CONTRACT CHANGE ORDER NO. 1 **SUPPL. --**

ROAD **SF-80-12.6/13.2** SHEET **1** OF **1** SHEETS

FEDERAL NO.(S) **ACBRIM-080-1(097)N** CONTRACT NO. **04-0120R4**

To **C.C. Myers, Inc.** Contractor

You are hereby directed to make the herein described changes from the plans and specifications or do the following described work not included in the plans and specifications on this contract.

NOTE: This change order is not effective until approved by the Chief Engineer.

Description of work to be done, estimate of quantities, and prices to be paid. Segregate between additional work at contract price, agreed price and force account. Unless otherwise stated, rates for rental equipment cover only such time as equipment is actually used and no allowance will be made for idle time.

This Change is requested by the **CONTRACTOR.**

The last percentage shown is the net accumulated increase or decrease from the original in the Engineer's Estimate.

EXTRA WORK @ FORCE ACCOUNT:

Maintain the roadway and provide additional traffic control for the sole convenience and direction of the public in accordance with Section 7-1.08, Public Convenience, of the Standard Specifications and as authorized by the Engineer.

Provide for the State's share of flagging costs in accordance with Section 12-2.02, Flagging Costs, of the Standard Specifications.

Estimated cost of Extra Work at Force Account .....$100,000.00.

Estimated Cost **Decrease** **$ 0.00** **or Increase** **$ 100,000.00**

By reason of this order the time of completion will be adjusted as follows:	**0 DAYS**

Submitted by: Kenneth Loncharich, Resident Engineer Date: 5-5-04

Approval Recommended: Kenneth Loncharich, Resident Engineer Date: 5-12-04

Approved by: Chief Engineer Date: 5/13/04

We, the undersigned contractor, have given careful consideration to the change proposed and hereby agree, if this proposal is approved, that we will provide all equipment, furnish all materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

Accepted, Date 5/7/04 Contractor **C.C. MYERS, INC.**

By Dewey C. Lee, Jr. Title **DEWEY C. LEE, JR. Contract Administrator**

If the contractor does not sign acceptance of this order, his attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

CONTINGENCY BALANCE (including this change): **$ 4,266,350.00**

$ 100,000.00 **INCREASE**

HEADQUARTERS APPROVAL REQUIRED? YES ☐ NO ☒

SUPPLEMENTAL FUND PROVIDED **$ 500,000.00**

IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? YES ☒ NO ☐

THIS CHANGE ORDER PROVIDES FOR:

1. Maintain the roadway and provide additional traffic control for the sole convenience and direction of the public in accordance with Section 7-1.08, Public Convenience, of the Standard Specifications and as authorized by the Engineer.

2. Payment for the State's share of flagging costs in accordance with Section 12-2.02, Flagging Costs, of the Standard Specifications.

This work will be performed under Extra Work at Force Account for an estimated cost of $100,000.00. Supplemental funds have been provided for the work of this change in the amount of $500,000.00.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

Maintenance concurrence is not required as this work is temporary and anticipated by the contract documents.

The Resident Engineer recommends this change order be approved.

475 Day(s)	0 Day(s)	381 Day(s)	80 %	7

THIS CHANGE ORDER PROVIDES FOR:

Provide additional funds to maintain the roadway and provide additional traffic control for the sole convenience and direction of the public in accordance with Section 7-1.08, Public Convenience, of the Standard Specifications and as authorized by the Engineer.

This Contract originally required that a Temporary Bypass Structure (TBS) be designed and constructed to facilitate the completion of the San Francisco-Oakland Bay Bridge corridor projects by the winter of 2006. The primary goal of the corridor projects is to achieve seismic safety as soon as possible. Due to extensions in the corridor schedule, the TBS will not be required to be in service until late 2009.

This is documented in the approved memorandum titled, "SFOBB Corridor Schedule Mitigation - Strategy for South-South Detour Contract Completion", which is attached to this Change Order. As part of that memorandum, work at the West Tie-In area is broken up into two phases with the first phase currently targeted for completion by the end of the fouth quarter of 2007. The design is currently in process and to mitigate any potential delays in completing the work on time, the Contractor is being directed to advance work in preparing the site, which includes closing the west-bound I-80 on-ramp until the end of 2007. The closing of the WB on-ramp will re-route traffic and impact San Francisco MUNI's ability to provide bus service to the general public and U.S. Coast Guard on Yerba Buena Island. This is added work and is a part of Phase 1 of the advance West Tie-In work.

The original Contract Change Order No. 1 utilized $100,000.00 of the existing $500,000.00 in Supplemental Work Funds as originally provided for this contract. Payment for this additional work will also be at Extra Work at Force Account for an estimated cost of $200,000.00, which can be financed from existing supplemental work funds, bringing the total amount allocated for this change order to $300,000.00.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

Design and Maintenance concurrence is not required, as this change does not affect the final design.

The Resident Engineer recommends approval of this contract change order.

CCO DESCRIPTION:
Additional Traffic Control

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Provide additional funds to maintain the roadway and provide additional traffic control for the sole convenience and direction of the public in accordance with Section 7-1.08, Public Convenience, of the Standard Specifications and as authorized by the Engineer.

This Contract originally required that a Temporary Bypass Structure (TBS) be designed and constructed to facilitate the completion of the San Francisco-Oakland Bay Bridge corridor projects by the winter of 2006. A December 14, 2006 Department Strategy Memo, approved by Richard Land and Tony Anziano, called for the Department to assume responsibility for the design of the ETI and WTI structures and to order design enhancements to the steel viaduct. The strategy memo recognized that these actions would likely extend the contract completion into 2010 which represents an approximate 3 year extension in contract time.

Due to the contract extension, additional funds are required to:

1. Maintain the roadway and provide additional traffic control for the sole convenience and direction of the public in accordance with Section 7-1.08, Public Convenience, of the Standard Specifications and as authorized by the Engineer.

2. Payment for the State's share of flagging costs in accordance with Section 12-2.02, Flagging Costs, of the Standard Specifications.

The original Contract Change Order No. 1 and Contract Change Order No. 1, Supplement No. 1 utilized $300,000.00 of the existing $500,000.00 in Supplemental Work Funds as originally provided for this contract. Payment for this additional work will also be at Extra Work at Force Account for an estimated cost of $200,000.00 which can be financed from existing supplemental work funds.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

Design and Maintenance concurrence is not required, as this change does not affect the final design.

The Resident Engineer recommends approval of this contract change order.

CCO DESCRIPTION: Additional Funds & Item Deletion	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Providing additional funds to maintain the roadway and provide additional traffic control for the sole convenience and direction of the public in accordance with Section 7-1.08, Public Convenience, of the Standard Specifications and as authorized by the Engineer. In addition, delete Contract Item No. 25 - Traffic Control System.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006 and both approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and subsequently the Toll Bridge Program Oversight Committee (TBPOC), recommended that the Department assume the design responsibility for the ETI and WTI structures and recommended the advance construction of foundation work for the Yerba Buena Island Transition Structure (YBITS) to be added to this contract. This strategy led the contract to be extended through late 2010, approximately 5 years past the original completion date.

Based on the December 14, 2006 memorandum, the design of the ETI structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in). The new roll out / roll in structure design necessitated a traffic control scheme different than the one as originally bid by the Contractor, thereby rendering their traffic control scheme irrelevant and no longer applicable. As such, the Contractor has requested to be compensated under Extra Work at Force Account to perform the following:

1. Maintain the roadway and provide additional traffic control for the sole convenience and direction of the public in accordance with Section 7-1.08, Public Convenience, of the Standard Specifications and as authorized by the Engineer.

2. Payment for the State's share of flagging costs in accordance with Section 12-2.02, Flagging Costs, of the Standard Specifications.

The original and supplemental funds of Contract Change Order No. 1 have been depleted and additional funding is required to continue the above work until project completion. As a consequence of the two approved strategy memorandums, this CCO also deletes Contract Item No. 25 (Traffic Control System) since the scope of work as originally contemplated has been completely changed, through which an Adjustment of Compensation would not provide adequate compensation.

Elimination of the existing traffic control system shall be made by eliminating the specified contract item at a savings of $500,000,000. Compensation for work performed on this item of work shall be paid as an Adjustment of Compensation at an agreed lump sum of $42,420.00. Compensation for maintaining traffic control and for providing flaggers shall be paid as Extra Work at Force Account for an estimated cost of $400,000.00, bringing the total EWFA value to $1,200,000.00. The net change order cost of -$57,580.00 shall be credited back to the contract's contingency fund. A cost analysis is on file.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

This change was concurred by Alec Melkonians - Asst. Project Manager, Hong Wong - Project Engineer, and Patrick Treacy - HQ Asst. Construction Coordinator. Maintenance concurrence is not required, as this change does not affect the final design.

FHWA concurrence is not required as they are no longer providing funds for this project.

Additional funding to maintain the roadway and provide additional traffic control for the sole convenience and direction of the public in accordance with Section 7-1.08, Public Convenience, of the Standard Specifications.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins. The contract was issued as a performance based contract with the contractor responsible for providing the design of the structure based on specified design criteria.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006 and both approved by Tony Anziano – Toll Bridge Program Manager, Richard land – Chief Engineer and subsequently by the Toll Bridge Program Oversight Committee (TBPOC), recommended that the Department assume the design responsibility for the ETI and WTI structures and recommended the advance construction of foundation work for the Yerba Buena Island Transition Structure (YBITS) to be added to this contract. The implementation of these strategies has led to the extension of the contract through the end of 2010 approximately 5 years past the original contract completion date.

The implementation of these strategies has also significantly added to the work identified to be performed under Change Order No. 1. It is now anticipated that additional funding will be required for the work of this change. The majority of the cost pertains to flagging that is required to safety allow public and construction traffic to use the narrow and twisting roadway that provides the sole access to the jobsite.

The work shall be compensated as extra work at force account at an estimated cost of $250,000.00 which shall be financed from the contract contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the change will not affect the controlling operation.

Maintenance concurrence is not required as the work doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 1	Suppl. No. 6	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds for scope of work as approved on the original Change Order #1.

Estimated cost of Extra Work at Force Account $500,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$500,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

FEDERAL NO.(S) **ACBRIM-080-1(097)N** CONTRACT NO. **04-0120R4**

To **C.C. Myers, Inc.** Contractor

You are hereby directed to make the herein described changes from the plans and specifications or do the following described work not included in the plans and specifications on this contract.

NOTE: This change order is not effective until approved by the Chief Engineer.

Description of work to be done, estimate of quantities, and prices to be paid. Segregate between additional work at contract price, agreed price and force account. Unless otherwise stated, rates for rental equipment cover only such time as equipment is actually used and no allowance will be made for idle time.

This Change is requested by the **ENGINEER.**

The last percentage shown is the net accumulated increase or decrease from the original in the Engineer's Estimate.

EXTRA WORK @ AGREED LUMP SUM PRICE:

In accordance with Section 2-1.06, "Bidder Compensation," of the Special Provisions, the Contractor shall contact and arrange for pass-through payment for bidder compensation in the amount of $500,000 within 5 days of receipt of payment from the Department, and providing proof of payment to the Department, for each of the following:

- FCI / Balfour Beatty, a Joint Venture, Phone No. (707) 742-6000
- California Engineering Contractors, Inc., Phone No. (415) 986-6500
- Schimmick Construction Company, Inc. / Obayashi Corp., a Joint Venture, Phone No. (510) 293-1100

For this work, the Contractor shall receive a 5% markup on the total funds issued upon presenting proof of payment to the Department. No additional markups will be allowed.

A total lump sum payment of $1,575,000.00 will be made for this work. This payment constitutes full compensation, including all mark ups, for this work.

Estimated Cost **Decrease** **0.00** **or Increase** **$ 1,575,000**

By reason of this order the time of completion will be adjusted as follows:	**0 DAYS**

HEADQUARTERS APPROVAL REQUIRED? YES ☐ NO ☒

SUPPLEMENTAL FUND PROVIDED: $ 1,575,000

IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? YES ☒ NO ☐

THIS CHANGE ORDER PROVIDES FOR:

...compensating the Contractor for pass-through payment of bidder compensation to the second, third, and fourth low bidders in conformance with Section 2-1.06, "Bidder Compensation," of the Special Provisions, ADDENDUM #14.
The Department recognized the cost required to prepare bids for a project of this magnitude. To encourage competitive bidding, within 90 days of award of contract, the second, third, and fourth low bidders shall each receive $500,000 to defray a portion of the costs of providing a responsive bid.

Therefore, in accordance with Section 2-1.06, "Bidder Compensation," of the Special Provisions, the Contractor shall contact and arrange for pass-through payment of bidder compensation in the amount of $500,000, and collect proof of payment in accordance with the payment provisions of Section 9-1.03B, "Work Performed by Special Forces and Other Special Services," of the Standard Specifications, for each of the following:

- FCI / Balfour Beatty, a Joint Venture, Phone No. (707) 742-6000
- California Engineering Contractors, Inc., Phone No. (415) 986-6500
- Schimmick Construction Company, Inc. / Obayashi Corp., a Joint Venture, Phone No. (510) 293-1100

For this work, the Contractor shall receive a 5% markup, in lieu of 15%, on the total funds issued upon presenting proof of payment to the Department. No additional markups will be allowed. THE CCO AMOUNT WILL BE PAID USING SUPPLEMENTAL FUND OF $1,575,000 PROVIDED FOR THIS PURPOSE IN THE SUPPLEMENTAL FUNDS.*

THIS CHANGE ORDER PROVIDES FOR:

Reimbursing the contractor at the rate of $2.00 per hour of on-site training or work on this contract for each Non-Journey Trainee as specified in Section 5-1.15, "Non-Journey Person Training Program", of the Special Provisions.

Section 5-1.15 provides for reimbursement of $2.00 per hour of on-site training or work on this contract for each Non-Journey Trainee. This change order provides the funds for this payment.

This work will be paid for as Adjustment of Compensation at Agreed Unit Price of $2.00 per hour of on-site training or work on this contract for each Non-Journey Trainee. It is estimated that Twenty-five (25) Non-Journey Trainees at 1,000 hours each will be used, with a total cost of $50,000.00. Supplemental funds have been provided for this change in the amount of $50,000.00.

Design and Maintenance concurrence is not required as this work is anticipated by the contract documents.

No adjustment of contract time is warranted by this change.

CCO DESCRIPTION: Removal of DBE/SBE Monitoring	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

(1) Paragraphs four and five of Section 2-1.02C, "Small Business and Disabled Veteran Business Enterprises Utilization and Reporting", of the Special Provisions are deleted.
(2) Section 5-1.16, "Monitoring", of the Special Provisions is deleted in its entirety.

Up until now, special provisions in the San Francisco Oakland Bay Bridge (SFOBB) east span contracts have required the contractor to submit forms identifying usage of Small Business Enterprises (SBEs), Disadvantaged Business Enterprises (DBEs), and Disabled Veteran Business Enterprises (DVBEs) on contracts on a monthly basis and attend a community meeting to present this information on a quarterly basis. The specifications also required the contractor to attend a community partnering meeting.

The requirements above were born out of complaints, concerns from the community about how well Caltrans is employing local DBEs, SBEs on the large SFOBB contracts.

Steve Hulsebus, Office Chief - Toll Bridge Roadway Design, requested this change order after discussing this matter with Bessie Papailias, Manager - SB/DVBE/Administration, Ruby Louie, Deputy District Director - External Affairs, and Dan McElhinney, Chief Deputy District Director - Toll Bridge Program. Their consensus was to remove these requirements from existing ongoing contracts through change orders.
The reasons are:
(a) The community (District Small Business Council and the Statewide Small Business Council) have not been asking for this information.
(b) Total DBE, SBE, and DVBE (as appropriate per contract) utilization is already collected at the end of each contract, and since there does not appear to be a need for real time data on this, knowing the final results at the end of the contract seems appropriate.
(c) Nothing is currently being done with the data collected to date.
(d) Saves money by not including in and removing from contracts.

Robert Kobal, HQs Construction Coordinator, concurs with this change. Design concurrence is not required for this change, as it does not affect the design. Maintenance concurrence is not required for this change, as it does not impact the maintenance or serviceability of the structure. Since none of the activities in this change meet any federal requirements, FHWA has determined that they will not participate in funding them.

Compensation for this work will be at Adjustment of Compensation at Agreed Lump Sum of $0.00, which can be financed from the contingency fund.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

HEADQUARTERS APPROVAL REQUIRED? YES ☐ NO ☒

SUPPLEMENTAL FUND PROVIDED **$ 30,000.00**

IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? YES ☒ NO ☐

THIS CHANGE ORDER PROVIDES FOR:

…compensating the Contractor for implementing specific storm water sampling and analytical procedures, in accordance with Section 10-1.02 "Water Pollution Control", subsection "Sampling and Analytical Requirements", of the contract Special Provisions, and as authorized by the Engineer.

The project has the potential to discharge non-visible pollutants in storm water from the construction site. The project Storm Water Pollution Prevention Plan (SWPPP) shall contain a Sampling and Analysis Plan (SAP) that describes the sampling and analysis strategy and schedule to be implemented on the project for monitoring and preventing non-visible pollutants from causing or contributing to exceedances of water quality objectives.

Storm water sampling and analysis will be paid for as extra work as provided for in Section 5-1.24 "Force Account Payment" of the Special Provisions, and Section 4-1.03D "Extra Work" of the Standard Specifications, for an estimated cost of $30,000.00. Supplemental funds have been provided for the work of this change in the amount of $30,000.00.

No payment will be made for the preparation, collection, analysis, and reporting of storm water samples required where appropriate BMPs are not implemented prior to a rain event, or if failure of a BMP is not corrected prior to a rain event.

Design and Maintenance concurrence is not required, as this work is temporary and anticipated by the contract documents

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

475 Day(s)	**0** Day(s)	**1600** Day(s)	**337** %	**0**

THIS CHANGE ORDER PROVIDES FOR:

... additional funds for the cost sharing of Storm Water Pollution Prevention Plan (SWPPP) maintenance between the Contractor and Caltrans as provided for in Section 10-1.02 "Water Pollution Control", subsection "Payment", of the contract Special Provisions, and as authorized by the Engineer.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

Cleanup, repair, removal, improper installation, and replacement of water pollution control practices damaged by the Contractor's negligence shall not be considered as included in the cost for performing maintenance.

SWPPP maintenance sharing will be paid for as extra work as provided for in Section 5-1.24 "Force Account Payment" of the Special Provisions, and Section 4-1.03D "Extra Work" of the Standard Specifications, for an estimated cost of $25,000.00, which shall be financed from the contract's contingency funds. Supplemental work funds was provided to the contract for the work of this change in the amount of $75,000.00 which has since been expended. A cost estimate is on file in the project records.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

Design and Maintenance concurrence is not required, as this work is temporary and anticipated by the contract documents

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 8	Suppl. No. 2	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds for the work specified under the original Change Order No. 8 and Change Order No. 8, Supplement No. 1.

Estimated cost of Extra Work at Force Account $80,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$80,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Submitted by

Signature	Resident Engineer JEANNIE BALDERRAMOS	Date 9-7-10

Approval Recommended by

Signature	Senior Resident Engineer DEANNA VILCHECK	Date 9/9/10

Engineer Approval by

Signature	Area Construction Manager DEANNA VILCHECK	Date 9/9/10

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

SUPPLEMENTAL FUND PROVIDED **$ 50,000.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? YES ☒ NO ☐

THIS CHANGE ORDER PROVIDES FOR:

...compensating the Contractor for performing additional photo surveys of existing facilities other than those facilities listed under Section 10-1.39 of the Special Provisions, and as authorized by the Engineer.

Section 10-1.39 of the Special Provisions states that additional photo survey's of existing facilities will be paid for as extra work as provided in Section 4-1.03D of the Standard Specifications. Additional existing facilities need to be surveyed.

The Contractor shall provide the Engineer with 6 copies of approved photo survey records.

This work will be done as Extra Work at Force Account at an estimated cost of $50,000.00, which will be financed from the supplemental funds provided for in this contract. Supplemental funds have been provided for this change in the amount of $50,000.00.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

Maintenance concurrence is not required, as this work is temporary and anticipated by the contract documents

The Resident Engineer recommends this change order be approved.

THIS CHANGE ORDER PROVIDES FOR:

…compensating the Contractor for providing temporary shuttle van service for transporting general public and passengers on Yerba Buena Island (YBI) in accordance with section 10-1.135 Temporary Shuttle Van Service of the Special Provisions and as approved by the Engineer.

The Contractor shall contract temporary shuttle van service to reduce the number of personal vehicles and to facilitate the construction of the bridge.

This work will be done as Extra Work at Force Account at an estimated cost of $650,000.00, which will be financed from the supplemental funds provided for in this contract. Supplemental funds have been provided for this change in the amount of $650,000.00.

This contract change order has been concurred by Nancy E. Bobb – FHWA Bay Bridge Project Oversight Manager and given a Record of Prior Approval to proceed with the work, dated June 30, 2004.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

Maintenance concurrence is not required, as this work is temporary and anticipated by the contract documents

The Resident Engineer recommends this change order be approved.

CCO DESCRIPTION: Add funds Temporary Shuttle Van Service	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Additional Funds.

Portions of the contract work were suspended from July 1, 2004 to October 1, 2004 under CCO 14. Other portions of the contract work were suspended from September 3, 2004 through March 31, 2005 under CCO 24. Though some of the previously suspended work is now progressing, some of the work is still under suspension. This new suspension will be addressed in CCO 24 - Supplement 2, which is currently being negotiated.

Because of these various partial suspensions, the extent of required temporary shuttle service has become greater than the contract originally anticipated. This change order provides additional funding for that extended demand for temporary shuttle service. It is also possible that more additional funding will be required for temporary shuttle service, once the full suspension affect has been determined.

Design and Maintenance concurrence is not required, as this change does not affect the final design.

Though supplemental funds have been provided for this work in the amount of $650,000.00, the original change order utilized all of these funds. Therefore, the additional payment for this work will be at Extra Work at Force Account for an estimated cost of $100,000.00, which can be financed from the contingency fund.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

CCO DESCRIPTION: Utility Potholing	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Preserving, maintaining, or relocating utilities; removing and disposing of abandoned existing utilities in accordance with Section 10-1.38 Existing Highway Facilities, subsection Existing Underground Facilities (Temporary Bypass Structure), and Section 10-1.22 Obstructions of the Special Provisions, and as authorized by the Engineer.

This project provides for the construction of a temporary bypass structure in the City and County of San Francisco from Yerba Buena Tunnel to portions of the existing Route 80 viaduct (Bridge No. 34-0004). This work includes the construction of foundations, substructures, temporary support structures, superstructure, bridge barriers, bridge deck drain systems, and all appurtenant items, which are shown on the contract Layout Plans.

Past experience on an adjacent SFOBB project (04-0120Q4) has indicated the existence of utilities not shown on the plans to be either abandoned or still active, which required preservation, maintenance, relocation, disposal, or removal. This CCO will provide the necessary funds to allow the Engineer to take the appropriate actions regarding existing utilities not indicated in the Contract Plans or Special Provisions.

