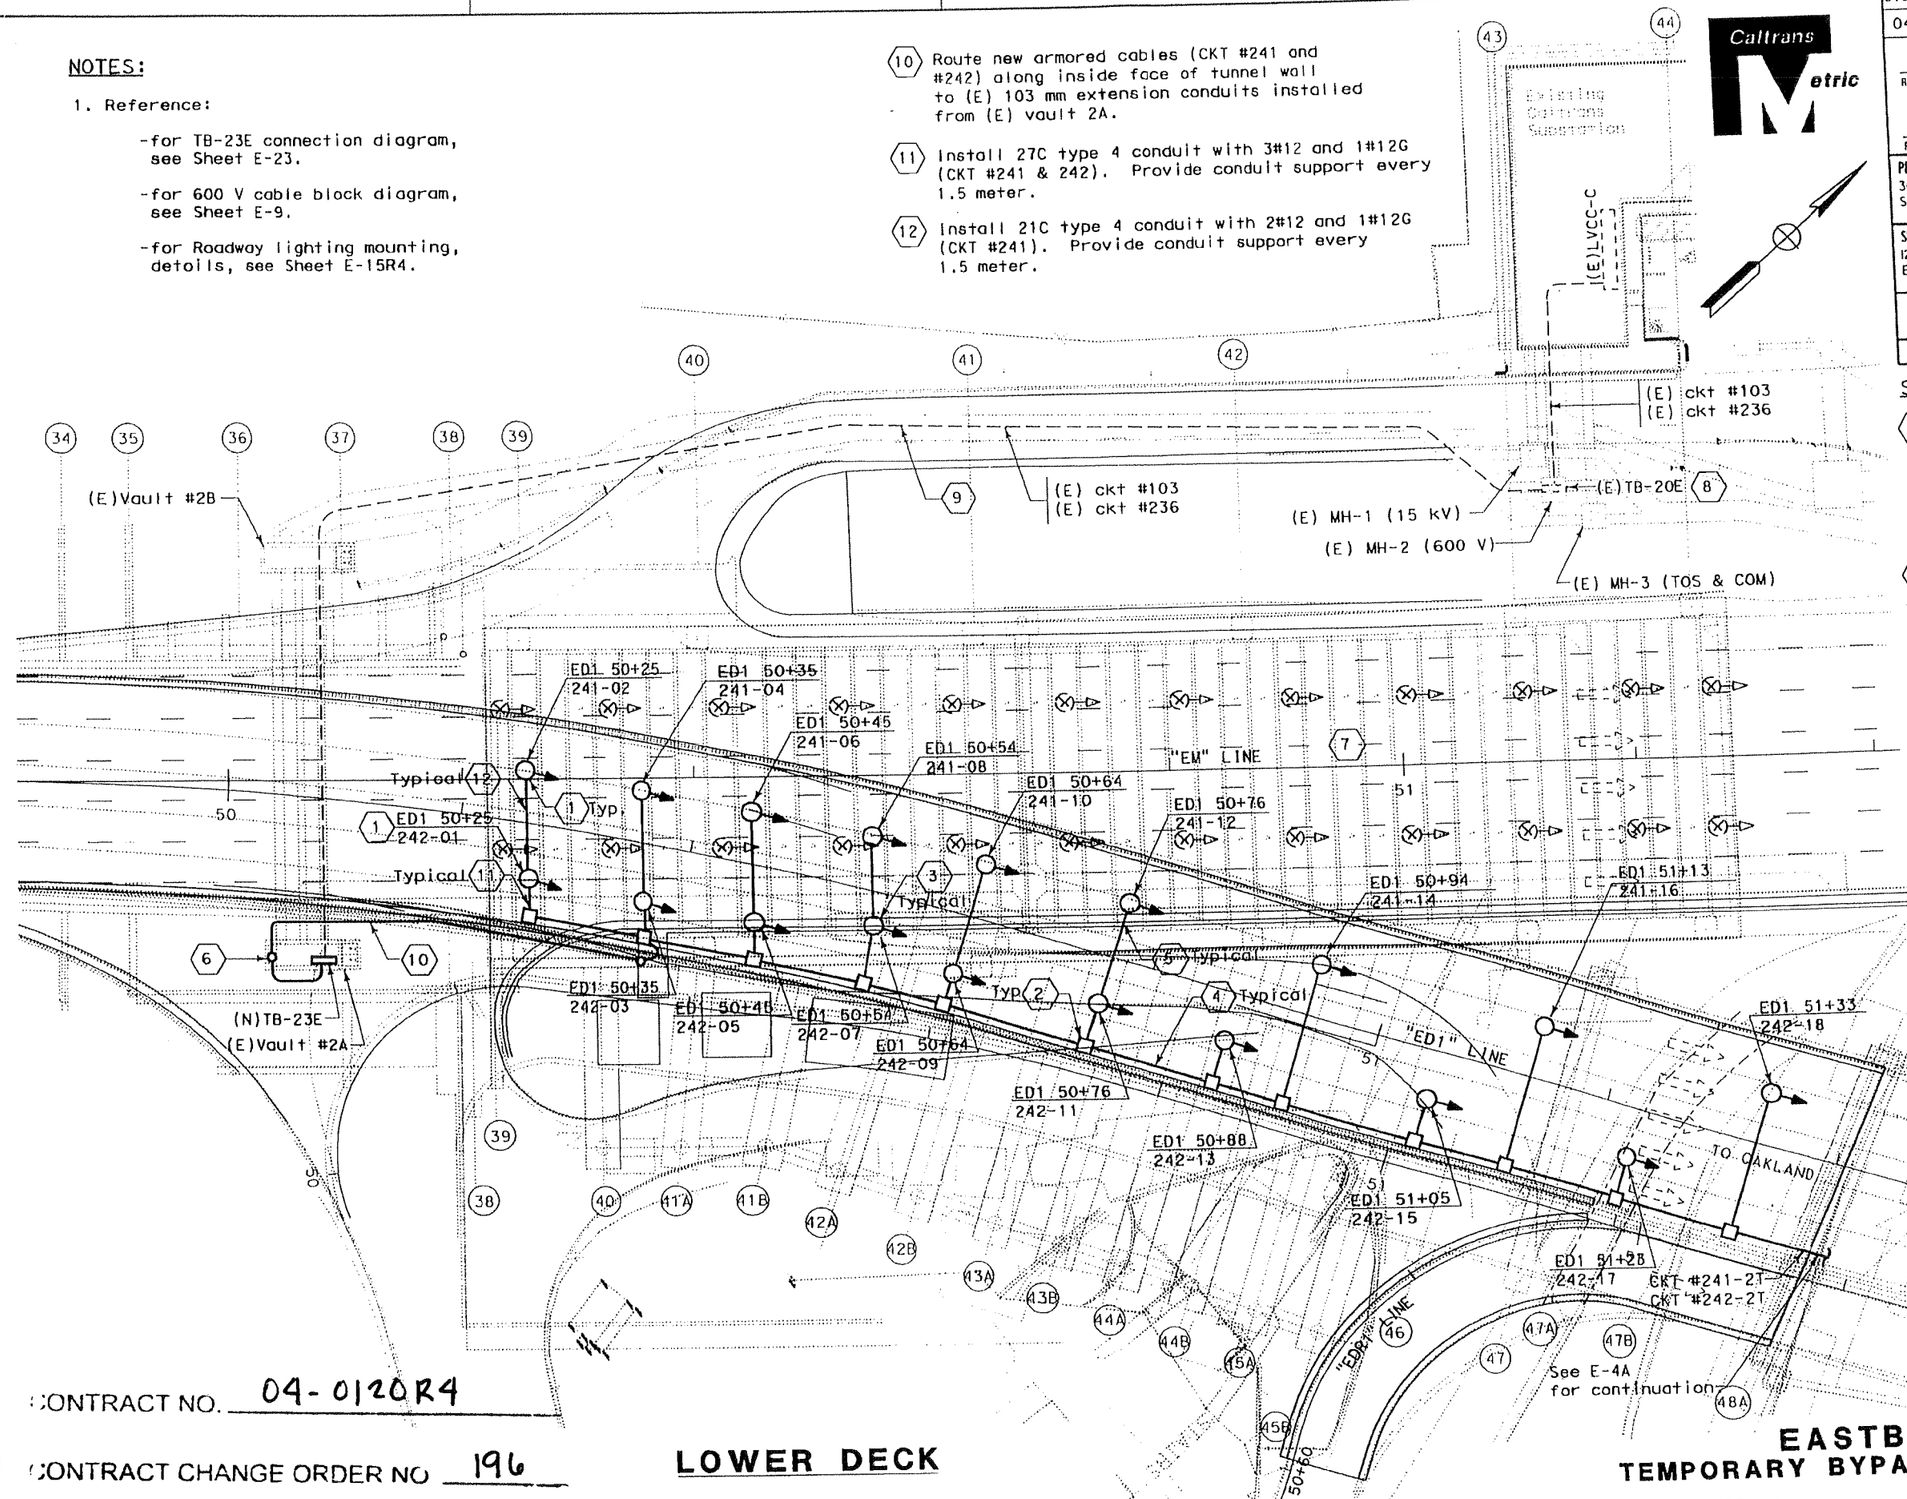
   -for Roadway lighting mounting, details, see Sheet E-15R4.

(10) Route new armored cables (CKT #241 and #242) along inside face of tunnel wall to (E) 103 mm extension conduits installed from (E) vault 2A.

(11) Install 27C type 4 conduit with 3#12 and 1#12G (CKT #241 & 242). Provide conduit support every 1.5 meter.

(12) Install 21C type 4 conduit with 2#12 and 1#12G (CKT #241). Provide conduit support every 1.5 meter.

Caltrans Metric



SHEET NOTES:

(1) Install new type III soffit fixture "HOLOPHANE TFP series luminaire" with 175 watts MH, 480 V, double fusing and with provision of special bracket. Mount fixture on concrete structure of westbound deck between bent caps.

(2) Install new NEMA type 4 splice box. Splice box to have a minimum dimension of 305(L) x 305(W) x 152(D). Fasten box on the ceiling with four (4) 10-24 concrete expansion anchors and hex head cap screws. Provide fused splice connectors to each ungrounded conductor.

(3) Locate light fixture 4.0 m from the inside face of barrier unless oterwise indicated.

(4) Install new 41C conduit with 6#6 AWG and 1#8G conductors (CKT #241 and #242). Provide conduit support every 1.5 meter maximum. See detail 1 on Sheet E-18.

(5) Install new 27C type 4 conduit with 3 #12 AWG conductors from splice box to lighting fixture. Provide conduit support every 1.5 meter.

(6) Intercept (E) ckt #241 and ckt #242 in (E) vault #2A and route via (N) TB-23E.

(7) Disconnect (E) soffit lighting fixture between bent #38 thru 48 after new temporary SSD soffit lighting is operational.

(8) (E) TB-20E located in (E) MH-2.

(9) Install 6#6 & 1#8 (Ckt #241 & 242) in (E) 103 conduit and route from (E) TB-20E to (N) TB-23E via (E) vault 2B and vault 2A.

NOTES:

1. Contractor shall verify existing installation prior to intercepting and splicing the new armored cables to ensure continuity of the electrical service.
2. Contractor shall provide and install new armored cables and secure them with lag supports no greater than 1.5 meters apart.
3. For New Soffit Lighting Fixture Location and Details, see Sheet E-7R2.
4. Contractor to Provide expansion fittings or loops at bridge expansion joints or points of deflections.

SHEET NOTES:

1. Electrical Contractor to intercept and reconnect existing circuits (ckt 241, 242) to maintain power to existing soffit (flouresecent) light fixtures From Pier E1 to Pier E2. Provide and install Nema 4X Junction Box as needed.
2. Terminate and connect new armored cables in splice box (CKT's #241-2T and #242-2T)
3. Circuits #241-2T and #242-2T conductors from Temporary Bypass Structure. See sheet E-4B drawings for more information.
4. Install new armored cable with 3 #6 & 1 #8G. Secure cable on the existing structure with cable clamps and channel strut.

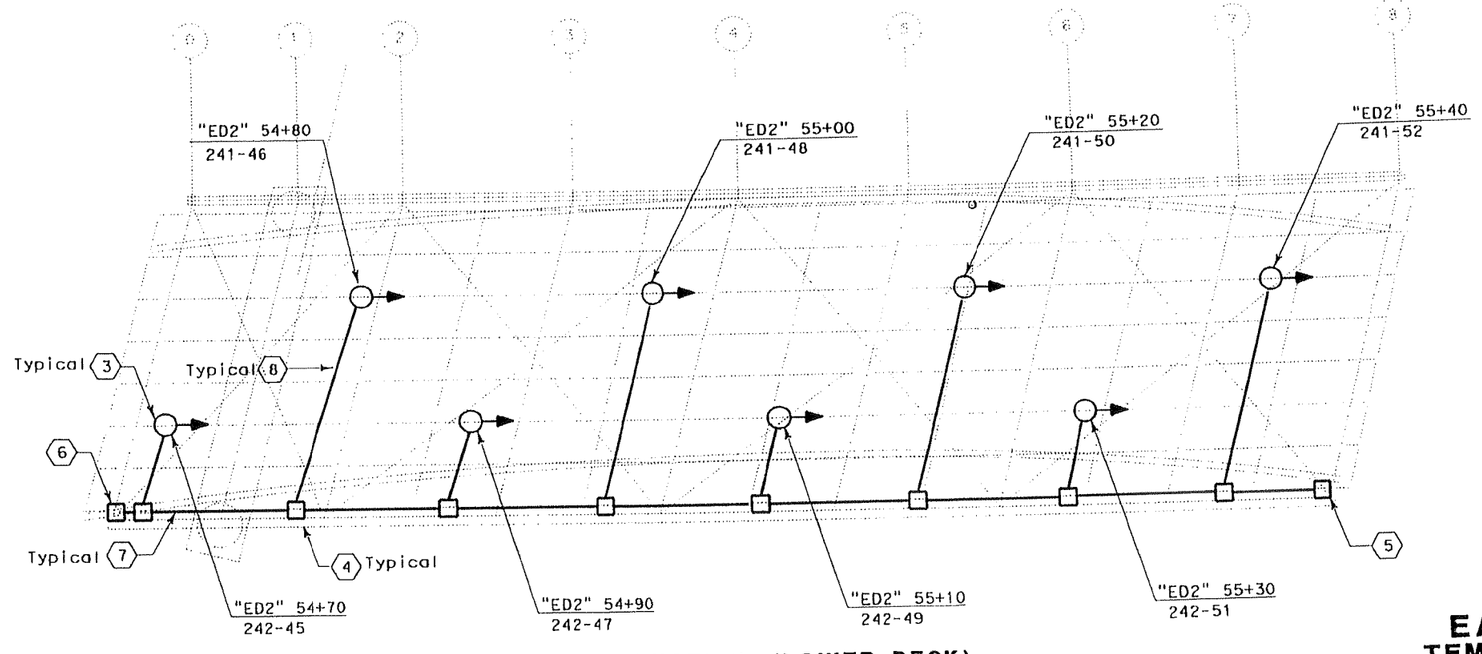
WESTBOUND STRUCTURE (UPPER DECK)



EASTBOUND STRUCTURE (LOWER DECK)

SHEET NOTES:

1. Install new Type 21 light fixture mounted on barrier rails with 400 watts HPS luminaire on 3.7 Meter mounting arm. See Caltrans Standard Plan ES-6A for more detail.
2. Install new Nema Type 4X splice box on the outside face of barrier. Splice box shall have a minimum dimension of 305(L) x 305(W) x 152(D). Secure box on the concrete barrier with four (4) 10-24 concrete expansion anchors and hex head cap screws. Provide fused splice connectors. See Caltrans Standard E-13A and 13-B for splicing details and fuse ratings.
3. Install new Type III soffit fixture "HOLOPHANE TFP series" luminaire with 175 watts, MH, 480 V, double fusing and with provision of special bracket. Secure fixture to steel structure of west bound deck. See detail on E-28 for more information.
4. Install new Nema Type 4X splice box with minimum dimensions of 305(L) x 305(W) x 152(D). Fasten box on the first longitudinal steel member inside south truss. Provide fused splice connectors. See Caltrans Standard E-13A and 13-B for splicing details and fuse ratings.
5. Install new Nema Type 4X splice box with minimum dimensions of 305(L) x 305(W) x 152(D). Fasten box on the steel structure. Provide enough cable length and coil cable in box for reconnection, to power existing East bound luminaires to remain.
6. Install new Nema Type 4X splice box with minimum dimensions of 305(L) x 305(W) x 152(D). Fasten box on the steel structure. Provide enough cable length and coil cable inside box for connection to new East bound soffit fixtures. See TRC dwgs. for more information.
7. Install new 41C, with 6 #6 & 1 #8G (CKTs #241 and #242). Secure conduit to Steel Structure. See Detail on Sheet E-25.
8. Install new 27C, LTFC with 3 #12 & 1 #12G from splice box to Lighting Fixture.

CONTRACT CHANGE ORDER MEMORANDUM

DATE: 6/22/2009 Page 1 of 1

TO: MIKE FORNER / DEANNA VILCHECK	FILE: E.A. 04 - 0120R4
	CO-RTE-PM SF-80-12.6/13.2
FROM: BILL CASEY	FED. NO. ACBRIM-080-1(097)N
CCO#: 196 SUPPLEMENT#: 0 Category Code: CBPC	CONTINGENCY BALANCE (incl. this change) $35,208,157.59
COST: $59,906.00 INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☐ YES ☑ NO
SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Lower Deck Soffit Lighting	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Furnishing and installing soffit lighting in the lower deck of the Temporary Bypass Structure (TBS).

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

This change order is necessary to supplement the original lighting design in the lower deck of the Temporary Bypass Structure. The original design lacked adequate lighting in the lower deck.

Compensation for this work shall be paid for as extra work at an agreed lump sum price of $ 59,906.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

There is no time adjustment since this change does not affect the critical operation of the project.

This change was concurred with by Alec Melkonians - Asst. Project Manager, and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this change does not affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 198	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

1) Eliminate the as-planned pavement delineation and sign plans shown on Contract Plan Sheets No. 72 through No. 77.

2) Furnish and Install the pavement delineation and signing (including barricades) in accordance with the attached revised pavement delineation and sign plans and sign and pavement delineation quantity plans: PD-1R1, PD-2R1, PD-3R2, PD-4R2, PD-5R2, PD-6R1, PD-7R, and PD-8R1 as shown on sheets no. 3 through 10 of this change order, and ETI Striping layout (sheet no. 11 of this change order) and Sign Details (sheet no.12 of this change order).

3) Relocate and install crash cushions based on the following layout plans: L-1 Westbound (sheet no. 7 of 13 of CCO 143), L-2 Westbound (sheet no. 6 of 193 of the original contract drawings), and L-2 Eastbound (sheet no. 8 of 13 of CCO 143)

Estimate of Decrease in Contract Item at Contract Price:

Item No. 27: TEMPORARY TRAFFIC STRIPE (PAINT)

Item No. 76: PAVEMENT MARKER (REFLECTIVE)								
	-1068 EA	(-100.00%)	@	$3.50	/EA	=	-$3,738.00	(-100.00%)

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 198	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

Item No. 89: BARRICADE (LEFT IN PLACE)
-4 EA (–100.00%) @ $125.00 /EA = –$500.00 (–100.00%)

Item No. 95: INSTALL SIGN (STRAP AND SADDLE BRACKET
-6 EA (–100.00%) @ $150.00 /EA = –$900.00 (–100.00%)

Estimated total cost for Decrease in Contract Item.....($112,789.00)

Extra Work at Lump Sum:

Provide compensation to the Contractor for all costs associated with furnishing and installing the pavement delineation, signing, barricades and crash cushions and for relocating all crash cushions as specified under Sheets No. 4 through 13 of this change order.

For this work the contractor will be compensated at agreed lump sum price of $412,252.00. This sum constitutes full compensation for providing labor, material and equipment tools, consumables, incidentals, accelerations, inefficiencies, an all applicable markups by reason of this change.

Estimated cost of Extra Work at Lump Sum $412,252.00

In accordance with section 4-1.03B(3), Eliminated Items, of the Standard Specifications, the adjustments due to the elimination of the above items, except item no. 28, channelizer (surface mounted), is zero.

In accordance with section 4-1.03B(2), Decrease of More than 25 percent, of the Standard Specifications, there will be no adjustment for the units of work on item no. 28, channelizer (surface mounted), due to the decrease in excess of 25% of the Engineer's Estimate.

CCO DESCRIPTION:
Revised Job wide Striping and Signing

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	0 Day(s)	0 %	0

THIS CHANGE ORDER PROVIDES FOR:

Performing the striping and delineation including installing barricades, and signing of the entire project, relocating a crash cushion, and installing crash cushions at three locations. All this work will be performed based on revised plan sheets and at a newly adjusted price.

This change order was initiated due to the change in the scope of the project and also as a consequence to delays in the execution of the project. The Contract was awarded in March of 2004 and the striping and signing work was envisioned to be completed before July 2005. The work now in this change order is expected to be done during 2009. This significant delay caused the contract item prices to be irrelevant due to inflation.

Caltrans design changed the scope to this project including design enhancements that changed items related to the striping, delineation, and signing of the entire project.

This change order eliminates the original contract items related to the work, as stated in the change order. Elimination of contract items decreases the relevant contract items at contract prices for a net decrease of $112,789.00. Compensation for all the work per the final design in the change order shall be paid as extra work at agreed lump price of $412,252.00.

The net change order cost of $299,463.00 shall be financed from the contingency funds. A cost analysis and backup information verifying the agreed price is on file in the project records.

No adjustment of contract time is warranted, as the work will not affect the controlling operation.

This change was concurred by Hong Wong, Project Engineer.

Maintenance concurrence is required as the work does affect roadway features.

SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: WTI Abutment 47A Shoring	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

The installation and removal of temporary shoring necessary for the construction of Abutment 47A of the West Tie-In structure.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project.

Change Order No. 62 was issued to provide for the structural excavation and construction of CIDH piles for the West Tie-In structure. This change order compensated the contractor for specific temporary shoring required for the excavation of Bents 46 and 47. The change order provided that any additional temporary shoring required for the work would be paid separately as the full extent of any other shoring requirements was unknown at the time.

It has now been determined that temporary shoring shall be required for the excavation associated with Abutment 47A which was excluded under Change Order No. 62. This change order provides compensation for the installation and removal of that shoring.

Compensation for the work of this change shall be paid as an extra work at force account at an estimated cost of $50,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Minh B. Nguyen - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, provide compensation to the Contractor for additional costs incurred by the Contractor's subcontractor Danny's Construction Company, Inc. (DCCI) pertaining to furnishing and installing additional safety netting during the erection of the steel truss of the Viaduct of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) due to all Department design enhancements incorporated into the truss.

For this work, the Contractor will be compensated a lump sum of $156,350.00. This sum constitutes full and final compensation for all additional costs, including all markups, associated with this work.