This work will be performed under Extra Work at Force Account for an estimated cost of $100,000.00. Supplemental funds have been provided for the work of this change in the amount of $550,000.00.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

THIS CHANGE ORDER PROVIDES FOR:

...providing additional funds for preserving, maintaining, or relocating utilities; removing and disposing of abandoned existing utilities in accordance with Section 10-1.38 Existing Highway Facilities, subsection Existing Underground Facilities (Temporary Bypass Structure), and Section 10-1.22 Obstructions of the Special Provisions, and as authorized by the Engineer.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

Past experience on this contract has indicated the existence of utilities not shown on the plans to be either abandoned or still active, which required preservation, maintenance, relocation, disposal, or removal. This CCO will provide additional funds to allow the Engineer to continue taking the appropriate actions regarding existing utilities not indicated in the Contract Plans or Special Provisions.

This work will be performed under Extra Work at Force Account for an estimated cost of $25,000.00, which shall be financed from the contract's contingency funds. Supplemental work funds was provided to the contract for the work of this change in the amount of $100,000.00, which has since been expended. A cost estimate is on file in the project records.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

Design and Maintenance concurrence is not required, as this work is temporary and anticipated by the contract documents

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

Adjustment of Compensation at Force Account:

Reimburse the contractor for providing mandatory formal joint training class on rapid strength concrete in accordance with Section 10-1.53, "Replace Concrete Pavement (Rapid Strength Concrete) - Just-In-Time Training", of the Special Provisions.

It is noted herein that per Section 10-1.53, compensation for providing Just-In-Time Training (JITT) will be made in conformance with the provisions in Section 9 1.03, "Force Account Payment," of the Standard Specifications, except no markups shall be added, and the Contractor will be paid for one half of the JITT cost. Costs for providing JITT shall include training materials, class site, and the JITT instructor including the JITT instructor's travel, lodging, meals and presentation materials. All costs incurred by the Contractor or Engineer for attending JITT shall be borne by the party incurring the costs.

Estimated cost of Adjustment of Compensation at Force Account $5,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$5,000.00**

CONTRACT CHANGE ORDER NO. 13 **SUPPL. --**

ROAD **SF-80-12.6/13.2** SHEET **1** OF **4** SHEETS

FEDERAL NO.(S) **ACBRIM-080-1(097)N** CONTRACT NO. **04-0120R4**

To **C.C. Myers, Inc.** Contractor

You are hereby directed to make the herein described changes from the plans and specifications or do the following described work not included in the plans and specifications on this contract.

NOTE: This change order is not effective until approved by the Chief Engineer.

Description of work to be done, estimate of quantities, and prices to be paid. Segregate between additional work at contract price, agreed price and force account. Unless otherwise stated, rates for rental equipment cover only such time as equipment is actually used and no allowance will be made for idle time.

This Change is requested by the **ENGINEER.**

The last percentage shown is the net accumulated increase or decrease from the original in the Engineer's Estimate.

Provide support and services for the Document Management System as outlined on sheets 2 through 4 of this contract change order and as authorized by the Engineer.

EXTRA WORK @ FORCE ACCOUNT:

Software technical support, software customization, training sessions, data input support for the Department, and network copier support (excluding paper and staples), will be paid for as extra work as provided for in Section 4-1.03D, "Extra Work", of the Standard Specifications and Section 5-1.24, "Force Account Payment", of the contract Special Provisions.

Cost of Extra Work at Force Account = $240,000.00

EXTRA WORK @ AGREED LUMP SUM PRICE:

Hardware, server support, software, concurrent user licenses, annual maintenance – 1st and 2nd year, and add-on software will be paid for as extra work at agreed lump sum.

Cost of Extra Work at Agreed Lump Sum = $246,743.50

The amount paid for the Document Management System under force account and agreed lump sum shall include full compensation for furnishing all labor, material, tools, equipment, and incidentals, including software, and for doing all work involved in providing and maintaining the Document Management System as described; including instructing and assisting the Engineer in the use of the computer software as directed by the Engineer.

DOCUMENT MANAGEMENT SYSTEM

As authorized by the Engineer, the Contractor shall provide a complete Document Control System (hardware and software) to facilitate efficient document management and control. The Contractor and the Engineer shall use the Document Management System for all documents created and received during the life of the project, which may include, but are not limited to, submittals, transmittals, shop drawings and calculations, Request for Information (RFI), letters, memorandums, working drawings and plan sheets.

COMPUTER SYSTEM

The Contractor shall provide a complete computer system (hardware and software) to use for the Document Management System. The minimum computer system to be furnished shall be complete with keyboard, mouse, and monitor. Any modification to the Document Management System, including hardware and software, must have prior written authorization from the Engineer. The system shall be from those identified by the Gartner Group as Tier 1 and shall conform to the following requirements:

HARDWARE REQUIREMENTS

A. Latest industry-available Intel Pentium Xeon processor or equivalent, in dual processor configuration at 2.8 GHz or faster.
B. Latest computer server operating system software compatible with the selected processor and associated hardware, Windows 2000 server with 20 client licenses (CAL's) or equivalent.
C. Minimum of 2 gigabytes of Random Access Memory (RAM).
D. Internal disk system with 800 Gigabytes storage with a RAID (Level 5) controller, one 1.44–megabyte 90 mm (3.5-inch) floppy disk drive and one DVD ROM/CD-RW or equivalent.
E. Tape Backup unit (100/200 Gigabyte) and 20 backup tapes.
F. Two Ethernet Network Interface Cards (NIC), 1000/100 Mbit or equivalent.
G. Fax/modem, V-90 or equivalent.
H. Network Attached Storage (NAS) device, minimum 800 Gigabytes
I. Uninterruptible power supply (minimum battery backup time of 15 minutes).
J. A 430 mm (17") minimum, color monitor capable of at least 1,024 x 768 pixels.
K. The network copier shall be a multifunction, Adobe Postscript Level 3 or compatible, copier/scanner/laser printer with a minimum of 128 megabytes RAM. The scanner shall have a minimum resolution of 24 dots per millimeter x 24 dots per millimeter (600 dots per inch x 600 dots per inch), scan black and white documents at a minimum of 55 pages per minute and shall be capable of scanning images to the TIF (tagged image format) and PDF (Adobe Portable Document Format) file formats. The scanner shall have the ability for the user to name the scanned documents using the network copier keypad. The network copier shall be able to scan, copy, and print in letter, legal, and 280mm x 432 mm (11" x 17") paper sizes and shall have the capability of being connected to a network with 10/100 Mbit Ethernet.
L. Provide service contracts for the scanner-copier-printer combinations. The volume to be used for calculation of the service agreement shall be 15,000 copies per month. The service contracts shall be for the duration of this contract change order.

SOFTWARE REQUIREMENTS

A. General software shall be the latest versions of Microsoft Office Professional, McAfee VirusScan virus protection or equivalent and tape backup software. The general software shall be compatible with the hardware provided.
B. One (1) Document Management System software, including 45 licenses and 45 annual maintenance renewal fees until 30 days after Contractor has received the final estimate. All requests for additional licenses and annual maintenance renewal fees in excess of those initially requested must receive prior written authorization from the Engineer. The software for use to implement the Document Management System must be a commercially available software package.

DELIVERY AND SETUP

Attention is directed to "Training" of this specification.
Prior to ordering the computer system, the Contractor shall submit, for approval by the Engineer, a detailed list of the computer hardware and software the Contractor proposes to furnish. The Engineer will have 3 working days to review and approve the Contractor's proposal.
Upon approval by the Engineer, the Contractor shall furnish, install, set up ready-for-use, maintain, and repair the computer system, including all client software installations, as necessary until 30 days after the Contractor has received the final estimate, at locations determined by the Engineer. The approved representative of the Document Management System shall coordinate with the Department's IT staff to establish the proper integration of the server into the State Network. The Document Management System technical support and repair shall be performed by an authorized representative of the Document Management System. The hardware and software shall be installed and ready for use no later than 30 days after approval of the CCO. Software maintenance, including licensing and other fees shall be maintained for 30 days after the Contractor has received the final estimate.
The Contractor shall instruct and assist the Engineer in the use of the hardware and software. Hardware repairs shall be made within 48 hours of notification by the Engineer, or replacement equipment shall be furnished and installed by the Contractor until repairs have been completed.
Computer hardware and software furnished shall remain the property of the Contractor and shall not be removed until 30 days after the Contractor has received the final estimate, or earlier as authorized by the Engineer.
The Contractor shall furnish software and all original software instruction manuals to the Engineer. The State will compensate the Contractor for replacement of software which is damaged, lost or stolen after delivery to the engineer.

TRAINING

Attention is directed to "Delivery and Setup" and "Data Delivery Requirements" of this specification.
Training shall be performed by an approved representative of the Document Management System provider. All training shall occur only after prior written authorization by the Engineer. As authorized by the Engineer and prior to the release of a new version of the Document Control Software, training shall be provided to the Document Control staff of both the Contractor and the Engineer.

DATA DELIVERY REQUIREMENTS

All data shall be transmitted between the Contractor and the Engineer in their original format and electronically as stated elsewhere in the contract Special Provisions and in this specification. When transmitting electronically, the documents shall be on CD-R (Compact Disc – Recordable) or reusable USB Flash drives and shall be compatible with the Document Management System hardware and software and with general hardware running Microsoft Windows operating system.

The electronic files shall conform to the following requirements:

A. The CD-R or the Flash drive shall contain the electronic document(s) in a searchable Adobe Portable Documents Format (PDF) unless authorized by the Engineer.
B. When scanned, the electronic documents shall be scanned to their original size.
C. The minimum resolution for the electronic PDF shall be 12 dots per millimeter (300 dots per inch) and the minimum color depth shall be 256 colors.
D. Each plan sheet shall or working drawing shall consist of one electronic PDF file.
E. Each PDF electronic file shall not exceed 50 pages.

The Contractor shall not be relieved of the requirements of Section 5-1.01 "WORKING DRAWINGS" of the contract Special Provisions.

The Document Management System shall also provide a method of exporting all data to the relational database, Microsoft Access, keeping all the existing relationships intact. This export function should be accessible by the user and should be able to be performed at any time by the user.

Estimated Cost **Decrease** **$ 0.00** **or Increase** **$ 486,743.50**

By reason of this order the time of completion will be adjusted as follows:	**0 DAYS**

Submitted by: _____ Date: 9/14/04
Kenneth Loncharich, Resident Engineer

Approval Recommended: _____ Date: 9/14/04
Kenneth Loncharich, Resident Engineer

Approved by: Chief Engineer _____ Date: 11/1/04

We, the undersigned contractor, have given careful consideration to the change proposed and hereby agree, if this proposal is approved, that we will provide all equipment, furnish all materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

Accepted, Date 10/05/04 Contractor **C.C. MYERS, INC.**

By _____ Title President

If the contractor does not sign acceptance of this order, his attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

THIS CHANGE ORDER PROVIDES FOR:

The Contractor to provide a complete Document Management System (hardware & software), to facilitate efficient document management and control on the project through its joint use by the Contractor and the Engineer on a multitude of documents. The Contractor and the Engineer shall use the system for all documents during the life off the project, which may include, but are not limited to, submittals, transmittals, shop drawings, and calculations, Request for Information (RFI)s, letters, memorandums, working drawings, and plans sheets.

For software technical support, and software customization of this change order, the Contractor will be paid extra work at force account for an estimated cost of $240,000.00, and for hardware, server and copier support, software, concurrent user licenses, annual maintenance – 1st and 2nd year, add-on software, training sessions, and data input support of this change order will be paid for as extra work at agreed lump sum for a cost of $246,743.50. Cost analysis is available on file in the project records.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

Maintenance concurrence is not required as this does not change the final product being constructed. FHWA concurrence was obtained from Nancy Bobb on June 30, 2004.

The Resident Engineer recommends this change order be approved.

FEDERAL NO.(S) **ACBRIM-080-1(097)N** CONTRACT NO. **04-0120R4**

To **C.C. Myers, Inc.** Contractor

You are hereby directed to make the herein described changes from the plans and specifications or do the following described work not included in the plans and specifications on this contract.

NOTE: This change order is not effective until approved by the Chief Engineer.

Description of work to be done, estimate of quantities, and prices to be paid. Segregate between additional work at contract price, agreed price and force account. Unless otherwise stated, rates for rental equipment cover only such time as equipment is actually used and no allowance will be made for idle time.

This Change is requested by the **ENGINEER.**

The last percentage shown is the net accumulated increase or decrease from the original in the Engineer's Estimate.

Provide support and services for the Document Management System as outlined on sheets 2 through 4 of this contract change order and as authorized by the Engineer.

EXTRA WORK @ FORCE ACCOUNT:

Software technical support, software customization, training sessions, data input support for the Department, and network copier support (excluding paper and staples), will be paid for as extra work as provided for in Section 4-1.03D, "Extra Work", of the Standard Specifications and Section 5-1.24, "Force Account Payment", of the contract Special Provisions.

Cost of Extra Work at Force Account = $240,000.00

EXTRA WORK @ AGREED LUMP SUM PRICE:

Hardware, server support, software, concurrent user licenses, annual maintenance – 1st and 2nd year, and add-on software will be paid for as extra work at agreed lump sum.

Cost of Extra Work at Agreed Lump Sum = $246,743.50

The amount paid for the Document Management System under force account and agreed lump sum shall include full compensation for furnishing all labor, material, tools, equipment, and incidentals, including software, and for doing all work involved in providing and maintaining the Document Management System as described; including instructing and assisting the Engineer in the use of the computer software as directed by the Engineer.

DOCUMENT MANAGEMENT SYSTEM

As authorized by the Engineer, the Contractor shall provide a complete Document Control System (hardware and software) to facilitate efficient document management and control. The Contractor and the Engineer shall use the Document Management System for all documents created and received during the life of the project, which may include, but are not limited to, submittals, transmittals, shop drawings and calculations, Request for Information (RFI), letters, memorandums, working drawings and plan sheets.

COMPUTER SYSTEM

The Contractor shall provide a complete computer system (hardware and software) to use for the Document Management System. The minimum computer system to be furnished shall be complete with keyboard, mouse, and monitor. Any modification to the Document Management System, including hardware and software, must have prior written authorization from the Engineer. The system shall be from those identified by the Gartner Group as Tier 1 and shall conform to the following requirements:

HARDWARE REQUIREMENTS

A. Latest industry-available Intel Pentium Xeon processor or equivalent, in dual processor configuration at 2.8 GHz or faster.
B. Latest computer server operating system software compatible with the selected processor and associated hardware, Windows 2000 server with 20 client licenses (CAL's) or equivalent.
C. Minimum of 2 gigabytes of Random Access Memory (RAM).
D. Internal disk system with 800 Gigabytes storage with a RAID (Level 5) controller, one 1.44–megabyte 90 mm (3.5-inch) floppy disk drive and one DVD ROM/CD-RW or equivalent.
E. Tape Backup unit (100/200 Gigabyte) and 20 backup tapes.
F. Two Ethernet Network Interface Cards (NIC), 1000/100 Mbit or equivalent.
G. Fax/modem, V-90 or equivalent.
H. Network Attached Storage (NAS) device, minimum 800 Gigabytes
I. Uninterruptible power supply (minimum battery backup time of 15 minutes).
J. A 430 mm (17") minimum, color monitor capable of at least 1,024 x 768 pixels.
K. The network copier shall be a multifunction, Adobe Postscript Level 3 or compatible, copier/scanner/laser printer with a minimum of 128 megabytes RAM. The scanner shall have a minimum resolution of 24 dots per millimeter x 24 dots per millimeter (600 dots per inch x 600 dots per inch), scan black and white documents at a minimum of 55 pages per minute and shall be capable of scanning images to the TIF (tagged image format) and PDF (Adobe Portable Document Format) file formats. The scanner shall have the ability for the user to name the scanned documents using the network copier keypad. The network copier shall be able to scan, copy, and print in letter, legal, and 280mm x 432 mm (11" x 17") paper sizes and shall have the capability of being connected to a network with 10/100 Mbit Ethernet.
L. Provide service contracts for the scanner-copier-printer combinations. The volume to be used for calculation of the service agreement shall be 15,000 copies per month. The service contracts shall be for the duration of this contract change order.

SOFTWARE REQUIREMENTS

A. General software shall be the latest versions of Microsoft Office Professional, McAfee VirusScan virus protection or equivalent and tape backup software. The general software shall be compatible with the hardware provided.
B. One (1) Document Management System software, including 45 licenses and 45 annual maintenance renewal fees until 30 days after Contractor has received the final estimate. All requests for additional licenses and annual maintenance renewal fees in excess of those initially requested must receive prior written authorization from the Engineer. The software for use to implement the Document Management System must be a commercially available software package.

DELIVERY AND SETUP

Attention is directed to "Training" of this specification.
Prior to ordering the computer system, the Contractor shall submit, for approval by the Engineer, a detailed list of the computer hardware and software the Contractor proposes to furnish. The Engineer will have 3 working days to review and approve the Contractor's proposal.
Upon approval by the Engineer, the Contractor shall furnish, install, set up ready-for-use, maintain, and repair the computer system, including all client software installations, as necessary until 30 days after the Contractor has received the final estimate, at locations determined by the Engineer. The approved representative of the Document Management System shall coordinate with the Department's IT staff to establish the proper integration of the server into the State Network. The Document Management System technical support and repair shall be performed by an authorized representative of the Document Management System. The hardware and software shall be installed and ready for use no later than 30 days after approval of the CCO. Software maintenance, including licensing and other fees shall be maintained for 30 days after the Contractor has received the final estimate.
The Contractor shall instruct and assist the Engineer in the use of the hardware and software. Hardware repairs shall be made within 48 hours of notification by the Engineer, or replacement equipment shall be furnished and installed by the Contractor until repairs have been completed.
Computer hardware and software furnished shall remain the property of the Contractor and shall not be removed until 30 days after the Contractor has received the final estimate, or earlier as authorized by the Engineer.
The Contractor shall furnish software and all original software instruction manuals to the Engineer. The State will compensate the Contractor for replacement of software which is damaged, lost or stolen after delivery to the engineer.

TRAINING

Attention is directed to "Delivery and Setup" and "Data Delivery Requirements" of this specification.
Training shall be performed by an approved representative of the Document Management System provider. All training shall occur only after prior written authorization by the Engineer. As authorized by the Engineer and prior to the release of a new version of the Document Control Software, training shall be provided to the Document Control staff of both the Contractor and the Engineer.

DATA DELIVERY REQUIREMENTS

All data shall be transmitted between the Contractor and the Engineer in their original format and electronically as stated elsewhere in the contract Special Provisions and in this specification. When transmitting electronically, the documents shall be on CD-R (Compact Disc – Recordable) or reusable USB Flash drives and shall be compatible with the Document Management System hardware and software and with general hardware running Microsoft Windows operating system.

The electronic files shall conform to the following requirements:

A. The CD-R or the Flash drive shall contain the electronic document(s) in a searchable Adobe Portable Documents Format (PDF) unless authorized by the Engineer.
B. When scanned, the electronic documents shall be scanned to their original size.
C. The minimum resolution for the electronic PDF shall be 12 dots per millimeter (300 dots per inch) and the minimum color depth shall be 256 colors.
D. Each plan sheet shall or working drawing shall consist of one electronic PDF file.
E. Each PDF electronic file shall not exceed 50 pages.

The Contractor shall not be relieved of the requirements of Section 5-1.01 "WORKING DRAWINGS" of the contract Special Provisions.

The Document Management System shall also provide a method of exporting all data to the relational database, Microsoft Access, keeping all the existing relationships intact. This export function should be accessible by the user and should be able to be performed at any time by the user.

Estimated Cost **Decrease** **$ 0.00** **or Increase** **$ 486,743.50**

By reason of this order the time of completion will be adjusted as follows:	**0 DAYS**

Submitted by: _____ Date: 9/14/04

475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Providing additional funds for software technical support and other services of the Document Management System.

The original contract change order provided for a complete Document Management System (hardware & software), to facilitate efficient document management and control on the project through its joint use by the Contractor and the Engineer on a multitude of documents. The Contractor and the Engineer shall use the system for all documents during the life of the project, which may include, but are not limited to, submittals, transmittals, shop drawings, and calculations, Request for Information (RFI)s, letters, memorandums, working drawings, and plans sheets.

Two separate Department strategy memorandums, issued on December 14, 2006 and December 25, 2006, and approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), resulted in additional work being added and other work being re-sequenced on this project. This strategy led the contract to be extended through late 2010, approximately 5 years past the original completion date.

This change order is necessary to continue the licenses and software technical support services required to maintain the Document Management System in place for its joint use by the Contractor and State since the original funds allotted have been depleted.

For this work, the Contractor will be compensated at Extra Work at Force Account for an estimated cost of $300,000.00. A cost analysis is on file in the project records.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager. Maintenance concurrence is not required as this does not affect the final product being constructed.

The Resident Engineer recommends this change order be approved.

NO COST CHANGE ORDER:

In accordance with Section 8-1.05 "Temporary Suspension of Work," of the Standard Specifications, portions of the contract are temporarily suspended, effective April 9, 2004. The date Area GR is available to the Contractor as Specified in Section 5-1.18, "Areas for Contractor Use", of the Special Provisions, is revised from July 1, 2004 to October 1, 2004. Construction operations within area GR will be rescheduled and / or re-sequenced since this area will not be available to the Contractor until October 1, 2004.

The suspension will be in effect through July 9, 2004 and the first chargeable working day will be July 10, 2004.

During the temporary suspension, unaffected portions of work can still proceed with the approval of the Engineer.

It has been determined that this suspension will benefit the State and the Contractor, therefore, in accordance with Section 10-1.20 "Time Related Overhead," of the Special Provisions, the lump sum bid item for Time Related Overhead will not be adjusted. The days in which the suspension is in effect will not be considered working days. There will be no other compensation including but not limited to, inefficiencies, "right of way" delays, escalation of labor, material and equipment costs, all overheads, underutilization of equipment, and any other costs whatsoever by reason of this change.

Estimated Cost **Decrease** **$ 0.00** **or Increase** **$ 0.00**

$ 0.00 **INCREASE**

HEADQUARTERS APPROVAL REQUIRED? YES ☐ NO ☒

SUPPLEMENTAL FUND PROVIDED **$ 0.00**

IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? YES ☒ NO ☐

THIS CHANGE ORDER PROVIDES FOR:

...the temporary suspension of portions of work in accordance with Section 8-1.05 "Temporary Suspension of Work," of the Standard Specifications, effective April 9, 2004. . The date Area GR is available to the Contractor as specified in Section 5-1.18, "Areas for Contractor's Use", of the Special Provision's, is revised from July 1, 2004 to October 1, 2004. The suspension will be in effect through July 6, 2004 and the first chargeable working day will be July 10, 2004.