475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

compensation to the contractor for costs associated with furnishing and installing additional safety netting for the steel erection of the Viaduct structure.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins. The contract was awarded as a performance-based project with the contractor responsible for meeting the design criteria specified in the contract.

This change order concerns costs pertaining to furnishing and installing additional safety netting required due to Department design enhancements to the Viaduct structure. The Viaduct consists of 4 spans of a double deck steel truss approximately 20 meters wide and 320 meters long with a weight of over 4,300 metric tons.

In order to satisfy the Department that the safety of the traveling public would be fully addressed, the Office of Structures Design requested several design enhancements to the steel truss. It was also determined in the Department's December 14, 2006 strategy memo that the Viaduct should be designed as a stand alone structure due to the anticipated lag in the completion of the ETI and WTI structures. This memo was approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and subsequently by the Toll Bridge Program Oversight Committee (TBPOC).

These enhancements were implemented by the Contractor's designer under Contract Change Orders No. 49, No. 50, No. 60, and No. 67 and were incorporated into the contractor's approved viaduct plan sheets as summarized below:

1) Changes to the stringer and floor beam connections.
2) The addition of bent caps at Bents 49 through 52 including stopper blocks and brackets.
3) Changes to the top lateral bracing and connections.
4) Changes to the vertical members.
5) Changes to the truss joint details.
6) Changes to the interface at the conform to the ETI structure.

These changes resulted in extending the duration of the Contractor's steel erection and limited their ability to perform pre-erection on the ground verses erecting most of the steel in place approximately 150 feet in the air. Each of these items acted to increase both the amount of safety netting required for the work and the duration that the safety netting would need to be in place. The netting was required along the southern end of the structure to protect United States Coast Guard traffic adjacent to the structure.

This change order provides compensation for the additional costs incurred concerning the safety netting due to the Department changes to the work.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $156,350.00 which shall be financed from the contract's contingency funds. A detailed cost estimate is on file.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as the safety netting doesn't affect any permanent roadway features.

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

1) Construct the CIP transition concrete barriers for the East Tie In structure as shown on Sheets No. 3 through 9 of this change order.

2) Furnish and install the concrete barrier (Type K) for the East Tie In structure as shown on Sheets No. 3 through 9 of this change order.

3) Delete the original contract bid item quantity for furnishing and installing the concrete barrier (Type K) for the West Tie In structure.

The plan sheets issued under this change order supersede any previously issued plan sheets pertaining to the East Tie-In concrete barrier.

Estimate of Decrease in Contract Item at Contract Price:

Item No. 68: CONCRETE BARRIER (TYPE K)

-560 M	(–100.00%)	$75.00	/M	=	–$42,000.00 (–100.00%)

In accordance with Section 4-1.03B(3), "Eliminated Items," of the Standard Specifications, the adjustment due to the elimination of Item #68, Concrete Barrier (Type K), is zero.

Total Cost for Decrease in Contract Item.....($42,000.00)

All work pertaining to constructing the CIP transition concrete barrier and furnishing and installing the concrete barrier (Type K) as shown on Sheets No. 3 through 9 of this change order shall be paid as extra work at force account under Change Order No. 204.

All work pertaining to furnishing and installing the concrete barrier (Type K) as shown on Sheets No. 7 and 8 of Change Order No. 143 shall be paid as extra work at force account under Change Order No. 204

CONTRACT CHANGE ORDER MEMORANDUM

TO: MIKE FORNER / DEANNA VILCHECK	FILE: E.A. 04 - 0120R4
	CO-RTE-PM SF-80-12.6/13.2
FROM: BILL CASEY	FED. NO. ACBRIM-080-1(097)N

CCO#: **202**	SUPPLEMENT#: **0**	Category Code: **CKPL**	CONTINGENCY BALANCE (incl. this change) **$55,358,714.59**
COST: **($42,000.00)**	INCREASE ☐	DECREASE ☑	HEADQUARTERS APPROVAL REQUIRED? ☐ YES ☑ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**			IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO

CCO DESCRIPTION:
Furnish ETI Concrete Barrier

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

the placement of concrete barrier on the East Tie In structure.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. Based on these memorandums, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in). The approval of these strategy memorandums extended the project completion date approximately 5 years.

Project Development along with Toll Bridge Design had issued plan sheets providing for the placement of both cast-in-place and Type K concrete barrier along the East Tie-In structure. This change order incorporates these plan sheets into the contract.

Compensation for this work shall be paid as extra work at force account under the previously approved Contract Change Order (CCO) No. 204. The majority of this work shall take place during the 2009 Labor Day Weekend closure of the San Francisco Oakland Bay Bridge for which CCO No. 204 has been issued.

This change order also eliminates the original contract bid item work for the placement of Type K concrete barrier on the West Tie-In structure. CCO No. 143 provided revised plan sheets for the Type K barrier but compensation for this scope of work was deferred. This revised scope of work shall also take place over the 2009 Labor Day Weekend closure and shall be paid under CCO No. 204.

It is estimated that the current funding provided for under CCO No. 204 is sufficient to cover these costs.

The elimination of the contract bid item for West Tie-In concrete barrier (Type K) shall result in a credit to the Department of $42,000.00. This change order will result in a $42,000.00 credit to the Department.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Maintenance.

Change Requested by: Engineer

CCO 203	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

As authorized by the Engineer, and as shown on Sheets 2 through 22 of this change, furnish and install a camera security system for the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

For this work, the Contractor will be paid the sum of $196,883.90, which constitutes full compensation, including all markups, for the work of this change.

Total Cost of Extra Work at Lump Sum $196,883.90

Allow the Contractor to use an equivalent armored jacketed FO cable in the cable tray in lieu of a 41C type 4 conduit with FO cable. Also, remove the requirement of having an integrated window wiper with replaceable rubber blade on the camera.

RECEIVED
08 OCT 93 0011

Estimated Cost: Increase ☑ Decrease ☐ $196,883.90

By reason of this order the time of completion will be adjusted as follows: 0 days

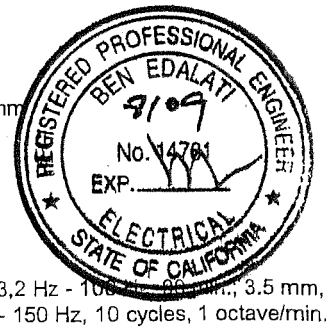
CONTRACT NO. 09-0120R4

CONTRACT CHANGE ORDER NO 203

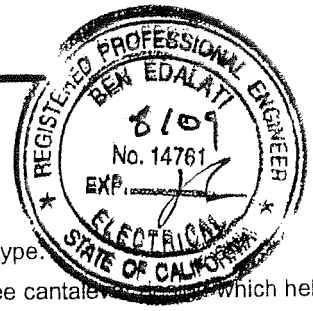
SHEET 2 OF 22

Description	8 port Fast Ethernet-switch, managed, Software Layer 2 Enhanced, for DIN rail store-and-forward-switching, fanless design
Port type and quantity	8 ports in total; 1. Uplink: 100BASE-FX, MM-SC; 2. Uplink: 100BASE-FX, MM-SC; 6 x standard 10/100 BASE TX, RJ45
More Interfaces	
Power supply/signaling contact	1 x plug-in terminal block, 6-pin
V.24 interface	1 x RJ11 socket
USB interface	1 x to connect auto-configuration adapter ACA21-USB
Network size - length of cable	
Twisted pair (TP)	
Multimode fiber (MM) 50/125 ?m	0 - 5000 m, 8 dB link budget at 1300 nm, A = 1 d/km, 3 dB reserve, B = 800 MHz x km
Multimode fiber (MM) 62.5/125 ?m	0 - 4000 m, 11 dB link budget at 1300 nm, A = 1 dB/km, 3 dB reserve, B = 500 MHz x km
Single mode fiber (SM) 9/125 ?m	
Single mode fiber (LH) 9/125 ?m (long haul transceiver)	
Network size -	
Line - / star topology	any
Ring structure (HIPER-Ring) quantity switches	50 (reconfiguration time < 0.3 sec.)
Power requirements	
Operating voltage	12/24/48 V DC (9,6-60) V and 24 V AC (18-30) V (redundant)
Software	
Management	Serial interface, web-interface, SNMP V1/V2, HiVision file transfer SW HTTP/TFTP
Diagnostics	LEDs, log-file, syslog, signal contact, RMON, port mirroring, topology discovery 802.1AB, disable learning
Configuration	Comand line interface (CLI), TELNET, BootP, DHCP, DHCP option 82, HIDiscovery, auto-configuration adapter (ACD11, ACA21-USB), Watchdog configuration
Security	Port security (IP and MAC), SNMP V3 (no encryption)
Redundancy functions	HIPER-ring (ring structure), MRP (IEC-ring functionality), (Release 4.0: RSTP 802.1w, Release 4.1: RSTP 802.1D-2004), redundant network/ring coupling, dual homing, redundant 24 V power supply
Filter	QoS 4 classes, priorisation (IEEE 802.1D/p), VLAN (IEEE 802.1Q), multicast (IGMP snooping/querier), multicast detection unknown multicast, broadcast limiter, fast aging
Realtime	SNTP server
Flow control	Flow Control 802.3x, Port Priority 802.1D/p, Priority (TOS/DIFFSERV)
Ambient conditions	
Operating temperature	0 to +60C
Storage/transport temperature	-40 to +70C
Relative humidity (non-condensing)	10% to 95%
Mechanical construction	
Dimensions (W x H x D)	No Larger than 75mm x 135mm x 115mm
Mounting	DIN Rail
Protection class	IP20
Mechanical stability	
IEC 60068-2-27 shock	15 g, 11 ms duration, 18 schocks
IEC 60068-2-6 vibration	1 mm, 2 Hz - 13.2 Hz, 90 min.; 0.7g, 13,2 Hz - 100 Hz, 90 min.; 3.5 mm, 3 Hz - 9 Hz, 10 cycles, 1 octave/min.; 1g, 9 Hz - 150 Hz, 10 cycles, 1 octave/min.
EMC interference immunity	
EN 61000-4-2 electrostatic discharge (ESD)	6 kV contact discharge, 8kV air discharge
EN 61000-4-3 electromagnetic field	10 V/m (80 - 1000 MHz)
EN 61000-4-4 fast transients (burst)	2 kV power line, 1 kV data line
EN 61000-4-5 surge voltage	power line: 2kV (line/earth), 1kV (line/line), 1kV data line
EN 61000-4-6 conducted immunity	3 V (10 kHz - 150 kHz), 10 V (150 kHz - 80 MHz)
EMC emitted immunity	
FCC CFR47 Part 15	FCC CFR47 Part 15
EN 55022	EN 55022 Class A
Approvals	
Safety of industrial control equipment	cUL 508
Hazardous locations	cUL 1604 Class1 Div 2



CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 203



1. General

1.1 The camera shall be a precision mechanical Pan-Tilt-Zoom type.

1.2 The camera shall have an option for a robust metal 45 degree cantalev[illegible] which helps eliminate blind spots inherent to conventional PTZ speed domes.

1.3 ~~The camera metal ball housing shall have an optically optimised flat window with wiper for distortion-free optical clarity in wet, rainy environments.~~

1.4 The camera shall be IP68 / NEMA 4X certified for performance in extreme environments.

1.5 The camera shall incorporate precision zoom optics with a day-night mechanical filter technology for outstanding performance in either visible light or under active infrared illumination.

1.6 The camera shall incorporate brushless motor technology for precision speed control and accuracy, greater mechanical stability, longer operational lifetime and whisper-quiet operation.

1.7 The camera shall be compatible with various industry-standard communications protocol including Pelco P/D.

1.8 The camera shall be suitable for either surface, pole, upside down ceiling, or corner-mounted applications.

1.9 The camera shall be energy efficient.

1.10 The camera shall operate with high reliability.

1.11 The camera shall have been rigorously tested and proven for use by the manufacturer.

1.12 When used, the infrared illuminator shall have a three year product warranty and be supported by a comprehensive technical support program from the manufacturer.

2. Performance

2.1 The camera shall provide IP68 / NEMA 4X certified performance for full functionality in extreme environments.

2.2 The camera shall be environmentally sealed for total protection against dust ingress and water immersion.

2.3 The camera shall incorporate brushless motor technology for precision speed control and accuracy, greater mechanical stability, longer operational lifetime and whisper-quiet operation.

2.4 The camera shall deliver outstanding optical performance through a tempered flat glass window with high transmissivity of visible and infrared light.

2.5 The camera shall have a small mechanical window wiper operable by remote control for distortion-free optical clarity in wet, rainy environments.

2.6 The camera shall be an 1/4" LXR type CCD for excellent IR sensitivity, low smear, low streak and excellent anti-blooming characteristics.

2.7 The camera shall have 768 x 494 effective pixels.

2.8 The camera shall have a motorized mechanical infrared filter to ensure accurate color reproduction during day and effective imaging under infrared illumination by night.

2.9 The camera shall have a 2:1 interlaced scanning system.

2.10 The camera shall have DSP signal processing for enhanced edge definition and detail reproduction.

2.11 The camera shall produce outstanding contrast characteristics for reduced glare and streaking.

2.12 The camera shall have daytime color mode.

2.13 The camera shall have daytime color resolution of 470 horizontal lines.

2.14 The camera shall have night-time monochrome mode.

2.15 The camera shall have a minimum illumination of 0.7 Lux @ F1.4, 1/60s

2.16 The camera shall operate at zero lux in night-time monochrome mode when used in combination with appropriate infrared illuminators.

REGISTERED PROFESSIONAL ENGINEER
BEN EDALATI
No. 14761
EXP. 3/09
ELECTRICAL
STATE OF CALIFORNIA

2.17 The camera design shall virtually eliminate focus shift to ensure accurate focus for a daytime average wavelength of 500nm and a night-time average wavelength of 850nm.

2.18 The camera shall have spectral response to infrared wavelengths between 700nm to 1100nm.

2.19 The camera shall produce accurate color representation by eliminating blooming and other color distortions.

2.20 The camera shall use frame integration to produce strong images under low-light conditions.

2.21 The camera shall have an optional 18x motorized optical zoom (focal length 4.1mm to 73.8mm) and 12x digital zoom.

2.22 The camera shall have an optional 36x motorized optical zoom (focal length 3.4mm to 122.4mm) and 12x digital zoom.

2.23 The camera shall produce a 48° horizontal field of view (HFV) at wide angle and 2.8° HFV at telephoto with 18x zoom.

2.24 The camera shall produce a 57.8° horizontal field of view (HFV) at wide angle and 1.7° HFV at telephoto with 36x zoom.

2.25 The camera shall have an integrated lens drive unit.

2.26 The camera shall a focus system that can be set to either automatic or manual mode.

2.27 The camera shall have an integrated pan tilt motor drive unit.

2.28 The camera shall have closed loop speed control for accurate speed control at both wide angle and telephoto.

2.29 The camera shall be capable of 360° continuous rotation.

2.30 The camera shall have a tilt range of 320° allowing either surface- or ceiling-mounted installations.

2.31 The camera shall have the tilt mechanism integrated into two robust support arms and the metal powerdome head.

2.32 The camera shall have a Pan-Tilt speed ranging up to 90° per second.

2.33 The camera shall be equipped with a RS485 / 422 connection.

2.34 The camera shall have 64 configurable Pan-Tilt-Zoom presets.

2.35 The camera shall have 6 Pan-Tilt-Zoom preset tours.

2.36 The camera shall be equipped with high precision resolver technology for high repeatability.

2.37 The camera shall have Pan-Tilt preset accuracy of better than 0.08°.

2.38 The camera shall be equipped with Pelco P/D communications protocol as standard with other industry standard protocols available as options.

3. Power Requirements

3.1 The camera shall be equipped with a dedicated power supply unit.

3.2 The dedicated power supply unit shall be available in models that accept input voltages of 120VAC, 240VAC, 12-24VDC or 24VAC.

3.3 The camera shall consume no more than 25.2 watts maximum.

3.4 The camera shall be equipped with 2m, 10m or 25m cable lengths (6.5ft, 32ft or 82ft)

4. Environmental

4.1 The camera housing shall be constructed of CNC-milled powder coated 6mm thick aluminum.

4.2 The camera shall be optionally configured at the factory with a 45° yoke that allows images to be captured from directly below the camera.

4.3 The camera housing shall be environmentally sealed.

4.4 The camera housing shall be weatherproof.

4.5 The camera housing shall be waterproof.

4.6 The camera housing shall be dustproof.

4.7 The camera housing shall be corrosion resistant.

4.8 The camera shall have an operating temperature range of -20°C to +60°C

4.9 The camera shall include an internal heater for effective temperature control.

4.10 The camera shall weigh no more than 10lbs /4.5kg.

4.11 The camera shall have a steel ball diameter of 165mm (6.5").

4.12 The camera shall have an overall height of 358mm (14.1").

4.13 The camera shall have a width of 202mm (8.0") across the two support arms.

4.14 The camera shall have a black or grey aluminium finish suitable for all-weather operation.

4.15 ~~The camera shall have an integrated window wiper with replaceable rubber blade~~.

4.16 The camera shall be compatible with base, wall and corner mount brackets.

5 Standards Compliance

5.1 The camera shall be compliant to NEMA 4X.

5.2 The camera shall be compliant to IP68.

GENERAL NOTES

1. All electrical work shall conform to (1999 and 2004) the latest issue of State of California Department of Transfortation Standard Specifications and Standard Plans. These general notes and special provisions under this contract also apply. For any conflict of provisions, California State Guidlines apply.
2. All conduit routing is shown diagrammatically. Pull box locations are located and shown on plan drawings. The contractor shall provide additional pull boxes as required. Exact location of equipment and devices may be adjusted by field conditions or as directed by the Engineer.
3. Minimum conduit sizes shall be 21 mm. All conduits located outside shall be rigid galvanized steel, PVC coated.
4. All equipment and devices shall be provided with nameplate tags as shown in the drawings.
5. All feeders and branch circuits shall be provided with an equipment ground wire.
6. The Contractor shall label all conductors and cables per cable schedules.
7. The Contractor shall provide all conduits with permanent field markers and labels
8. The Contractor shall provide and install new armored cables on metal racks, troughs, in cable trays or secured to supports spaced not greater than 1500 mm apart.
9. The Contractor shall provide splice boxes for armored cables.
10. For other related work not shown on the plan sheets, see Electrical Special Provision.
11. Contractor to verify all controlling field dimensions before ordering or fabricating any material.
12. Provide and install new armored cables or conduit as shown, scheduled and as needed in construction. Support cables or conduit from surface using 41x41 channel, hot dipped galvanized and appropriate strut mounted clamps. See Detail. Support armored cables or conduit horizontally along Temporary Bypass Structure (TBS) using steel ladder cable trays.
13. New cable will be completely routed and tested before cutting existing circuits and/ or interconnecting new.
14. Existing temporary FO cables installed on Southgate Road wall and by YBI Substation project are to be removed by Caltrans after new FO cables are installed and operational.
15. Contractor to provide expansion fittings or loops at bridge expansion joints or points of deflection. Provide stainless steel support grips to hold the weight of electrical cable as it loops or hangs in vertical, sloping or horizontal position.
16. All materials and equipment are subject to Engineers written approval. (1)

PROJECT NOTES

[1] Install new FO cable (Outdoor Optical Cable 6F MM 62.5/125")on cable tray. Secure cable with cable clamps every 1.5 meter.

[2] Install new 41C type 4 conduit with FO cable (" Optical Cable 12F MM 62.5/125") and armored cable with (2#6+1#8G)on cable tray. Secure cables with cable clamps every 1.5 meter. (1)

[3] Install CCTV camera (1) with PTZ, shoe mount on existing type 15 standard on upper deck. See mounting details on E-12 for more information.

[4] Install new CCTV camera (1) with PTZ, shoe mount on the lower deck at the vertical truss structure. See mounting detail on E-12 for more information.

[5] Remove existing one 20A-1P circuit breakers 21 and replace with new 30A-1P circuit breaker to match existing. Label breaker " Cameras". (1)

[6] Install new fiberglass NEMA 4X enclosure wth 610W x 610L x 203D min dimension for communication box . Secure boxes on the outside face of the vertical steel truss with beam clamps and unistrut. Provide (2) 41mm nipples between boxes. See block diagram on E-10 and mounting detail on E-12 for more information.

[7] Contractor shall pull 4.0 meters of FO cable and coil inside the box. Contractor shall splice pigtail connectors and test. Provide test result. Caltrans will do the final connction to patch panel.

[8] Install new 41C type 4 conduit with FO cable (Outdoor Optical Cable 12F MM 62.5/125). (1)

[9] Install new FO cable (Outdoor Optical Cable 12F MM 62.5/125) Provide 7.5 meters of cable length, coiled and tie-wrap above existing ( )controller cabinet at YBI substation. (1)

[10] Install new fiberglass NEMA 4X enclosure wth 610W x 610L x 203D min dimension for Fiber box . Secure boxes on the outside face of the vertical steel truss with beam clamps and unistrut. Provide (2) 41mm nipples between boxes. See block diagram on E-10 and mounting detail on E-12 for more information.

SHEET NOTES:

1. Install new FO cable (Outdoor Optical Cable 12F MM 62.5/12.5) in (E) empty 103 mm conduit (conduit no. 0303) via (E) vault 2B and 2A.
2. Install new armored cable, 2#6 and 1#8G (120 V, CCTV) in (E) empty 103 mm conduit (conduit no. 0405) via (E) vault 2B and 2A.
3. Route new armored cable with 2#8 + 1#10G and 4IC(type 4) with FO cable along inside face of tunnel wall to (E) 103mm extension from vault 2A.
4. Caltrans will remove existing temporary conduit with FO cable from (E) AT&T pull box to YBI substation mounted on surface structure via (E) pb-1 and mh-3 when new FO cable is installed and operational.
5. Transition to tunnel wall to exposed face of abutment, then rise to cable tray at south edge of westbound roadway. Provide expansion fittings or loops at bridge expansion joints or points of depletion.
6. Install two new 4IC type 4 conduits with 1 FO cable (Outdoor Optical Cable 12F M 62.5/125)each. See Comm system block diagram for more information.
7. Install new armored cable, 2#6 and 1#8G (120 V, CCTV) in (E) cable tray system.

CCO DESCRIPTION:
SSD Security Cameras

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Furnish and install a camera security system for the Yerba Buena Island Detour (YBID) structure.

The YBID was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

This change order is necessary to maintain the security of the YBID structure in conformance with the State's Homeland Security requirements.

Compensation for this work shall be paid for as extra work at an agreed lump sum price of $196,883.90, which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Maintenance.

Maintenance concurrence is not required as this change does not affect any permanent roadway features.

Change Requested by: Engineer

CCO: 204	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds for scope of work as approved on the original Change Order #204.