Due to utility impacts and other delays from adjacent SFOBB contracts (0120G4 and 0120Q4), portions of work on this Contract (0120R4) will be temporarily suspended for approximately 3 months. Areas for Contractor use as specified in the Contract will not be available. These dates are being revised by the change order. If the work is not suspended, Area GR would be the controlling operation and the Department would be responsible for Contractor delays and incur time-related overhead (TRO) and right-of-way delay costs.

This temporary suspension will mutually benefit the State and Contractor, therefore, in accordance with Section 10-1.20, "Time Related Overhead", of the Special Provisions, the lump sum TRO bid item will not be adjusted.

Benefits to the State include:

- Saving R/W delay and TRO costs because the contractual lock out dates for areas on this contract have to be postponed because of current projects (State contract 04-0120G4) won't be completed by the specified dates.
- Saving R/W delay and potential TRO costs because existing utilities have been found that are not shown on the contract plans can be relocated.
- No R/W delay costs as agreed to by the Contractor.

RECEIVED
03707 FEB -1 06

Benefits to the Contractor include:

- Contractor will postpone mobilizing equipment and labor in areas precluded by the change order.

Additionally, both parties will benefit because it provides time to complete enhancement of design criteria for the East Tie-In for Contractor's chosen design. Instead of trying to enhance design criteria for the East Tie-In during construction, the suspension will provide the Contractor time to properly develop and evaluate the design criteria. The Contractor chose a design strategy different than envisioned by the Contract but is within the parameters of the Contract. If this process does not go smoothly there could be significant financial risk due to potentially stopping the work. The Contractor would most likely have tried to pass responsibility to the Department.

If the Contract were to proceed without the suspension, it would potentially result in more money being spent by both parties. The Contractor would likely try to recoup all the additional costs.

49.14

During the temporary suspension, unaffected portions of work can still proceed with the approval of the Engineer.

In accordance with Section 10-1.20 "Time Related Overhead," of the Special Provisions, the lump sum bid item for Time Related Overhead will not be adjusted. The days in which the suspension is in effect will not be considered working days. There will be no compensation including, but not limited to, inefficiencies, right of way delays, escalation of labor, material or equipment costs, all overheads, underutilization of equipment, or any other costs, whatsoever, by reason of this change.

IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? YES ☒ NO ☐

THIS CHANGE ORDER PROVIDES FOR:

Providing assistance to Caltrans' Archaeologists as authorized in the field by the Engineer.

This project provides for the construction of a temporary bypass structure in the City and County of San Francisco from Yerba Buena Tunnel to portions of the existing Route 80 viaduct (Bridge No. 34-0004) . This work includes the construction of foundations, substructures, temporary support structures, superstructure, bridge barriers, bridge deck drain systems, and all appurtenant items, which are shown on the contract Layout Plans.

Caltrans policy and State regulations require archaeological investigations to be conducted in association with this project's work in order to ensure potential archaeological resources are properly evaluated. The locations, where this work is required, is designated as Environmentally Sensitive Areas (ESA-1) as shown on the contract Construction Details, Environmental Sensitive Areas. The Contractor is required to provide the necessary labor, equipment and materials to assist the archaeologists in their investigations to clear the area for future construction on the 04-0120P4 contract. Native American remains have been discovered in the area and more are expected to be found.

This work is not covered under the contract items. Therefore, this work will be done under Extra Work at Force Account for an estimated total of **$ 30,000.00**.

Maintenance concurrence is not required for this change as it does not impact the maintenance or serviceability of the structure.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

CCO DESCRIPTION: Add Funds for Archaeology Investigation	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Additional Funds.

As noted in the original change order this project provides for the construction of a temporary bypass structure in the City and County of San Francisco from Yerba Buena Tunnel to portions of the existing Route 80 viaduct (Bridge No. 34-0004). This work includes the construction of foundations, substructures, temporary support structures, superstructure, bridge barriers, bridge deck drain systems, and all appurtenant items, which are shown on the contract Layout Plans.

Caltrans policy and State regulations require archaeological investigations to be conducted in association with this project's work in order to ensure potential archaeological resources are properly evaluated. The locations, where this work is required, is designated as Environmentally Sensitive Areas (ESA-1) as shown on the contract Construction Details, Environmental Sensitive Areas. The Contractor is required to provide the necessary labor, equipment and materials to assist the archaeologists in their investigations to clear the area for future construction on the 04-0120P4 Contract. Native American remains have been discovered in the area and more are expected to be found.

This change is necessary because the extent of required archeological investigations has become greater than originally anticipated.

Design and Maintenance concurrence is not required, as this change does not affect the final design.

This work is not covered by Contract Items. Therefore, additional payment for this work will be at Extra Work at Force Account for an estimated cost of $15,000.00, which can be financed from the contingency fund.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 17	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

As authorized by the Engineer:

(1) Install drainage system to convey the water away from the base of slope at the utility tunnel entry vault. Match top of G1 inlet grate elevation to the proposed FG elevation, which will be 0.750 meter below TG. Additionally, AC Dike Type E or F shall be hand-formed.

(2) Remove the air line running between Vault 2 and Vault 5, and remove the existing abandoned air line running between Vault 3 and Vault 4.

(3) Design the following utility and pipe openings at Abutment 39.

(a) A standard 600 mm wide x 1800 mm high access opening and door through Abutment 39. (Refer to Bridge Details BO-13 of the Standard Plans)

(b) Eight (8) 100 mm conduit penetrations (with a minimum of 230 mm center-to-center offset) through Abutment 39.

(c) One (1) 300mm penetration for the existing 300mm corrugated plastic pipe.

All work designed shall be in accordance with the Steel Door Institute (SDI), the Door and Hardware Institute (DHI), the National Fire Protection Association (NFPA) and all local ordinances.

For this work the contractor will be paid the agreed lump sum of $ 108,217.45. This sum constitutes full compensation including markups, for furnishing all labor, materials, tools, equipment and incidentals for doing all the work involved in this change.

No adjustment in contract time will be made since this work is not a controlling operation.

All work shall be performed in accordance with the Contract Special Provisions and Standard Specifications.

Total cost of Adjustment of Compensation at Lump Sum $108,217.45

FEDERAL NO.(S) **ACBRIM-080-1(097)N** CONTRACT NO. **04-0120R4**

To **C.C. Myers, Inc.** Contractor

You are hereby directed to make the herein described changes from the plans and specifications or do the following described work not included in the plans and specifications on this contract.

NOTE: This change order is not effective until approved by the Chief Engineer.

Description of work to be done, estimate of quantities, and prices to be paid. Segregate between additional work at contract price, agreed price and force account. Unless otherwise stated, rates for rental equipment cover only such time as equipment is actually used and no allowance will be made for idle time.

This Change is requested by the **ENGINEER.**

The last percentage shown is the net accumulated increase or decrease from the original in the Engineer's Estimate.

EXTRA WORK AT FORCE ACCOUNT:

Provide access control measures as provided for in Section 5-1.28, Photo Identification System, of the contract Special Provisions, and as authorized by the Engineer.

Access control measures will be paid for as extra work as provided for in Section 5-1.24 "Force Account Payment" of the Special Provisions, and Section 4-1.03D "Extra Work" of the Standard Specifications.

Estimate of Extra Work at Force Account = $ 50,000.00

Estimated Cost **Decrease** **$ 0.00** **or Increase** **$ 50,000.00**

CONTRACT CHANGE ORDER MEMORANDUM

DATE: 5/9/2005

TO: AMER BATA / LOURDES DAVID	FILE: **E.A.** 04 - 0120R4
FROM: LOURDES DAVID	**CO-RTE-PM** SF-80-12.6/13.2
	FED. NO. ACBRIM-080-1(097)N
CCO#: **19** SUPPLEMENT#: **0** Category Code: **CHPJ**	CONTINGENCY BALANCE (incl. this change): **$3,634,193.49**
COST: **$0.00** INCREASE ☐ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☐ YES ☑ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: EDR 1 Alignment Modification	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:
an alignment modification to the EDR 1 Line.

This project provides for the construction of a temporary bypass structure in the City and County of San Francisco from Yerba Buena Tunnel to portions of the existing Route 80 viaduct (Bridge No. 34-0004). This work includes the construction of foundations, substructures, temporary support structures, superstructure, bridge barriers, bridge deck drain systems, and all appurtenant items, which are shown on the contract Layout Plans.

The alignment data, profile data and curve data originally designed by Parson Brinckerhoff Quade & Douglas does not properly tie into the EDR 1 alignment. Trinh Lai, Design Engineer - Toll Bridge Design, requested a contract change order to modify the EDR 1 alignment on July 09, 2004 and November 23, 2004. A revised Project Plan Sheet L-4 dated and stamped July 09, 2004 was provided with the July 9th request for change order. A revised Project Plan Sheet P-6 dated and stamped November 23, 2004 was provided with the November 23rd request for change order. Revised Project Plan Sheet L-4 modifies EDR 1 Line alignment and curve data. Revised Project Plan Sheet P-6 modifies EDR 1 Line profile data.

On 4/13/05 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. Maintenance concurrence is not required, as this work does not affect the final design.

Payment for the work of this change order will be at Adjustment of Compensation at a Lump Sum of $0.00. This price is found to be fair and reasonable because the work of this change order has not begun and the change affects only the alignment. Quantities, equipment and manpower are not affected.

On 3/2/05 the Contractor returned this change order unsigned and stated that their design subcontractor, Imbsen & Associates, Inc, believed additional design costs would be incurred. On 4/8/05 the State sent a letter to the Contractor requesting that the Contractor provide a description and cost breakdown of these supposed costs. The State also stated that if no additional cost information was provided by 4/22/05, that this change order would be issued unilaterally. No cost information was received from the Contractor by 4/22/05. The Contractor was verbally reminded that this change order would now be issued unilaterally and the Contractor verbally stated that they had no issue with this change order being issued unilaterally. Therefore this change order is being issued unilaterally.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 20	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Modify requirement stated in Design Criteria 3.3.2 shown on Sheet 97 of 193 of the Contract Plans, which requires Fasteners to be ASTM A325 high strength bolts, to allow for substitution of A325 bolts with A490 bolts. Exposed surfaces of A490 bolts shall be protected from corrosion by coating any exposed surfaces with an approved corrosion prevention system (prior to final application of an approved paint) or an approved paint system that is compatible with the steel forming the connection. The condition of the A490 bolts shall be maintained to meet the as-manufactured condition until they are incorporated into the work.

The exposed surfaces shall be cleaned and painted in conformance with the provisions in Sections 59-2, "Painting Structural Steel", and 91, "Paint", of the Standard Specifications; and Sections 59, "Painting", and 10-1.55, "South Edge Girder Support - Clean and Paint Structural Steel", of the Special Provisions; as well as Section 3.3.6 of the Design Criteria shown on the Contract Plans.

The Contractor requested this Contract Change Order. For this work, the contractor will be paid the agreed lump sum of $ 0.00. This sum constitutes full compensation, including markups, for this change. Any additional work or related costs, either direct or indirect, as a result of this contract change order will be borne entirely by the Contractor.

Total cost of Adjustment of Compensation at Agreed Lump Sum $0.00

Estimated Cost: **Increase** ☐ **Decrease** ☐ **$0.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO#: **20** SUPPLEMENT#: **0** Category Code: **CHSX**	CONTINGENCY BALANCE (incl. this change) **$1,283,063.79**
COST: **$0.00** INCREASE ☐ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: A490 Bolts	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

modification of requirement stated in Design Criteria 3.3.2 shown on Sheet 97 of 193 of the Contract Plans, which requires Fasteners to be ASTM A325 high strength bolts, to allow for substitution of A325 bolts with A490 bolts. The Contractor requested this Contract Change Order.

The Contractor's design for the Structural Steel calls for the use of A490 Bolts in lieu of the A235 Bolts that are specified in the Contract Plans. Their design uses A490 Bolts because the structural properties of A490 Bolts allow for the use of less bolts, which equates to smaller plate sizes which then reduces the structure's seismic loading. Additionally, less bolts allow for the structure's construction to be expedited and completed within the Contractor's original schedule. The Contractor's Designer, Imbsen and Associates, Inc. (IAI) determined that as long as all exposed surfaces of the A490 bolts are protected from corrosion by hand painting with a corrosion prevention system, that this substitution is acceptable.

The State Design Engineer has reviewed the IAI determination and concurs with the substitution.

Payment for the Adjustment of Compensation will be an Agreed Lump Sum of $0.00, which can be financed from the contingency fund. This price is found to be fair and reasonable because the cost of the added work of hand-applying corrosion protection to the exposed surfaces of these A490 Bolts is offset by savings in material costs. A detailed cost analysis is on file.

Amer Bata, Area Construction Manager - San Francisco Oakland Bay Bridge, Trinh Lai - Project Engineer, Robert Kobal - Caltrans' Headquarters Assistant Construction Coordinator, and Dan T. Adams - Senior Bridge Engineer (OSD), concur with this change. On 12/13/05 Nancy Bobb, FHWA Rep, granted FHWA Prior Approval of this change order.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 22	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

In accordance with sheets 2 through 7 of this change order and as determined by the Engineer:

(1) Clean vegetation and debris from the existing stairs and walkways leading from the intersection of Southgate Rd. and McCalla Rd. down to the Contractor's jobsite trailer.

(2) Install temporary lighting and a small section of fencing.

(3) Provide minor grading in order to create a small walk path adjacent to Macalla Rd., just off the edge of traveled way (ETW) leading from the bottom of the stairs to the entrance of the U S Coast Guard canopy.

Estimated cost of Extra Work at Force Account $35,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$35,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Clean existing stairways and walkways	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

In accordance with sheets 2 through 7 of the change order and as determined by the Engineer:
(1) Cleaning vegetation and debris from the existing stairs and walkways leading from the intersection of Southgate Rd. and McCalla Rd. down to the Contractor's jobsite trailer.
(2) Installing temporary lighting and a small section of fencing.
(3) Providing minor grading in order to create a small walk path adjacent to Macalla Rd., just off the edge of traveled way (ETW) leading from the bottom of the stairs to the entrance of the U S Coast Guard canopy.

The Contractor is currently being compensated for providing a temporary shuttle van service for transporting the general public and passengers on Yerba Buena Island (YBI) to reduce the number of personal vehicles and to facilitate the construction of the bridge. Cleaning the existing stairs and walkways will reduce the amount of shuttle service required, as passengers intending to use the shuttle can then use the stairs to access the shuttle - rather than being shuttled the entire distance that they are now being shuttled.

Trinh Lai, Project Engineer, Mark Shindler, Right of Way Chief, and Greg Ressio, Coast Guard Representative, concur with this work. On 4/13/05 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. Design and Maintenance concurrence is not required as this work is temporary.

This work is not covered by any contract items. Therefore, payment for this work will be at Extra Work at Force Account for an estimated cost of $35,000.00, which can be financed from the contingency fund.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 24	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Unit Price:

In accordance with Section 8-1.05, "Temporary Suspension of Work", of the Standard Specifications, portions of the contract are temporarily suspended, effective September 3, 2004. The State and the Contractor mutually agree that all construction operations involving the Temporary Bypass Structure, shall be suspended. Additionally, k-rail placement, roadway restriping, and other traffic control operations shall be suspended. Other work shall proceed in accordance with the contract.

The suspension will be in effect through March 31, 2005 and the first chargeable working day after the suspension ends will be April 1, 2005.

This suspension relates only to field site construction activities. Contractor Design of these facilities shall continue. Administrative procedures will continue on the design process.

The State and the Contractor mutually agree that complete design submittals for the outstanding portions of the Temporary Bypass Structure, without any Engineer requested enhancements, will be submitted in accordance with the following milestone dates:

East Tie-In Contractor Proposed Design Criteria and Final Design (without intermediate staging)	November 29, 2004
East Tie-In Design	January 31, 2005
West Tie-In Design	December 31, 2004
Viaduct Design	December 31, 2004

Complete design submittals shall comply with the requirements of Special Provisions Section 5-1.12, "Contractor Design", and shall encompass all phases of the work. This includes the foundations, substructure, and superstructure work in addition to any stage construction leading up to the final state of the structure.

The submitted Design shall be in accordance with the contract plans and specifications or may be modified as approved by the Engineer in writing.

In accordance with Section 10-1.20, "Time Related Overhead," of the Special Provisions, the lump sum bid item for, "Time Related Overhead" will not be adjusted. The Contractor agrees to accept payment based on an Agreed Unit Price of $10,387.94/day for 210 days for a lump sum total equal to $2,181,467.40 for the duration of the suspension period as compensation for direct and other impacted costs including payment for personnel, equipment and material costs at the project site incurred during the suspension period which is not related to item work. Payment for equipment and material are paid in accordance with Section 8.109,"Right of Way Delay," of the Standard Specifications. The State reserves the right to modify the agreed unit price with a supplement to this change order if there are reductions in equipment, material and other verifiable costs. The Contractor shall notify the State immediately of such changes. The days in which the suspension is in effect will not be considered working days.

By accepting this change order the Contractor further agrees to rescind and drop further pursuit of claims for the issues presented in Notice of Potential Claim (NOPC) No. 5, as this change order is considered the full resolution thereof.

COST: **$2,181,467.40** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: East & West Tie-In Temp Suspension	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

for temporary suspension of portions of the contract from September 3, 2004 through March 31, 2005. This suspension relates only to field site construction activities. Contractor Design of these facilities shall continue. Administrative procedures will continue on the design process.

This Contract Change Order (CCO) is to accommodate the extension of Contract 04-0120G4 (Substation and Retrofit), to mitigate delays resulting from the SAS 04-0120F4 contract, to delay switching traffic onto the Temporary Bypass Structure (TBS) until 2006, and to finalize necessary enhancement needed on this contract to extend the service performance for the TBS. The Contractor is allowed per contract to build the foundations without the complete design in place. This would make it more costly to construct any enhancements later because it would be like retrofitting a brand new bridge. The logistic costs for doing that would be high.

Janet Adams - Project Manager, Amer Bata, Area Construction Manager - San Francisco Oakland Bay Bridge, Trinh Lai, Project Engineer, and Robert Kobal, Caltrans' Headquarters Assistant Construction Coordinator, concur with this change.

In accordance with Section 10-1.20, "Time Related Overhead," of the Special Provisions, the lump sum bid item for Time Related Overhead will not be used. The Contractor agrees to accept payment based on an Agreed Unit Price of $10,387.94/day for 210 days for a lump sum total equal to $2,181,467.40 for the duration of the suspension period as compensation for direct and other impacted costs including payment for personnel, equipment and material costs at the project site incurred during the suspension period which is not related to item work. All costs are field verified. Payment for equipment and material are paid in accordance with Section 8.109, "Right of Way Delay", of the Standard Specifications.

This work is not covered by any contract items. Therefore, payment for the Adjustment of Compensation of this change order will be a Unit Price of $10,387.94/day for an estimated total cost of $2,181,467.40, which can be financed from the contingency fund. This contract change order does not include future extensions that are likely to be needed for this contract at full TRO rates ($12,632/day or $88,000+/week), and additional ROW costs. A cost analysis for this change order is on file.

Additional time extensions may be necessary factoring into an actual award date for the skyway extension work (formerly SAS contract).

No adjustment of the contract time is warranted, as the days in which the suspension is in effect will not be considered working days.

By accepting this change order the Contractor further agrees to rescind and drop further pursuit of claims for the issues presented in Notice of Potential Claim (NOPC) No. 5 (the costs for delaying the contractor to perform foundation work), as this change order is considered full resolution thereof.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 24	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Unit Price:

Continue to provide inclinometer readings at the slope area between Bents 48 and 49 during the temporary suspension (September 3, 2004 - March 31, 2005) provided by Contract Change Order 24.

For the work of providing extra inclinometer readings, the contractor will be paid $1,689.06 per inclinometer reading for an estimated eighteen (18) readings for an estimated total cost of $30,403.08. This unit price constitutes full compensation, including all markups, for the work of this change.

Estimated Total Cost of Adjustment of Compensation at Agreed Unit Price: $30,403.08

Adjustment of Compensation at Lump Sum:

As stated in the original Contract Change Order (CCO) 24: "The State reserves the right to modify the agreed unit price with a supplement to this change order (CCO 24) if there are reductions in equipment, material and other verifiable costs."

Some of the equipment, which was listed as idle equipment in determining the Agreed Unit Price of CCO 24, was utilized on other change orders. Therefore this change order provides an adjustment of compensation crediting the Agreed Unit Price of CCO 24 for this reduction in idle equipment cost.

For this reduction in equipment costs, the contractor agrees to credit the State at Adjustment of Compensation at an Agreed Lump Sum of ($620.09). This sum constitutes full and complete compensation, including all markups, for this portion of the change order.

Total credit of Adjustment of Compensation at Agreed Lump Sum .....($620.09)

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$29,782.99**

By reason of this order the time of completion will be adjusted as follows: 0 days

COST: **$29,782.99** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Inclinometer readings & equip credit	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

(1) Provide compensation for continuing to provide inclinometer readings at the slope area between Bents 48 and 49 during the temporary suspension (September 3, 2004 - March 31, 2005) provided by Contract Change Order (CCO) 24.

(2) Provide reduction in compensation of Agreed Unit Price of CCO 24, since some of the idle equipment listed on CCO 24 was actually utilized on other CCOs.

(1) Section 5 1.14, "Contractor Design - Geotechnical Investigation" of the Special Provisions states that: "Due to the steep gradients of the restricted slope area designated on the plans, only geological site reconnaissance has been conducted. .. .. .. The slope shall be monitored during construction of the TBS to check for any slope displacement within 200 meters of either side of the TBS. .. .. .. Vertical and horizontal displacements of the slope shall be monitored continuously and shall be accurately measured and recorded at least weekly during construction of the TBS."

The slope area between Bents 48 and 49 is the area designated on the contract plans as the restricted area addressed by Section 5-1.14 of the Special Provisions. The contractor is providing inclinometer readings to monitor slope displacement in this restricted area. As slope displacement is still of concern during the suspension, these inclinometer readings need to continue during the suspension. Inclinometer readings during the suspension would be extra readings - not anticipated at bid time. Therefore this change order provides compensation for these extra inclinometer readings during the time of the suspension.

(2) As stated in the original Contract Change Order (CCO) 24: "The State reserves the right to modify the agreed unit price with a supplement to this change order (CCO 24) if there are reductions in equipment, material and other verifiable costs."

Some of the equipment, which was listed as idle equipment in determining the Agreed Unit Price of CCO 24, was utilized on other change orders. Therefore this change order provides an adjustment of compensation crediting the Agreed Unit Price of CCO 24 for this reduction in idle equipment cost.

Robert Kobal, Headquarters' Assistant Construction Coordinator, concurs with this change. On 4/13/05 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. Design and Maintenance concurrence is not required as this work is temporary and does not affect the final design.

(1) For the work of providing extra inclinometer readings, the contractor will be compensated at Adjustment of Compensation at Agreed Unit Price of $1,689.06 per inclinometer reading for an estimated Eighteen (18) readings for an estimated total cost of $30,403.08, which can be financed from the contingency fund. This price is found to be fair and reasonable based on a force account analysis submitted by the Contractor and verified by the Engineer. This analysis is on file.