Estimated cost of Extra Work at Force Account $2,500,000.00

A determination of the delay in completion of the contract due to the work specified by Contract Change Order No. 204 has been made in accordance with the provisions of Section 8-1.07, "Liquidated Damages," of the Standard Specifications. There will be no adjustment of time as a result of the original Change Order No. 204 and this supplement.

RECEIVED
2010 JUN 23 AM 11:52

Estimated Cost: Increase ☑ Decrease ☐ **$2,500,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Labor Day Weekend Support Costs	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	0

THIS CHANGE ORDER PROVIDES FOR:

Additional funding for support costs pertaining to the traffic switch to the YBI Detour during the 2009 Labor Day Weekend closure of the San Francisco Oakland Bay Bridge (SFOBB).

This contract calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the east tie in (ETI) to the bridge, the west tie in (WTI) to the island and the viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

The Department based design of the ETI structure required the roll out of an existing span of the SFOBB and the roll in of the new ETI span. This roll out / roll in required a full 3 to 4 day closure of the SFOBB. The actual roll out / roll in and traffic switch to the YBI Detour was performed during a full closure of the SFOBB over Labor Day Weekend 2009. The major work that took place over that weekend concerned the roll out of the existing steel truss span and the roll in of the new East Tie In Truss span. Each of these spans are double deck steel trusses approximately 90 meters long, 25 meters wide and weigh approximately 4,000 metric tons.

The original Change Order No. 204 provided compensation for (1) the installation of the expansion joints, bearings and barriers for the ETI truss (2) support costs associated with the roll out / roll in operations and (3) support costs associated with the actual Labor Day Weekend closure of the SFOBB.

The actual costs of the roll out / roll in operation performed during the closure of the SFOBB were consistent with the costs estimated for the original change order. However, the extent of the cost incurred both prior to and after the roll out / roll in operation significantly exceeded the original estimate. Extensive costs were incurred at Pier E1 prior to the closure related to surveying the as-built condition of that structure in order to insure the existing roll out span could be safety and efficiently removed and that the new roll in span would properly fit onto the existing structure. The extent of the coring required at the Pier E1 concrete deck was also more extensive than estimated.

Unanticipated costs were incurred after the detour was put in place due to numerous adjustments associated with the new expansion joints and isolation bearings and improvements made to the concrete deck to improve the profile of the new roadway. The extent of the costs associated with the mobilization and demobilization of the equipment required for the roll out / roll in event also exceeded the original estimate.

Due to these additional costs it is now anticipated that an additional $2,500,000.00 will be required to fund this work. Compensation shall be paid as extra work at force account at an estimated costs $2,500,000.00 which shall be financed from the contract's contingency funds. A cost analysis is on file. This change order was approved by the TBPOC on March

4, 2010.

A determination of the delay in completion of the contract due to the work specified by Contract Change Order No. 204 has been made in accordance with the provisions of Section 8-1.07, "Liquidated Damages," of the Standard Specifications. There will be no adjustment of time as a result of the original Change Order No. 204 and this supplement.

This change was concurred by Ken Terpstra - Project Manager, Lina Ellis - Maintenance, and Jaime Gutierrez - Project Engineer.

Maintenance concurrence is not required as the skid bent is a temporary structure that doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 206	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Provide compensation to the Contractor for additional costs associated with the erection of the steel skid bent system of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

For this work, the Contractor shall be compensated an agreed lump sum of $176,670.00. Except for outstanding costs pertaining to work specified to be performed at force account under previously issued change orders, this lump sum constitutes full and final compensation, including all markups, for all outstanding costs incurred by the Contractor's steel erection subcontractor, Danny's Construction Company, Inc. (DCCI), pertaining to the skid bent system of the ETI structure and the subsequent roll in of the truss into its final alignment.

Compensation provided under this change includes the cost of furnishing all shim plates required for the connection at the top beam of the skid bent towers and the bottom flange of the skid beam.

Compensation for outstanding costs incurred by the Contractor to support DCCI ETI operations, including providing welding inspection for quality control and providing access to the work, are excluded from this change order.

Total Cost of Extra Work at Lump Sum $176,670.00

Estimated Cost: Increase ☑ Decrease ☐ **$176,670.00**

By **reason of this order the time of completion will be adjusted as follows:** 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 207	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Incorporate the changes to the steel truss of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) as shown in the revised plan sheets of Sheets No. 2 through 9 of this change order.

Extra Work at Force Account:

Provide for the fabrication and delivery to the jobsite of all steel plates, brackets, stiffeners and bolts necessary to incorporate the changes to the steel truss provided for under this change order.

Estimated Cost of Extra Work at Force Account $400,000.00

Costs associated with the installation and erection of all steel plates, brackets, stiffeners and bolts and for performing all modifications to the steel truss necessary to incorporate the changes provided for under this change order are deferred.

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$400,000.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

CONTRACT CHANGE ORDER MEMORANDUM

TO: MIKE FORNER / DEANNA VILCHECK	FILE: E.A. 04 - 0120R4
	CO-RTE-PM SF-80-12.6/13.2
FROM: BILL CASEY	FED. NO. ACBRIM-080-1(097)N
CCO#: 207 SUPPLEMENT#: 0 Category Code: CHPA	CONTINGENCY BALANCE (incl. this change) $34,579,005.59
COST: $400,000.00 INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: ETI Truss Added Gusset Plates	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

design revisions to the steel truss of the East Tie-In (ETI) structure.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

Change Orders No. 129 and 140 provided for the fabrication and erection of the steel truss of the ETI structure. Toll Bridge Design has now issued additional plan sheets that provide design enhancements to the 2 panel points at both the upper and lower decks of the truss. These changes provide added gusset plates and various brackets at each connection in order to provide additional strength to those connections. The changes incorporate approximately 15 metric tons of additional steel and both the addition and the replacement of thousands of high strength bolts.

Compensation for the fabrication and delivery of the added plates and brackets shall be paid as extra work at force account at an estimated cost of $400,000.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

Compensation for the installation and erection of the added plates and brackets and the placement of all additional bolts will be addressed under separate contract change order.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Structure Maintenance.

THIS CHANGE ORDER PROVIDES FOR:

additional funds.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

The original contract change order calls for a design revisions to the steel truss of the East Tie-In (ETI) structure. These changes provide added gusset plates and various brackets at each connection in order to provide additional strength to those connections. The changes incorporate approximately 15 metric tons of additional steel and both the addition and the replacement of thousands of high strength bolts.

This change is necessary since fabrication work was more extensive than estimated and due to additional cost to expedite the material delivery. The existing funds is not enough to cover this change, therefore, a request for additional funds of $100,000.00 is needed, which can be financed by the contract's contingency funds.

Contractor's signature is not required on Extra Work at Force Account request for additional funds change orders, therefore, it is proposed to process this change unilaterally.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

Alec Melkonians, Asst. Project Manager, and Hong Wong, Project Engineer, concurred on this change. Maintenance concurrence is not required since Lina Ellis - Structure Maintenance already concurred on the original CCO.

SUPERSTRUCTURE CONCRETE

Superstructure concrete including closure concrete, and cast-in-place deck joints shall conform to the following requirements:

The concrete mix for the superstructure concrete shall be designed to achieve the following additional properties:

A. Modulus of Elasticity: The modulus of elasticity of portland cement concrete shall be at least *31,000 MPa* at 28 days when tested in accordance with the requirements in California Test 522. The samples shall be moist-cured for 7 days, followed by air drying at 23oC and 50% relative humidity until test age. The modulus shall also be reported at 3, 7, 56 and 90 days. Test specimen size shall be same as compressive strengths. Test results shall be based on the average of three test specimens at each age.

B. Creep: The specific creep coefficient, as determined in accordance with the requirements in ASTM Designation: C 512, after 365 days of loading, shall not exceed 75 millionths/MPa. Test specimens shall be 152 x 305 mm cylinders and shall be moist-cured for 7 days, followed by air drying at 23oC and 50% relative humidity. Test cylinders shall be loaded at 28 days to a stress of 20% to 40% of the 56-day design compressive strength shown on the plans but not less than 20% nor greater than 40% of the measured strength at 28 days. For submittal of prequalification data, coefficients after 28, 56 and 90 days of loading shall be submitted and used to predict the coefficient at 365 day creep coefficient. The Contractor shall predict the coefficient at 365 days based on the procedures of CEB-FIP Model Code for Concrete Structures, by the Comite Euro-International de Beton. Mix design approval shall be contingent upon the 365 day creep coefficient satisfying the stated requirement. The Contractor shall report the 365 day creep coefficient determined from test results when available.

C. Shrinkage: The shrinkage strain of Portland cement concrete shall not exceed 0.045% after 180 days of drying in accordance with the requirements in ASTM Designation: C 157. Sample size shall be 100 x 100 x 285 mm. Samples shall be moist-cured for 7 days followed by air drying at 23oC and 50% relative humidity. Shrinkage strain shall be calculated as the change in strain from the beginning of drying at 7 days.

Concrete testing shall be performed by the Contractor's independent test laboratory. The laboratory shall be accredited or inspected for conformance to the requirements in ASTM Designation: C 1077 and approved by the Engineer. All testing shall be performed by ACI certified technicians. In addition to the requirements of Section 90-9, "Compressive Strength," of the Standard Specifications, concrete for the superstructure shall have the following additional testing performed by the Contractor's independent testing laboratory:

A. Modulus or Elasticity, Creep and Shrinkage test results shall be submitted to the Engineer for each proposed mix. The test results shall be submitted in both printed form and electronic media. The engineer will notify the Contractor in writing when the test results are determined to be complete. Once the Engineer has determined the test results to be complete, the Contractor shall all the Engineer 25

working days to review the test results. Superstructure Concrete shall not be placed until the Engineer has reviewed the test reports and responded in writing.

B. Three samples taken from the first placement shall be tested for modulus of elasticity in accordance with ASTM C 469, "Standard Test Method for Static Modulus of Elasticity and Poisson's Ratio of Concrete in Compression." The results shall be reported as an average of the three samples. Samples shall be moist-cured for 3 days and then tested to determine 3-day results.

C. Two samples taken from each placement shall be tested for creep in accordance with the requirements in ASTM Designation: C 512, "Standard Test Method for Creep of Concrete in Compression." Creep data shall be presented both as specific creep (creep strain/applied creep load) and creep coefficient (creep deformation as a ratio to initial elastic deformation). The test cylinders shall be loaded at 28 days to a stress of 20 to 40% of the 56-day design compressive strength shown on the plans but not less than 20% nor greater than 40% of the measured strength at 28 days. Coefficients after 28, 56 and 90 days under load shall be submitted and used to predict the coefficient at 365 days based on the procedures of CEB-FIP Model Code for Concrete Structures, by the Comite Euro-International de Beton.

D. Samples taken from each placement shall be tested for shrinkage in accordance with the requirements in ASTM Designation: C 157. Sample size shall be 100 x 100 x 285 mm. The samples shall be moist-cured for 7 days followed by air drying at 23oC and 50% relative humidity. Shrinkage strain shall be calculated as the change in strain from the beginning of drying at 7 days.

E. Three full size 150 x 300 mm and three 102 x 203 mm reserve cylinders shall be taken for each placement. The cylinders shall be stored near the placement and shall be kept for the duration of the project. Cylinders shall be stripped from their molds when formwork at the corresponding placement is stripped. Thereafter, specimens shall be stored and protected from rain and direct sunlight. Each cylinder shall be clearly identified as to the location and date cast using permanent markers and they shall be stored in such a way that specific cylinders are easily retrievable. At the completion of the project any cylinders not requested by the Engineer shall become the property of the Contractor and shall be removed and disposed of as provided in Section 7-1.13, "Disposal of Material Outside the Right of Way," of the Standard Specifications.

F. Superstructure camber values shown on the plans are calculated based on estimated modulus of elasticity and time-dependent creep and shrinkage values. After approval of the modulus of elasticity, creep and shrinkage test results, the Engineer reserves the right to modify the camber values for the superstructure during the 25 working day review period specified.

G. The Contractor shall measure the deflection of the superstructure to the nearest millimeter each working day from the time prestressing is completed until the closures are placed and shall report the measured values to the Engineer no less than once every 7 days.

As directed by the Engineer, concrete testing of production concrete shall be performed by the Contractor's independent test laboratory. The laboratory shall be accredited or inspected for conformance to the requirements in ASTM Designation: C 1077 and approved by the Engineer. All testing shall be performed by ACI certified technicians.

The superstructure concrete shall have the following testing performed by the Contractor's independent testing laboratory:

A. Compressive Strength required per ASTM C39

Test Age (days)	Test Cylinders
3	2
7	2
28	2
56	2
90	2
180	2
360	2

Total 12 compressive strength cylinders

B. Modulus of Elasticity Determinations required by ASTM C 469

Test Age (days)	Test Cylinders
3	3
7	3
28	3
56	3
90	3
180	3
360	3

The 3 day test specimens shall be moist cured for 3 days, the other test cylinders shall be moist cured for 7 days followed by air drying at 23 degrees C and at 50% relative humidity until the designated test age.

C. Creep of Concrete in Compression required by ASTM C 512.
Test specimens shall be 152 x 305 mm (6x12 in) cylinders and shall be moist-cured for 7 days, followed by air drying at 23° C and 50% relative humidity. Test cylinders shall be loaded at 28 days to a stress of 20% to 40% of the 28-day design compressive strength of the compressive strength test cylinders.

Both the creep coefficients and as well as the specific creep (creep strain/applied creep load) for the concrete mix shall be determined at 28,56,90,180, and 360 days. This data shall be used to predict the creep coefficient at 365 days.

Sufficient test cylinders shall be cast from the concrete mix to determine the compressive strength under the indicated curing periods - 3 and 7 day moist curing periods. The average of 2 additional test specimens required for shrinkage determinations and two to three specimens are required for shrinkage required for the creep frame apparatus. At a minimum twenty additional test cylinders will be required to complete the creep test requirements.

D. Length Change Determination required byASTM C157 Modified Shrinkage Tests

Shrinkage tests of the concrete mix shall be performed in accordance with the indicated test procedure.

Sample size shall be 100 x 100 x 285 mm. The average of 3 prisms shall be used to determine shrinkage at 3,7,28,90,180 and 360 days. The shrinkage shall not exceed 0.045% after 180 days of drying.

Samples shall be moist-cured for 7 days followed by air drying at 23° C and at 50% relative humidity. Shrinkage strain shall be calculated as the change in strain from the beginning of drying at 7 days.

Concrete test data of production concrete shall be submitted to the Engineer for information only.

STAGE 3 JACKS AND LOAD CELL INSTALLATION

no scale

STAGE 3: JACKS AND LOAD CELL INSTALLATION

① - Install Jacks and Load Cells on Jacking Corbels at South Edge Beam locations.

② - Jack Up South Edge Beam in accordance with "Existing YBI Viaduct Jacking Plan" on "Construction Details No. 1" sheet. Install Shoring Towers.

③ - Install Jacks and Load Cells at WTI Right Column Locations. Jack 25 kN of Force onto Prestress Bars to remove Slack. Lock Jacks rigid. Retighten lower anchor nuts to 425 N-m torque. to reseat the anchor plates

④ - Install Jacks and Load Cells on Jacking Corbels on Column 46L at B-46L Location. Jack 25 kN of Force onto Jacking Corbels to adequatly seat the Jack. Lock Jacks rigid.

Note:

- Indicates location of Jacks and Load Cells

CONTRACT CHANGE ORDER NO. 208
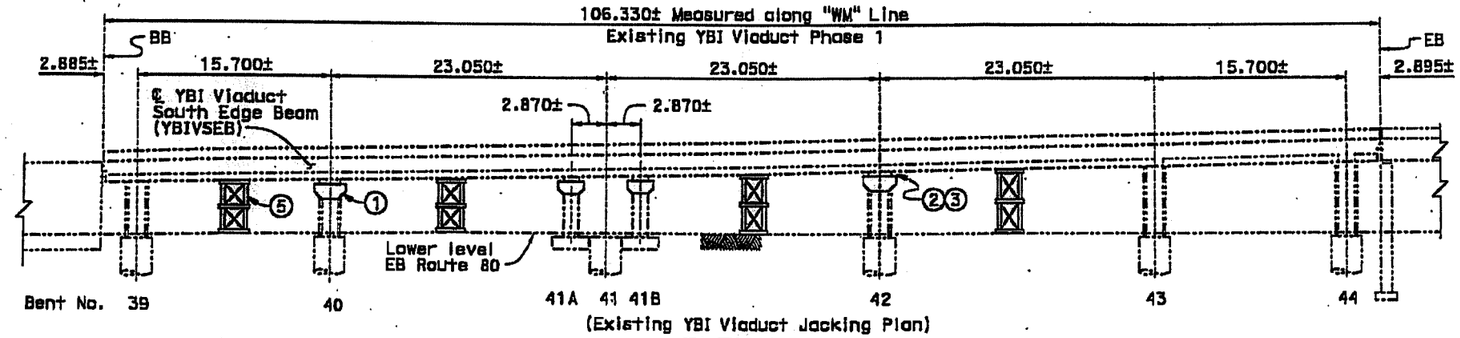
SHEET 10 OF 22



(Existing YBI Viaduct Jacking Plan)

ELEVATION
1:250

EXISTING YBI VIADUCT JACKING PLAN

Note:

Contractor shall submit a jacking and load monitoring plan to the Engineer for approval.

Jacking procedure shall be completed prior to construction of YBI Viaduct South Edge Beam Corbel and prior to post tensioning of WTI Bents 40 through 46.

① Construct Jacking Corbels, see "Column Modifications" sheet

② Place Jacks with load cells attached.

Each Jack shall be equipped with a Load Cell.

Load Cells shall be supplied by the Contractor and approved by Caltrans.

Load Cells shall be capable of continuously reporting loadings for the period the Jacks are in place.

Jacks shall be capable of being locked off and remain rigid (after desired load transfer has been accomplished) for the duration of the period they are in place. Jacks shall be approved by Caltrans.

③ Jacking Procedure, see "Jacking Load Table" for estimated dead load reactions at each jacking location

A) Bent 40

Jack YBI Viaduct South Edge Beam (YBIVSEB) until a 5 mm separation between YBIVSEB and Bearing Pads at Bent 40 has been achieved.

Assuming four Jacks per Column will be used;

Loads shall be applied in 400 kN intervals and the loads in each Jack shall never differ by more than 400 kN.

When the 5 mm separation has been achieved, the loadings in all four Jacks shall be similar within 5%. When the 5 mm separation and the balance loading has been achieved the Jacks shall be locked rigid.

B) Bent 42

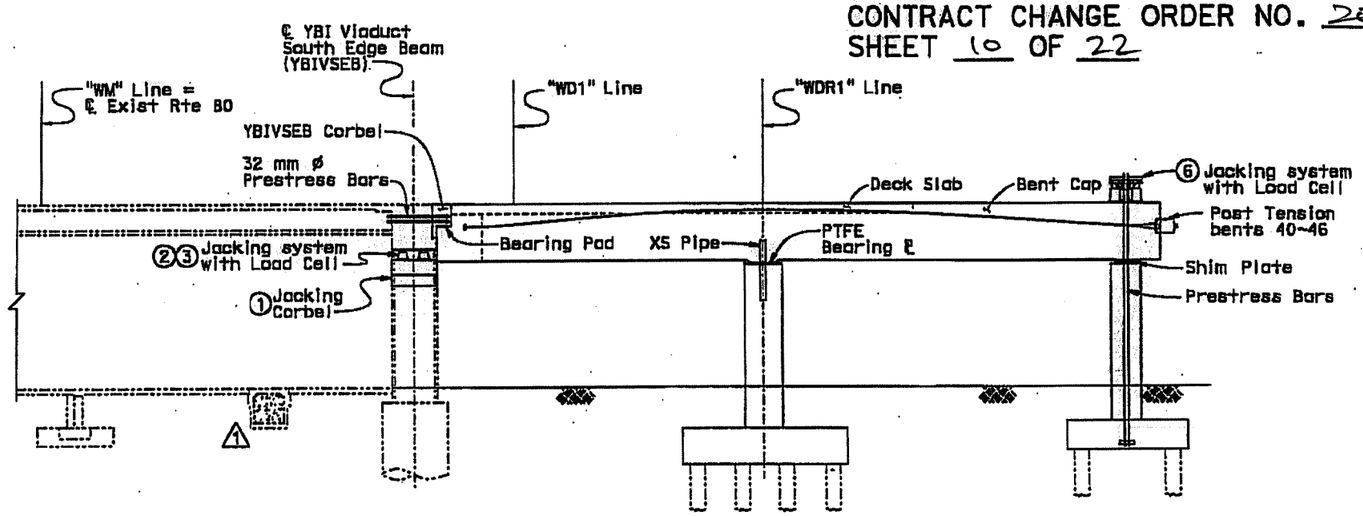
Repeat jacking procedure as outlined for Bent 40.

C) Bent 41A and 41B

Bents 41A and 41B shall be jacked simultaneously.
Repeat jacking procedure as outlined for Bent 40 with the following differences:

Loads shall be applied in 200 kN intervals and the loads in each Jack shall never differ by more than 200 kN.

④ After all Jacks have been locked rigid, Load Cells and YBIVSEB profile shall be monitored daily to assure Jacks remain rigid and profile remains consistent. Adjustment of Jacks may be required to mitigate settlement or loss of hydraulic pressure as directed by the Engineer.



TYPICAL SECTION
no scale

⑤ Place Shoring Towers under YBIVSEB at midspan in spans shown on diagram.

Preload Shoring Tower as directed in Structure Specifications.

Place Shim Plates between Shoring Towers and YBIVSEB and shim tight. Remove Jacks on Shoring Towers.

Shoring Towers shall be designed to carry 450 kN loading with no more than 3 mm of deflection.

The Shoring Tower load capacity shall be greater than 1320 kN.

⑥ Place Jacks with Load Cells at WTI Right Column locations.
Jack 25 kN of force onto Prestress Bars to remove slack.
Lock Jacks rigid.
Retighten lower anchor nuts to 425 N-m of torque to reseat the anchor plates.

⑦ Place Jacks with Load Cells at Bent 46 Left Column Jacking Corbel.
Jack to 25 kN of force on Jacking Corbels.
Lock Jacks rigid.

JACKING LOAD TABLE	
YBI VIADUCT BENT	⊛ DEAD LOAD REACTION (kN)
40	4800
41A	2700
41B	2700
42	5400

⊛ Dead Load Reported is unfactored. Live Loads can be assumed to be as high as 40% of the Dead Load Reaction.

NOTE:
THE CONTRACTOR SHALL VERIFY ALL CONTROLLING FIELD DIMENSIONS BEFORE ORDERING OR FABRICATING ANY MATERIAL.

2. Concrete Placement Plan
   - A) Begin Traffic Control. Shift Westbound traffic to two north most lanes. (8 hour Traffic Control)
   - B) Place concrete for hinge Corbel, concrete shall be high early strength mix that is capable of achieving an f'_{ci}= 28 MPa or greater in three hours.
   - C) Let Hinge concrete set for one hour.
3. Remove slack from 32 mm ø Prestress Bars in Hinge Corbel. Tighten all Prestress Anchor Nuts to 300 N-m torque.
4. The Traffic Control may be lifted when all Prestress Anchor Nuts have been tightened and the concrete has been in place for at least three hours.
5. Post tension and grout all 32 mm ø Prestress Bars in Hinge Corbel.

POST TENSIONING PLAN (WTI BENT 40 THROUGH BENT 46)

Note:

See "Bent Layout" sheets.

WTI Bents shall be Post Tensioned by the following sequence:

1. Post Tension Bents 40 through 46 and Beam Footing 46L to 20% Pjack
2. Post Tension Bents 40 through 46 and Beam Footing 46L to 40% Pjack
3. Post Tension Bents 40 through 46 and Beam Footing 46L to 60% Pjack
4. Post Tension Bents 40 through 46 and Beam Footing 46L to 80% Pjack
5. Post Tension Bents 40 through 46 and Beam Footing 46L to 100% Pjack
6. Simultaneous Post tensioning of Bents is permissible within each sequence. After each sequence of post tensioning approval of the Engineer is required before proceeding to the next sequence.
7. Grout all Prestress Tendons
8. Remove all Falsework and Shoring Towers

LOAD TRANSFER ASSURANCE PLAN

1. Check Load Cells at all locations.
   - A) Compare load cell Data to target loads at each load cell location, see "Target Loads" Tables
   - B) If Load Cell readings indicate that loads are within 10% of target loads at the WTI locations and the loads on the YBIVSEB Jacks have been reduced by 90% then release and remove all YBIVSEB Jacks. Monitor the profile of YBIVSEB.
   - C) If target loads have not been achieved or if the profile of YBIVSEB is not within tolerance then adjustment of the affected WTI Bents as directed by the Engineer will be required. For bent adjustment details see "Column Details No. 2" sheet
2. Once load transfers have been achieved and accepted by the Engineer, the Load Cells and YBIVSEB shall be monitored for a period of 60 days.
3. If Load Cells and YBIVSEB indicate adequate stability after 60 day period the Contractor may proceed with the "Final Post Tensioning Procedure" of the Prestress Bars in the WTI Right Columns by adding 600 kN additional jacking force on each Tension Column, see "Column Details No. 2" sheet.
4. Grout Prestress Bars
5. Remove YBI Columns at Bents 40, 41A, 41B and 42.

NOTE:
THE CONTRACTOR SHALL VERIFY ALL CONTROLLING FIELD DIMENSIONS BEFORE ORDERING OR FABRICATING ANY MATERIAL.

CONTRACT CHANGE ORDER MEMORANDUM

TO: MIKE FORNER / DEANNA VILCHECK	FILE: E.A. 04 - 0120R4 CO-RTE-PM SF-80-12.6/13.2 FED. NO.
FROM: JEANNIE BALDERRAMOS	
CCO#: 208 SUPPLEMENT#: 0 Category Code: CHPT	CONTINGENCY BALANCE (incl. this change) $38,269,564.59
COST: $131,600.00 INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☐ YES ☑ NO
SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Miscellaneous WTI Changes	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	0

THIS CHANGE ORDER PROVIDES FOR:

Miscellaneous changes to the construction of the West Tie-In (WTI) structure.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon certain design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently the TBPOC that provided for the Department to assume control of the design of the West Tie-In structure from the contractor.

As requested by Toll Bridge Design, this change order provides for numerous changes to the structure's lighting, concrete bent caps and deck, alignment, joint seals and deck drains along with other miscellaneous revisions. Major costs associated with this change include additional concrete placement and testing costs and additional costs associated with the realignment of a concrete barrier.

Compensation for this work shall be paid as an adjustment of compensation at an agreed unit price of $131,600.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

Mike Whiteside - YBI Coordination Engineer requested this change per Memorandum on November 12, 2008 with concurrences by Ken Terpstra - Project Manager, Jaime Gutierrez - Project Engineer, and Lina Ellis - Structure Maintenance.

Change Requested by: Engineer

CCO 209	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, provide compensation to the Contractor for additional costs incurred by the Contractor's subcontractor Danny's Construction Company, Inc pertaining to the requirement to allow U. S. Coast Guard traffic to pass through the work site on Macalla Road during the erection of the steel truss of the Viaduct of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

For this work, the Contractor will be compensated a lump sum of $92,810.00. This sum constitutes full and final compensation for all additional costs, including all markups, associated with this work.

Total Cost of Adjustment of Compensation at Lump Sum $92,810.00

SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: VIA Steel Erection USCG Traffic Delays	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

compensation to the Contractor for delays and flagging costs associated with the need to allow United States Coast Guard (USCG) traffic to pass through the work site during the steel erection of the Viaduct structure.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins. The contract was awarded as a performance-based project with the contractor responsible for meeting the design criteria specified in the contract.

This change order concerns costs pertaining to delay and flagging costs associated with the USCG traffic affecting the steel erection of the Viaduct structure. The Viaduct consists of 4 spans of a double deck steel truss approximately 20 meters wide and 320 meters long with a weight of over 4,300 metric tons.

The newly erected Viaduct passes over Macalla Road that acts as the only land based access to the USCG base on Yerba Buena Island. The contract does not provide adequate provisions concerning maintaining access to the USCG during the actual steel erection of the Viaduct over the roadway. The Department initially directed the Contractor to provide flagging for this traffic and limited closures of this access to a maximum of 15 minute intervals. This change order compensates the Contractor for flagging and delay costs associated with this direction.

Eventually, Contract Change Order No. 136 was issued to construct alternative access to the Coast Guard and thus eliminate any future delays to the work.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $92,810.00 which shall be financed from the contract's contingency funds. A detailed cost estimate is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

CCO DESCRIPTION: Duct Bank Work	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

compensating the Contractor for performing all duct bank revision work as shown on Sheets 2 through 5 of this change.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

The Department issued a December 25, 2006 strategy memo which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer), and subsequently by the Toll Bridge Oversight Committee (TBPOC) that called for the advance construction of foundation work for the Yerba Buena Island Transition Structure (YBITS) under this contract. The work included the construction of several footings, columns, miscellaneous drainage, roadway and electrical facilities.

This change order is necessary to provide details to the compressed air line drain, the underground conduit drain, and to correct the duct bank profile. This change was requested by Trinh Lai - Office of Toll Bridge Design, per memorandum dated April 7, 2008.

Compensation for this work shall be paid for as extra work at an agreed lump sum price of $129,152.00, which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 212	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform demolition of existing structure in preparation for the roll out and roll in of Span YB4 over the Labor Day Weekend 2009 bridge closure, as described here, in accordance with the attached Sheets 3 through 9 of this change order (Sheets 131C, 131D, 131E, 131F, 131G, 158R2, and 163R1 of 214).

1) Remove upper deck, joists and stringers at Pier E1 between floor beams U35 and U36 per sheet 131C and 131G. Remove lower deck, joists and stringers at Pier E1 between floor beams L35 and L36 per sheet 131E and 131G.
2) Remove the upper deck joint at Pier YB4 between floor beams U26 and U27. Remove the bracing on one side of the joint to provide minimum of 100 mm clearance per sheet 131C and 131G. Remove the lower deck joint at Pier YB4 between floor beams L26 and L27 (this Lower Deck work is not shown on these drawings). Remove the bracing on one side of the joint to provide minimum of 100 mm clearance (similar to that shown for the upper deck at Section C-C on sheet 131G).
3) Sawcut a transverse joint 25 mm wide at panel point L31 per sheet 131E and 131F.
4) At 8 locations on the upper deck, remove portion of the concrete deck per Detail 1 on Sheet 131D. This scope does not include cutting the flange (as shown in Detail 1). The locations included are at each end of floor beams U30, U31, U32 and U34 as shown on Sheet 131C. This scope does not include Detail 1 work at the 4 locations shown at floor beams U27 and U35.
5) At 2 locations (North and South ends of Floor Beam L31) on the lower deck, cut the existing steel curb and barrier (as shown in Detail 2 on sheet 131F). This scope does not include cutting the flange (as shown in Detail 2). This scope does not include any Detail 2 work at the 4 additional locations shown on drawing 131E at floor beams L27, L30, L32, and L35.

The following items of work are not specifically shown on these CCO drawings, but are included in the scope of work of this lump sum amount:

1) Remove existing concrete bolsters at Pier E1 to allow sufficient clearance for rollout. This work to be completed during regular work shifts prior to the rollout.
2) Perform exploratory chipping in the area of Pier E1 bearing pads. This work to be completed during regular work shifts prior to the rollout.
3) Remove and reinstall the existing pin restrainer nuts from Pier E1 and Bent YB4.
4) Cut the bearing shoes at Piers E1 and YB4 per Caltrans YB4 Roll Out Procedures.
5) Remove sufficient portions of the bearing shoes at Pier E1 to allow for installation of the new bearings.
6) Cut the existing piping, utilities, and miscellaneous items at Piers E1 and YB4 to allow roll out and roll in clearance.

The following items are not included in the scope of this lump sum amount:

1) Layout or verification of minimum gaps or clearances.
2) Work related to the actual lifting or rolling of Span YB4.
3) Installation or operation of localized jacks at the bearing shoes.
4) Steel plates over openings or providing handrails at edge of openings.
5) Providing platforms to access the work.
6) Providing protective covers or otherwise limiting access below the work area through the use of spotters, fencing, or other means.

The work being done under this lump sum agreement includes the cost to perform the work per the Contractor's (or Subcontractor's) approved Lead Compliance Plan.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 212	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

The lump sum agreed price anticipates starting at the beginning of the Labor Day shutdown, and working in an expedited manner with multiple crews continuously until the work is done, and includes the cost of any adverse impacts to productivity and efficiency, as well as all compensation for working nights, Saturdays, Sundays, and Holidays as necessary to perform this work.

The equipment provided for this work are to include (at a minimum):
4 each 70,000 pound (minimum) excavators with breakers (3 plus one backup unit)
4 each 50,000 pound (minimum) excavators with breakers
4 each bobcat loaders with attachments
1 each rubber tire loader
2 each water trucks
8 each end dump trucks

This change order price includes full compensation for any required testing and legal disposal of debris materials generated during the work.

For this extra work, the Contractor will be compensated $209,720. This lump sum constitutes full compensation, including markups, for furnishing all labor, material, tools, equipment, and incidentals for doing the work involved in this change.

Total Cost of Extra Work at Lump Sum $209,720.00

Any additional demolition work that is ordered by the Engineer (either on these drawings, or in addition to the work shown on these drawings) for the roll out or roll in that is not included in this lump sum, will be done under the force account

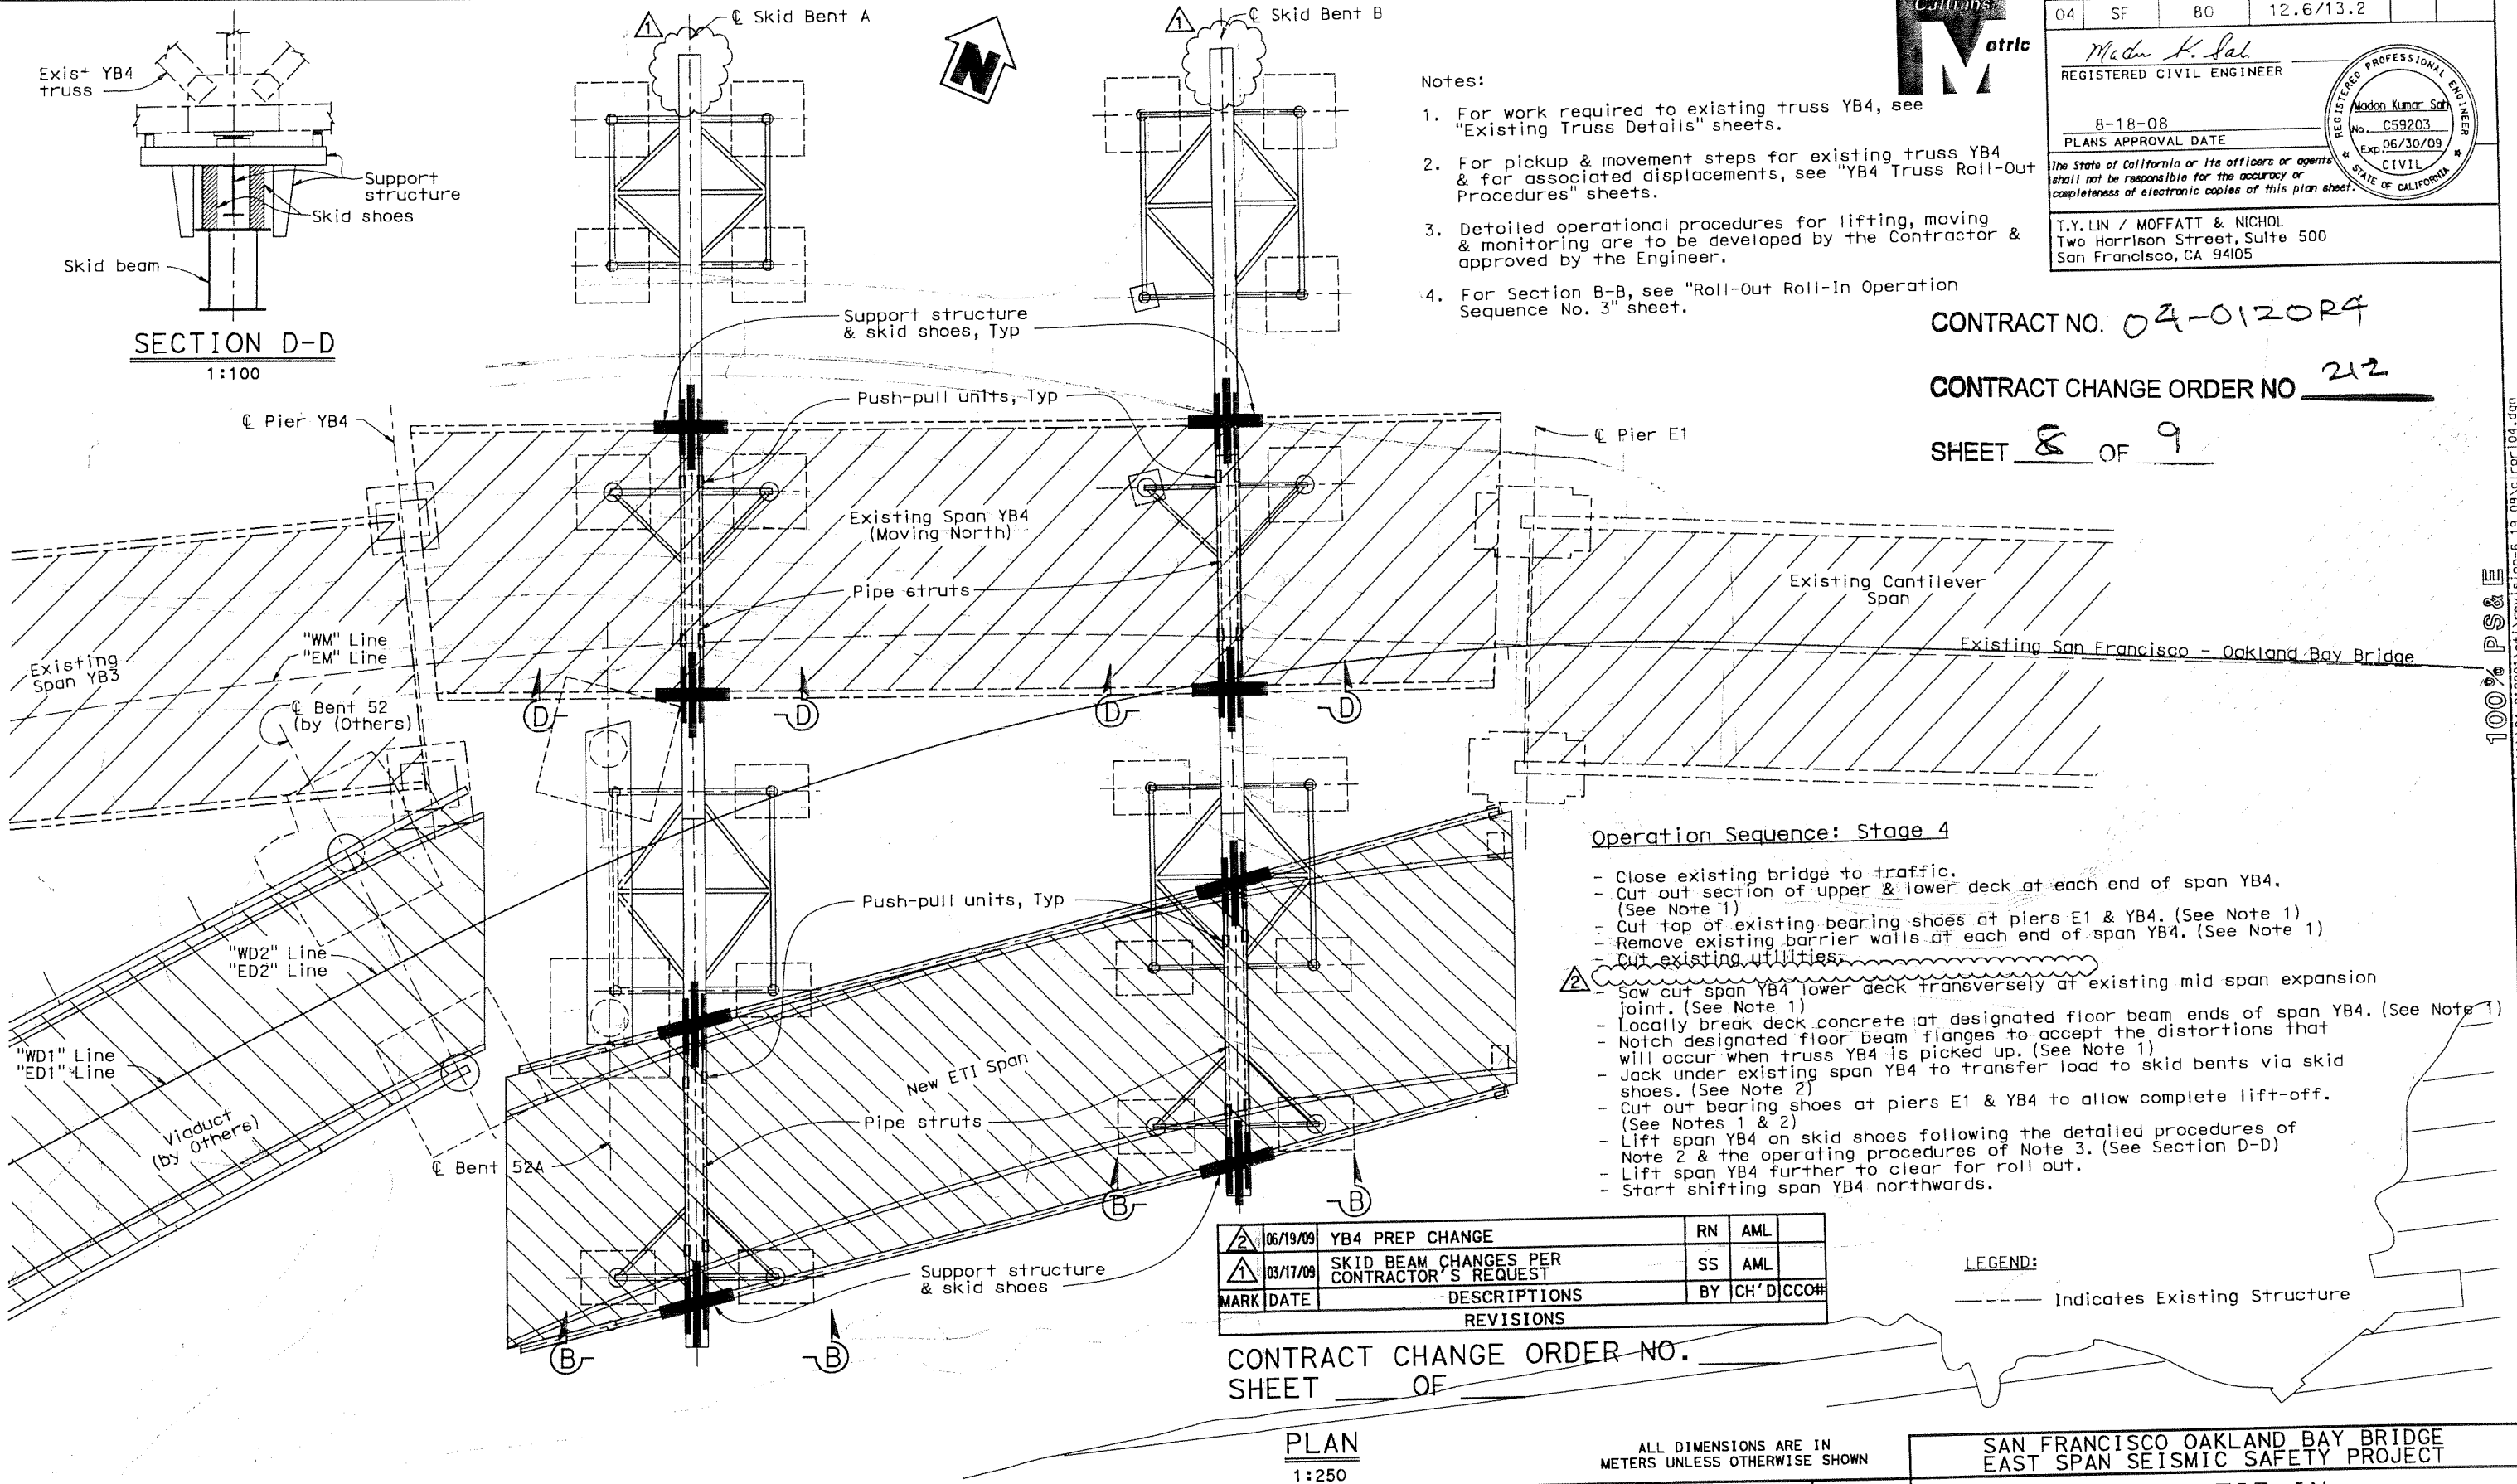
SHEET 8 OF 9

Notes:

1. For work required to existing truss YB4, see "Existing Truss Details" sheets.
2. For pickup & movement steps for existing truss YB4 & for associated displacements, see "YB4 Truss Roll-Out Procedures" sheets.
3. Detailed operational procedures for lifting, moving & monitoring are to be developed by the Contractor & approved by the Engineer.
4. For Section B-B, see "Roll-Out Roll-In Operation Sequence No. 3" sheet.