(2) For the reduction in equipment costs, the State will be credited at Adjustment of Compensation at an Agreed Lump Sum of ($620.09), which will be returned to the contingency fund. This credit is found to be fair and reasonable based on a force account analysis prepared by the Engineer. This analysis is on file.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 24	Suppl. No. 2	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 8-1.05, "Temporary Suspension of Work", of the Standard Specifications, and State Letter No. 349 dated March 24, 2005, the contract completion date will be extended by an amount of 381 working days to coincide with the period of suspension for portions of the contract work from April 1, 2005 to April 16, 2006. The suspended work entails all construction field activities that will affect the existing Route 80 mainline traffic and the existing structure. All other work shall proceed in accordance with the contract. Contractor Design of these facilities and administrative procedures shall continue on the design process.

The following activities will remain unaffected by the temporary suspension:

1. All design, fabrication and non-field activities
2. All field work that does not require permanent closure of ramps and connectors and as authorized by the Engineer.
3. Maintainence of the approved Storm Water Pollution Prevention Plan (SWPPP) for the entire project.
4. Maintainence of the project site for public convenience and safety.

Adjustment Deferred on Excess Quantity Increase:

Payment for quantities of Item No. 8, " Time-Related Overhead", in excess of 149% of the contract lump sum price bid will be adjusted in accordance with Section 10-1.20 "Time-Related Overhead", of the Special Provisions. Determination of the adjustment is deferred until completion of work on this item.

Adjustment of compensation for Time Related Overhead:

Item No. 8 Time Related Overhead adjusted by 381 Working Days (+80.20%) = $4,812,631.58 (+80.20%)

Total cost of Adjustment of Compensation at Lump Sum $4,812,631.58

Acceptance of this change does not preclude the contractor from pursuing a claim for additional compensation on behalf of their sub-contarctor, Condon-Johnson & Associates, Inc. for overhead costs.

In accordance with the 6th paragraph of Section 8-1.05, "TEMPORARY SUSPENSION OF WORK," of the Standard Specifications, any additional compensation due, "other than overhead costs", as a result of this suspension will be deferred until the end of the suspension period.

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

The limits of the support structure limits as shown in the contract plans may be increased to allow the encroachment of the south portion of the footings of Bents 48, 49, and 52 for the Viaduct and West Tie-In segments, as shown in the Contractor's design plans on page 2 of 2 of this contract change order.

Any future deviations of the construction support limits will be subject to the approval of the Engineer.

Section 5-1.116, "Differing Site Conditions", of the Standard Specifications shall not apply to those areas outside of the TBS support limits. The Contractor further agrees that no additional compensation shall be made due to the Contractor's requested change.

There will be no other compensation, including but not limited to, inefficiencies, "right of way" delays, escalation of labor, material and equipment costs, all overheads, underutilization of equipment, and any other costs. This applies to those areas outside of the TBS support limits.

Total credit for Adjustment of Compensation at Agreed Lump Sum .....($19,000.00)

Estimated Cost: Increase ☐ Decrease ☑ **($19,000.00)**

By reason of this order the time of completion will be adjusted as follows: 0 days

COST: **($19,000.00)** INCREASE ☐ DECREASE ☑	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Limits of support structure deviations	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

allowance of limits of the support structure limits as shown in the contract plans to be increased to allow the encroachment of the south portion of the footings of Bents 48, 49, and 52 for the Viaduct and West Tie-In segments, as shown in the Contractor's design plans on page 2 of 2 of this contract change order.

This Contract requires that a Temporary Bypass Structure (TBS) be designed and constructed by the Contractor to detour traffic on WB and EB Highway 80 between the eastern tunnel portal on Yerba Buena Island to Pier E1 on the San Francisco Oakland Bay Bridge (SFOBB). The contract plans and specifications provide an alignment and limits inside which the substructure of the bridge is to be contained.

The Contractor's design submittal has one footing for the West Tie-In segment and two footings for the Viaduct structure that fall outside the southern line of the TBS support limits. The Contractor has requested relief from this requirement and in exchange has agreed to credit the State the sum of $ 19,000.00 for the future costs of removing portions of these footings located outside the plan limits should it be required. At this time, there is no impact to the State in granting the allowance of the construction of these footings as planned by the Contractor.

Peter Siegenthaler, Principal Transportation Engineer - SFOBB, Dan Adams, Substructures Technical Specialist - Office of Structures Design, and Steve Hulsebus, Office Chief SFOBB Roadway Design - District 04 Toll Bridge Design, concur with this change. Maintenance concurrence is not required as there are no new impacts to maintenance in allowing this change.

There are no established bid items for this work. Therefore, the State will be credited at Adjustment of Compensation at Agreed Lump Sum Price of ($19,000.00). This price is found fair and reasonable based on a force account analysis submitted by the Contractor and verified by the Engineer. This analysis is on file in the project records.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

The first paragraph of Design Criteria Section 4.2.1, "Balanced Stiffness", on contract plan sheet 98 of 193 (Revised Per Addendum No. 11 dated October 06, 2003) shall be revised as follows:

"For the Viaduct Structure, the ratio of effective stiffness between any two bents within a frame or between any two columns within a bent shall satisfy equation 4.1, and the ratio of effective stiffness between adjacent bents within a frame or between adjacent columns within a bent shall satisfy equation 4.2."

For this work the contractor will be paid the agreed lump sum of $0.00. This sum constitutes full compensation, including markups, for this change.

Total cost of Adjustment of Compensation at Agreed Lump Sum Price $0.00

Estimated Cost: **Increase** ☐ **Decrease** ☐ **$0.00**

SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Bent 48 Articulation	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

The first paragraph of Design Criteria Section 4.2.1, "Balanced Stiffness", on contract plan sheet 98 of 193 shall be revised such that the Balanced Stiffness equations do not apply to the abutments.

This Contract requires that a structure be designed and constructed by the Contractor. The contract plans and specifications provide the necessary alignments and criteria by which the design is to be developed.

Article 4.2.1 of the design criteria was taken from Section 7.1.1 of the Seismic Design Criteria (SDC) Manual, which talks of the benefits of balanced stiffness between bents within a frame and also columns within a bent. When developing the criteria for this project, the Project Engineer also wanted to balance the abutment stiffness with the bent stiffness to keep the end span (Span 48) from experiencing excessive displacements. Since this abutment would not be a typical abutment with retained soil and shear keys, the Project Engineer was concerned that the Contractor would propose a design that provided too little stiffness at the abutment.

However, the Contractor's proposed design is utilizing much more flexible bents than the concept design had envisioned. The Contractor's design is not balanced in that the abutment bearings are much stiffer than the bents. Currently, the Contractor's design displacement at the abutments is within an acceptable range. In order for this design to comply with all of the Design Criteria, a sliding bearing would be needed at the abutments. This would result in unacceptable excessive displacements in upwards of 11" which is in conflict with the Project Engineer's original intent at this location.

Since requiring that the abutment bearing stiffness be balanced with the bent stiffness would result in a structure that would not have an improved performance over the Contractor's original design, the design review team is in agreement with the Contractor's request to delete this portion of the criteria as it applies to the abutments.

This proposed change will make Design Criteria Article 4.2.1 read identical to SDC 7.1.1.

Dan Adams, Design Engineer, Trinh Lai, Project Engineer, and Robert Kobal, Headquarters' Assistant Construction Coordinator, concur with this change. On 2/1/05 Nancy Bobb, FHWA Rep, granted FHWA Prior Approval of this change order. On 4/13/05 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Payment for the work of this change order will be at Adjustment of Compensation at an Agreed Lump Sum of $0.00. This price is found to be fair and reasonable because the work of this change order has not begun and the change affects only design parameters. Quantities, equipment and manpower are not affected.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Bent 52L Transition Struc Ftg Conflict	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

redesigning and constructing the footing at Bent 52 Left to clear the future W4R footing as shown on Sheets 2 through 5 of the Contract Change Order. The clearances from the W4R footing line to the piles and footing for Bent 52 Left shall be 1.0m and 0.6m respectively. No shoring design for the future W4R footing shall be required.

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on WB and EB Highway 80 between the eastern tunnel portal on Yerba Buena Island to Pier E1 on the San Francisco Oakland Bay Bridge.

Contract plan sheets 142 & 143 of 193 specify the limits allowed for structure supports on the Viaduct segment of the TBS. The locations of the future transition structure project footings are also shown on these plans. However, the future W4R footings were not shown on these plan sheets and at the same time will encroach upon the specified support limits for this project. In the review of the preliminary plan sets for the Viaduct segment, it was determined that the location of Bent 52 Left would conflict with the future W4R footing. Rather than redesign the footing on the transition structure project, it was determined that the Bent 52 Left footing should be redesigned to clear the W4R footing.

The agreed lump sum of $ 94,386.51 provided in the contract change order is based on a force account analysis. Records and calculations used to determine the agreed price basis are on file in the project records.

This change has been discussed with and concurred by Dan T. Adams of the Office of Structure Designs, Trinh Lai of District 04 Toll Bridge Design, Robert Kobal - HQ Asst. Construction Coordinator, and Jon Tapping - Project Manager.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 28	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

(1) Place hydroseed soil erosion control in disturbed soils area on the flat area on top of the slopes around the pier columns constructed under Contract 04-0120C4 as determined by the Engineer and in accordance with specification sheets 2 and 3 of this change order.

(2) Regrade around existing Drainage Inlet (D.I.) located west of the W2 West Pier as shown on sheet 4 of this change order and as directed by the Engineer. Excavate around the D.I. at 2 meter radius to one meter depth and backfill using Class 2 aggregate base to grade in lifts to 95% compaction. Place A.C. pavement to dimensions shown around D.I. and one meter width of V-Ditch. Match A.C. grade at grated manhole cover.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

Estimated cost of Extra Work at Force Account $20,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$20,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

Contractor Acceptance by

Signature	(Print name and title) DEWEY C. LEE, JR. Contract Administrator	Date 12/6/04

10-1 EROSION CONTROL (TYPE D)

Erosion control (Type D) shall conform to the provisions in Section 20-3, "Erosion Control," of the Standard Specifications and these special provisions and shall consist of applying erosion control materials to, all disturbed soil areas and areas directed by the Engineer.

MATERIALS

Materials shall conform to the provisions in Section 20-2, "Materials," of the Standard Specifications and these special provisions.

Seed

Seed shall conform to the provisions in Section 20-2.10, "Seed," of the Standard Specifications. Individual seed species shall be measured and mixed in the presence of the Engineer.

Seed shall be delivered to the project site in unopened separate containers with the seed tag attached. Containers without a seed tag attached will not be accepted.

A sample of approximately 30 g of seed will be taken from each seed container by the Engineer.

Legume Seed

Legume seed shall be pellet-inoculated or industrial-inoculated and shall conform to the following:

A. Inoculated seed shall be inoculated in conformance with the provisions in Section 20-2.10, "Seed," of the Standard Specifications.
B. Inoculated seed shall have a calcium carbonate coating.
C. Industrial-inoculated seed shall be inoculated with Rhizobia and coated using an industrial process by a manufacturer whose principal business is seed coating and seed inoculation.
D. Industrial-inoculated seed shall be sown within 180 calendar days after inoculation.
E. Legume seed shall consist of the following:

LEGUME SEED

Botanical Name (Common Name)	Percent Germination (Minimum)	Kilograms Pure Live Seed Per Hectare (Slope Measurement)
Trifolium incarnatum (Crimson Clover)	40	12.0

Non-Legume Seed

Non-legume seed shall consist of the following:

NON-LEGUME SEED

Botanical Name (Common Name)	Percent Germination (Minimum)	Kilograms Pure Live Seed Per Hectare (Slope Measurement)
Eschscholzia californica California Poppy	35	1.0
Hordeum vulgare 'UC 603' Cereal Barley	90	50.0

Commercial Fertilizer

Commercial fertilizer shall conform to the provisions in Section 20-2.02, "Commercial Fertilizer," of the Standard Specifications.

Stabilizing Emulsion

Stabilizing emulsion shall conform to the provisions in Section 20-2.11, "Stabilizing Emulsion," of the Standard Specifications and these special provisions.

Stabilizing emulsion shall be in a dry powder form, may be reemulsifiable, and shall be a processed organic adhesive derivative of Plantago ovata used as a soil tackifier.

APPLICATION

Erosion control materials shall be applied in a 1-step process. Multiple tank loads may be required to apply all erosion control materials uniformly:

The following mixture in the proportions indicated shall be applied with hydro-seeding equipment within 60 minutes after the seed has been added to the mixture:

Material	Kilograms Per Hectare (Slope Measurement)
Legume Seed	12.0
Non-Legume Seed	51.0
Fiber	2,800
Stabilizing emulsion	140
Commercial Fertilizer	500

The ratio of total water to total stabilizing emulsion in the mixture shall be as recommended by the manufacturer.

The proportions of erosion control materials may be changed by the Engineer to meet field conditions.

CONTRACT CHANGE ORDER MEMORANDUM

TO: AMER BATA / LOURDES DAVID	FILE: **E.A.** 04 - 0120R4
FROM: LOURDES DAVID	**CO-RTE-PM** SF-80-12.6/13.2
	FED. NO. ACBRIM-080-1(097)N
CCO#: **28** SUPPLEMENT#: **0** Category Code: **CDPF**	CONTINGENCY BALANCE (incl. this change): **$1,433,322.79**
COST: **$20,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☐ YES ☑ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Add hydroseed to area around W2 Columns	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

(1) Placing hydroseed soil erosion control in disturbed soils area on the flat area on top of the slopes around the pier columns constructed under Contract 04-0120C4 as determined by the Engineer and in accordance with specification sheets 2 and 3 of this change order.

(2) Regrading around existing Drainage Inlet (D.I.) located west of the W2 West Pier as shown on sheet 4 of this change order. Excavate around the D.I. at two meter radius to one meter depth and backfill using Class 2 aggregate base to grade in lifts to 95% compaction. Place A.C. pavement to dimensions shown around D.I. and one meter width of V-Ditch. Match A.C. grade at grated manhole cover.

(1) According to Paul Elshoff, Brown & Caldwell Water Quality Specialist for Caltrans District 4 Division of Construction, the final erosion control measures were not included in the project plans for project 04-0120C4, with exception of the area around the north column slope. The soils in the flat area on top of the slopes were not addressed. Project 04-0120C4 was granted relief of maintenance on October 20, 2004 without addressing this issue. Amer Bata, Area Construction Manager for SFOBB, recommends that the erosion control work be addressed under this contract. This change order addresses the erosion control for the flat area on top of the slopes around the pier columns constructed under Contract 04-0120C4.

(2) It was observed that storm water did not drain into the existing D.I. as intended by the 04-0120C4 Contract. The storm water was being absorbed into the ground around the D.I instead. This change order adds a non-porous A.C. surface over this area so the storm water will reach the D.I. rather than be absorbed by the existing ground around the existing D.I. The existing manhole has an existing grated manhole cover (as shown on sheet 4 of this change order). As stated in the change order the A.C. final grade is to match the final grade of the existing grated manhole cover, which covers the existing D.I.

This work is temporary. Future contracts will be providing the final grading and erosion control in this area. This change order work is being requested in order to provide erosion control until the other contracts do provide the final erosion control.

Isaac Perez, Hydraulics Engineer, and David Yam, Landscape Architect, concur with this change. Design and Maintenance concurrence is not required, as the work of this change order is temporary and does not affect the original contract design.

This work is not covered by any contract items. Therefore, payment for this work will be at Extra Work at Force Account for an estimated cost of $20,000.00, which can be financed from the contingency fund.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

THIS CHANGE ORDER PROVIDES FOR:

replacement of the main entry security gate surveillance camera for the United States Coast Guard (USCG) base.

The main entry security gate surveillance camera for the USCG base sustained water damage during recent storms. This change order replaces this camera.

This change was necessary in order to satisfy the agreement between the USCG and Caltrans.

Mark Shindler, Sr Right of Way Agent, requested this change. Trinh Lai, Project Engineer, concurs with this change. Design concurrence is not required as this change does not affect the design of the project. Maintenance concurrence is not required as this change restores the original intended design.

This work is not covered by any contract items. Therefore, payment for the Extra Work will be at Agreed Lump Sum of $3,542.00, which can be financed from the contingency fund. A detailed cost analysis is on file.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 30	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Conduct additional elastic response spectrum analyses on the Viaduct segment of the proposed Temporary Bypass Structure for the following structural configurations:

a. Strutted columns for Bents 49, 50, 51, and 52 with pinned connections at the column strut/column connection.
b. Bent caps at Bents 49, 50, 51, and 52 with monolithic connections at the cap/column connection.

The structure will be assumed to have the same axial stiffness at the bent cap for the analytical assessment. The cap shall be sized with the expectation that a plastic hinge will form in the cap member prior to the formation of a plastic hinge in the column.

The analyses will be conducted at both D(EE) and D(LS) levels. The analyses shall be conducted with at least 200 modes of vibration included in the response analysis.

For this work, the contractor will be paid the sum of $10,700.00. This sum constitutes full compensation, including markups, for this change.

Total cost of Adjustment of Compensation at Agreed Lump Sum $10,700.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$10,700.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Additional elastic response analyses	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

conduction of additional elastic response spectrum analyses on the Viaduct segment of the proposed Temporary Bypass Structure.

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on WB and EB Highway 80 between the eastern tunnel portal on Yerba Buena Island to Pier E1 on the San Francisco Oakland Bay Bridge. It is being completed as one segment of the New East Span corridor. The completed structure will allow a future transition structure to be built tying in the New East Span to the existing. This Contract was originally fast tracked for early completion to allow for a westbound opening of the New East Span. The corridor schedule has now been revised and an early completion of the TBS is no longer required. As a result, the State is in the process of determining options for the construction of the TBS and the required design life.

The Engineer is requesting an analysis of the viaduct with different connections at the tops of the columns. This work is in addition to that being completed by the Contractor's design engineers, but not outside the limits of the specifications. The Contractor's current design reflects but one way of satisfying the contract requirements. This work is being completed as a study for the Engineer to make a determination regarding the extension of the lifespan of the structure and cannot be completed by the Engineer. Therefore, the Engineer has directed that the Contractor's design engineers complete this work. The impact of the results of this study shall be determined at a later date.

Tom Ostrom, Structures Design Engineer, concurs with this change. On 4/13/05 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. Maintenance concurrence is not required for this change, as it does not impact the maintenance or serviceability of the structure.

Compensation for this work will be at Adjustment of Compensation at Agreed Lump Sum of $10,700.00, which can be financed from the contingency fund. A detailed cost analysis is on file.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CCO: 31	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Implement sampling and analysis of the soils at locations that fall outside horizontal limits of the material classification zones of the excavation material determined to be hazardous as depicted on Contract Plan Sheet C-5 (Sheet 21 of 193), in accordance with Section 10-1.42, "Earthwork - Sampling and Analysis", of the contract Special Provisions, and as authorized by the Engineer.

As provided for in Section 10-1.42 of the Special Provisions: "Sampling and analysis of material excavated from outside the horizontal limits of the material classification zones shown on the plans will be paid for as extra work as provided for in Section 4-1.03D of the Standard Specifications."

Estimated cost of Extra Work at Force Account $20,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$20,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

THIS CHANGE ORDER PROVIDES FOR:

compensation for sampling and analysis of material excavated from outside the horizontal limits of the material classification zones shown on the plans as provided for in Section 10-1.42, "Earthwork - Sampling and Analysis", of the contract Special Provisions, and as authorized by the Engineer.

No soil sampling and analysis is available outside the horizontal limits of the material classification zones shown on the plans. Per Charles Smith, Environmental Design Engineer, the location of the contractor's supports was not known prior to bid. Due to the unknowns, the contract was written to compensate the contractor for this work as extra work.

Charles Smith, Environmental Design Engineer, concurs with this change. Maintenance concurrence is not required as this work is contemplated in the contract documents.

This work is not covered by any contract items. Therefore, payment for this work will be at Extra Work at Force Account for an estimated cost of $20,000.00, which can be financed from the supplemental funds of which $500,000.00 was allotted for this work.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

(1) Revision of Section 10-I .04, "Non-Storm Water Discharges - Land-Based Excavation Dewatering," of the Special Provisions such that it states that the Contractor shall dewater the excavation in conformance with the requirements of San Francisco - Public Utilities Commission (SF-PUC) Batch Discharge Permit and Authorization Letter issued on October 5, 2004, rather than San Francisco Bay Regional Water Quality Control Board (RWQCB) Order No. 01-100.

(2) Revision of Excavation and Dewatering Plan to remove existing references to the San Francisco Bay Regional Water Quality Control Board (RWQCB) Order No. 01-100 and include reference to the San Francisco - Public Utilities Commission (SF-PUC) Batch Discharge Permit and Authorization Letter issued on October 5, 2004.

For this work the contractor will be paid the agreed lump sum of $0.00. This sum constitutes full compensation, including markups, for this change.

Total cost of Adjustment of Compensation at Agreed Lump Sum Price $0.00

Estimated Cost: **Increase** ☐ **Decrease** ☐ **$0.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: SFPUC Permit Spec Change	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

(1) Revision of Section 10-l .04, "Non-Storm Water Discharges - Land-Based Excavation Dewatering," of the Special Provisions such that it states that the Contractor shall dewater the excavation in conformance with the requirements of San Francisco - Public Utilities Commission (SF-PUC) Batch Discharge Permit and Authorization Letter issued on October 5, 2004, rather than San Francisco Bay Regional Water Quality Control Board (RWQCB) Order No. 01-100.

(2) Revision of Excavation and Dewatering Plan to remove existing references to the San Francisco Bay Regional Water Quality Control Board (RWQCB) Order No. 01-100 and include reference to the San Francisco - Public Utilities Commission (SF-PUC) Batch Discharge Permit and Authorization Letter issued on October 5, 2004.

The Department obtained a batch discharge permit from the City and County of San Francisco for this 04-0120R4 project. The Department pursued coverage under the SF-PUC batch Discharge permit for several reasons including but not limited to:

1- It's much faster to obtain the SF-PUC permit over the RWQCB permit.
2- SF-PUC does not require EPA application forms or NOI forms.
3- Eliminates the Standard annual fees of $5,688.00 for permit renewal.
4- The effluent limitations are more generous than the RWQCB permit.
5- The reporting requirements are much less than the RWQCB permit.
6- The sampling requirements are much less than the RWQCB permit.
7- The overall risk associated with the SF-PUC permit is less because the water is pre-treated and then treated by the City and then discharged under the City's permit. (In essence it takes RWQCB review and direct oversight out of the Dewatering equation).

Charles Smith and Melissa Barrow, Environmental Engineers, Frank Gorham, SWPPP Coordinator, and Trinh Lai, Project Engineer, concur with this change. Maintenance and Design concurrence is not required, as this work is temporary and does not affect the final design. On 3/9/05 Nancy Bobb, FHWA Representative, granted FHWA Prior Approval of this change order. On 3/14/05 Ken Darby, Division of Construction CCO Engineer, granted conditional Headquarters' Issue and Approve. The condition being to obtain the Contractor's signature on the CCO. On 4/13/05 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order.