SECTION D-D
1:100



PLAN
1:250

Operation Sequence: Stage 4

- Close existing bridge to traffic.
- Cut out section of upper & lower deck at each end of span YB4. (See Note 1)
- Cut top of existing bearing shoes at piers E1 & YB4. (See Note 1)
- Remove existing barrier walls at each end of span YB4. (See Note 1)
- Cut existing utilities.
- (2) Saw cut span YB4 lower deck transversely at existing mid span expansion joint. (See Note 1)
- Locally break deck concrete at designated floor beam ends of span YB4. (See Note 1)
- Notch designated floor beam flanges to accept the distortions that will occur when truss YB4 is picked up. (See Note 1)
- Jack under existing span YB4 to transfer load to skid bents via skid shoes. (See Note 2)
- Cut out bearing shoes at piers E1 & YB4 to allow complete lift-off. (See Notes 1 & 2)
- Lift span YB4 on skid shoes following the detailed procedures of Note 2 & the operating procedures of Note 3. (See Section D-D)
- Lift span YB4 further to clear for roll out.
- Start shifting span YB4 northwards.

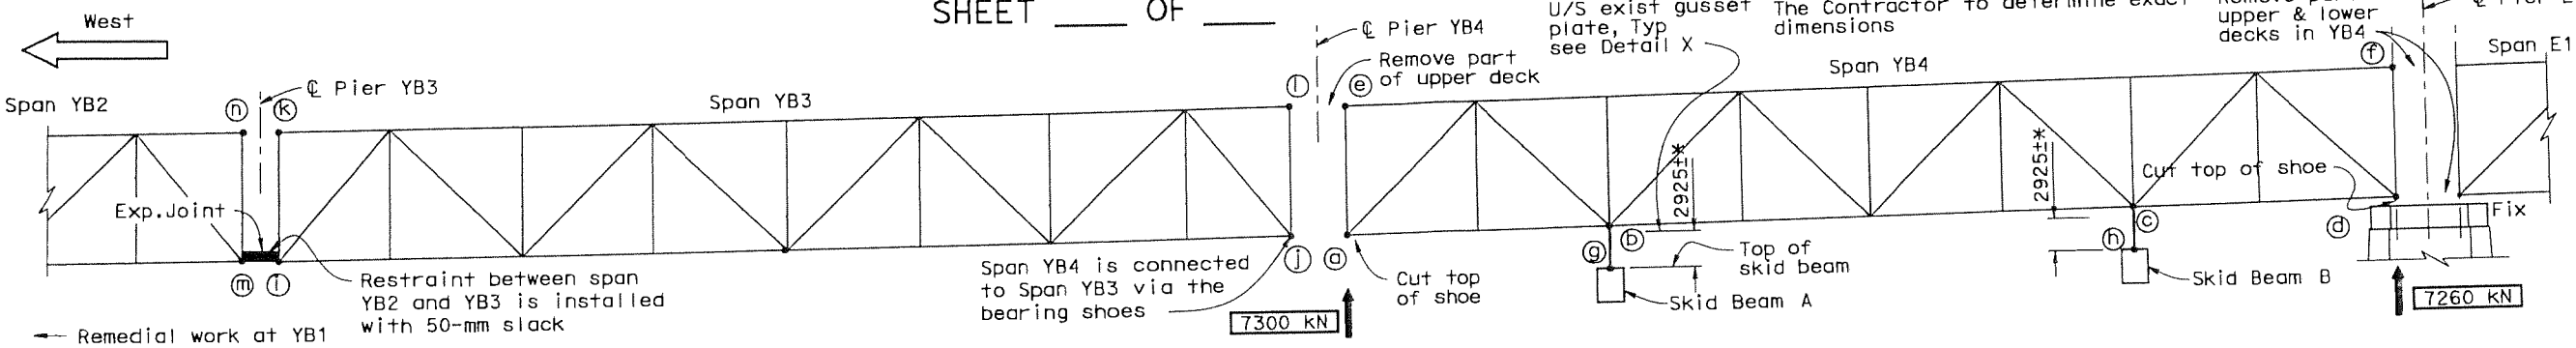
CONTRACT CHANGE ORDER NO. __
SHEET ___ OF ___

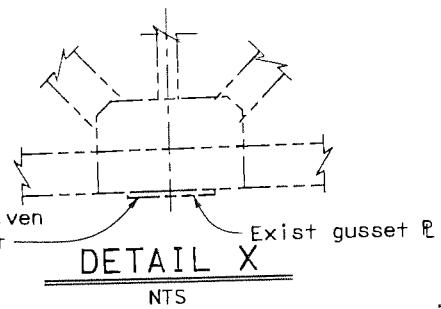
Phase 1: (Prepare to jack-up)

- Initial position. All preparation work on span YB4 is completed. (See Note C)**
- Restraints at pier YB3 are installed with 50 mm slack, tie back of span YB1 to abutment is installed.

After road is closed:

A. Remove portions of upper & lower decks as noted. (See Note C)**
B. Cut tops of bearing shoes at pier E1 & pier YB4 to allow pins to lift out.
C. Break out concrete at top deck shear brackets. (See Note C)** 1
D. Notch flanges of floor beams. (See Note C)**
E. Saw cut or break out midspan joint in the bottom deck. (See Note C)**





DETAIL X
NTS

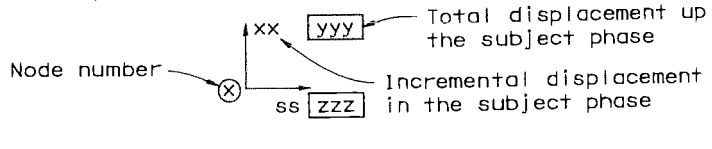
* Dimensions are given for convenience only. Dimensions are derived from survey. The Contractor to determine exact dimensions

Phase 2: (Take-up 75% load)

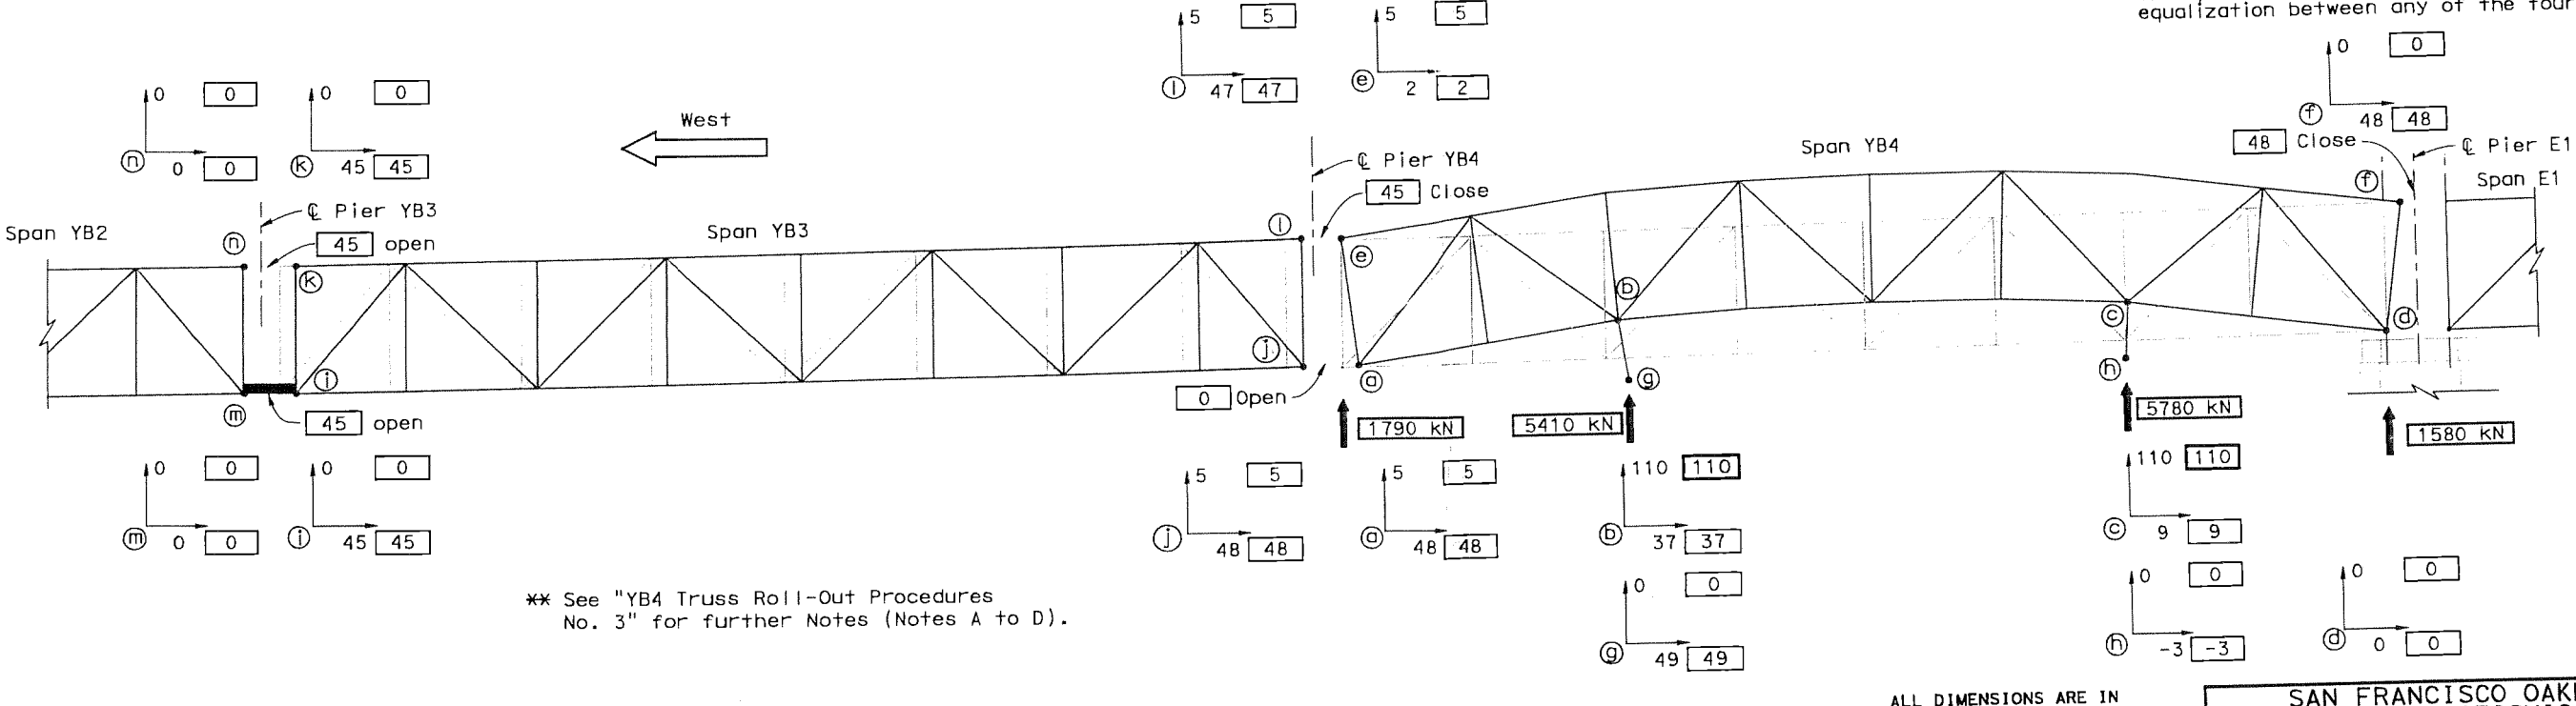
A. Engage East & West skid units (can be done earlier). (See Note B)**
B. Fasten to Truss YB4. (See Note B)**
C. Pick up load on east & west skid units simultaneously until each unit is carrying 5500 KN (approximately 75% of its anticipated maximum load). (See Note 4 & Note B)**

Notes:

1. All displacements are with respect to the initial position of the truss nodes before any jacking operations have taken place.
2. The displacement notation is as following



3. Point of east-west restraint is the bearing on Pier E1.
4. Maximum differential between loads at East & West Skid bents not to exceed 1800 KN during lifting.
5. Maximum differential extension of skid shoe jacks on any one skid beam not to exceed 50 mm.
6. Reactions are given per pick-up location and are as calculated. Add 5% contingency to all reactions.
7. Jacks will have to extend further than the displacements shown to accommodate skid beam and skid bent deflections. Allow maximum 50 mm for the total of the two.
8. Displacements given are as calculated. Allow ±33% variation on all displacements.
9. For the purpose of design of skidding system, increase all reactions by a further 8% to allow for the load redistributions that will occur due to skid beam deflections etc. while truss is being carried in four point mode.
10. It is presumed that the existing YB4 truss will be transported in a "four point support" mode, i.e. no hydraulic equalization between any of the four reaction points.



** See "YB4 Truss Roll-Out Procedures No. 3" for further Notes (Notes A to D).

SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: YB4 Roll Out Demolition	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

Demolition work of portions of the existing bridge Span YB4, in preparation for the roll out and roll in of Span YB4 over the Labor Day weekend 2009 shutdown, in accordance with Sheets 3 through 9 of the change order.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. Based on these memorandums, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in). The approval of these strategy memorandums extended the project completion date approximately 5 years.

As a consequence of the change, the East Tie-In Roll Out / Roll In design includes demolition of portions of Span YB-4 (the section that will be rolled out) immediately prior to the roll out operation. Under this change order, the Contractor will perform this demolition work as authorized by the Engineer.

For this work, the Contractor will be compensated at the agreed lump sum of $209,720.00, which will be financed from the contract's contingency funds. A detailed cost analysis for this change is on file in the project records.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

Mike Whiteside - YBI Coordination Engineer requested this change per Memorandum on June 19, 2009 with concurrences by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence for this change order is not required, as this is not part of the permanent structure.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 213	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, provide compensation to the Contractor for all additional escalation costs to be incurred in furnishing and installing the Bent 48 expansion joints and barrier plates and in constructing the deck drainage system of the steel Viaduct of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) due to all Department delays to the work.

For this work, the Contractor will be compensated a lump sum of $488,100.00. This sum constitutes full and final compensation for all additional costs to be incurred, including all markups, due to all Department delays to the work.

Total Cost of Adjustment of Compensation at Lump Sum $488,100.00

This change order acts to resolve all outstanding costs associated with Notice of Potential Claim No. 9 and the construction of the approved Viaduct deck drainage system.

Estimated Cost: Increase ☑ Decrease ☐ **$488,100.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: VIAExpansion Joint & Drainage Escalation	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor for escalation costs associated with the expansion joint and deck drainage system of the Viaduct.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins. The contract was awarded as a performance-based project with the contractor responsible for meeting the design criteria specified in the contract.

The Viaduct consists of 4 spans of a double deck steel truss approximately 20 meters wide and 320 meters long with a weight of over 4,300 metric tons. Due to extensive Department-ordered changes and delays to the project, the contract completion date has been extended by approximately 4 and a half years. Due to these delays, the Contractor has incurred considerable escalation costs associated with furnishing and installing the expansion joints at Bent 48 and in constructing the deck drainage system for the structure. This change order provides compensation for these additional costs.

The expansion joints at Bent 48 consist of 2 separate steel expansion joints, one for each the upper and lower deck, each approximately 24 meters long and 1 meter wide. These joints also require the installation of 4 steel barrier plates. Due to Department delays, the fabrication of these items realized unusual price increases due to the extraordinary global steel price escalation during the 2004 through 2006 period. Additional cost were incurred in both the fabrication and installation of the joints and plates due to more typical labor and equipment escalation realized. The deck drainage concerning the construction of scuppers in the bridge barrier rail has also incurred these more typical labor and equipment escalation costs.

Compensation provided under this change order is based on an as-planned verses actual costs analysis for the affected expansion joints, barrier plates and deck drainage.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $488,100.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

This change order acts to resolve all outstanding costs associated with Notice of Potential Claim No. 9 and the construction of the approved Viaduct deck drainage system.

No adjustment of contract time is warranted as this change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this is an administrative change and doesn't affect any permanent roadway features.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 214	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Provide compensation to the Contractor for additional costs associated with the erection of the steel truss of the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

For this work, the Contractor shall be compensated an agreed lump sum of $645,210.00. Except for the 6 items of work specifically excluded herein, this lump sum constitutes full and final compensation, including all markups, for all outstanding costs incurred by the Contractor's steel erection subcontractor Danny's Construction Company, Inc. (DCCI) pertaining to the erection of the steel truss of the East Tie-In.

Compensation for the following 6 items of work pertaining to the steel erection of the steel truss of the East Tie-In is excluded from the resolution of costs associated with this change order:

1) Costs associated with the double handling of steel which had to be stored off site as defined under Change Order No. 225.
2) Costs associated with the mockup of the ETI expansion joints as defined under Change Order No. 144.
3) Costs associated with the falsework erection at tower L8 North incurred due to unanticipated pile depth at the falsework foundation.
4) Costs associated with the installation of the ETI metal decking incurred due to the elimination of the asphalt wearing surface.
5) Costs associated with the erection and installation of the ETI temporary bracing as defined under Change Order No. 187
6) Costs associated with the roll out of Span YB4, the roll in of the ETI truss and the installation of the ETI truss bearings, expansion joints and expansion joint barrier as defined under Change Order No. 204.

Excluding these 6 items of work, no additional compensation shall be paid pertaining to costs incurred by DCCI in the erection of the steel truss of the ETI.

Total Cost of Extra Work at Lump Sum $645,210.00

Outstanding costs associated with steel erection work pertaining to the ETI skid bent or the existing steel truss (Spans YB1 through YB4 and Pier E1) are not addressed under this change order.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 215	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Estimate of Decrease in Contract Item at Contract Price:

Item No. 79: 300 MM WATER MAIN					
-73 M	(-100.00%)	$450.00 /M	=	-$32,850.00	(-200.00%)
Item No. 80: 100 MM WATER LINE					
-74 M	(-100.00%)	$350.00 /M	=	-$25,900.00	(-200.00%)

Total Cost for Decrease in Contract Item.....($58,750.00)

In accordance with Section 4-1.03B(3), "Eliminated Items," of the Standard Specifications, the adjustment due to the elimination of Item #79, 300mm Water Main, and Item #80, 100mm Waterline, is zero.

Extra Work at Force Account:

As authorized by the Engineer, and in accordance with Section 10-1.65 Water Mains of the Contract Special Provisions, furnish and install a 100 mm and 300 mm waterline on Yerba Buena Island.

Estimated cost of Extra Work at Force Account $100,000.00

RECEIVED
08 OCT -8 P01:09

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$41,250.00**

CCO DESCRIPTION: Waterline Ground Work	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Furnishing and installing a 100 mm and 300 mm ground waterline on Yerba Buena Island.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

Based on the approved strategy memorandums, the Department assumed responsibility for the ground waterline work and provided direction to the Contractor on what work was needed to accommodate the design changes on the Yerba Buena Island Detour. Due to the change in original scope of work on the waterline and the 5-year delay that has been incurred on the project, the original Contract Bid Item No. 79 - 300mm Water Main and Item No. 80 - 100mm Water Line, shall be eliminated as this work is no longer representative of the work as originally bid. Consequently, the work of this change order shall be compensated for under Extra Work at Force Account.

Contract Bid Item Nos. 79 and 80, for a total amount of $58,750.00 will be deleted from the contract. The Contractor will be compensated for the Department's revised waterline work at Extra Work at Force Account for $100,000.00. The net change order cost of $41,250.00 shall be financed from the projects contingency funds. A cost analysis is on file in the project records.

No adjustment of contract time is warranted as this change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this is an administrative change and doesn't affect any permanent roadway features.

CCO DESCRIPTION:
ETI Pier E1 Barrier Rail Supports

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**8**

THIS CHANGE ORDER PROVIDES FOR:

Adding steel support members for the East Tie In, south truss, lower deck barrier rail connection to the existing structure.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins. The contract was awarded as a performance-based project with the contractor responsible for meeting the design criteria specified in the contract.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

Project Development along with Toll Bridge Design has previously issued plan sheets providing for the replacement of steel barrier rail along the existing structure at the location where existing structure meets the new East Tie-In roll in structure. These new design drawings add steel members as required to support the new barrier rail location. This change order incorporates these plan sheets into the contract.

Due to the expedited requirements of this change order to procure, fabricate, and install the steel, compensation for this work shall be paid as extra work at force account for an estimated cost of $175,000.00, which shall be financed from the contract's contingency funds. A cost estimate is on file. This work shall take place either prior to or during the 2009 Labor Day Weekend closure of the San Francisco-Oakland Bay Bridge.

No adjustment of contract time is warranted as this change will not affect the controlling operation.

Mike Whiteside - YBI Coordination Engineer requested this change per Memorandum on August 17, 2009 with concurrences by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 217	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform all work as specified within this change order pertaining to the demolition and removal of the skid bent and beam of the East Tie-In portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)).

Compensation paid under this change order includes all costs associated with the following 6 items of work:

1) Performing all bridge removal work associated with the demolition and disposal of the skid bent system, including all skid bents, beams, walkways and appurtenances, of the East Tie-In. This work includes the demolition and disposal of Skid Beam Segment A1 and Segment B1 after being lowered with the Span YB4 truss and the demolition and disposal of Bent 1 and Bent 2 towers of both Skid Bent A and Skid Bent B after they are transported to allow for the lowering of the Span YB4 truss.

2) Performing all bridge removal work associated with the demolition and disposal of the 8 structural steel supports installed between the bottom chord and the skid beam for both the YB4 and ETI trusses that were installed under Change Order No. 171.

3) Performing all bridge removal work associated with the demolition and disposal of skid bent foundation B2W.

4) Performing all bridge removal work associated with the demolition and disposal of the 4 concrete falsework foundations constructed to support the lowered Span YB4 truss. The 4 concrete foundations to be removed consist of the 2 eastern concrete pads of falsework Bent 8 and the 2 foundations for falsework Bent 9 that support the north and south truss falsework.

5) Performing all bridge removal work associated with the demolition and disposal of the 7 concrete foundations constructed to support the gantry system used to lower the Span YB4 truss onto falsework. The foundations to be removed include all foundations for the Skid Beam A gantry towers excluding the large foundation constructed above skid bent foundations A1W and A1E and the 2 minor foundations constructed between skid bent foundations A3W and A3E and all foundations for the Skid Beam B gantry towers excluding the 2 minor foundations constructed between skid bent foundations B1W and B1E.

6) Performing any repair work to the Bent W3R footing necessary due to any damage incurred during the demolition of the concrete foundations specified under Items No. 3 and No. 5 above.

For this work, the Contractor shall be compensated a lump sum of $3,152,900.00. Except for the items of work specifically excluded in this change order, this sum constitutes full and final compensation, including all markups, for all costs associated with the work of this change.

Under the terms of this change order, the Contractor assumes full ownership of all materials being removed.

Total Cost of Extra Work at Lump Sum $3,152,900.00

This change order excludes any costs associated with the backfill of the ETI area. Any costs associated with this work shall be paid under a separate change order.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 217	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

Flagging costs associated with the work of this change shall be paid under Change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum compensation provided under this change order.

The compensation paid under this change order includes all engineering and survey costs associated with the work of this change order and no additional compensation shall be paid.