Payment for the work of this change order will be at Adjustment of Compensation at an Agreed Lump Sum of $0.00. This price is found to be fair and reasonable because the work of revising the Excavation and Dewatering Plan will balance out against the future savings in complying with the new permit requirements.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 34	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Amend Section 8-3.01, "Welding", of the Special Provisions as follows:

(1) In Section 8-3.01, subsection "Welding Quality Control", the second paragraph shall be changed as follows:

Unless otherwise specified, welding quality control shall apply when any work is welded in conformance with the provisions in Section 49, "Piling", Section 52, "Reinforcement", Section 55, "Steel Structures", or Section 75-1.035, "Bridge Joint Restrainer Units", of the Standard Specifications.

(2) The following subsection shall be added to Section 8-3.01, "Welding", of the Special Provisions:

[Beginning of specification addition]

WELDING FOR OVERHEAD SIGN AND POLE STRUCTURES

The Contractor shall meet the following requirements for any work welded in conformance with the provisions in Section 56-1, "Overhead Sign Structures", or Section 86 2.04, "Standards, Steel Pedestals and Posts", of the Standard Specifications.

Welding inspection personnel or Nondestructive Testing (NDT) firms to be used in the work shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project, except for when the welding is performed at a permanent fabrication or manufacturing facility which is certified under the American Institute of Steel Construction (AISC) Quality Certification Program, Category Sbd, Conventional Steel Building Structures.

Welding Qualification Audit

Contractors or subcontractors performing welding operations for overhead sign and pole structures shall not deliver materials to the project without having successfully completed the Department's "Manufacturing Qualification Audit for Overhead Sign and Pole Structures," hereinafter referred to as the audit, not more than one year prior to the delivery of the materials. The Engineer will perform the audit. Copies of the audit form, and procedures for requesting and completing the audit, are available at the Transportation Laboratory or the following website:

http://www.dot.ca.gov/hq/esc/Translab/smbresources.htm

An audit that was approved by the Engineer no more than one year prior to the beginning of work on this contract will be acceptable for the entire period of this contract, provided the Engineer determines the audit was for the same type of work that is to be performed on this contract.

Successful completion of an audit shall not relieve the Contractor of the responsibility for furnishing materials or producing finished work of the quality specified in these special provisions and as shown on the plans.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 34	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

Welding Report

A daily production log for welding shall be kept for each day that welding is performed. The log shall clearly indicate the locations of all welding. The log shall include the welders' names, amount of welding performed, any problems or deficiencies discovered, and any testing or repair work performed, at each location. The daily report from each Quality Control (QC) Inspector shall also be included in the log.

A Welding Report shall be submitted to the Engineer 48 hours prior to furnishing a Certificate of Compliance for the material in conformance with the provisions in Section 6 1.07, "Certificates of Compliance", of the Standard Specifications.

The Welding Report shall include the following items:

A. Reports of all visual weld inspections and NDT.
B. Radiographs and radiographic reports, and other required NDT reports.
C. Documentation that the Contractor has evaluated all radiographs and other nondestructive tests and corrected all rejectable deficiencies, and all repaired welds have been reexamined by the required NDT and found acceptable.
D. Daily production log.

For work welded in conformance with the provisions in Section 56 1, "Overhead Sign Structures," or Section 86 2.04, "Standards, Steel Pedestals and Posts," of the Standard Specifications, a Welding Report shall be submitted in conformance with the provisions in "Welding Quality Control," of these special provisions.

[End of specification addition]

For this work the contractor will be paid the agreed lump sum of $0.00. This sum constitutes full compensation, including markups, for this change.

Estimated Cost: **Increase** ☐ **Decrease** ☐ **$0.00**

CCO DESCRIPTION: Pole Structure Welding Spec Revision	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:
amending Section 8-3, "Welding", of the Contract Special Provisions.

The Standard Special Provisions (SSPs) that were in effect at bid time for this project have been modified by current SSPs. The Engineer has initiated a specification change order to keep the welding requirements consistent with the currently recognized welding practices of the Department. The work of this change order has not begun and the change affects only the Contractor's Welding Quality Control Program (WQCP). Though the Contractor would incur extra costs associated with a newly required extensive annual audit, these extra costs would be offset by the cost savings to the Contractor's WQCP in that the Contractor would not have to schedule and attend a pre-weld meeting nor develop and submit a project specific WQCP for approval and would only be required to submit one welding report when the material is delivered (as opposed to submitting a welding report any time welding is done on the material).

The current Standard Special Provisions, which are incorporated into this change order, were made available through the Department's specification unit. Dustin Allred, Materials Engineering and Testing Services (METS) Technician, and Rob Kobal, Headquarters' Assistant Construction Coordinator, concur with this change.

On 4/13/05 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. On 4/15/05 Nancy Bobb, FHWA Rep, granted FHWA Prior Approval of this change order. On 4/19/05 Ken Darby, Division of Construction Contract Change Order Engineer, granted conditional Headquarters" Issue and Approve (HQs I&A) for this change order. The conditions of the HQs I&A being noting FHWA Prior Approval on the Memo and obtaining the Contractor's signature on the change order.

Design and Maintenance concurrence is not required, as this change does not affect the final design.

Payment for the work of this change order will be at Adjustment of Compensation at an Agreed Lump Sum of $0.00, which can be financed from the contingency fund. This price is found to be fair and reasonable based on a force account analysis prepared by the Engineer. This analysis is on file.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CCO DESCRIPTION: SSL A - Additional Demolition Work	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

removing existing sidewalk, gutter, and retaining wall / parapet from Bent 39 to Bent 42 at the north side of the lower deck of the Bay Bridge in accordance with the detail shown on Contract Plan Sheet 113 of 193 (Sheet 3 of 3 of this Contract Change Order).

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on WB and EB Highway 80 between the eastern tunnel portal on Yerba Buena Island to Pier E1 on the San Francisco Oakland Bay Bridge. To divert lower deck traffic onto the TBS, an opening is created through the existing viaduct by removing some of the columns at the south side of the structure.

To facilitate the lower deck detour, new structure support walls must be constructed to maintain the integrity of the viaduct. At the north side of the structure or Structure Support Location A (SSL A), infill walls are constructed between Bents 39 through 47. In between the existing columns are gutters, short parapet / retaining walls and footings that must be removed prior to the construction of these new support walls. The work between Bents 39 to 42 was originally to be completed on the Substation Contract 04-0120G4 with the balance to be completed on the TBS contract. The Substation contract deleted this demolition work during the life of the contract but this was never updated on the TBS contract prior to bid opening. Therefore, the limits of the removal work must be extended to include locations between Bents 39 to 42 in order for the SSL A to be completed. This work will be considered as extra work.

The agreed lump sum of $ 16,734.80, provided in the contract change order, is based on a force account analysis and can be financed from the contingency balance. Records and calculations used to determine the agreed price basis are on file in the project records.

This change has been discussed with Dan T. Adams of the Office of Structure Designs, Trinh Lai of District 04 Toll Bridge Design, and Rob Kobal of Headquarters Construction and they are in agreement with this change.

Maintenance concurrence is not required as this work was anticipated by the contract documents.

Consideration of a time adjustment will be deferred pending completion of the work specified in this change order.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 37	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

In accordance with Section 7-1.08, "Public Convenience", Section 7-1.09, "Public Safety", and Section 12, "Construction Area Traffic Control Devices", of the Standard Specifications and Sections 5-1.04, "Public Safety", and 10-1.29, "Maintaining Traffic", of the project Special Provisions:

The Contractor shall provide a traveled way as determined by the Engineer that is a minimum of 3.6 meters wide and 3.7 meters high, to allow for a transverse crossing of Southgate Road between Hillcrest Road and Macalla Road, within four (4) hours of the Engineer's notification. The traveled way shall allow the passage of construction equipment or vehicles of any kind, which meet the conditions set forth in Division 15 of the California Vehicle Code.

This work will be paid for in accordance with Section 5-1.24, "Force Account Payment", of the Special Provisions and Section 4-1.03D, "Extra Work", of the Standard Specifications.

Any delays to the Contractor's operations as a direct result of this traveled way installation, operation and removal shall be considered right of way delays within the meaning of Section 8-1.09, "Right of Way Delays", and compensation for the delay will be determined in conformance with the provisions in Section 8-1.09.

Estimated cost of Extra Work at Force Account $20,000.00

Extra Work at Lump Sum:

Compensate the contractor for the preparation and submittal of the above contingency plan.

For this work the contractor will be paid the agreed lump sum of $2,500.00. This sum constitutes full compensation, including markups, for this portion of the change.

Total cost of Extra Work at Agreed Lump Sum $2,500.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$22,500.00**

CCO DESCRIPTION: 4 hour emergency traveled way	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

(1) Construction of a traveled way that is a minimum 3.6 meter wide and 3.7 meter high, to allow for a transverse crossing of Southgate Road between Hillcrest Road and Macalla Road, within four (4) hours of the Engineer's direction.
(2) Compensation for the preparation and submittal of the above contingency plan.

On October 8, 2004 Trinh Lai, Project Engineer, sent a letter addressed to Lourdes David, Senior Resident Engineer, recommending this change order. The Office of Toll Bridge Design recommends this change order in order to make provisions for public access around Yerba Buena Island in case of road closures due to construction activities.

On 4/13/05 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. Design and Maintenance concurrence is not required as this work is temporary and will not affect the final design.

(1) This work is not covered by any contract items. Therefore, payment for this work will be at Extra Work at Force Account for an estimated total cost of $20,000.00, which can be financed from the contingency fund.

(2) Payment for providing the contingency plan will be at Extra Work at an Agreed Lump Sum of $2,500.00, which can be financed from the contingency fund. This price is found fair and reasonable based on a force account analysis submitted by the Contractor and verified by the Engineer. This analysis is on file in the project records.

Total estimated cost of this change order is $22,500.00.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may affect or become the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Contractor

CCO: 38	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

The fourth paragraph of Design Criteria Section 8.2.1, "Support Structure Design Loads", on contract plan sheet 104 of 193 (Revised Per Addendum No. 11 dated October 06, 2003) shall be revised as follows:

"Existing Viaduct shall remain elastic under Design Evaluation Earthquake (DEE) and Displacement Limit State (DLS) demands. Vertical response shall be in accordance with Section 4 and deflection limits shown on Table 8.7.1."

This modification to Section 8.2.1 shall not relieve the Contractor of the requirements of the other design requirements within the contract plans and specifications.

For this work the contractor will be paid the agreed lump sum of $0.00. This sum constitutes full compensation, including markups, for this change. Any changes to the Contractor's design as a result of this change, or any consequences thereof are included in the full compensation, including markups, of this change.

Total cost of Adjustment of Compensation at Agreed Lump Sum Price $0.00

Estimated Cost: **Increase** ☐ **Decrease** ☐ **$0.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Revise West Tie-In Design Criteria	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Modification of the fourth paragraph of Design Criteria Section 8.2.1, "Support Structure Design Loads", on contract plan sheet 104 of 193 such that the requirements for target fundamental period no longer apply and that the existing structure remain elastic under Design Evaluation Earthquake (DEE) and Displacement Limit State (DLS) demands.

The Contractor requested this change in a letter dated January 12, 2005 addressed to Lourdes David, Resident Engineer. In this letter the Contractor further stated, "There will be no additional cost or savings to the State by reason of this change."

This Contract requires that a Temporary Bypass Structure (TBS) be designed and constructed by the Contractor to detour traffic on WB and EB Highway 80 between the eastern tunnel portal on Yerba Buena Island to Pier E1 on the San Francisco Oakland Bay Bridge. The contract plans and specifications provide the necessary alignments and criteria by which the design is to be developed, but leaves the detailed engineering design of the structure to the Contractor.

The original intent of Article 8.2.1 of the design criteria was to protect the existing viaduct from sustaining damage resulting from movement of the new structure during the design seismic event by establishing a target fundamental period for the new structure at 0.55 ± 0.05 sec. This limits the spectral acceleration as determined by Figure 4.1.2A of the Design Criteria to a value between 0.25 and 0.40g. The spectral acceleration values factor into the calculated load transmitted through to the existing structure.

The Contractor has demonstrated that the target period can be changed and results in a lower load applied to the existing structure during seismic event. By allowing for the design of a structure with a higher fundamental period that yields a lower spectral acceleration value, the loads applied to the existing structure can be significantly lowered. This is a substantial benefit to the Department designed retrofit elements of the existing structure. The Contractor's current design possesses an approximate period of 1 sec that roughly correlates to a spectral acceleration value between 0.1-0.2g. The Contractor's calculations further show that the existing structure will remain elastic during both the DEE and DLS events.

Dan Adams, Structures Design Engineer, Trinh Lai, Project Engineer, and Robert Kobal, Headquarters' Assistant Construction Coordinator, concur with this change. On 4/27/2005 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. On 5/2/2005 Nancy Bobb, FHWA Representative, granted FHWA Prior Approval of this change order. On 5/12/2005 Ken Darby, Division of Construction CCO Engineer, granted conditional Headquarters' Issue and Approval of this change order. The HQs I&A is conditional on obtaining the Contractor's signature on the change order.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Payment for the work of this change order will be at Adjustment of Compensation at an Agreed Lump Sum of $0.00. This price is found to be fair and reasonable because the work of this change order has not begun and the change affects only design parameters. Quantities, equipment and manpower are not affected. Any changes to the contractors design as a result of this change, or any consequences thereof, are included in the full compensation, including markups, of this change.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CCO DESCRIPTION: Provide shuttle service for USCG	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

compensation for providing shuttle service for United States Coast Guard (USCG) personnel from Treasure Island to the USCG facility when determined by the Engineer.

This change order is being issued in accordance with Special Provisions Section "5-1.35, "Relations with the Untied States Coast Guard", which states: "This project is located in San Francisco Bay at Yerba Buena Island, adjacent to a navigable channel, which is under the jurisdiction of the United States Coast Guard (USCG), Eleventh District, Coast Guard Island, Alameda, California, 94501-5100. A USCG Bridge Permit has been issued covering work to be performed under this contract."

In a Memo dated 5/23/05 sent by Trinh Lai, Project Engineer, to Lourdes David, Resident Engineer (RE), the Office of Toll Bridge Design recommended a change order be written to provide shuttle service for USCG personnel from Treasure Island to the USCG Facility for the dates of June 8th and July 15th, 2005. Due to the limited parking area as a result of construction activities on the Temporary Bypass Structure and in conformance with the Memorandum Of Agreement (MOA) between the USCG and the State of California, Department of Transportation dated June 2002; the State should pay for the shuttle service. Section 4b(9) of the referenced MOA states: "Caltrans understands that vehicle parking on the COAST GUARD facility is constrained and will take all reasonable measures to ensure, without cost to the COAST GUARD, that any areas available for parking during the duration of the PROJECT will be made accessible for vehicles." The State feels this CCO is a reasonable measure to uphold the State's end of the agreement.

It is possible that due to future construction activities this shuttle service may be required on future dates as well as the dates of June 8th and July 15th, 2005. Therefore this CCO is being written to also allow for future dates as determined by the Engineer.

Mark Shindler, Right of Way Chief, concurs with this change order. On 6/2/2005 Amer Bata, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. Design and Maintenance concurrence is not required, as this work will not affect the final design.

This work is not covered by any contract items. Therefore, payment for this work will be at Extra Work at Force Account for an estimated cost of $10,000.00, which can be financed from the contingency funds.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CCO DESCRIPTION: USCG Oakland to YBI Shuttle	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1660** Day(s)	**349** %	**0**

THIS CHANGE ORDER PROVIDES FOR:

Additional funding for temporary shuttle van service for transporting US Coast Guard personnel from their home base to Yerba Buena Island.

This project was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The detour encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins. The contract was issued as a performance based contract with the contractor responsible for providing the design of the structure based on specified design criteria.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006 and both approved by Tony Anziano – Toll Bridge Program Manager, Richard land – Chief Engineer and subsequently by the Toll Bridge Program Oversight Committee (TBPOC), recommended that the Department assume the design responsibility for the ETI and WTI structures and recommended the advance construction of foundation work for the Yerba Buena Island Transition Structure (YBITS) to be added to this contract. The implementation of these strategies has led to the extension of the contract through the end of 2010 approximately 5 years past the original contract completion date.

Change Order No. 39, Supplement No. 1 provided for the transport of US Coast Guard personnel to and from their station at Yerba Buena Island to their offices in Oakland, CA and Alameda, CA. The offices are located several miles from the YBI station and the shuttle service helps to mitigate Department impacts to the Coast Guard due to the 5 year extension of this contract and the significant increase in work. The only access to the YBI station runs directly through this contract's work site and traffic disruptions occur on a daily basis.

The scope of work has recently been reduced concerning this change order however, existing funding will not be adequate to provide for this work through the end of the contract. It is estimated an additional $200,000.00 will be required to fund this work.

The work shall be performed as extra work at force account at an estimated cost of $200,000 and shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

Maintenance concurrence is not required as this change order does not affect any permanent roadway features.

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Provide compensation for sewer pipe material change to install ductile iron pipe (DIP) in lieu of PVC for the sewer force main at Bent 52.

For this work the contractor will be paid the agreed lump sum of $1,561.95. This sum constitutes full compensation, including markups, for this change.

Estimated cost of Extra Work at Lump Sum $1,561.95

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$1,561.95**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Sewer Pipe Material Change	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

compensation for sewer pipe material change to install ductile iron pipe (DIP) in lieu of PVC for the sewer force main at Bent 52.

At Bent 52, a sewer force main was in conflict with a proposed new footing of the Temporary Bypass Structure (TBS), and had to be relocated. The contract plans show this utility as made of PVC pipe. However, during utility potholing work at Bent 52, the Contractor determined that the sewer force main to be relocated was ductile iron pipe (DIP), not PVC as shown on the plans. The decision was made to use DIP to maintain consistency of material for the new section of pipe. This change order provides the compensation for this work as DIP is more expensive than PVC.

Design and Maintenance concurrence is not required, as this change order does not change the design details.

Payment for the work of this change order will be at Extra Work at an Agreed Lump Sum for $1,561.95. This price is found to be fair and reasonable based on a force account analysis submitted by the Contractor and verified by the Engineer. This sum is the difference in cost between the use of DIP and PVC material. This analysis is on file.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CCO DESCRIPTION: Bent 48R Pile Load Test	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

(1) Preparing three piles for a pile load test at Bent 48 Right footing in accordance with Sheet 2 of the change order.
(2) Providing support to the State's Engineer to setup and remove the pile load test equipment.

This Contract requires that a Temporary Bypass Structure (TBS) be designed and constructed by the Contractor to detour traffic on WB and EB Highway 80 between the eastern tunnel portal on Yerba Buena Island to Pier E1 on the San Francisco Oakland Bay Bridge.

On the West Tie-In segment, the Bent 48 footing is founded upon 600 mm driven steel shell piling. The pile demands for uplift at Bent 48 were calculated to be 300 kips per pile; therefore, the piles were tipped to obtain a nominal resistance (tension) to meet or exceed 300 kips per pile. However, several of the piles met refusal during installation and did not obtain the required embedment required for tension.

Additional PDA testing was performed on two piles at this location and resulted in a report generated by the Contractor's Geotechnical Engineer that accepted the piles as driven; however, the State Geotechnical staff is not in agreement with this decision. Since the piles are the only components of the foundation that will resist the tension demands, it is vital that the nominal resistance (tension) be obtained.

In a letter dated 8/8/05 Dan Adams, Bridge Design Engineer, requested that a static pile load test be conducted to verify the nominal resistance (tension) for theses piles. Therefore the State will be performing a pile load test to verify that the reported pile capacity of 300 kips in uplift can be obtained in the field. Should this value not be obtained, the Contractor will be required to re-evaluate or re-design the footing.

This work was not originally contemplated by the contract. It is being performed as additional Quality Assurance by the State to ensure public safety. This change order provides for compensation to the Contractor for preparing the pile heads and for supporting the State's Foundation Testing group in setting up and then removing the State testing equipment.

Trinh Lai, Project Engineer, and Robert Kobal, Caltrans' Headquarters' Assistant Construction Coordinator, concur with this change. On 8/8/05 Rick Morrow, Area Construction Manager - SFOBB, and Lourdes David, Construction Engineer, granted District Prior Approval of this change order. Maintenance concurrence is not required as this work is temporary and does not affect the final design.

This work will be performed under Extra Work at Force Account for an estimated cost of $20,000.00, which can be financed from the contingency funds.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Replace the last two paragraphs of the Special Provisions Section 5-1.25, "Payments", with the following:

In determining the partial payments to be made to the Contractor, only the following listed materials will be considered for inclusion in the payment as materials furnished but not incorporated in the work:

A. Temporary Bypass Structure, East Tie-In
B. Temporary Bypass Structure, Viaduct
C. Temporary Bypass Structure, West Tie-In

Materials furnished but not incorporated into the work in fenced areas with locked gates or in locked warehouses will be eligible for partial payment if the Contractor furnishes evidence satisfactory to the Engineer that its storage is subject to or under the control of the Department and that it has been designated or fabricated specifically for this project and is of such character that it is not adaptable to any other use. Such materials are not required to be stored within the State of California.

The total amount paid for materials furnished but not incorporated in the work shall not exceed 25 percent of the total contract amount.

To be eligible for these payments for any material stored outside the United States, the Contractor shall furnish an advance payment bond, first demand bank guarantee, or combination of no more than two thereof to secure the value of potential partial payments for material furnished but not incorporated in the work pursuant to these special provisions and Section 9-1.06, "Partial Payments", of the Standard Specifications. The advance payment bond or first demand bank guarantee shall be in a sum not less than the amount requested for payment by the Contractor, and shall, at a minimum, match the terms of the sample advance payment bond or first demand bank guarantee forms attached to this change order. The value of the advance payment bond or first demand bank guarantee shall not be adjusted more than once per year. The Contractor shall certify in writing to the Engineer that the proposed bonding company or bank complies with these special provisions. The bonding company shall be licensed to do business in the State of California, and shall be certified to write a bond equal to 30% of the executed contract price by the United States Department of the Treasury. The bank shall have United States operations with a minimum rating of "A-" by either AM Best or Standard & Poor. All alterations, extensions of time, extra and additional work, and other changes authorized by these special provisions or any part of the contract may be made without securing the consent of the surety of the bond or the bank.

Adjustment of Compensation at Lump Sum for the amount of $75,953.88 will be for payment of interest on loans for materials listed above for the period beginning April 1, 2005 through the time that this contract change order becomes effective. Payment will be made with the submittal of proper documentation.

By reason of this change, it is agreed that no further compensation is due to the Contractor, including compensation for any finance charges, bonds, sureties or customs custody deposits, for material used for the items listed above, for delays caused by the Department after April 1, 2005.