Estimated Cost: Increase ☑ Decrease ☐ **$3,152,900.00**

475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

the demolition and disposal of the East Tie-In skid bent system.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

The new design of the ETI structure provides for a roll-out / roll-in concept with a new double deck steel truss span being erected adjacent to the existing span and then rolled into place after the existing span is rolled out. As part of this work, a skid bent system has been constructed to provide for the roll out of the existing truss and the roll in of the new truss. This change order provides for the demolition and disposal of the skid bent system.

The work encompassed under this change includes the demolition of over 3,000 metric tons of steel members including 24 steel tower legs up to 1.5 meters in diameter and 45 meters high and 2 approximately 100 meter long skid beams weighing over 4 metric tons per meter all being supported by extensive steel bracing and supports. The work also includes the demolition of 12 reinforced concrete foundations totaling to approximately 360 cubic meters of concrete and the demolition of 8 structural steel members that were installed to provide stability to the existing and new trusses during their roll out and roll in.

Compensation for the work of this change shall be paid as extra work at an agreed lump sum price of $3,152,900.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

Under the terms of this change order, the contractor assumes ownership of the structural steel associated with the skid bent removal. A commensurate credit for the salvage value of this steel, based on the current market value, is provided within the agreed lump sum compensation being paid.

No adjustment of contract time is warranted as the change does not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer. TBPOC Approval granted on 9/18/2009 for an amount not to exceed $4,500,000.00.

Maintenance concurrence is not required as the work will not affect and permanent roadway items.

This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Provide compensation to the Contractor for all costs associated with the erection and installation of all steel plates, brackets, stiffeners and bolts necessary to incorporate the changes to the steel truss provided for under Change Order No. 207.

For this work, the Contractor shall be compensated an agreed lump sum of $625,410.00. This lump sum constitutes full and final compensation, including all markups, for all additional costs associated with this change.

Total Cost of Extra Work at Lump Sum $625,410.00

Costs associated with any rework required on the deck forms pertaining to pouring the ETI truss concrete deck incurred due to the erection and installation of all steel plates, brackets, stiffeners and bolts being performed under this change order are excluded from the compensation provided and will be compensated at force account under Change Order No. 207.

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$625,410.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: ETI Truss Added Gusset Plate Erection	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

providing for the erection of numerous added gusset plates to the East Tie-In truss.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins. The contract was awarded as a performance-based project with the contractor responsible for meeting the design criteria specified in the contract.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

Change Orders No. 129 and 140 provided for the fabrication and erection of the steel truss of the ETI structure. Toll Bridge Design has now issued additional plan sheets that provide design enhancements to the 2 panel points at both the upper and lower decks of the truss. These changes provide added gusset plates and various brackets at each connection in order to provide additional strength to those connections. The changes were incorporated under Change Order No. 207 and include approximately 15 metric tons of additional steel and both the addition and the replacement of thousands of high strength bolts. Change Order No. 207 deferred all costs associated with the installation and erection of this steel.

This change order shall provide compensation for the installation and erection of the added plates and brackets and the placement of all additional bolts. Considerable rework of the existing truss members shall also be required and compensated under this change order.

Compensation for the erection of the added plates and brackets shall be paid as extra work at an agreed lump sum of $625,410.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

Costs associated with any rework required on the deck forms pertaining to pouring the ETI truss concrete deck incurred due to the erection and installation of all steel plates, brackets, stiffeners and bolts being performed under this change order are excluded from the compensation provided and will be compensated at force account under Change Order No. 207. This work is estimated at approximately $10,000.00 and will be funded by the existing force account funds provided under that change order.

Authority to Proceed with this work was obtained from Headquarters Construction on August 27, 2009 for an amount not to exceed $750,000.00.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Structure Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 220	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

As determined necessary by the Engineer and as shown on Sheets 2 to 11, furnish and install temporary lighting in the Temporary Bypass Structure to include the tunnel prior to the West Tie-In Structure.

For this work, the Contractor will be paid the sum of $198,000.00, which constitutes full compensation to include a temporary generator for the East Span lights on both the lower and upper deck during the Labor Day Weekend Roll in and all markups, for the work of this change.

Total Cost of Extra Work at Lump Sum $198,000.00

GENERAL NOTES

1. All electrical work shall conform to (1999 and 2004) the latest issue of State of California Department of Transportation Standard Specifications and Standard Plans. These general notes and special provisions under this contract also apply. For any conflict of provisions, California State Guidelines apply.
2. All conduit routing is shown diagrammatically. Pull box locations are located and shown on plan drawings. The contractor shall provide additional pull boxes as required. Exact location of equipment and devices may be adjusted by field conditions or as directed by the Engineer.
3. Minimum conduit sizes shall be 21 mm. All conduits located outside shall be rigid galvanized steel, PVC coated.
4. All equipment and devices shall be provided with nameplate tags as shown in the drawings.
5. All feeders and branch circuits shall be provided with an equipment ground wire.
6. The Contractor shall label all conductors and cables per cable schedules.
7. The Contractor shall provide all conduits with permanent field markers and labels
8. The Contractor shall provide and install new armored cables on metal racks, troughs, in cable trays or secured to supports spaced not greater than 1500 mm apart.
9. The Contractor shall provide splice boxes for armored cables.
10. For other related work not shown on the plan sheets, see Electrical Special Provision.
11. Contractor to verify all controlling field dimensions before ordering or fabricating any material.
12. Provide and install new armored cables or conduit as shown, scheduled and as needed in construction. Support cables or conduit from surface using 41x41 channel, hot dipped galvanized and appropriate strut mounted clamps. See Detail. Support armored cables or conduit horizontally along Temporary Bypass Structure (TBS) using steel ladder cable trays.
13. New cable will be completely routed and tested before cutting existing circuits and/ or interconnecting new.
15. Contractor to provide expansion fittings or loops at bridge expansion joints or points of deflection. Provide stainless steel support grips to hold the weight of electrical cable as it loops or hangs in vertical, sloping or horizontal position.
16. All materials and equipment are subject to Engineers written approval.

CCO DESCRIPTION: Flashing Beacon and Tunnel Lighting	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Furnish and install temporary lighting in the Temporary Bypass Structure to include the tunnel prior to the West Tie-In Structure.

The YBID was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

This change order is necessary to provide sufficient illumination inadvertently not placed in the original contract plans. In addition, it will further enhance public safety for the traveling public in the Temporary Bypass Structure.

Compensation for this work shall be paid for as extra work at an agreed lump sum price of $198,000.00, which shall be financed from the contract's contingency funds. A cost analysis is on file.

Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Lina Ellis - Maintenance concurred with this change.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 221	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer and as shown on Sheets 2 and 3 of this change, furnish and install a transition cover plate a Bent 47 column of the West Tie-In adjacent to the E/B 80 On-ramp.

Estimated Cost of Extra Work at Force Account $25,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$25,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Submitted by

THIS CHANGE ORDER PROVIDES FOR:

the lease of a stockpile site adjacent to the project.

This contract provides for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour will allow for the construction of the permanent structure, the Yerba Buena Island Transition Structure, which connects the signature SAS structure to Yerba Buena Island.

The detour consist of three main structures, the East Tie-In (ETI) to the bridge, the West Tie-In (WTI) to the island and the Viaduct structure between the two tie ins. The contract was awarded as a performance-based project with the Contractor responsible for meeting the design criteria specified in the contract.

Two separate Department strategy memos, dated December 14, 2006 and December 25, 2006 and both approved by Tony Anziano, Toll Bridge Program Manager, Richard Land, Chief Engineer and subsequently the TBPOC, recommended that the Department assume the design responsibility for the ETI and WTI structures structure and recommended the advance construction, within this contract, of numerous foundation and columns from the Yerba Buena Island Transition Structure contract that will follow the completion of this project.

The assumption of the design responsibility and the added foundation work will result in consuming most of the Contractor's planned storage areas within the project limits. This change order will provide for the Contractor to lease a parcel of land adjacent to the project site that will allow them to store materials without adversely affecting their work.

The parcel shall provide approximately 2 acres of storage area and is anticipated to be leased through the Spring of 2010. The quoted monthly lease price has been determined to be in line with typical leased properties in the area.

The work shall be performed as extra work at force account for an estimated cost of $400,000.00 and shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this change order will not affect any permanent roadway features.

475 Day(s)	**0** Day(s)	**0** Day(s)	**0** %	**0**

THIS CHANGE ORDER PROVIDES FOR:
compensation to the contractor for additional steel handling costs incurred due to Department caused delays to the East Tie-In steel fabrication.

This contract was awarded on March 10, 2004 to construct a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the east tie in to the bridge, the west tie in to the island and the viaduct structure between the two tie ins. The contract was awarded as a performance based project with the contractor responsible for meeting the design criteria specified in the contract.

Two separate Department strategy memos, dated December 14, 2006 and December 25, 2006 and both approved by Tony Anziano, Toll Bridge Program Manager, Richard Land, Chief Engineer and subsequently the TBPOC, recommended that the Department assume the design responsibility for the ETI and WTI structures and recommended the advance construction, within this contract, of numerous foundation and columns from the Yerba Buena Island Transition Structure contract that will follow the completion of this project.

This change order concerns additional costs associated with the double handling of fabricated steel to be erected for the East Tie-In (ETI) structure. The East Tie-In consists of a double deck steel truss approximately 20 meters wide and 80 meters long with a weight of approximately 1,270 metric tons and a steel skid bent support system with a weight of approximately 3,000 metric tons.

The fabrication and erection of the ETI truss and skid bent has been provided for under Change Orders No. 116, No. 129 and No. 140. These change orders provided for the delivery and unloading of the fabricated steel to the project site. Due to various Department caused delays to the fabrication of these structures, the contractor shall be forced to store the material at an off site location and then transport the steel to the jobsite as necessary to meet the contracted erection schedule. This change order provides for these additional costs associated with double handling the steel.

Compensation for the additional handling and transportation costs shall be paid as an adjustment of compensation at force account at an estimated cost of $500,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

CCO DESCRIPTION: Viaduct Manhole Cover Plates	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**0**

THIS CHANGE ORDER PROVIDES FOR:

modifications to the manhole openings of the portal struts of the of the Viaduct structure.

This contract calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the east tie-in (ETI) to the bridge, the west tie-in (WTI) to the island and the Viaduct structure between the two. The contract was awarded as a performance based project with the contractor responsible for meeting the design criteria specified in the contract.

In order to satisfy the Department that the safety of the traveling public would be fully addressed, the Office of Structures Design requested several design enhancements to the steel truss. It was also determined in the Department's December 14, 2006 strategy memo that the Viaduct should be designed as a stand alone structure due to the anticipated lag in the completion of the ETI and WTI structures. This memo was approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and subsequently by the Toll Bridge Program Oversight Committee (TBPOC).

The Viaduct consists of 4 spans of a double deck steel truss approximately 20 meters wide and 320 meters long with a weight of over 4,300 metric tons. This change order provides for the addition of manhole cover plates on the manhole openings of the portal struts of the Viaduct in order to eliminate the potential hazard of debris falling onto the travel way from animals that may nest in these openings. These changes have been requested by Project Development.

As the Viaduct remains a performance based structure with the contractor responsible for the design, the contractor shall modify the design by adding cover plates to the manhole openings as requested and as approved by the Engineer. The contractor will then implement the approved design modifications by incorporating them into the existing structure. The approved existing design includes 4 manhole openings in each of the 8 portal struts located on the structure with no requirement to cover these openings.

Compensation for incorporating the design modifications into the contract and furnishing and installing the manhole cover plates shall be paid as extra work at force account at an estimated cost of $30,000.00 which shall be funded by the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Minh B. Nguyen - Project Engineer, and Lina Ellis - Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 227	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Perform final grading and implement permanent erosion control measures to the areas backfilled under this change order as determined by the Engineer.

Estimated cost of Extra Work at Force Account $50,000.00

Extra Work at Lump Sum:

Perform the following 2 items of work:

1) Transport, place and compact all excess soil from the Treasure Island storage yard at the corner of Avenue H and 9th St. to The project site. The soil shall be placed as backfill in the areas under the East Tie-In and Viaduct portions of the Temporary Bypass Structure as determined by the Engineer. All soil shall be placed in accordance with Section 19-5 of the Contract Standard Specifiations.

2) Perform the removal of the temporary soil nail wall, placed for the construction of the East Tie-In skid bent foundations, to a minimum of 0.9 meters below the top of the wall and where necessary to construct the electrical duck bank and compressed air line to D Line Sta. 4+85. All concrete removed may be incorporated as backfill into the East Tie-In area.

For these 2 items of work, the Contractor shall be compensated a lump sum of $391,040.00. Except for the items of work specifically excluded below, this sum constitutes full and final compensation, including all markups, for all costs associated with the work of this change.

All work associated with the implementation and maintenance of the Contractor's Storm Water Pollution Prevention Plan shall be paid by the Department separately from this change order.

Flagging costs associated with this work shall be paid under Change Order No. 1 with these costs being paid at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum compensation provided under this change order.

Extra Work at Lump Sum $391,040.00

In the event a portion of the soil from the Treasure Island storage yard at the corner of Avenue H and 9th St. cannot be incorporated back into the project site and needs to be off-hauled, the Contractor shall credit the Department an agreed unit price of $55.00 per cubic meter of soil that is off-hauled. Any credit owed the Department shall be provided for under a supplemental change order. Costs associated with any actual off-haul of soil from the project, if incurred, shall be paid under Change Order No. 155.

CCO DESCRIPTION: ETI Backfill & Restoration	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	0

THIS CHANGE ORDER PROVIDES FOR:
backfill of the East Tie-In area.

This project, the Transitional Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC. This memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design.

The new design of the ETI structure provided for the mass excavation of the area under the structure to allow for the construction of 20 foundations that where required to support a skid bent system. The contract provided for the excavation and the transport of the soil to a storage site approximately 1 mile from the project site. This change order provides for the stored soil to be transported back to the jobsite and incorporated into the work as backfill of the ETI area.

The work encompassed under this change includes the transport and backfill of approximately 6,750 cubic meters of soil. Additionally, the change order provides for the removal of the top 0.9 meters of a soil nail wall that was constructed to allow for the construction of the ETI skid bent footings. Areas where the wall conflicts with the construction of a planned electrical duct bank will also be removed.

Compensation for the soil backfill and wall removal shall be paid as extra work at an agreed lump sum price of $391,040.00. Compensation for any final grading and erosion control measures shall be paid as extra work at force account at an estimated cost of $50,000.00. The total estimated change order cost of $441,040.00 shall be financed from the contract's contingency funds. A cost analysis is on file.

It is anticipated that all of the stored soil shall be incorporated back into the project site. In the event soil needs to be off-hauled from the project, the contractor shall provide a credit to the Department for backfill work not performed. Any credit, if required, shall be provided under a supplement to this change order.

No adjustment of contract time warranted as the work shall not affect the controlling operation.

This change was concurred with by Ken Terpstra - Project Manager, Jaime Gutierrez - Project Engineer, and Lina Ellis - Maintenance.

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	7

THIS CHANGE ORDER PROVIDES FOR:

Furnishing and installing call boxes and SCADA system components on the upper and lower decks of the San Francisco Oakland Bay Bridge (SFOBB).

This project provides for the construction of a detour of the mainline eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour, which spans approximately 650 meters, is comprised of a double deck steel truss bridge which transitions to a concrete and roadway structure as it approaches the Yerba Buena Island tunnel.

A separate contract (EA 04-010904) is concurrently installing new call boxes and components of a SCADA system on the SFOBB. Those contract plans mistakenly call for new call boxes and components to be installed on the portion of the bridge that is being replaced by the detour under this contract. This change order provides revised plan sheets that install these components on the new detour structure. In order to avoid construction conflicts between this work and the on-going work being performed on this contract, Project Development has requested that this work be removed from the existing contract (EA 04-010904) and placed into this contract. This change order provides for this added work. Similarly, a credit for the deleted work shall be taken under the other contract.

Compensation for this work shall paid as extra work at an agreed lump sum of $15,980.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

Lane closures for the work of this change shall be compensated separately from this change order under previously approved Change Order No. 240.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Ken Terpstra - Project Manager, Jaime Gutierrez - Project Engineer, and Lina Ellis - Maintenance.

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

The salvage of maintenance traveler motors and trolleys during the removal of the existing bridge.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins. The contract also calls for the bridge removal of 330 meters of the existing SFOBB after traffic is placed on the new detour and the existing bridge is abandoned.

This change order provides for the salvage of existing maintenance traveler motors and trolleys during the removal of the abandoned bridge and delivery of these salvaged items to the Department SFOBB maintenance yard. This work was specified under Section 10-1.38, "Existing Highway Facilities" of the contract Special Provisions to be performed as extra work.

Compensation for the cost of the salvage and delivery of the motors and trolleys shall be paid as an extra work at force account at an estimated cost of $100,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

475 Day(s)	0 Day(s)	1660 Day(s)	349 %	7

THIS CHANGE ORDER PROVIDES FOR:

Shuttle service to mitigate disruptions to bus service due to the temporary closure of the Yerba Buena Island (YBI) westbound on ramp.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project.

Toll Bridge Program Management has made the determination to provide for the temporary closure of the existing YBI on ramp to westbound I-80. This closure will allow for the demolition of the abandoned concrete viaduct of the east span of the San Francisco Oakland Bay Bridge where it ties into the island. It was determined that the limited access to the structure being demolished and the close proximity of the structure to the YBI on ramp presented potential safety concerns. Upon the completion of the demolition, the on ramp will be reopened to public traffic.

The closure of the on ramp has a detrimental effect on the MUNI bus service provided to both YBI and Treasure Island by the San Francisco Municipal Transportation Agency (SFMTA). Without mitigating these effects, the buses would be forced to detour to the on ramp on the opposite side of the island which would severely impact service. It has been agreed with the SFMTA and the Treasure Island Development Authority that the Department will mitigate this disruption by providing private shuttle service to the community located near the closed on ramp therefore eliminating the buses needed to retrace its route to the opposite side of the island.

Similar shuttle service was provided for under Section 10-1.135 "Temporary Shuttle Van Service" of the contract Special Provisions pertaining to the temporary closure of Southgate Road and the eastbound I-80 off ramp. This closure of the westbound I-80 on ramp was not anticipated under the original contract.

The contractor shall provide for this private shuttle service on a force account basis. It is anticipated that the service will be required for approximately 10 to 12 months. No other costs are anticipated due to the closure of the on ramp at this time.

Compensation for the cost of providing the shuttle service shall be paid as an extra work at force account for an estimated cost of $600,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Minh B. Nguyen - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

The fabrication of steel plate test specimens to be used for skid resistance testing by the Department.

This project, the Yerba Buena Island Detour (YBID), calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in).

The fabrication of these plates has been requested by Mike Whiteside - Yerba Buena Island (YBI) Coordination Engineer, in order to evaluate the skid resistance of the as-designed and various alternative surface treatments for the YBI Detour that was constructed under this contract.

The work will include the fabrication of up to 12 steel plates with minimum dimensions of 30" by 60" and with surface texturing applied as determined by the Department. The delivery of the plates to the Department's test facility will also be compensated under this change order.

Compensation for the work of this change shall be paid as an extra work at force account at an estimated cost of $100,000.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 232	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform the following 2 items of work pertaining to the construction of the electrical duck bank and compressed air line from D Line Sta. 1+63 to 4+85:

1) Install stone bedding under the entire length of the 150 mm compressed airline. Stone bedding shall be placed in accordance with Section A-A of the duct bank utility detail plan sheet UD-4 (Sheet 2 of 2 of this change).

2) Remove and dispose of skid bent foundations A2W, A2E, B1W and B1E of the East Tie-In structure. All foundations shall be removed to the bottom of footing. Removal of the A2W footing will include the removal of the footing's CIDH piles to a depth of 1.5 meters below the bottom of that footing.

For this work, the Contractor shall be compensated a lump sum of $105,620.00. Except for the items of work specifically excluded in this change order, this sum constitutes full and final compensation, including all markups, for all costs associated with the work of this change.

Flagging costs associated with the work of this change shall be paid under Change Order No. 1 with these costs being paic at 50% by the Department. The remaining flagging costs are considered to be included in the lump sum compensation provided under this change order.

Total Cost of Extra Work at Lump Sum $105,620.00

475 Day(s)	0 Day(s)	1660 Day(s)	349 %	7

THIS CHANGE ORDER PROVIDES FOR:

The demolition of skid bent footings and the placement of stone bedding pertaining to the projects electrical duct bank and compressed air line.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums issued on December 14, 2006 entitled 'Strategy for South-South Detour Contract Completion' and December 25, 2006 entitled 'Recommendation to Construct Select Yerba Buena Island Transition Structure Foundations by Contract Change Order' were approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), which recommended the design of the ETI and WTI structures and enhancement of the Viaduct be assumed by the Department as opposed to the as-bid performance based contractor design and that a portion of the YBITS foundation work be performed under this contract by change order.

This project provides for the construction of an approximately 320 meter long electrical duct bank and adjacent compressed air line. The plans call for the placement of stone bedding under the air line but only in locations where the slope exceeds a 1:3 grade. None of the air line meets this criteria. Project Development has now requested that the entire length of the air line be placed on the stone bedding previously specified for slopes exceeding the 1:3 grade. This change order provides for furnishing and placing this stone bedding.

In addition, this change order provides for the removal and disposal of 4 large reinforced concrete footings. These footings, which conflict with the duct bank alignment, were added by change order to support the temporary skid bent system associated with the East Tie-In structure and were not included in the original scope of work pertaining to the construction of the duct bank. The work includes the removal of approximately 250 cubic meters of reinforced concrete and the top 1.5 meters of the 4 CIDH piles of footing A2W.

Compensation for the work of this change shall be paid as extra work at an agreed lump sum price of $105,620.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager, Minh B. Nguyen - Project Engineer, and Lina Ellis - Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 233	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

In addition to the agreed lump sum, the Contractor will be paid on a Force Account basis for providing traffic control and construction area lighting as required to perform this work. The Contractor shall provide traffic control system for lane closures, and shall conform to the provisions in Sections 10-1.31, "Traffic Control System for Lane Closure," and 10-1.30, "Closure Requirements and Conditions" of the Special Provisions. Except as authorized by the Engineer, lanes shall be closed only during the hours as allowed in Special Provision section 10-1.29, "Maintaining Traffic".

Estimated Cost of Extra Work at Force Account $35,000.00

Extra Work at Lump Sum:

Perform the following items of work pertaining to the construction of a high friction surface treatment of the exposed steel roadway driving surfaces at the East Tie In expansion joints at Pier E1 (upper and lower deck) and Bent 52A (upper and lower deck):

Prepare surfaces, install high friction surface treatment in accordance with attached specification (Sheets 2 through 3 of this change order). Work that interferes with public traffic shall be performed only during the hours allowed in the Special Provisions for lane closures. The Lump Sum price anticipates that this work is to be done at night, with multiple lane closures, and with construction staged over four different nights.