Estimated cost of Adjustment of Compensation at Lump Sum $75,953.88

COST: **$75,953.88** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Materials On Hand Payment Allowance	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Partial payment for materials furnished but not incorporated into the work (Materials on Hand) that is stored outside of the United States, secured by an advance payment bond provided by the Contractor.

The Contract was awarded in March 2004 with an original construction completion date of July 2005. Since it's inception the project has been under either a full or partial suspension as a result of delays in completion of the Sub-station Contract (preceding this project) or the postponed Self Anchored Suspension (SAS) Bridge Contract, due to the fact that the lone bidder's cost estimate was about double the engineer's estimate.

The South-South Detour (SSD) Temporary Bypass Structure (TBS) Contract was originally designed to be in service for a period of approximately 2 years. Completion of the contract by July 2005 as scheduled would have compromised safety of the structure and the safety of the travelling public, as the TBS would have been under service for twice (approximately 4 years) its intended load carrying service life duration. Also, the negative impact on the travelling public, as a result of the reduced speed imposed on the TBS would increase traveler delays across the bridge, compounded with increased number of accidents on the bridge, due to the inherent nature of the double S-curve bridge geometric layout.

As a result of the ordered suspensions, the contract duration has increased by over 2.5 times its original duration (from 475 days to 1205 days). In order to reduce the Departments exposure to a possible "Change in Character of Work" Claim (as specified under Section 4-1.03C of the Standard Specifications), it is prudent to act proactively by issuing this change order that compensates the contractor for some of the costs of delay by paying for materials furnished but not incorporated into the work that are stored outside of the United States. In order to reduce the Department's exposure to default on these materials, the payments are secured by a contractor provided bond.

Under the current contract there are no clauses that allow for partial payments to be made for materials stored and controlled outside of the United States. As a result of the past and current suspensions noted above, the Contractor has been impacted by having to finance these costs by securing loans without payments from the State. A change in the contract language is necessary to allow the State to make payments to the Contractor with the condition that a bond is secured as collateral for such payments. Allowing for partial payments will enable the Department to compensate the Contractor for finance costs incurred since April 1, 2005. No further finance costs will be warranted once this contract change order is executed as these costs will eventually be paid for by contract items.

The Adjustment of Compensation at Lump Sum for the amount of $75,953.88 will be for payment of interest on loans for materials listed above for the period beginning April 1, 2005 through the time that this contract change order becomes effective. Payment will be made with the submittal of proper documentation.

Note that the proposed change order is part of the currently advertised SAS contract (04-0120F4) special provisions (section 5-1.25, "Payments") requirements.

All other possible options have been exhausted, such as having the steel raw material be shipped and stored in the United States so payment under the current contract special provisions section 5-1.25, "Payments", be made, but this would mean the re-shipping of the steel raw material back to China for fabrication of the structural steel members. To date, fabrication of the steel raw material has not yet commenced, since the TBS design has not been finalized. This option would further delay the contract along with causing undue financial hardship to the Contractor as a result of double handling of the material.

Pete Siegenthaler - Principal Engineer and Amer Bata - Area Construction Manager SFOBB, concur with this change on 9/6/05. On 09/06/2005 Amer Bata and Lourdes David - Construction Engineer, granted District Prior Approval of this change order. Bob Pieplow - Program Manager, Jon Tapping - Toll Bridge Chief concurred with this change on 8/30/05. Jose Aguirre - CT Asst. Chief Counsel concurred with this change on 5/27/05. Trinh Lai - Project Engineer and Janet Adams - Project Manager concurred with this change on 9/13/05 and 9/14/05. Nancy Bobb - FHWA concurred with this change on 09/14/05.

Design and Maintenance concurrence is not required as this change does not affect the final design.

No adjustment of the contract time is warranted as this change does not affect the controlling operation.

CCO: 44	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Perform additional design work in order to incorporate the following items of work into the project electrical plans:

1) Relocate 8 call boxes from the existing structure to the new Temporary Bypass Structure. Call boxes to be relocated are identified as CB-139, 239, 140, 240, 339, 439, 340, and 440.

2) Install new power and signal cables from the existing structure to the new call box locations relocated under Item No. 1.

3) Field verify the location of the 4 call boxes located east of Pier E1 and relocate those boxes if necessary. Call boxes to be field verified are identified as CB-141, 241, 341, and 441.

4) Remove existing circuits I.D. Nos. 237 and 239 from junction box in curb of westbound YBI Off Ramp, intercept circuits in Vault 2A, and re-route and connect to existing circuit 237/239 conductors feeding westbound YBI tunnel lights.

5) Incorporate the 13 lighting and navigational-aid circuits concerning the as-built drawings from Contract 04-0120G1 (Circuit 100, 101, 103, 201, 236, 237, 239, 241, 242, 243, 244, 247 and 249) into the new bridge.

6) Abandon Utility Vaults 3 and 4, intercept the bridge ground wire at a manhole between the new YBI substation and the West Tie-In and route to Vaults 2A and 2B.

7) Intercept cables, listed in Table A and B of the original contract plan Sheet E-9, in Vault 2A. Provide for the removal of the temporary cables installed under Contract 04-0120G1 after the cut over to these new cables.

For this work, the Contractor will be compensated a lump sum of $47,480.00. This sum constitutes full and final compensation, including all markups and interest, associated with the work of this change.

This change order provides compensation for additional design costs only. Any additional costs associated with the construction of the electrical system due to the design revisions incorporated due to this change are deferred and shall be paid separately.

Total Cost of Extra Work at Lump Sum $47,480.00

CONTRACT CHANGE ORDER

CCO DESCRIPTION: Electrical Design	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

compensation to the contractor for providing design services incorporating various Department-ordered electrical changes into the project plans.

This contract provides for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consists of three main structures, the east tie in to the bridge, the west tie in to the island, and the viaduct structure between the two tie ins. The contract was awarded as a performance based project with the contractor responsible for meeting the design criteria specified in the contract.

This change order compensates the contractor for providing design services in order to incorporate numerous Department-ordered design changes into the contract electrical plans. The changes mainly concern the relocation of existing call boxes from the existing structure to the temporary structure and incorporating electrical changes from an earlier contract (04-0120G1) that were implemented after this contract was awarded.

Compensation shall be paid as extra work at an agreed lump sum of $47,480.00 which shall be financed from the contract's contingency funds. A cost estimate is on file.

This change order provides compensation for additional design costs only. Any additional costs associated with the construction of the electrical system due to the design revisions incorporated due to this change are deferred and shall be paid separately.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer.

Maintenance concurrence is not required as the viaduct is a temporary structure and doesn't affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 45	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Estimate of Increase in Contract Item at Contract Price:

Item No. 21: TEMPORARY COVER
10000 M2 (+200.00%) $5.00 /M2 = +$50,000.00 (+200.00%)

Estimated total cost for Increase in Contract Item.....$50,000.00

Adjustment of Compensation at Unit Price:

Perform additional water pollution control in accordance with Section 10-1.02 'Water Pollution Control', of the Special Provisions and all approved Storm Water Pollution Prevention Plan (SWPPP) Amendments to date.

Cleanup, repair, removal, improper installation, and replacement of water pollution control practices damaged by the Contractor's negligence shall not be considered as included in the cost for performing water pollution control.

For performing additional water pollution control, the sum of $421.00 per day will be paid for Item No. 15 'Water Pollution Control', for the duration of the contract.

For performing work in preparing any required SWPPP Addendums, the sum of $300.00 will be paid for each addendum.

Estimated cost of Adjustment of Compensation at Agreed Unit Price $200,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$250,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: ADDITIONAL SWPPP	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Performing additional water pollution control in accordance with Section 10-1.02 'Water Pollution Control', of the Special Provisions and all approved Storm Water Pollution Prevention Plan (SWPPP) Amendments to date.

Currently, portions of work in the field for the East Tie-In and West Tie-In segments of the Temporary Bypass Structure (TBS) are suspended to delay switching traffic onto the TBS until 2007 to prevent unnecessary traffic impacts that would occur if the Contractor's "as bid" schedule was followed.

The Department is performing coordination for the whole San Francisco Oakland Bay Bridge (SFOBB) corridor to meet the current delivery schedule for the Self Anchored Suspension (SAS) contract with the least impact to the traveling public. It has been determined that the TBS is not needed until July 2007. However, changes to the SAS and Yerba Buena Island (YBI) Transition contracts may still occur and is to be considered. These changes may affect the time of completion of the TBS and further delay the traffic switch beyond July 2007.

The Contractor's original budget and contract schedule of 475 calendar days necessitated SWPPP implementation for only one rain season. However, with the current projected completion date of Summer 2007, SWPPP implementation is now projected to be required for an additional 2 rain seasons.

For performing additional water pollution control, payment for the Adjustment of Compensation of this change order will be a Unit Price of $421.00 per day, which is the original daily unit price for Contract Item No. 15 'Water Pollution Control'. For performing work in preparing any required SWPPP Addendums, the sum of $300.00 will be paid for each addendum. Total estimated cost for this change is $200,000.00., which can be financed from the contingency fund. A cost analysis for this change order is on file.

Additionally, Contract Item No. 21 'Temporary Cover' has overun by 175% to date. As there is still the balance of the 2005/2006 and 2006/2007 rainy seasons remaining, the contract item must be increased to accommodate the added work. Total estimated cost for this change is $50,000.00, which can be financed from the contingency fund.

Jon Tapping - Project Manager, Rick Morrow - Area Construction Manager, Nancy Bobb - FHWA, concur with this change. Ken Darby - HQ CCO Review also granted approval of this change.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation..

Design and Maintenance concurrence is not required as this suspension does not affect the final design.

CCO DESCRIPTION: Re-open Southgate road	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

reopening Southgate Road to one way traffic in accordance with page 2 of 2 of this Contract Change Order (Sheet TH-2), Section 7-1.08, Public Convenience, of the Standard Specifications, and as authorized by the Engineer.

For public convenience, the Department has decided to reopen Southgate Road during the current partial suspension for USCG personnel and the travelling public, with one-way traffic provided through Southgate Road from Macalla Road to Hillcrest Road. Proper one-way traffic through Southgate Road requires using temporary concrete barriers, additional signage, striping, intermittent closures (traffic control), additional falsework, and other modifications to construct work.

Re-opening Southgate Road was recommended by the Office of Toll Bridge Design in a letter dated October 14 , 2005 from Trinh Lai - Project Engineer to Lourdes David - Resident Engineer. Trinh Lai also provided the plans for the roadway reopening. John Thomas - Traffic Safety, recommended and concurred with this change on October 4, 2005.

This work is not covered by any contract items. Therefore, payment for this work will be Extra Work at Force Account for an estimated total cost of $50,000, which can be financed from the contingency plan.

Maintenace concurrence is not required as it does not effect the maintenace of the structure.

Since Southgate road will remain open to public traffic, even after the partial suspension is lifted, the Contractor's operations and efficiency will be impacted. Compensation for delays resulting from this work or potential traffic impacts will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

CCO DESCRIPTION: Buried Man-Made Objects	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Compensating the Contractor for the removal and disposal of Buried Man-Made Objects encountered on the jobsite as authorized by the Engineer in accordance with Section 19-1.04 Buried Man-Made Objects and Section 7-1.13 Disposal of Material Outside the Highway Right of Way of the Standard Specifications.

This contract requires that a Temporary Bypass Structure (TBS) be designed and constructed by the Contractor to detour traffic on the WB and EB Highway 80 between the eastern tunnel portal on Yerba Buena Island to Pier E1 on the San Francisco-Oakland Bay Bridge.

The location TBS alignment is within a region proviously occupied by the United States Navy and currently occupied by the United States Coast Guard. The region contains numerous abandoned in place underground utilities and buried abandoned building foundations. The fill overlaying the native ground contains rubble from previously demolished structures and foundations. During the placement of foundations for the TBS, these obstructions have been found which resulted in the necessity of their removal and in some instances modifications to the foundations.

Delays to the Contractor's operations which result from the removal and disposal of Buried Man-Made Objects will be compensated in accordance with Section 8-1.09 Right of Way Delays of the Standard Specifications.

This work is not covered under the contract items. Therefore, this work will be done under Extra Work at Force Account for an estimated total of $ 50,000.00. Supplemental Work funds have been allocated for this work totaling $ 200,000.00, as shown on the Detailed Estimate of Job Cost.

Trinh Lai, Project Engineer, concurs with this change. On November 14, 2005, Amer Bata, Area Construction Manager, granted District Prior Approval of this change order.

Maintenance concurrence is not required for this change as it does not impact the maintenance or serviceability of the structure.

Adjustment of contract time is deferred pending completion of the specified work as it may become the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 49	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Conduct additional design analysis on the Viaduct segment of the proposed Temporary Bypass Structure for the following structural configurations:

- Bolted stringer to floorbeam connections with the bolts fully tensioned prior to placement of concrete deck surfacing but modeled as stringers simply supported between floor beams. The joint fixity assumptions shall be made consistent with the design model.

The analysis shall be completed by the generation of a full three dimensional (3-D) computer model that incorporates all the proposed stringers as individual members. This model shall be analyzed for the dead load and live load configurations utilized in the original design analysis. The analysis shall determine the overall effect on the floor beams, truss sections, and their connections. The demand to capacity (D/C) ratios shall be recorded for the moments in the stringers.

A final report shall be generated containing the results of the analytical model. The report shall provide a table of floorbeam and truss elements whose demand capacity ratios exceed the value of one (1). The report shall also contain an electronic copy of the 3-D model's working input and output files. No redesign work is required at this time.

No analysis or model modification/revisions will be required beyond the receipt of the final report as a part of this change.

For this work, the Contractor will be paid the sum of $ 109,182.80. This sum constitutes full compensation, including markups, for this change.

Total Cost of Adjustment of Compensation At Agreed Lump Sum $109,182.80

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$109,182.80**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Viaduct- Stringer Floorbean Design Study	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

conducting additional design analysis upon the Viaduct segment of the proposed Temporary Bypass Structure utilizing the structural configuration as detailed in the text of the Change Order document.

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on westbound and eastbound Highway 80 between the eastern portal of the tunnel on Yerba Buena Island to Pier E-1 on the San Francisco-Oakland Bay Bridge. It is being completed as one segment of the New East Span corridor. The completed structure will allow a future transition structure to be built tying in the New East Span to the existing. The Contractor's Engineer is responsible for completing the design of the various segments of the TBS and submits these packages to the State for authorization for construction. By submitting these documents, the Contractor's Engineer acknowledges that the packages are complete and constructible.

The Engineer is requesting that an additional analysis of the stringer to floorbeam connections on the Viaduct segment of the TBS be performed. The Contractor's current design reflects but one way of satisfying the contract requirements. This work is being completed as a study for the Engineer to make a determination regarding an enhancement to the design. Currently, the Contractor's Engineer has designed the bolted stringer to floor beam connection to move during deck casting by incorporating a slotted hole on one side of the stringer connection. The bolts are partially tensioned prior to deck casting and then fully tensioned only after the deck concrete is in place. The State's Design Review Team positions that this connection detail does not provide sufficient tolerances to address allowable industry standards for fabrication tolerances nor do the submitted Supplemental Technical Special Provisions adequately address this issue. As this is not a clearly definitive issue, the State is requesting that this study be performed to determine the effects of fully tensioning the bolted connections prior to casting of the deck. The Design Review Team believes that this method of installation will resolve the design and tolerance issues regarding the stringer floor beam connection. The State cannot complete this analysis as the design is the responsibility of the Contractor's Engineer. The impact of the results of this study shall be determined at a later date.

Dan Adams, Design Engineer, Trinh Lai, Project Engineer, and Robert Kobal, Headquarters' Assistant Construction Coordinator, concur with this change.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Compensation for this work will be at Adjustment of Compensation at the Agreed Lump Sum of $ 109,182.80, which can be financed from the contingency fund. A detailed cost analysis is on file.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 49	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Revise the Viaduct stringer to floor beam connections based upon the results of the design study completed under CCO 49. The bolted connections shall be fully tensioned, where possible, prior to deck concrete placement and standard sized bolt holes shall be utilized where applicable.

Perform and submit a complete design and check analysis including revised plan sheets in accordance with the requirements of Special Provisions Section 5-1.14, "Contractor Design," subsection, "Final Design Submittal." The revised stringer floorbeam connection, and any affected portion of the Viaduct segment structure shall be designed to satisfy the Design Criteria contained within the Contract plans. This design submittal package, including functional electronic input and output files, shall be submitted for acceptance, and review for authorization for construction.

The Contractor shall develop a task list and meet with the State to determine the process by which the work is to be executed. This task list may be revised by the State based upon the results of the incrementally completed design tasks.

The Contractor shall submit biweekly invoices for payments of services that shall be certified for completeness and accuracy by an authorized representative of the Contractor's Engineer. These documents may be subject to audit.

The total cost or credit of implementing this change in the field is deferred until completion of the design.

Consideration of a time adjustment will be deferred until completion of work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07 Liquidated Damages of the Standard Specifications.

All work shall be performed in accordance with the Contract Plans, Contract Special Provisions, Standard Specifications, and the Standard Plans.

Estimated cost of Extra Work at Force Account $150,000.00

CCO DESCRIPTION: Viaduct-Stringer Floorbeam Design Study	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Revising the Viaduct stringer to floor beam connections based upon the analysis assumptions of the design study completed under CCO 49. The bolted connections shall be fully tensioned prior to deck concrete placement and standard sized bolt holes shall be utilized. Perform and submit a complete design and check analysis including revised plan sheets in accordance with the requirements of Special Provisions Section 5-1.14, "Contractor Design," subsection, "Final Design Submittal.".

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on westbound and eastbound Highway 80 between the eastern portal of the tunnel on Yerba Buena Island to Pier E-1 on the San Francisco-Oakland Bay Bridge. It is being completed as one segment of the New East Span corridor. The completed structure will allow a future transition structure to be built tying in the New East Span to the existing. The Contractor's Engineer is responsible for completing the design of the various segments of the TBS and submits these packages to the State for authorization for construction.

HQ Design is requesting that the stringer to floor beam connection details be revised per the results of the design study completed on CCO 49. This change is considered an enhancement to the overall design and is necessary to provide for extended service life and to improve seismic safety.

The design work will proceed incrementally and the State will be providing direction at each phase of the design requiring flexibility in defining the work tasks. Therefore, this work will be done under extra work at force account for an estimated cost of $ 150,000.00, which can be financed in part from existing supplemental work funds and the remaining balance from the contingency funds available for this project.

The total cost or credit of implementing this change in the field is deferred until completion of the design.

Dan Adams - Design Engineer, Trinh Lai - Project Engineer, concur with this change.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

This Table is provided to depict the status of the Design Enhancement work allotted by the Contract's Supplemental Funds.

THIS CHANGE ORDER PROVIDES FOR:

Additional funds to revise the Viaduct stringer to floor beam connections based upon the analysis assumptions of the design study completed under CCO 49 and CCO 49 S1. The bolted connections shall be fully tensioned prior to deck concrete placement and standard sized bolt holes shall be utilized. Additional funds to perform and submit a complete design and check analysis including revised plan sheets in accordance with the requirements of Special Provisions Section 5-1.14, "Contractor Design," subsection, "Final Design Submittal.".

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on westbound and eastbound Highway 80 between the eastern portal of the tunnel on Yerba Buena Island to Pier E-1 on the San Francisco-Oakland Bay Bridge. It is being completed as one segment of the New East Span corridor. The completed structure will allow a future transition structure to be built tying in the New East Span to the existing. The Contractor's Engineer is responsible for completing the design of the various segments of the TBS and submits these packages to the State for authorization for construction.

HQ Design is requesting that the stringer to floor beam connection details be revised per the results of the design study completed on CCO 49 and CCO 49 S1. This change is considered an enhancement to the overall design and is necessary to provide for extended service life and to improve seismic safety.

The design work will proceed incrementally and the State will be providing direction at each phase of the design requiring flexibility in defining the work tasks. Therefore, this work will be done under extra work at force account for an estimated cost of $ 100,000.00, which can be financed from existing contingency funds available for this project.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

The total cost or credit of implementing this change in the field is deferred until completion of the design.

Dan Adams - Design Engineer, Trinh Lai - Project Engineer, and Ken Terpstra - Project Manager concur with this change. HQ CCO Desk provided I & A approval of this change on 12/08/06.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

This Table is provided to depict the status of the Design Enhancement work allotted by the Contract's Supplemental Funds.

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Revise the currently proposed Viaduct segment design to stand alone and be de-coupled from the East Tie-In structure. The boundary conditions at Bents 48 and 52 shall assume no participation between the Viaduct and the West and East Tie-Ins. Perform additional exploratory, design, and check analysis as directed by the State's Engineer to complete this task.

Provide for the following enhancements to the current design:

* Provide connectivity in the form of structural steel struts or concrete bent caps between the columns located at Bents 49, 50, 51, & 52. Incorporate findings as applicable from the Design Study report generated by previous CCO 30.

* Provide additional support between the trusses and the top of columns 49, 50, 51, & 52 to prevent the truss chords from dropping vertically if the bearing keeper system shears off and fails.

The analysis shall be based on the three dimensional (3-D) computer model generated for CCO 49. The Contractor shall develop a task list for each request and coordinate with the Engineer to determine the process by which the work is to be executed. Each request shall be pre-approved by the States's Engineer prior to beginning work.

The foundation and substructure designs shall be re-analyzed based upon the directed changes.

The Contractor shall submit detailed biweekly invoices for payment of services.

Consideration of a time adjustment will be deferred until completion of work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07 Liquidated Damages of the Standard Specifications.

Estimated cost of Extra Work at Force Account $325,000.00

SUPPLEMENTAL FUNDS PROVIDED: **$325,000.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Viaduct Design Enhancements	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Revising the current Viaduct Design to stand alone and be de-coupled from the East Tie-In structure and to provide for specific enhancements to the current design as detailed in the CCO.

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on westbound and eastbound Highway 80 between the eastern portal of the tunnel on Yerba Buena Island to Pier E-1 on the San Francisco-Oakland Bay Bridge (SFOBB). The completed structure will allow a future permanent transition structure to be built tying in the New East Span to the existing. It is being completed as one segment of the New East Span corridor.

At the time of bid opening, the TBS was to have been completed within a short time period and be in service for two to three years. Due to changes in other East Span projects, the corridor schedule has been extended, and traffic will be on the detour longer than originally intended. To alleviate the burden upon the traveling public with reduced traffic lanes, construction work on the Tie-In segments will continue to be suspended until the corridor schedule is finalized.

All work is continuing to proceed with the design of the TBS segments and construction has proceeded with the Viaduct foundations and columns.

The requested enhancements are necessary as the Viaduct segment will be constructed ahead of the remaining segments and will need to stand alone for a period of one to two years. The current Viaduct design relies upon the East Tie-In for stability. Additional redundancy will also be included by means of this change to provide for extended service life and to improve seismic and wind response.