For this work, the Contractor shall be compensated a lump sum of $71,915.00. Except for the items of work specifically noted as paid for under the Force Account portion of this change order, this lump sum constitutes full compensation, including markups, for furnishing all labor, material, tools, equipment, and incidentals for doing the work involved in this change.

Total Cost of Extra Work at Lump Sum $71,915.00

RECEIVED 2009 NOV 03 AM 10:

Estimated Cost: Increase ☑ Decrease ☐ **$106,915.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

Contractor Acceptance by		
Signature	**(Print name and title)** DANIEL E. HANCK, PRESIDENT	**Date** 11/06/09

Preparation:

Surfaces shall be clean, dry, and free of all dust, oil, debris and any other material that might interfere with the bond between the epoxy resin binder material and existing surfaces. Adequate cleaning of all surfaces will be determined by the engineer. Utilities, drainage structures, curbs and any other structure within or adjacent to the treatment location shall be protected from the application of the surface treatment materials. Cover and protect all existing pavement markings that are adjacent to the application as directed by the Engineer.

Pre-treat joints and cracks greater than 1/4 inch in width and depth with the mixed epoxy specified herein. Once the epoxy in the pre-treated areas has gelled, the epoxy binder and aggregate topping installation may proceed.

Mixing and Application of Epoxy Binder:

Option (A) Hand mixing of the two–part modified epoxy base binder.
The two part modified epoxy base binder components Part (A) and Part (B) shall be proportioned to the correct ratio (50:50 +/- 4% by weight), mixed using a low speed high torque drill fitted with a helical stirrer. This application may be used when installing low application volume areas such as intersections or areas less than 300 linear feet in length or where truck mounted application machines are not applicable to the specified locations because of logistical restrictions.
The mixed components shall be hand applied onto a prepared surface at a minimum application coverage rate of 2.5lb +/- 0.5 per square yard coverage. Hand applied base binder shall be uniformly spread onto the substrate surface by means of a serrated edged squeegee. Immediately spread the high friction surfacing aggregate onto the installed two part modified epoxy base binder, at a rate of 13lb +/- 2lbs per square yard coverage.
Option (B) Mechanical mixing of the two-part modified epoxy base binder components.
The two-part modified epoxy base binder shall be applied, by a truck mounted apportioning device onto the section to be treated within the specified temperature range. The truck mounted applicator shall be capable of applying the binder and aggregate in varying widths of up to 8 feet at a uniform application thickness.
The mixed components shall be applied mechanically onto the prepared pavement surface at a minimum coverage rate of 15 gal/per minute with a uniform thickness of 60 mils onto the pavement surface.

Application of Aggregate Wearing Course:

Immediately spread the high friction aggregate onto the installed base binder, at a rate of 13lb +/- 2lbs per square yard onto the applied epoxy binder prior to the epoxy binder reaching its gel time coverage. Installer shall spread aggregate to provide complete coverage of the wet epoxy binder with aggregate as necessary to achieve a uniform surface. No exposed wet spots shall be visible once the aggregate is placed.

After the epoxy has set up, excess aggregate shall be removed by a suction sweeper.

A manufacturer's representative shall be on site to provide technical assistance during the start up operations.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 233

SHEET 3 OF 3

HIGH FRICTION SURFACE TREATMENT

Description:

This work consists of furnishing and applying a high friction surfacing system.

Materials:

The system shall consist of a two part exothermic epoxy resin binder.

EPOXY BINDER REQUIREMENTS		
Property	**Requirement**	**Test Method**
Ultimate Tensile Strength	2,800 psi min.	ASTM D638
Compressive Strength	1600 psi min.	ASTM D695
Gel Time	10 minutes min.	ASTM D2471
Peek Exothermic Temperature	150°F min.	ASTM D2471
Water Absorption	Less than 0.25%	ASTM D570
Shore Hardness	70 min.	ASTM D2240
Viscosity	3,000 cps min.	ASTM D2169
Bleed Test	Little trace	Swab test visual 7 days @ RT
Cure Rate	3 hours max	Thin Film @ 75°F
Mixing Ratio	1:1	n/a

The epoxy binder materials which are not exothermic in curing and do not meet the viscosity requirements, will not be allowed. Independent laboratory report documents shall be provided documenting that the epoxy binder meets the requirements of this section.

Aggregate Surface Topping:

The bauxite aggregate shall be as per the manufacture's specification. The aggregate shall be clean, dry, and free from foreign matter.

Aggregate materials shall meet these requirements:

SFC	Sideway Force Coefficient 0.7 ASTM E670
SRV/SRT	Skid Resistance Value Test 65 70 ASTM E303
PSV	Polished Stone Value 70 75 ASTM E660
Texture Depth	Sand Patch Method 1 min 1.2 ASTM E965
AAV	Aggregate Abrasion Value 20 max 4 LA Abrasion Test
Aggregate grading No 6 Sieve Size 5% max +/	0.5%
No 16 Sieve Size 5% max +/	0.5%

Application Conditions:

Do not apply the epoxy binder on a wet surface or when the ambient temperature is below 40°F or when the anticipated weather conditions would prevent the proper application of the surface treatment as determined by the manufacturer's representative.

CCO DESCRIPTION: Surface Treatment for ETI Joints	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	7

THIS CHANGE ORDER PROVIDES FOR:

This change provides for compensating the Contractor for all costs associated with furnishing and installing a high friction surface treatment on the roadway at each of the four (4) expansion joints plates for Bent 52A and Pier E1.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was completed and the work has proceeded. The now-in-service ETI has new expansion joints at each end that include a steel plate roadway driving surface. The steel plate surface at each location is approximately 3 meters long x 18 meters wide, covering the full five lane width of the roadway. There are two joints on the top deck, about 75 meters apart, with two similar joint on the bottom deck at these locations.

Project Design has requested that these steel plate driving surfaces be coated with a high friction surface treatment consisting of an epoxy resin with an aggregate surface topping. This change order provides for furnishing and placing the surface treatment.

For this work the Contractor will be compensated at the agreed lump sum of $71,915.00. The agreed lump sum will cover the installation of the surface treatment. In addition to the agreed lump sum, the Contractor will be paid on a Force Account basis for the associated required traffic control and lighting work required, as directed by the Engineer. The additional Force Account Amount of this change order will be $35,000.00.

The total CCO amount of $106,915.00 shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was requested by Alec Melkonians, Project Manager, in memoranda dated October 21, 2009, and concurred with by Minh B. Nguyen - Project Engineer and Lina Ellis - Maintenance.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 234	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor for additional costs, incurred by the Contractor's steel erection subcontractor Danny's Construction Company, Inc. (DCCI), associated with the following items of work pertaining to the East Tie-In (ETI) portion of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)):

1) Provide for the removal of the existing Span YB4 maintenance traveler trolley and water line in order to allow for the installation of the skid bent distribution and stability beam assembly for the Span YB4 roll out.

2) Furnish and install additional guy cables to the two legged ETI skid bents at Bent A3, A6, B3 and B6 as approved by the Engineer.

For this work, the Contractor shall be compensated an agreed lump sum of $54,120.00 which constitutes full and final compensation, including all markups, for all outstanding costs incurred by DCCI pertaining to the 2 items of work listed above.

Total Cost of Adjustment of Compensation at Lump Sum $54,120.00

Estimated Cost: Increase ☑ Decrease ☐ **$54,120.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION:
ETI F/W Redesign & Skid Bent Guy Cables

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor's steel erection subcontractor for additional costs incurred in the erection of the skid bent of the East Tie-In structure.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

The original contract was awarded as a performance based contract with the contractor responsible for the design of the structures based upon meeting specified design criteria. The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the TBPOC.

The strategy memo recommended that the design of the ETI structure be assumed by the Department as opposed to the as-bid performance based contractor design. The new design of the ETI structure provides for a roll-out / roll-in concept with a new double deck steel truss span being erected adjacent to the existing span and then rolled into place after the existing span is rolled out.

As part of the ETI work, the contract provides for the construction of a skid bent system that will support the roll out of the existing span and the roll in of the new span. This change order provides compensation for additional costs incurred by the contractor's steel erection subcontractor associated with addition guy cables that were required at several bents of the skid bent towers in order to provide additional resistance to lateral movement during the erection of the bents. These additional cables were not required under the contract specifications.

Additionally, the contractor was ordered to remove the existing maintenance traveler trolley and water line on the Span YB4 truss prior to the roll out of the truss. These existing items conflicted with the installation of the skid bent distribution and stability beam assembly that were required for the roll out of the truss.

Compensation for these costs shall be paid as an adjustment of compensation at an agreed lump sum of $54,120.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Minh B. Nguyen - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

DESIGN OVERSIGHT

STATE OF CALIFORNIA - DEPARTMENT OF TRANSPORTATION

GENERAL NOTES

1. All electrical work shall conform to the latest issue of State of California Department of Transportation Standard Specifications and Standard Plans. These general notes and special provisions under this contract also apply. For any conflict of provisions, California State Guidelines apply.
2. All conduit routing is shown diagrammatically. Pull box locations are located and shown on plan drawings. The contractor shall provide additional pull boxes as required. Exact location of equipment and devices may be adjusted by field conditions or as directed by the Engineer.
3. Minimum conduit sizes shall be 21 mm. All conduits located outside shall be rigid galvanized steel, PVC coated.
4. All equipment and devices shall be provided with nameplate tags as shown in the drawings.
5. All feeders and branch circuits shall be provided with an equipment ground wire.
6. The Contractor shall label all conductors and cables per cable schedules.
7. The Contractor shall provide all conduits with permanent field markers and labels
8. The Contractor shall provide and install new armored cables on metal racks, troughs, in cable trays or secured to supports spaced not greater than 1500 mm apart.
9. The Contractor shall provide splice boxes for armored cables.
10. For other related work not shown on the plan sheets, see Electrical Special Provision.
11. Contractor to verify all controlling field dimensions before ordering or fabricating any material.
12. Provide and install new armored cables or conduit as shown, scheduled and as needed in construction. Support cables or conduit from surface using 41x41 channel, hot dipped galvanized and appropriate strut mounted clamps. See Detail. Support armored cables or conduit horizontally along Temporary Bypass Structure (TBS) using steel ladder cable trays.
13. New cable will be completely routed and tested before cutting existing circuits and/ or interconnecting new.
15. Contractor to provide expansion fittings or loops at bridge expansion joints or points of deflection. Provide stainless steel support grips to hold the weight of electrical cable as it loops or hangs in vertical, sloping or horizontal position.
16. All materials and equipment are subject to Engineers written approval.

(Coordinate with the State for digit size before ordering or fabricating the equipment), Type K Band , single direction Doppler radar, FCC part 15 compliant, 12 degrees, +/- 2 degrees beam width with +/- 1.5 mph accuracy. 120 V, in NEMA 3R self contained enclosure and with 6 mm thick shatter resistant GE Lexan display cover to protect LEDs. See sheet E-4 for more information.

(2) Route 27 mm type 2 conduit with 3#12 + 1#12G from speed radar sign to (E) transformer box located in (E) vault-2B via (E) electrical duct.

(3) Install new 5 amp -2 pole circuit breaker in existing transformer box located in (E) vault 2B for 120 V, supply to new speed radar sign unit.

(4) Route new 2#12 +G armored cable from (E) transformer box located in (E) vault-2B via (E) electrical duct, (E) TB-01 to south-side speed radar sign.

(5) Install and secure armored cable to existing tunnel wall. Provide cable support using unistrut and cable clamps every 1.5 meter.

CONTRACT CHANGE ORDER MEMORANDUM

TO: MIKE FORNER / DEANNA VILCHECK	FILE: **E.A.** 04 - 0120R4
	CO-RTE-PM SF-80-12.6/13.2
FROM: BILL CASEY	**FED. NO.**
CCO#: **235** SUPPLEMENT#: **0** Category Code: **CKXX**	CONTINGENCY BALANCE (incl. this change) **$44,159,346.59**
COST: **$300,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Traffic Improvements to Mainline Detour	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**0** Day(s)	**0** %	**0**

THIS CHANGE ORDER PROVIDES FOR:

Providing for numerous traffic enhancements on the mainline detour.

This project provides for the construction of a detour of the mainline eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour, which spans approximately 650 meters, is comprised of a double deck steel truss bridge which transitions to a concrete and roadway structure as it approaches the Yerba Buena Island tunnel.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

The detour opened to traffic on September 8, 2009. Project Development has now begun issuing changes to enhance the safety of the detour to public traffic. Changes now being issued include the addition of radar warning signs, additional pavement delineation, additional advisory and warning signing and additional lighting. The change order also provides for the contractor to furnish and install mounting brackets for a planned changeable message sign. This change order shall provide for these traffic improvements.

The cost associated with this work shall be compensated as extra work at force account at an estimated cost of $300,000.00 which shall be financed from the contract's contingency funds.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was requested by Alec Melkonians - Asst. Project Manager per Memorandum dated November 6, 2009 and concurred with by Minh B. Nguyen - Project Engineer and Lina Ellis - Maintenance. Authorization to Proceed with this work was issued by Headquarters Construction on November 24, 2009.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 235	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Furnish and install mounting hardware and install flashing beacon assemblies as shown on Sheets 2 through 3 of this change order and as determined by the Engineer.

Furnish and install modified chain link railing (Type 7) and mounting hardware on the WD1 Line as shown on Sheets No. 4 through 12 of this change order and as determined by the Engineer.

Estimated cost of Extra Work at Force Account $200,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$200,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

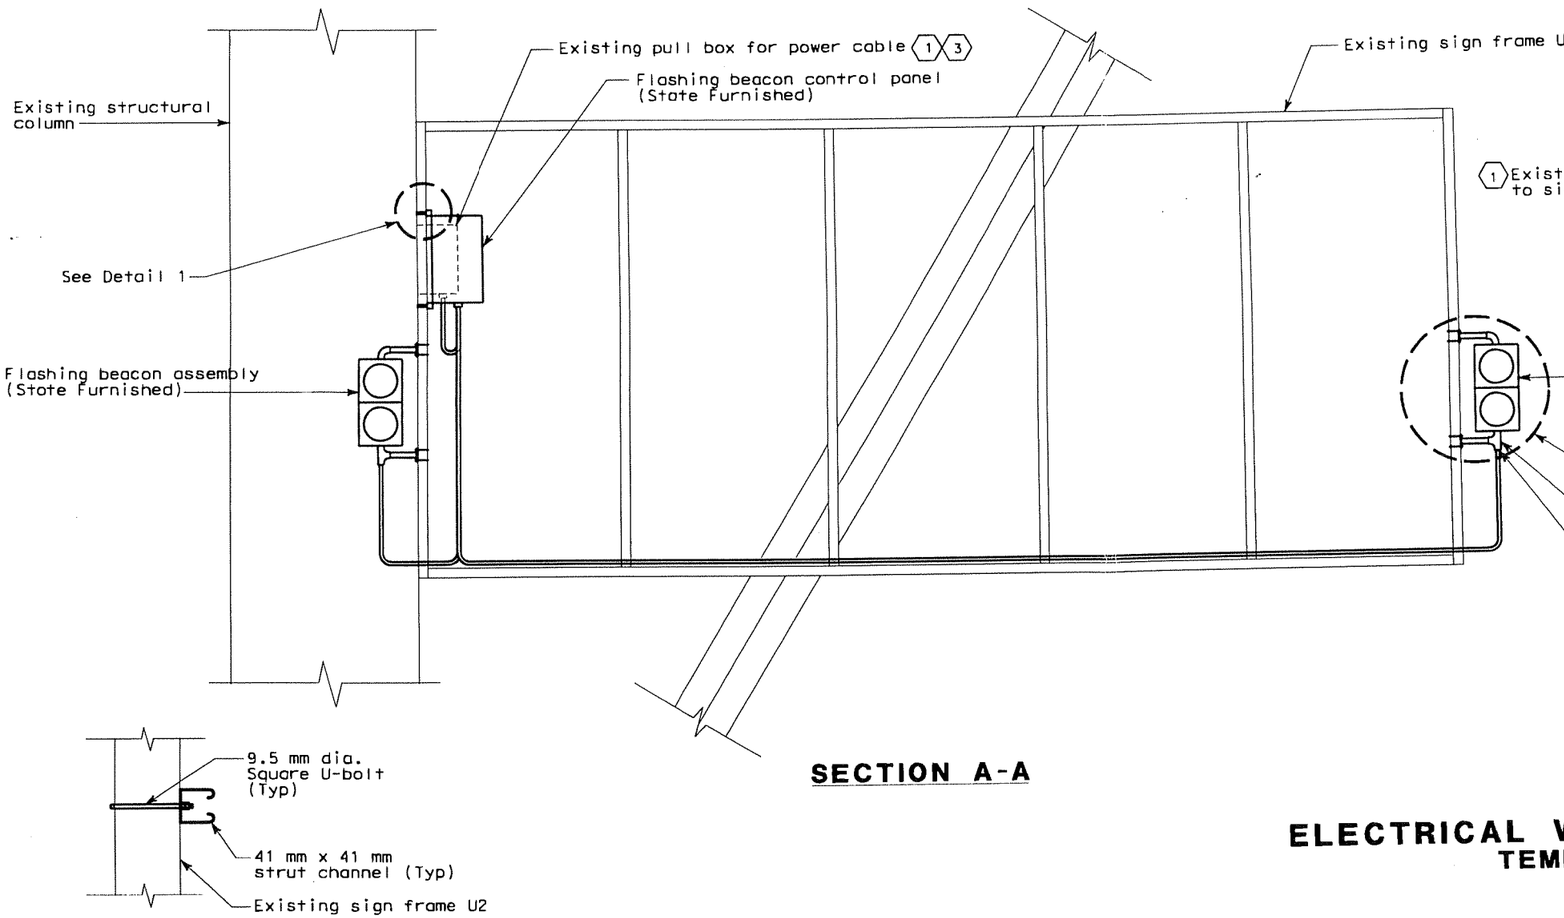
PLAN



SECTION A-A

DETAIL 1

SHEET NOTES:

(1) De-energize existing power lighting circuit prior to connecting the power to flashing beacon control panel. Power wiring to flashing beacon control assembly shall be made by splicing the existing lighting wires inside the existing power cable pull box.

(2) Attach and secure conduits to sign frame using conduit clamps or stainless steel conduit band.

(3) All conduit connections to flashing beacon control panel, flashing beacon housings and existing pull box shall be watertighted.

NOTES

1. Railing assembly except chain link fabric to be galvanized after fabrication.
2. Posts shall be vertical.
3. Railing shall conform to horizontal and vertical alignment. When railing is placed on a curved horizontal alignment with radius of 45 m or less, thread the 7.9 mm ø cable through 10 mm ø welded eye rods embedded 100 mm into the top of the concrete parapet and equally spaced to limit the midordinate distance between the 7.9 mm ø cable and the curve to 25 mm maximum. Horizontal angle shall be bent to conform to horizontal alignment if radius is 45 m or less and may be on 3 m chords if radius is over 45 m.
4. Horizontal angle shall be continuous over not less than two intermediate posts, except that a shorter length is permitted at expansion joints, electroliers and other rail discontinuities.
5. When rail is on slope, place fabric parallel to slope.
6. Alternative details may be submitted by Contractor for Engineer's approval.
7. For details and reinforcement not shown see Standard Plan B11-54.
8. See Project Plans for limits of Chain Link Railing Type 7.
9. Provide thimbles at all cable loops.
10. Expansion joint same dimension as expansion joint in deck or wall. Increase slotted hole length and splice bar length correspondingly.

CCO DESCRIPTION:
Mainline Traffic Enhancements

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	7

THIS CHANGE ORDER PROVIDES FOR:
Furnishing and installing a dynamic message sign.

This project provides for the construction of a detour of the mainline eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour, which spans approximately 650 meters, is comprised of a double deck steel truss bridge which transitions to a concrete and roadway structure as it approaches the Yerba Buena Island tunnel.

The detour opened to traffic on September 8, 2009. The original Change Order No. 235, along with Supplement No. 1, provided for the contractor to furnish and install additional radar warning signs, additional pavement delineation, additional advisory and warning signing, additional lighting, flashing beacons and chain link railing. Project Development has now requested additional safety enhancements concerning the installation of a large dynamic message sign to provide advance warning to westbound traffic approaching the detour. This change order shall provide for furnishing and installing this sign.

The work includes furnishing, mounting and powering a message sign with an approximate size of 280" wide by 84" tall which will provide dynamic imaging to the traveling public. The sign will be mounted on an existing overhead sign structure with additional mounting hardware. The removal of the existing changeable message sign that will be replaced by this new sign is also included under this change order.

Additional funding is also anticipated to be required for the scope of work provided under the original Change Order No. 235 and Supplement No. 1 as the costs of furnishing and installing the additional signing and fencing has exceeded the original cost estimates.

Compensation for this work shall be paid as extra work at force account at an estimated cost of $350,000.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Ken Terpstra - Project Manager, Jaime Gutierrez - Project Engineer, and Lina Ellis - Maintenance.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, provide compensation to the Contractor for all additional costs incurred due to the extended operation and delayed removal of the temporary construction marine access trestle located south of Pier E1 due to all Department delays to the work.

For this work, the Contractor will be compensated a lump sum of $267,510.00. This sum constitutes full and final compensation for all additional costs incurred due to the extended operation of the trestle, including all markups, due to all Department delays and changes to the work.

Estimated cost of Adjustment of Compensation at Lump Sum $267,510.00

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications.

CCO DESCRIPTION: Temp Trestle Extended Rental Costs	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	0

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor for extended equipment rental costs and escalation costs associated with their temporary marine access trestle.

This contract calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the East Tie-In (ETI) to the bridge, the West Tie-In (WTI) to the island and the Viaduct structure between the two.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract for the direct enhancement to the Viaduct, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project.

As part of the contract work, the contractor constructed a temporary marine access trestle that allowed for the marine delivery of structural steel directly to the project site. The trestle is approximately 50 meters long and 10 meters wide and is comprised mainly of steel piles and beams along with 12x12 wooden timbers. Due to extensive Department ordered changes and delays to the project, the contract completion date has been extended by approximately 5 years. Due to these delays, the contractor has incurred extended non-operating equipment rental costs for the trestle's extended use and escalation costs associated with the removal of the trestle. This change order provides compensation for these additional costs.

The contract baseline schedule showed the temporary trestle was to be removed in June of 2005. Due to the Department delays to the contract, the trestle was required to remain in place through September of 2009. The trestle was used to receive structural steel deliveries for both the Viaduct and East-Tie In structures. Compensation for the extended rental of the trestle is based on the daily rental rates provided by the Department for non-operated equipment. Compensation for labor and equipment escalation costs for the removal of the trestle is based on an as-planned verses actual cost basis.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $267,510.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications.

No adjustment of contract time is warranted as this change will not affect the controlling operation.

This change was concurred with by Alec Melkonians - Project Manager and Jaime Gutierrez - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

Change Requested by: Engineer

CCO 238	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Incorporate the following drainage modifications to the steel Viaduct of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)):

1) Eliminate the 8% depression in the OGAC wearing surface at the barrier scuppers for both the upper and lower decks (WD1 and ED1 Lines).

2) Provide for additional scuppers on the upper deck (WD1 Line) as determined by the Engineer.

Extra Work at Force Account:

Provide for the design modifications of the Viaduct drainage system called for under this change order and as authorized by the Engineer and provide for the construction of the additional scuppers at the upper deck concrete barrier as required by these design modifications.

Estimated Cost of Extra Work at Force Account $100,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$100,000.00**

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 239	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

The following adjustments shall be made due to the November 9, 2009 and November 10, 2009 ordered suspension of the Span YB1 through Span YB3 bridge removal work due to the truck accident which occurred within the project limits:

1) The lump sum price for Contract Bid Item No. 8, "Time-Related Overhead" shall be adjusted by 2 working days. These 2 compensable days shall replace 2 of the 30 non-compensable days provided under Change Order No. 91, Supplement No. 2. The remaining 28 non-compensable working days shall be defined as the last 28 working days of the contract from November 13 through December 10, 2010.

2) The date the Contractor shall complete all Contract work within the area defined as Area PRA, as defined under Change Order No. 91, Supplement No. 2, shall be extended by 2 working days from July 31, 2010 to August 2, 2010.

No contract time extension shall be provided due to the suspension of work specified under this change order.

Extra Work at Force Account:

Provide compensation to the Contractor for all costs associated with the cleanup of the November 9, 2009 truck accident and any ensuing structural inspection and repair of damage to the Viaduct structure as determined by the Engineer.

Estimated cost of Extra Work at Force Account $30,000.00

Adjustment of Compensation at Unit Price:

In accordance with Section 10-1.20 "Time-Related Overhead" of the contract Special Provisions, the lump sum price for Contract Bid Item No. 8, "Time-Related Overhead" shall be adjusted by $12,631.58 per working day for each of the 2 compensable working days that are provided under this change order.

Cost of Adjustment of Compensation at Agreed Unit Price:

2 working days @ $12,631.58 per working day = $25,263.16

This lump sum shall be adjusted for time-related overhead payments in excess of 149 percent of the Contractor's lump sum price bid for Contract Bid Item No. 8 "Time Related Overhead". This adjustment shall be performed in accordance with Section 10-1.20 "Time-Related Overhead" of the contract Special Provisions.

Estimated cost of Adjustment of Compensation at Agreed Unit Price $25,263.16

475 Day(s)	**0** Day(s)	**1600** Day(s)	**337** %	**0**

THIS CHANGE ORDER PROVIDES FOR:

Compensation and an adjustment of an internal contract milestone resulting from a truck accident within the project limits.

This contract calls for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the east tie in (ETI) to the bridge, the west tie in (WTI) to the island and the viaduct structure between the two tie ins. Once traffic is placed on the detour, the contract provides for the removal of the existing structure. The contract was awarded as a performance based project, with the contractor responsible for meeting the design criteria specified in the contract

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

The temporary detour was opened to traffic in September 2009 at which time the work pertaining to the removal of the existing bridge began. On the morning of November 9, 2009, a semi-trailer truck lost control while driving on the upper deck of the detour and fell 150 feet into the worksite below. This incident resulted in a 2-day suspension of the bridge removal work on the abandoned structure while the accident investigate was performed and the site was cleaned up.

The suspension directly impacted the controlling bridge removal operation and a time impact analysis shows a 2 working day time extension should be granted to the contract. The suspension also resulted in a 2 day impact to the internal milestone of completing work within a specified area of the project site (Area PRA) that was established under Change Order No. 91, Supplement No. 2.

Change Order No. 91, Supplement No. 2 provided a 465 working day time extension to the contract with 30 days specified as non-compensable delays. The contractor has agreed to accept 2 additional days of compensable time (time-related overhead) for the impacts resulting from the suspension of work with no extension of the contract time. This will result in 2 compensable days replacing 2 of the 30 non-compensable days specified under Change Order No. 91, Supplement No. 2.

The contractor has agreed to accept this replacement of non-compensable days with compensable days in lieu of an actual time extension at the request of the Department. This will alleviate potential conflicts with the Yerba Buena Island Transition Structure contract (04-0120S4) which has a specified move-in date after the completion of this contract. The change order also provides a 2 day extension to the Area PRA internal milestone.

This change order also provides for the cleanup of the accident site within the project limits and for the contractor to provide for the inspection and repair of the damage caused by the truck impacting one of the concrete columns of the Viaduct structure. The Viaduct structure was designed by the contractor under the performance based design criteria and the inspection and repair shall satisfy the designer that the structure has no adverse structural impacts.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

Compensation for time related overhead costs shall be paid as an adjustment of compensation at an agreed unit price at a cost of $25,263.16. This sum is based upon a rate of $12,631.58 per working day as calculated from Contract Bid Item No. 8 "Time-Related Overhead" in accordance with Section 10-1.20 "Time-Related Overhead" of the contract Special Provisions. The costs of the actual accident cleanup and inspection and repair shall be paid as extra work at force account at an estimated cost of $30,000.00. The total estimated change order cost of $55,263.16 shall be financed from the contract's contingency funds.

This change order also requires the adjustment of time related overhead payments in excess of 149 percent of the Contractor's lump sum price bid for Contract Bid Item No. 8. This adjustment shall be performed through a separate change order based upon documented costs incurred in accordance with Section 10-1.20 of the contract Special Provisions.

This change was concurred with by Alec Melkonians - Asst. Project Manager, and Minh B. Nguyen - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Mainline Traffic Closures	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1660 Day(s)	349 %	0

THIS CHANGE ORDER PROVIDES FOR:
Additional nightly lane closures of the mainline upper and lower decks.

This project provides for the construction of a detour of the mainline eastbound and westbound I-80 traffic that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour, which spans approximately 650 meters, is comprised of a double deck steel truss bridge which transitions to a concrete and roadway structure as it approaches the Yerba Buena Island tunnel.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project.

The detour opened to traffic in September of 2009 and experienced elevated traffic incidents over the first several months of its operation. Project Development requested that lane closures be implemented on both the upper and lower decks in order to regulate the nighttime flow of traffic and allow speed enforcement measures to be provided on the mainline detour by the California Highway Patrol.

The original Change Order No. 240 provided for these lane closures over a 4-month time period in order to allow for additional warning signing and pavement delineations to be installed. Change Order No. 1, Supplement No. 1 provided an additional 5 weeks of closures based on a determination by the Toll Bridge Program Oversight Committee (TBPOC).

The TBPOC, during their April 1, 2010 meeting, has determined that the lane closures should now be extended an additional 8 weeks in order to allow additional time for the Department to study the feasibility of ending the closures. This change order provides for this addition 8 weeks of closures.

Lane closure charts have been provided by Traffic Operations for this work and were included under the original Change Order No. 240. The charts provide for the closure of 1 to 4 lanes of the 5 lane roadway. Each of the two decks will be closed on a nightly basis.

The cost associated with this work shall be compensated as extra work at agreed unit prices for each deck closure provided at an estimated cost of $491,680.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred with by Ken Terpstra - Project Manager, and Jaime Gutierrez - Project Engineer.

Maintenance concurrence is not required as this change doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 240	Suppl. No. 3	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Unit Price:

Provide for additional nighttime lane closures of the Westbound upper deck (WD1 Line) and Eastbound lower deck (ED1 Line) as allowed under Sheet No. 2 of the original Change Order No. 240 and as determined by the Engineer.

For this work, the Contractor shall be compensated the following agreed unit prices for each individual deck closure provided:

Monday Night through Thursday Night Closures 40 EA @ $3,620.00 /EA =$144,800.00
Friday Night Closure 10 EA @ $4,210.00 /EA =$ 42,100.00
Saturday, Sunday and Holiday Night Closures 20 EA @ $5,240.00 /EA =$104,800.00

These unit prices constitute full compensation, including all markups, for the lane closures provided under this change order.

Estimated Cost of Extra Work at Unit Price - $291,700.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$291,700.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 246	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Furnish and install the 12 each rumble strip sets on the upper and lower decks of the San Francisco Oakland Bay Bridge as shown on Sheet No. 2 and 5 of this change order.

For this work, the Contractor shall be compensated an agreed lump sum of $146,160.00. Excluding the cost of providing lane closures, this lump sum constitutes full and final compensation, including all markups, for all costs associated with this work. This compensation also includes the cost of furnishing and installing the test rumble strips performed adjacent to Burma Road on December 2, 2009 as ordered by the Engineer.

Any lane closures required for the work of this change shall be provided under Change Order No. 240. The cost of furnishing and installing the advance warning signs as shown on Sheets No. 2 and 3 of this change order shall be paid under the previously issued Change Order No. 235. These costs are excluded from this change order.

Cost of Extra Work at Lump Sum $146,160.00

Estimated Cost: Increase ☑ Decrease ☐ **$146,160.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 247	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Furnish and install the 14 each wireless magnetometer vehicle detection stations, including all vehicle sensor nodes, junction boxes, enclosures, access point and repeater sensor detectors and all appurtenances, on the upper and lower decks of the San Francisco Oakland Bay Bridge as shown on Sheet No. 2 through No. 24 (Plan Sheets CCO-E1 through CCO-E23) of this change order.

For this work, the Contractor shall be compensated an agreed lump sum of $338,570.00. Excluding the cost of providing lane closures, this lump sum constitutes full and final compensation, including all markups, for all costs associated with this work.

Any lane closures required for the work of this change shall be provided under Change Order No. 240. These costs are excluded from this change order.

Estimated cost of Extra Work at Lump Sum $338,570.00

Estimated Cost: Increase ☑ Decrease ☐ **$338,570.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

VEHICLE SENSOR NODE INSTALLATION PROCEDURE

1. PRIOR TO INSTALLATION, IDENTIFY VEHICLE SENSOR NODE'S ID, LANE NUMBER, AND LOCATION IN LANE.
2. MAKE SURE THE VEHICLE SENSOR NODE IS ENCAPSULATED BY A REQUIRED PLASTIC SHELL.
3. MAKE SURE THE VEHICLE SENSOR NODE INSTALLS FLAT IN THE CORED HOLED AND IS NOT TILTED.
4. USE THE HEAT-GUN OR HOT COMPRESSED AIR TO DRY THE INSIDE OF THE CORED HOLE. THERE MUST BE ABSOLUTELY NO MOISTURE ON THE APPLIED SURFACE.
5. FILL THE HOLE ABOUT 1/4" FULL OF THE SEALANT.
6. PLACE VEHICLE SENSOR NODE IN THE HOLE WITH ARROW POINTING IN THE DIRECTION OF TRAFFIC. THE SEALANT SHOULD STILL HAVE WORK TIME, SO THE VEHICLE SENSOR NODE CAN BE ROTATED TO THE CORRECT ORIENTATION. PUSH VEHICLE SENSOR NODE DOWN SO IT LAYS FLAT ON THE BOTTOM OF THE HOLE.
7. FILL THE HOLE WITH THE REMAINING SEALANT TO COVER THE VEHICLE SENSOR NODE. LEVEL SEALANT WITH THE SURFACE OF THE ROAD.
8. AFTER THE FIRST APPLICATION, DO NOT LET THE SEALANT SIT FOR MORE THAN 30 SECONDS BEFORE THE NEXT APPLICATION.
9. DEPENDING ON AMBIENT TEMPERATURE AND HUMIDITY, SEALANT DRYING TIME WILL VARY FROM 5 MINUTES TO 15 MINUTES. VERIFY HARDNESS OF SEALANT BEFORE REOPENING THE LANE FOR TRAFFIC.
10. RECORD DISTANCES BETWEEN EACH VEHICLE SENSOR NODE PAIR.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 248	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Modify the alignment and profile of the duct bank as shown on Pages No. 2 through 5 of this change order.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor for all additional costs incurred due to the conflict encountered during the installation of the duct bank from D Line Sta. 3+40 to 3+70 due to the presence of the existing 300 mm VCP sewer line and 150 mm force main sewer line.

For this work, the Contractor shall be compensated an agreed lump sum of $95,940.00 which constitutes full and final compensation, including all markups, for all additional costs incurred.

Cost of Adjustment of Compensation at Lump Sum $95,940.00

Any costs savings owed to the Department resulting from the eliminated portion of the duct bank from D Line Sta. 4+78 to 4+85 shall be provided for under Change Order No. 257.

Estimated Cost: Increase ☑ Decrease ☐ **$95,940.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Submitted by

Deanna Vilcheck	DEANNA VILCHECK	10/6/10

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 249	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Eliminate the furnishing and installation of the 210mm DIP water line as shown on Sheet No. 2 and 3 of this change order.

For this work, the Contractor shall credit the Department an agreed lump sum of $510,000.00 which constitutes full and final compensation, including all markups, for all cost savings associated with the elimination of this work.

Cost of Adjustment of Compensation at Agreed Lump Sum.....($510,000.00)

Estimated Cost: **Increase** ☐ **Decrease** ☑ **($510,000.00)**

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 250	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Furnish and install chain link fence (Type 2.4) with extended arm and 3 strands of barb wire to the south and east of Southgate Road and furnish and install a 2.4 meter high wooden fence with swing gate south of Southgate Road as shown on Sheet No. 2 of this change order and as determined by the Engineer.

The Engineer shall layout the exact location of the fence in the field.

Estimated cost of Extra Work at Force Account $180,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$180,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Signature Jeannie Balderrama	**Resident Engineer** JEANNIE BALDERRAMOS	**Date** 4-26-10
Signature Deanna Vilcheck	**Area Construction Manager** DEANNA VILCHECK	**Date** 4/29/10
Signature Deanna Vilcheck	**Area Construction Manager** DEANNA VILCHECK	**Date** 5/19/10

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Compensate the Contractor for stoppage and loss of productivity costs incurred by their subcontractor, Silverado Contractors, pertaining to any impacts to the work for the demolition of the existing bridge structure due to United States Coast Guard requested noise restrictions. Work also includes the breaking of existing concrete at corner of abutment footing near the gas line on Southgate road, as directed by the Engineer in the field.

For this work, the Contractor shall be compensated an agreed lump sum of $21,400.00 which constitutes full compensation for all labor, equipment, and material costs, including all markups, for all costs associated with this change.

Extra Work at Agreed Lump Sum $21,400.00

Estimated Cost: Increase ☑ Decrease ☐ **$21,400.00**

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 253	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Provide all labor, equipment, and material to remove existing asbestos containing transite pipes encountered between Pier YB1 and Bent 48 of the existing structure that is being demolished. Material will be double bagged or wrapped in two layers of 6-mil polyethylene sheeting and sealed, and placed in a storage location on site for removal by others.

Price includes any required:

1. Additional sampling and testing of material
2. Preparation of a transite removal work plan, and implementing all required measures
3. Preparation of any required engineering calculations and / or drawings for temporary support design and bridge removal plan
4. Air monitoring
5. Sawcut concrete as required to remove pipe
6. Removal and bagging of adjacent concrete encasement that cannot readily be separated from the asbestos containing material
7. Wetting down material for dust control
8. Vacuuming up any transite chards
9. Decontamination of materials, equipment and personnel as required to prevent spreading of contamination to other locations
10. Providing any additional personal protective equipment required for the work.

This price includes compensation for all contractor and subcontractor delays and impacts related to encountering and the removing the asbestos containing transite pipes between Pier YB1 and Bent 48.

Contractor is to use a subcontractor who is fully licensed to perform asbestos removal work.

This work excludes the loading, transportation and disposal of asbestos bearing materials, which will be performed by the Caltrans on-call abatement contractor under separate contract.

For this work, the Contractor shall be compensated an agreed lump sum of $74,040.00 which constitutes full compensation, including all markups, for all costs associated with this change.

Extra Work at Agreed Lump Sum $74,040.00

Extra Work at Lump Sum:

Provide all labor, equipment, and material to remove existing cardboard and associated material encountered between Pier YB1 and Bent 48 of the existing structure that is being demolished. The work includes the loading, transportation and disposal of material at an offsite facility.

The work includes:
1. Sampling and testing of material.
2. Breaking cardboard away from concrete, including any labor and equipment required to remove and segregate from other materials.
3. Providing personal protective equipment required for the work.

For this work, the Contractor shall be compensated an agreed lump sum of $20,460.00 which constitutes full compensation, including all markups, for all costs associated with this change, including any delays and impacts related to encountering and the removing this material between Pier YB1 and Bent 48.

Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As determined necessary by the Engineer, clean and coat all reinforcing bars for the columns pertaining to the Yerba Buena Island Transition Structure (Bridge No. 34-0006 L/R) that are designated to remain exposed at the end of the current contract.

Cleaning shall be by wire brushing or abrasive blast cleaning to remove all dirt, loose rust, salt contamination and residue on the metal surfaces. Immediately after cleaning, the surfaces shall be covered with one application of unthinned zinc-rich primer (organic vehicle type) conforming to the provisions in Section 91 of the Standard Specifications, "Paint," except that 2 applications shall be applied where determined necessary by the Engineer. The primer shall be submitted to and approved by the Engineer prior to use. Aerosol cans shall not be used. The paint shall be thoroughly mixed at the time of application.

This work will be paid for in accordance with Section 5-1.24 "Force Account Payment" of the Special Provisions, and Section 4-1.03D "Extra Work" of the Standard Specifications.

Estimated cost of Extra Work at Force Account $180,000.00

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 256	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

The Contractor shall reference and incorporate into the Contract the Department's new National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance (Order No. 2009-009-DWQ), Construction General Permit effective July 1, 2010.

The Department's permit references and incorporates by reference the current statewide general permit issued by the SWRCB titled "Order No. 2009-0009-DWQ, National Pollutant Discharge Elimination System (NPDES) General Permit No. CAS000002, Waste Discharge Requirements for Discharges of Storm Water Runoff Associated with Construction and Land Disturbance Activities" that regulates discharges of stormwater and non-stormwater from construction activities disturbing one or more acres of soil in a common plan of development. Copies of the statewide permit and its modifications are available for review from the SWRCB, Division of Water Quality, 1001 "I" Street, P.O. Box 100, Sacramento, California 95812-0100, Telephone fax: (916) 341-5463 and may also be obtained at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/

Said document shall be considered a part of, and shall become, an integral part of the special provisions and contract for this project.

The requirements of this permit shall supersede the Department's permit referenced under Section 10-1.02 "WATER POLLUTION CONTROL" of the Contract Special Provisions entitled: "Order No. 99-06-DWQ, NPDES No. CAS000003, National Pollutant Discharge Elimination System Permit, Storm Water Permit and Waste Discharge Requirements for the State of California, Department of Transportation Properties. Facilities, and Activities". The requirements of this new permit shall govern over all relevant aspects of the Contract.

This Contract shall comply to the requirements pertaining to Risk Level 2 as defined under the permit.

Any additional costs resulting from this change order shall be compensated under Change order No. 119.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 257	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Eliminate the installation of the last 7 meters of the electrical duct bank and 150mm compressed air line that was called for on Sheet No. 168 of Change Order No. 73. The end of the advance construction is revised to Station "D" 4+78. The end treatments specified for the duct bank and compressed air line will be applied at this revised end point.

All conduit, reinforcing steel and associated appurtenances required for the future construction of the 7 meters of duct bank and compressed air line (eliminated under this change order) shall be furnished to the Department and stored on the project site for future use on a subsequent contract.

Eliminate the removal of the portion of the soil nail wall that conflicted with the construction of the portion of the duct bank and compressed air line that has been eliminated under this change order. This work was provided for under Change Order No. 237 but the eliminated work shall be credited under this change order.

Eliminate the placement of stone bedding for the compressed air line being eliminated under this change order. This work was provided for under Change Order No. 232 but the eliminated work shall be credited under this change order.

For the changes specified under this change order, the Contractor shall credit the Department an agreed lump sum of $49,520.00 which constitutes full and final compensation, including all markups, for all cost savings associated with the elimination of this work. No additional costs shall be paid for furnishing and storing the materials for future use as specified.

Cost of Adjustment of Compensation at Lump Sum .....($49,520.00)

Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Provide for the following changes concerning Drainage System No. 1 from Bent W7 of the Yerba Buena Island Transition Structure (Br. No. 34-0006L/R):

1)Construct a reinforced concrete collar at the vertical curve for the 450mm APC (Drainage Unit h) as shown on Page No. 2 of this change order.

2)Modify the drainage system from Bent W7 of the Yerba Buena Island Transition Structure (Br. No. 34-0006L/R) as shown on Pages No. 3 through 4 of this change order.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor for all additional costs incurred due to the modifications to the drainage system at Bent W7 incorporated under this change order. For this work, the Contractor shall be compensated an agreed lump sum of $55,970.00 which constitutes full and final compensation, including all markups, for all additional costs incurred.

Compensation provided under this change order includes all outstanding costs associated with all delays and added work incurred during the construction of Drainage System No. 1 from Bent W7 and Drainage System No. 1 and No. 5 from the Bent W6 due to the changes incorporated under this change and due to any conflicts or unanticipated obstructions encountered during the installation of these systems.

Cost of Adjustment of Compensation at Lump Sum $55,970.00

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 259	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

In accordance with Section 8-1.05, "Temporary Suspension of Work" of the Standard Specifications, provide compensation to the Contractor for the following jobsite maintenance work which was necessary due to the temporary suspension of work ordered by the Engineer from September 3, 2004 through April 16, 2006:

1) Remove rust from all column forms from June 8, through June 27, 2005.
2) Regrade Bent 49 footings due to erosion from June 3 through June 7, 2005.
3) Clear weeds and overgrowth throughout the jobsite from April 14 through June 1, 2005.

For this work, the Contractor shall be compensated an agreed lump sum of $8,610.00 which constitutes full and final compensation, including all markups, for all additional costs incurred.

Extra Work at agreed Lump Sum $8,610.00

Estimated Cost: Increase ☑ Decrease ☐ **$8,610.00**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor for all outstanding labor and equipment costs incurred during the construction of Bents W5, W6 and W7 in order to mitigate Department delays to the Contract. For these costs, the Contractor shall be compensated an agreed lump sum of $176,590.00 which constitutes full and final compensation, including all markups, for this change.

Cost of Adjustment of Compensation at Agreed Lump Sum.....$176,590.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$176,590.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 266	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

The Contractor shall credit the Department for the reduced scope of work performed under Contract Bid Item No. 2 "Construction Staking" due to the changes ordered by the Department to the East Tie-In and West Tie-In structures.

For this work, the Contractor shall credit the Department an agreed lump sum of $27,300.00 which constitutes full and final compensation, including all markups, for all cost savings associated with the change in scope of this item of work.

Cost of Adjustment of Compensation at Lump Sum .....($27,300.00)

Estimated Cost: **Increase** ☐ **Decrease** ☑ **($27,300.00)**

By reason of this order the time of completion will be adjusted as follows: 0 days