The design work will proceed incrementally with the State providing direction at each step. Therefore, this work will be done under extra work at force account for an estimated cost of $ 325,000.00, which can be financed from the project supplemental work funds.

Dan Adams - Design Engineer, Trinh Lai - Project Engineer, and Robert Kobal - Headquarters' Assistant Construction Coordinator concur with this change. Nancy Bobb - FHWA, granted Prior Approval of this change order on 4/13/06. HQ CCO Issue & Approve was not necessary as this change order will utilize existing Supplemental Work Funds.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 50	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds to revise the currently proposed Viaduct segment design to stand alone and be de-coupled from the East Tie-In structure. The boundary conditions at Bents 48 and 52 shall assume no participation between the Viaduct and the West and East Tie-Ins. Perform additional exploratory, design, and check analysis as directed by the State's Engineer to complete this task.

Provide for the following enhancements to the current design:

* Provide connectivity in the form of structural steel struts or concrete bent caps between the columns located at Bents 49, 50, 51, & 52. Incorporate findings as applicable from the Design Study report generated by previous CCO 30.

* Provide additional support between the trusses and the top of columns 49, 50, 51, & 52 to prevent the truss chords from dropping vertically if the bearing keeper system shears off and fails.

The analysis shall be based on the three dimensional (3-D) computer model generated for CCO 49. The Contractor shall develop a task list for each request and coordinate with the Engineer to determine the process by which the work is to be executed. Each request shall be pre-approved by the States's Engineer prior to beginning work.

The foundation and substructure designs shall be re-analyzed based upon the directed changes.

The Contractor shall submit detailed biweekly invoices for payment of services.

Consideration of a time adjustment will be deferred until completion of work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07 Liquidated Damages of the Standard Specifications.

Estimated cost of Extra Work at Force Account $300,000.00

SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Viaduct Design Enhancements	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

Providing additional funds for revising the current Viaduct Design to stand alone and be de-coupled from the East Tie-In structure and to provide for specific enhancements to the current design as detailed in the original CCO 50.

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on westbound and eastbound Highway 80 between the eastern portal of the tunnel on Yerba Buena Island to Pier E-1 on the San Francisco-Oakland Bay Bridge (SFOBB). The completed structure will allow a future permanent transition structure to be built tying in the New East Span to the existing. It is being completed as one segment of the New East Span corridor.

At the time of bid opening, the TBS was to have been completed within a short time period and be in service for two to three years. Due to changes in other East Span projects, the corridor schedule has been extended, and traffic will be on the detour longer than originally intended. To alleviate the burden upon the traveling public with reduced traffic lanes, construction work on the Tie-In segments will continue to be suspended until the corridor schedule is finalized.

All work is continuing to proceed with the design of the TBS segments and construction has proceeded with the Viaduct foundations and columns.

The requested enhancements are necessary as the Viaduct segment will be constructed ahead of the remaining segments and will need to stand alone for a period of one to two years. The current Viaduct design relies upon the East Tie-In for stability. Additional redundancy will also be included by means of this change to provide for extended service life and to improve seismic and wind response.

Under the original CCO 50, the design work was to proceed incrementally with the State providing direction at each step. The State had underestimated the amount of time to complete this design. Therefore, this work will be done under extra work at force account for an estimated cost of $ 300,000.00, which can be financed from the project's contingency funds. The original CCO 50 was financed with the project's supplemental works funds, which have all been used.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

Dan Adams - Design Engineer and Trinh Lai - Project Engineer, concur with this change. FHWA Prior Approval no longer required as federal authorization for this project has been officially withdrawn.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	381 Day(s)	80 %	7

THIS CHANGE ORDER PROVIDES FOR:

Providing additional funds for revising the current Viaduct Design to stand alone and be de-coupled from the East Tie-In structure and to provide for specific enhancements to the current design as detailed in the original CCO 50.

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on westbound and eastbound Highway 80 between the eastern portal of the tunnel on Yerba Buena Island to Pier E-1 on the San Francisco-Oakland Bay Bridge (SFOBB). The completed structure will allow a future permanent transition structure to be built tying in the New East Span to the existing. It is being completed as one segment of the New East Span corridor.

At the time of bid opening, the TBS was to have been completed within a short time period and be in service for two to three years. Due to changes in other East Span projects, the corridor schedule has been extended, and traffic will be on the detour longer than originally intended. To alleviate the burden upon the traveling public with reduced traffic lanes, construction work on the Tie-In segments will continue to be suspended until the corridor schedule is finalized.

All work is continuing to proceed with the design of the TBS segments and construction has proceeded with the Viaduct foundations and columns.

The requested enhancements are necessary as the Viaduct segment will be constructed ahead of the remaining segments and will need to stand alone for a period of one to two years. The current Viaduct design relies upon the East Tie-In for stability. Additional redundancy will also be included by means of this change to provide for extended service life and to improve seismic and wind response.

Under the original CCO 50, the design work was to proceed incrementally with the State providing direction at each step. The State had underestimated the amount of time to complete this design. Therefore, this work will be done under extra work at force account for an estimated cost of $ 100,000.00, which can be financed from the project's contingency funds. The original CCO 50 was financed with the project's supplemental works funds, which have all been used.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

Dan Adams - Design Engineer, Trinh Lai - Project Engineer, Ken Terpstra - Project Manager, and Robert Kobal - Headquarters' Assistant Construction Coordinator concur with this change. HQ CCO Desk provided I & A approval of this change on 12/08/06.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 50	Suppl. No. 3	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds to revise the currently proposed Viaduct segment design to stand alone and be de-coupled from the East Tie-In structure. The boundary conditions at Bents 48 and 52 shall assume no participation between the Viaduct and the West and East Tie-Ins. Perform additional exploratory, design, and check analysis as directed by the State's Engineer to complete this task.

Provide for the following enhancements to the current design:

* Provide connectivity in the form of structural steel struts or concrete bent caps between the columns located at Bents 49, 50, 51, & 52. Incorporate findings as applicable from the Design Study report generated by previous CCO 30.

* Provide additional support between the trusses and the top of columns 49, 50, 51, & 52 to prevent the truss chords from dropping vertically if the bearing keeper system shears off and fails.

The analysis shall be based on the three dimensional (3-D) computer model generated for CCO 49. The Contractor shall develop a task list for each request and coordinate with the Engineer to determine the process by which the work is to be executed. Each request shall be pre-approved by the States's Engineer prior to beginning work.

The foundation and substructure designs shall be re-analyzed based upon the directed changes.

The Contractor shall submit detailed biweekly invoices for payment of services.

Consideration of a time adjustment will be deferred until completion of work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07 Liquidated Damages of the Standard Specifications.

Estimated cost of Extra Work at Force Account $175,000.00

THIS CHANGE ORDER PROVIDES FOR:

Providing additional funds for revising the current Viaduct Design to stand alone and be de-coupled from the East Tie-In structure and to provide for specific enhancements to the current design as detailed in the original CCO 50.

This Contract requires that a temporary bypass structure (TBS) be designed and constructed by the Contractor to detour traffic on westbound and eastbound Highway 80 between the eastern portal of the tunnel on Yerba Buena Island to Pier E-1 on the San Francisco-Oakland Bay Bridge (SFOBB). The completed structure will allow a future permanent transition structure to be built tying in the New East Span to the existing. It is being completed as one segment of the New East Span corridor.

At the time of bid opening, the TBS was to have been completed within a short time period and be in service for two to three years. Due to changes in other East Span projects, the corridor schedule has been extended, and traffic will be on the detour longer than originally intended. To alleviate the burden upon the traveling public with reduced traffic lanes, construction work on the Tie-In segments will continue to be suspended until the corridor schedule is finalized.

All work is continuing to proceed with the design of the TBS segments and construction has proceeded with the Viaduct foundations and columns.

The requested enhancements are necessary as the Viaduct segment will be constructed ahead of the remaining segments and will need to stand alone for a period of one to two years. The current Viaduct design relies upon the East Tie-In for stability. Additional redundancy will also be included by means of this change to provide for extended service life and to improve seismic and wind response.

Under the original CCO 50, the design work was to proceed incrementally with the State providing direction at each step. The State had underestimated the amount of time to complete this design. Therefore, this work will be done under extra work at force account for an estimated cost of $ 175,000.00, which can be financed from the project's contingency funds, bringing the total amount allocated for this change order to $900,000.00. The original CCO 50 was financed with the project's supplemental works funds, which have all been used.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

Dan Adams - Design Engineer, Ken Terpstra - Project Manager, and Robert Kobal - Headquarters' Assistant Construction Coordinator concur with this change. HQ CCO Desk provided I & A approval of this change on 02/09/2007.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

475 Day(s)	**0** Day(s)	**1600** Day(s)	**337** %	**0**

THIS CHANGE ORDER PROVIDES FOR:

Providing additional funds for revising the current Viaduct Design to stand alone and be de-coupled from the East Tie-In structure and to provide for specific enhancements to the current design as detailed in the original CCO 50.

This project, the Yerba Buena Island Detour (YBID), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The YBID encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums, dated December 14, 2006 and December 25, 2006, approved by Tony Anziano - Toll Bridge Program Manager and Richard Land - Chief Engineer, recommended that the Department assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit work of the permanent Yerba Buena Island Transition Structure (YBITS) onto this project. The approval of these strategy memorandums extended the project completion date approximately 5 years.

Under the original CCO 50, the design work was to proceed incrementally with the State providing direction at each step. The State had underestimated the amount of time to complete this design. Therefore, this work will be done under extra work at force account for an estimated cost of $30,000.00, which can be financed from the project's contingency funds, bringing the total amount allocated to this change order to $930,000.00. The original CCO 50 was financed with the project's supplemental works funds, which have all been expended.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

No adjustment of contract time is warranted by this change, as it does not affect the controlling operation.

This change was concurred with by Alec Melkonians - Asst. Project Manager and Minh B. Nguyen - Project Engineer.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

CCO DESCRIPTION: NOPC 12 & 13 Resolution	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

This contract change order compensates the Contractor for additional costs associated with Notice of Potential Claim #12 for issues as outlined in the Contractor's proposal dated 4/3/06 and referenced in the following correspondence:

215-RFI-00.00017-00, 215-RFI-001.00018-0, 215-STL.00021, 215-STL.00148, 215-STL.00159, 215-STL.00160, 215-STT.00297, 215-STT.00312, 05.03.02-000210, 05.03.01-000172, 05.03.01-000193, 05.03.01-000468, 05.03.01-000494, 05.03.01-00525

The Department and the Contractor have agreed to share entitlement for costs to remove and dispose of the utility conduits and vault at Bent 48, as outlined in Notice of Potential Claim #12. The utility lines were shown on the contract plans, however, the utility vault was not shown. The Department will pay the cost for removing and disposing of the utility vault, including any vibration monitoring and restaking costs. The Contractor will pay the cost for the remobilization of the piledriving equipment.

Based on the cost break down submitted by the Contractor, the State agreed to settle this claim for a lump sum amount of $25,234.12, which can be financed from contingency funds available for this project.

Additionally, the Contractor also agrees to drop and no longer pursue NOPC # 13 for flagging issues on Macalla Road, as outlined in the Contractor's proposal dated 4/3/06 and referenced in the following correspondence:

215-2TT.00382, 215-STL.00183, 215-215.00400, 05.03.01-000452, 05.03.01-000565, 05.03.01-000591

Maintenance concurrence is not necessary with this change order as this does not change the final product.

No adjustment of contract time is warranted, as this change does not affect the controlling operation(s) of work.

It is recommended by the Resident Engineer that this Contract Change Order be approved.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 52	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

The Contractor is directed to cease design work on the East and West Tie-In segments of the Temporary Bypass Structure (TBS). Compensation for work completed to date shall be made by item payment.

The State will design, and provide plans and specifications for the Contractor to complete the construction of these segments.

The Contractor, Contractor's Engineer, Geotechnical Engineer, and Design Manager will maintain their responsibilities for the design construction, and certification of the construction for Viaduct segment of the Temporary Bypass Structure in accordance with the plans and specifications. The Viaduct shall be designed to stand alone in accordance with Contract Change Order No. 50.

All design references related to the Temporary Bypass Structure contained within the plans and specifications shall apply only to the Viaduct Segment.

The following separate change orders shall be issued to address the various issues related to this change:

1. Close out of Design Costs and any adjustments in item for work related to the East and West Tie-Ins
2. Construction costs for the State designed East and West Tie-Ins segments

Consideration of a time adjustment will be deferred until completion of the work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07, "Liquidated Damages," of the Standard Specifications.

For this work the contractor will be paid the agreed lump sum of $0.00. This sum constitutes full compensation, including markups, for this change.

Total cost of Adjustment of Compensation at Lump Sum Price $0.00

CCO DESCRIPTION: Elimination of Contract Tie-Ins	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**0** Day(s)	**0** %	**6**

THIS CHANGE ORDER PROVIDES FOR:

directing the Contractor to cease design work on the East Tie-In (ETI) and West Tie-In (WTI) segments of the Temporary Bypass Structure (TBS). The State will assume the design for the WTI and ETI, and provide plans and specifications to the Contractor for completion of these segments. The Contractor, Contractor's Engineer, and Design Manager shall maintain their roles and responsibilities under the current contract for the design, construction, and certification of the Viaduct segment of the TBS.

The TBS is being constructed to detour traffic from San Francisco Oakland Bay Bridge to allow the completion of the new east span. This Contract uses a performance based design and construct delivery method to expedite completion. The TBS is composed of the ETI, Viaduct, and WTI. At time of contract award the proposed SFOBB corridor was scheduled for completion in late 2006, requiring the TBS to be completed in 2005. Due to extensions in the corridor schedule the TBS detour will not be required to be in service until 2010. Furthermore, early opening of the TBS will impact the traveling public due to the lower posted speed limits, reduced lane width, and unconventional geometry. Therefore, it is desirable to delay the traveling public on the TBS for as long as possible.

West Tie-In

The existing structure within the limits of the WTI is comprised of a double deck concrete viaduct that was originally completed in 1936 and retrofitted in 1962. The State is in the process of designing the retrofit of the existing Yerba Buena Island Viaduct (YBIV) outside the current contract. By assuming design responsibility of the WTI under this change order, the permanent retrofit of YBIV can be combined with the WTI and therefore constructed prior to detouring traffic onto the TBS. Combining the design of the WTI with the necessary retrofit of the existing bridge will benefit the State by achieving seismic safety at an earlier date, reduce the overall time and traffic impacts to the public, and eliminate the need to reduce eastbound traffic lane widths to ten feet. Extensive structural reconfigurations will be avoided in the future with the integration of retrofit work.

East Tie-In

With the current contract, the State expected the contractor would utilize the Roll-Out/Roll-In (RORI) concept for the East Tie-In work. However, being a performance based contract, the bidding process allowed innovation and alternative designs. The Contractor's ETI design submitted to the State included several complexities that increased the risk of disruption to the traveling public during the construction phase, especially load transfer, increased the need for maintenance of the ETI during its service life and introduced unpredictable behavior of lateral loads. By assuming responsibility of the ETI and utilizing the RORI concept the State will advance a more predictable design, which allows accomplishing a load transfer in two stages during a single 24 hr bridge closure. Also, unlike the contractor's submitted design, the RORI design does not rely on material property and performance assumptions of the 70 year old structure, It is considered least disruptive to the traveling public.

The unknown risks associated with the contractors proposed design presents issues that the State found to be unacceptable. It is not certain that the Contractor's design would ever meet the State's requirements for limited risks and minimal impact to the traveling public. As a result, the State has decided that it will be best to assume this task it will be in a better position to manage its risks.

To implement this change, supplemental contract change orders will be necessary to address the following:

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

1. Construction of the State designed ETI and WTI structures.
2. Close out of Design costs and any adjustments in the contract items for work related to the East and West Tie-Ins.

Consideration of a time adjustment will be deferred pending completion of the work specified in this change order.

This change was discussed with and concurred by Tony Anziano - Toll Bridge Program Manager, Peter Siegenthaler - SFOBB Construction Manager, and Jon Tapping - Headquarters Construction Coordinator, Tom Ostrom - Office of Structure Design. TBPOC provided authorization to proceed with this change order per their meeting on May 31, 2006. FHWA authorzation is no longer required as federal authorization for this project has been officially withdrawn. This change is in accordance with the approved "SFOBB Corridor Schedule Mitigation - Strategy for South-South Detour Contract Completion".

Supporting documents and information are on file at the office of the Resident Engineer.

This Contract Change Order will be unilaterally approved as the Contractor has refused to sign on the basis that this change order does not contain specific language to address compensation for costs connected to the elimination of the design work. Attached is their letter 215-STT.00711

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 53	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

The Contractor is directed to cease further work on the partially completed eleven (11) cell modular joint seal proposed for use at the cantilevered joint on the Viaduct Segment of the Temporary Bypass Structure. The partially fabricated joint seal shall be kept at its currently stored location for salvage by State forces. The Contractor shall provide assistance as necessary to the State to facilitate the removal of the material.

Payment will be in accordance with Section 4-1.03D, Extra Work, of the Standard Specifications, and Section 5-1.24, Force Account Payment, of the Special Provisions, and no other compensation will be allowed therefor.

No adjustment in contract time will be made since this work is not a controlling operation.

A supplemental change order will be issued to take a credit for savings associated with elimination of work related to this change order.

Estimated cost of Extra Work at Force Account $240,000.00

0043

Estimated Cost: Increase ☑ Decrease ☐ $240,000.00

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Handling & Storage of Joint Seals	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**381** Day(s)	**80** %	**6**

THIS CHANGE ORDER PROVIDES FOR:

Cease further work on the partially completed eleven (11) cell modular joint seal proposed for use at the cantilevered joint on the Viaduct Segment of the Temporary Bypass Structure.

This Contract constructs a temporary bypass structure (TBS) to reroute traffic on existing Highway 80 to allow for the completion of the new San Francisco Oakland Bay Bridge. It was awarded as a "performance based design criteria project," which requires the Contractor to complete both the design and construction of the TBS. This delivery method was chosen to allow early contract award and completion by maximizing Contractor flexibility and efficiency in construction. As a result, early fabrication of the bridge components with long lead times is necessary to meet the construction schedule. This includes but is not limited to modular joint seals.

On March 16, 2006, the State directed the Contractor (Ltr 690) to redesign the Viaduct segment of the TBS to "stand alone" as it would be constructed prior to the adjacent East Tie-In segment. After analyzing the preliminary results of these efforts, it was determined that the joint seals as designed would be in conflict. On May 08, 2006, the Contractor was directed to cease further production on the joint seal and to store the material until such time that the revised joint seal requirements could be determined. After receiving the storage costs, it was determined that shipping the joint seals out to the job site for storage would be more economical as storage costs at the fabricator's shop was excessively high and it was unknown at the time when the East Tie-In design issues driving the joint configuration would be resolved.

On June 14, 2006, the State provided notice to the Contractor (Ltr 713) that the design of the East Tie-In and West Tie-In segments of the TBS would be completed by the State. At this point in time, it was still uncertain whether the partially fabricated joint seals could be reutilized.

On July 31, 2006, the State notified the Contractor (Ltr 730) that the joint seals will not be reused and requested that a final cost be provided. This letter was issued with concurrence from Tom Ostrom, Structures Design. The partially fabricated joint seal material will be salvaged by the Foundations Testing and Instrumentation branch. As the joint seal is currently on site, the cost of transporting the material for salvage exceeds any return value.

The cost for this joint seal was included as part of the lump sum contract item for constructing the Viaduct segment of the TBS. A supplemental change order will be issued to take a credit on this item once the future joint seal requirements are determined.

This change was concurred by Tom Ostrom - Office of Structure Design North, Ken Terpstra - SFOBB Project Manager, Robert Kobal - HQ Asst. Construction Coordinator, and Ken Darby - HQ CCO Desk.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation..

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

The Resident Engineer recommends this change order be approved.

0.6m x 0.075m scuppers into the barrier rail along the length of the Viaduct Superstructure in lieu of a conventional deck drain system. The opening at the face of the barrier shall be 600 mm with a wider opening of 625 mm on the back face.

The following table summarizes the spacing and location of the scuppers:

"WD1" Line (Upper Deck):

South Edge of Deck Limits	North Edge of Deck Limits	Spacing
54+65.3 – 54+02		8 m
54+02 – 53+32		10 m
53+32 – 52+89		3 m
	53+07 – 52+72	5 m
	52+72 – 51+82	10 m
	51+82 – 51+40.5	8 m

"ED1" Line (Lower Deck):

South Edge of Deck Limits	North Edge of Deck Limits	Spacing
54+65.3 – 53+30		10 m
53+30 – 52+94		5 m
	53+04 – 52+60	5 m
	52+60 – 51+80	10 m
	51+80 – 51+40.5	5 m

The proposed barrier rail shall be modified to incorporate this opening while maintaining its structural integrity.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO. 54

SHEET 5 OF 6

Temporary Bypass Structure – Deck Drainage Design

The Construction and Project Development Offices requested the Hydraulics Branch to provide the Deck Drainage design for the Temporary Bypass Structure (TBS). It was agreed that the TBS drainage should be designed utilizing the most hydraulically efficient and less complex system. Non-standard geometrics, one-foot shoulders, 10.5 feet lane widths, were some of the constraints encountered in designing a drainage system taking into account hydraulics capacity, traffic safety, structural integrity, and maintenance. All these factors were evaluated and it was concluded that the design should only consider scuppers. Scuppers are openings in the concrete barrier through which water can flow from the bridge deck.

Design Criteria

- Storm Design Frequency and Design Spread – Considering that this is a temporary structure that will be utilized for approximately five years, it was determined that a 10-year design frequency should be appropriate. The spread of water should be kept within the proposed one-foot shoulder; thus, proper scupper spacing should be determined to prevent risks associated with water in traffic lanes. However, in certain segments of the structure where the cross slope approaches to zero (superelevation reversals), the spread of water will infringe into the traffic lanes. At these locations the depth of water on the roadway can be considered insignificant; nevertheless a traffic management measure should be ready for implementation in the event that the spread of water on the roadway becomes unsafe to motorists.
- Speed of traffic – Traffic speed was a concern presented to the Traffic Branch, and they agreed that a mandatory traffic speed of 45 MPH would be posted at the approach of the TBS. Hydroplaning is a function of speeds greater than 45 MPH, water depth, and condition of the pavement surface.
- Pavement Surface – The Hydraulics Branch also requested that the Materials Branch should be contacted to recommend a pavement surface that would reduce the hydroplaning potential on the TBS. The use of open-graded asphalt concrete (AC) has been shown to greatly reduce the hydroplaning potential of the roadway surface; this reduction is due to the ability of the water to be forced through the pavement under the tire.
- Use of Scuppers – When scuppers are used to release water into the air, care must be taken that no erosion or damage occurs underneath. Water should never be discharged onto an embankment surface that lacks erosion protection. In locations where the free fall exceeds about 25 feet, the natural air movement will disperse the water enough not to erode the ground surface.

CCO DESCRIPTION: Deck Drainage Redesign			**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**381** Day(s)	**80** %	**6**

THIS CHANGE ORDER PROVIDES FOR:

The Contractor to provide a redesign of the barrier rail by incorporating the deck drainage barrier rail and scupper design drawings as per the attached plans and specifications. This redesign shall be incorporated into the deck drainage design as part of the Viaduct Superstructure submittal.

This Contract requires that the Temporary Bypass Structure (TBS) be designed and constructed by the Contractor to detour traffic from the San Francisco Oakland Bay Bridge (SFOBB) to allow for the completion of the new east span. At the time of contract award, the proposed SFOBB corridor was scheduled for completion in late 2006, requiring the TBS to be completed in 2005. Due to extensions in the corridor schedule, the TBS detour will not be required to be in service until 2009 and its service life has been extended an additional 4 - 5 years, thereby increasing the number of rainy seasons the TBS must sustain.

Given the structure geometry and lane configuration (narrow lanes and shoulders) as shown on the Contract plans, the deck drainage as initially proposed indicated water encroachment onto the travel way, which is not allowed per Department design standards. Listed in the design criteria is the Class-1 Drainage requirement that does not allow the use of scuppers. However, Caltrans Hydraulics Design determined that the use of scuppers offered the best solution and therefore recommended that the Class-1 Drainage requirement be eliminated from the design criteria so that scuppers can be incorporated into the design.

This work will be done under extra work at force account for an estimated cost of $ 8,000.00, which can be financed from the contingency fund.

Maintenance concurrence has been granted to gently slope the one-foot shoulder to create additional storage, while considering traffic safety concerns.

Adjustment to contract time in not warranted as this change does not affect the controlling operation.

This change has been discussed with and concurred by Trinh Lai - Project Engineer,Toll Bridge Design, Isacc Perez - CT Hydraulics, and Ken Brown - Maintenance.

Approval of this change order is recommended by the Resident Engineer.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 55	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications, compensate the Contractor for all outstanding costs incurred due to Department delays concerning the steel fabrication of the Temporary Bypass Structure, Viaduct (Contract Bid Item No. 11) superstructure at Shanghai Grand Tower Steel Structure Co., Ltd (SGT), located in Shanghai, China and due to the eventual relocation of this fabrication work from SGT to Dongkuk Structures & Construction Co., Ltd (Dongkuk), located in South Korea.

For this work, the Contractor will be compensated a lump sum of $5,665,330.00. This sum constitutes full and final compensation, except as specifically excluded herein, for all outstanding costs, including all markups, incurred due to the termination and relocation of viaduct superstructure fabrication from SGT to Dongkuk.

Compensation provided herein includes, but is not limited to, the following costs:

1) All additional costs incurred by the Contractor pertaining to SGT due to Department delays to the work and the termination of the purchase agreement with SGT.
2) All costs incurred in transporting materials and relocating the fabrication work from SGT to Dongkuk.
3) All additional costs incurred by the Contractor due to the fabrication work being performed by Dongkuk in lieu of SGT.
4) All costs associated with any repairs or heat straightening concerning the materials delivered from SGT to Dongkuk.
5) All costs incurred by the Contractor concerning Imbsen & Associates, Inc. in the review of SGT working drawings.

This change order acts as full and final compensation for all additional costs incurred by the Contractor concerning their original purchase agreement with SGT, dated January 2, 2004, and the amendment to this purchase agreement, entered into as of May 19, 2006, that terminated this purchase agreement.

Compensation for the following 3 items are specifically excluded from this change order:

1) Direct costs incurred by the Engineer of Record, Imbsen & Associates, Inc, as they pertain to the design approval process concerning the Temporary Bypass Structure, Viaduct (Contract Bid Item No. 13) superstructure.
2) Costs incurred by Dongkuk due to Department changes to the Temporary Bypass Structure, Viaduct (Contract Bid Item No. 11) superstructure that were incurred after the Contractor entered into a purchase agreement with Dongkuk on June 2 2006 and that are unrelated to the relocation of the fabrication work from SGT to Dongkuk.
3) Costs incurred by Dongkuk due to any potential Department delays to the fabrication of the Temporary Bypass Structure Viaduct (Contract Bid Item No. 11) superstructure that were incurred after the Contractor entered into a purchase agreement with Dongkuk on June 2 , 2006.

Costs concerning structural steel purchased by Dongkuk that pertains to the Contractor's as-planned steel viaduct superstructure is deferred and shall be paid through a supplemental change order. Compensation shall be paid for steel purchased by Dongkuk and invoiced to the Contractor, as stated in Exhibit A, Item 3 of the June 2, 2006 purchase agreement with Dongkuk. A 10% materials markup shall be added to the invoiced cost.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 55	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

Compensation provided under this change order includes $653,895.53 in direct costs invoiced by Imbsen & Associates, Inc to the Contractor concerning the review of SGT's viaduct working drawings and no additional compensation shall be paid for this work. Costs concerning the review of Dongkuk working drawings concerning the viaduct are not compensated under this change order. These costs shall remain in dispute as they pertain to Notice of Potential Claim No. 10 concerning the responsibility for the review of working drawings.

Total Cost of Adjustment of Compensation at Lump Sum $5,665,330.00

Estimated Cost: Increase ☑ Decrease ☐ **$5,665,330.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Change in Viaduct Fabrication	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**381** Day(s)	**80** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor for costs concerning the relocation of their viaduct steel fabrication operations from China to South Korea.

This contract was awarded on March 10, 2004 to construct a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the East Tie-In (ETI) to the bridge, the West Tie-In (WTI) to the island and the Viaduct structure between the two tie-ins. The contract was awarded as a performance based project, with the contractor responsible for meeting the design criteria specified in the contract, and was bid to be completed in 475 calendar days at a cost of $78,759,650.

The contract incurred three suspensions of work over the periods from April 9, 2004 through July 9, 2004, due to delays in the completion of the Substation project, and from September 3, 2004 through April 16, 2006, due to delays to the start of the Self Anchored Suspension Bridge project. Contract Change Order No. 14 and No. 24 provided for these suspensions of work. While these suspensions affected progress of the work, the design approval process of the three main structures continued. This change order concerns both Department delays due to both the suspensions of the work and the approval of the design of the steel viaduct structure that resulted in the fabrication of the structure being moved from China to South Korea.

The construction of the steel viaduct structure was bid under Contract Item No. 11 at a lump sum of $27,740,000 and the design of the viaduct was included under Contract Item No. 13, at a lump sum of $5,000,000, that included the design of the viaduct and the east and west tie ins. The contractor originally entered into a purchase agreement with Shanghai Grand Tower Steel Structure Co., Ltd (SGT), located in Shanghai, China, to fabricate the contractor designed steel truss superstructure which would be shipped to the project site and erected on the concrete columns built in place. The agreement called for the 4 truss spans to be shipped between December 1, 2004 and January 15, 2005.

These Department induced suspensions and delays in the viaduct structure design approval process resulted in significant delays to the fabrication work and eventually led to the relocation of the fabrication from SGT to Dongkuk Structures & Construction Co., Ltd (Dongkuk), located in South Korea. The work suspensions and delays to the design approval resulted in the contractor missing their fabrication window at SGT. A chronology and details of the design approval delays are listed below:

1) Rejection of the Use of Pot Bearings:
The contractor's original design submittal for the steel viaduct included the use of fixed pot bearings between the steel truss and their connection to the columns. In July of 2004 the Department rejected the use of these bearings and in response the contractor resubmitted their design employing lead core bearings. This led to added complications to the design of the structure due to the different seismic response realized from the change in bearings. By January of 2005, the Department recognized that the use of pot bearings provided a more predictable structural performance than the substituted lead core bearings and the contractor was allowed to reincorporate the bearing into their design. It wasn't until April of 2005 that the pot bearings gained final acceptance in the incorporated design.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

2) Floor Beam to Stringer Connection:
In December of 2004 the Department responded with numerous comments concerning the proposed connection of the floor beams to the stringers based on concerns regarding constructability and serviceability. By May of 2006, after 18 months of discussions with the designer, the Department elected to order design changes to the floor beam connection in order to satisfy the Department that the safety of the traveling public would be fully addressed. These design changes have now being implemented under Change Order No. 49.

3) Deck Drainage System:
The contractor's design proposed scuppers in the bridge deck to provide drainage for the structure's roadway. This proposal was rejected by the Department in May of 2004 based upon the contractual design criteria. After numerous iterations, the contractor stated their was no feasible alternatives to the proposed scuppers and the Department performed their own analysis. The result of this analysis was that it was determined that the design criteria, concerning the mandated cross slope and shoulders widths, provided in the contract didn't provide for adequate bridge drainage and the design criteria was amended to allow for the use of scuppers in the bridge deck. This issue wasn't fully resolved until June of 2006.

4) Department Adoption of Viaduct Design:
Throughout the viaduct design approval process, the Department had technical concerns and design preference differences with several components of the contractor's proposed design of the viaduct. Delays to the main SFOBB Self Anchored Suspension Bridge presented 2 issues to this project. First, it presented the probability of the detour structure being in use for a significantly longer period than originally anticipated. Second, it provided a schedule window that allowed for a more thorough design review to be conducted. These factors resulted in the Department ordering design changes concerning the floor beam and stringer connection (Change order No. 49) and the addition of bent caps to the as-planned columns (Change Order No. 50). While these changes will act to improve the structure's performance over its anticipated extended service life, they have also resulted in significant delays to the fabrication of the viaduct.

Based on these suspensions of the work and the design delays discussed above, the fabrication of the steel viaduct structure was significantly delayed. The contractor initially intended to begin fabrication work at SGT during the summer of 2004. The actual fabrication of the viaduct didn't fully begin until November of 2006.

By January of 2006, the contractor began notifying the Department that their SGT fabrication window was no longer guaranteed. At this time, SGT had received significant domestic contracts concerning the 2008 Olympics that, after 18 months of delays incurred due to the suspensions and design approval process, pushed the viaduct fabrication work off of their schedule. By April of 2006, the contractor had determined SGT could no longer guarantee delivery of the viaduct structure and an alternative fabricator, Dongkuk, was located in South Korea. This change order provides compensation for this fabrication relocation due to the significant Department delays to the approval of the proposed viaduct steel structure.

Compensation has been determined based upon Section 4-1.03 "Changes" of the Standard Specifications and a review of the original SGT purchase agreement, the close out SGT purchase agreement and the new Dongkuk purchase agreement. Major costs include delays costs incurred at SGT, additional labor and plant costs at Dongkuk inherent in move to a higher cost environment compared to China, transportation costs associated with shipping the purchased raw steel from Shanghai to Dongkuk's fabrication yard in South Korea and SGT shop drawing review costs incurred by the contractor's designer.

Compensation shall be paid as an Adjustment of Compensation at an Agreed Lump Sum of $5,665,330.00 that shall be financed from the contract's contingency fund. A cost analysis is on file.

Compensation concerning any structural steel purchase by Dongkuk required as part of the as-planned viaduct superstructure is deferred as these costs have not been quantified to date. The total costs of this deferred item is estimated to be less than $1,000,000.

This change order provides compensation for all costs incurred due to fabrication delays at SGT, the relocation of the fabrication work from SGT to Dongkuk and the transportation costs of all materials from SGT to Dongkuk. It is anticipated additional costs shall be claimed by the contractor concerning delays and changes to the fabrication of the viaduct steel truss at Dongkuk that occurred after June 2, 2006 when the purchase agreement with Dongkuk was signed. These costs shall be addressed through a subsequent change order.

Costs incurred by the Contractor's designer, Imbsen & Associates, Inc., pertaining to the viaduct design approval process are excluded from this change order. These costs are being addressed on a global basis, along with design approval costs associated with the East and West Tie-In structures, under Notice of Potential Claims No. 2, 3, 8, 9 and 16.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

Despite the significant delays incurred to the viaduct steel fabrication, more extensive delays have been incurred to the design approval to the two tie-in structures with the design now being directed by the Department. No adjustment of contract time is warranted for this change as these tie-in structure designs are the controlling operation on the project.

Approval to negotiate this change was granted by the Toll Bridge Program Oversight Committee (TBPOC) in April 18, 2006. The total cost to terminate the SGT contract, relocate the fabrication to Dongkuk, and to implement the design changes to the viaduct was approved at a cost not to exceed $13,500,00.00. This change was discussed and concurred by Ken Terpstra - Project Manager on 6/7/07.

Maintenance concurrence is not required as the change order does not affect any permanent roadway features.

Supporting documents and information are on file at the office of the Resident Engineer.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 55	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Provide compensation to the Contractor for all costs associated with furnishing raw steel that was incurred due to the relocation of the steel Viaduct superstructure fabrication work of the Temporary Bypass Structure (Bridge No. 34-0006 (TEMP)) from Shanghai Grand Tower Steel Structure Co., Ltd (SGT) to Dongkuk Structures & Construction Co., LTD (Dongkuk) and to all Department ordered design enhancements to the Viaduct that were incorporated into the approved Viaduct plans dated October 9, 2006.

This change order provides full compensation for all costs associated with furnishing raw structural steel that was deferred under the original Contract Change Order No. 55 and for furnishing all raw steel due to the Department ordered design enhancements implemented under Contract Change Orders No. 49 and No. 50 that were incorporated into the approved Viaduct plans dated October 9, 2006.

This change order provides for full and final compensation of all costs associated with furnishing raw steel due to all Department delays, Department ordered design enhancements, and Department impacts to the design pertaining to the approved Viaduct plans dated October 9, 2006.

Compensation for any raw steel purchased due to Department design enhancements ordered under Contract Change Orders No. 50 and No. 67 that were incorporated into the approved Viaduct plans dated July 19, 2007 is not addressed by this change order.

Total Cost of Adjustment of Compensation at Lump Sum $980,600.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$980,600.00**

CCO DESCRIPTION: SGT to Dongkuk Material Closeout	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Compensation to the contractor for the costs of purchasing raw steel associated with the fabrication of the Viaduct structure.

This contract calls for construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consist of three main structures, the East Tie-In to the bridge, the West Tie-In to the island and the Viaduct structure between the two tie-ins. The contract was awarded as a performance based project with the contractor responsible for meeting the design criteria specified in the contract.

The original Contract Change Order No. 55 provided compensation for costs incurred in the relocation of the Viaduct fabrication work from Shanghai Grand Tower Steel Structure Co., Ltd (SGT) in China to Dongkuk Structures & Construction Co., LTD (Dongkuk) in South Korea. Costs associated with any additional raw steel purchases required to complete the as-planned fabrication work were deferred under that change order. This supplement compensates the contractor for those deferred costs which have now been documented.

Compensation is also provided for the cost of raw steel purchases associated with Department ordered design enhancements to the Viaduct that were incorporated into the contractor designed plan sheets under executed Change Orders No. 49 and 50. These changes concerned enhancements ordered to the steel truss concerning the connection of the floor beams and stringers and the addition of stopper blocks and brackets at the bent caps. Compensation for the raw steel costs are included under this supplement as the additional steel associated with the as-planned work and the ordered design enhancement were purchased together and are difficult to segregate (both quantitatively and administratively). Additional fabrication costs associated with design enhancements shall be compensated under a separate change order.

Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $980,600.00 that will be financed from the contract's contingency fund. A cost analysis is on file.

The original Contract Change Order No. 55 was approved by the Toll Bridge Program Oversight Committee (TBPOC) on June 27, 2007. At that time, the deferred cost of furnishing raw steel covered under this supplement was approved at a cost not to exceed $1,000,000.00. Approximately $550,000.00 of the total $980,600.00 of costs is directly related to these deferred costs from the original change order with the remaining costs associated with the Department ordered design enhancements.

This change was concurred by Alec Melkonians - Asst. Project Manager.

Maintenance concurrence is not required as the change order doesn't affect any permanent roadway features.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 56	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

In accordance with Section 4-1.03 "Changes" of the contract Standard Specifications and with the Dispute Review Board's recommendation pertaining to Notice of Potential Claim No. 3 "East Tie-In Design Criteria", provide compensation to the Contractor for additional costs incurred by the Contractor's subcontractor TRC Imbsen due to the Department's involvement in the design process concerning Contract Bid Item No. 13 "Contractor Design" and the eventual assumption of the design responsibility of the East Tie-In and West Tie-In structures by the Department.

For this work, the Contractor will be compensated a lump sum of $6,837,310.00 in addition to the lump sum price paid for Contract Bid Item No. 13. Except for outstanding costs pertaining to the 5 change orders mentioned below, this sum constitutes full and final compensation for all outstanding costs, both past and future, pertaining to work performed by TRC Imbsen, including all subsidiaries and subcontractors, and no additional compensation shall be paid concerning these costs.

Outstanding design and review costs, both past and future, incurred by TRC Imbsen associated with Department ordered design enhancements and design coordination implemented under Change Orders No. 49, No. 50, No. 67, No. 105, and No. 109 are excluded from this change order and shall be compensated under those respective change orders.

Except for the 3 items of work specifically excluded below, this change order resolves all outstanding costs associated with the following Notice of Potential Claims and no additional compensation shall be paid:

1) Notice of Potential Claim No. 2 – Bolted Connection Design Criteria
2) Notice of Potential Claim No. 3 – East Tie-In Design Criteria
3) Notice of Potential Claim No. 4 – Pile Dynamic Monitoring
4) Notice of Potential Claim No. 8 – Rejection of Viaduct Pot Bearing Design
5) Notice of Potential Claim No. 9 - Rejection of Viaduct Deck Drainage Design
6) Notice of Potential Claim No. 10 – Review & Approval of Shop Drawings
7) Notice of Potential Claim No. 11 – Testing of Micropiles
8) Notice of Potential Claim No. 14 – CIDH Pile Inspection
9) Notice of Potential Claim No. 16 – Department Involvement in Design Process

Costs associated with the 3 items of work listed below, as they pertain to the 9 notice of potential claims listed above, have not been addressed by this change order and shall remain outstanding:

1) Any outstanding escalation costs incurred by the Contractor or their subcontractor's, excluding TRC Imbsen, due to Department caused delays to the contract work.

2) Any outstanding costs associated with the fabrication and construction of the viaduct structure due to Department ordered design enhancements implemented under Change Orders No. 49, No. 50 and No. 67.

3) Any outstanding costs associated with the actual construction of the approved Viaduct deck drainage system.

The lump sum compensation provided under this change order includes direct compensation of $6,190,000.00 to TRC Imbsen for the full resolution of all outstanding costs incurred on Notice of Potential Claims No. 2, No. 3, No. 8, No. 9 and No. 16.

Total Cost of Adjustment of Compensation at Lump Sum $6,837,310.00

Contractor Acceptance by

Signature	(Print name and title)	Date
	DANIEL F. HOMICK, PRESIDENT	3/17/08

Quantification of the design costs, concerning the application of an appropriate markup and fee, was based on a recently approved consulting contract that the designer, TRC Imbsen, has with the Department. Consulting Services has also confirmed the markup and fee applied is appropriate.

In the review of the contractor's actual documented costs, a significant deduction was also made for perceived contractor design issues unrelated to the Department's involvement. These design issues most appropriately can be attributed to the revised design criteria of the ETI and numerous design issues related to the Viaduct structure. Additionally, submitted costs related to the NOPC's cost quantification and recovery were excluded in accordance with the contract specifications. The resulting compensation owed to the contractor, due to Department caused impacts and delays, was found to be $6,837,300. This sum includes interest and a subcontractor markup as defined within the contract's special provisions. A summary of this cost analysis is attached.

The project's funding agency the Bay Area Toll Authority has performed an independent analysis concerning the contractor's submitted costs which looked at the additional plan sheets required in the submittal review process. The analysis employed historical data reflecting typical design hours incurred per plan sheet. The result of the analysis supported the actual design hours documented by the contractor and resulted in a recommendation of compensation not to exceed $7,529,400.00.

This change order provides compensation in the amount of $6,837,310 for all Department changes and delays in the design process. Compensation shall be paid as an adjustment of compensation at an agreed lump sum of $6,837,310 which shall be financed from the contract's contingency funds. A detailed cost estimate is on file.

The change order will act to resolve all outstanding costs associated with the 9 NOPC's related to the design of the TBS. Escalation costs, excluding design costs, resulting from Department delays, costs associated with the Department's ordered design enhancements and costs associated with the approved deck drainage system aren't addressed by this change order. Costs associated with the Department ordered design enhancements shall be paid under the approved change orders specified for that work.

Adjustment of contract time is deferred as the involvement in the design process may affect the controlling operation.

Maintenance concurrence is not required as this is an administrative change and doesn't affect any permanent roadway features.

1) The retrofit of a 350 foot section of the concrete deck approaching the Yerba Buena Tunnel was re-sequenced to be performed within the TBS project as opposed to a separate contract after traffic is placed on the new SFOBB.
2) The responsibility for the design of both the WTI and ETI structures were taken from the contractor and assumed by the Department.
3) Numerous design enhancements were ordered to the Viaduct in order to create a stand-alone structure.

This changed Department strategy was documented in a December 14, 2006 strategy memo that was approved by Tony Anziano, Toll Bridge Program Manager, Richard Land, Chief Engineer and the TBPOC.
3) Department Involvement in the Design Process -
During the same 2-year time period that the SAS was experiencing funding issues, the TBS project was experiencing it's own delays concerning the approval of the contractor's design submittals. These delays stemmed from conflicting interpretations of the contract design criteria and the Department's limited comfort level with the proposed design.

One of the more significant issues with the design of the TBS concerned the ETI structure. The contract design criteria for the ETI called for a roll out / roll in design where a new truss span would be constructed adjacent to the existing span. Once completed, the new span would be rolled into place after the existing span was rolled out. Upon the TBS bid opening in December of 2003, the 3 low bidders (of 4 total bidders) all submitted a design that called for the existing structure to be incorporated into the ETI structure as opposed to the roll out / roll in method called for in the plans. After considerable review of this design alternative, the concept was approved by the Department and the contract was awarded to the low bidder CC Myers Inc (CCM) in March of 2004.

This alternative design of the ETI resulted in continuous disputes between the contractor and the Department during the design and review process. One particular dispute (Notice of Potential Claim No 3), concerning the contractor's submittal of a revised design criteria for the alternative design, was brought to the project's Dispute Review Board (DRB). The DRB ruled that the Department's request for a revised design criteria was reasonable but found such fault with the Department's design review and approval process that they recommended the contractor's costs and any delays be compensated by the Department. The DRB commented that "the review process Caltrans employed in the CCM alternative design for the design criteria and for the design was sufficiently protracted, delayed, ambiguous, contradictory and confusing to cause CCM unreasonably delay and extra costs".

While the DRB determination was specific to the ETI design criteria, their observations concerning the Department's involvement in the design process are consistent with the review process of the entire TBS. The Department lacked a comfort level with the proposed design throughout the design process that the safety of the traveling public wasn't being fully addressed. While the extended SFOBB corridor schedule allowed for a more thorough review, these concerns eventually had to be addressed by assuming the design of the ETI and WTI structures and ordering enhancements to the Viaduct. Unfortunately, addressing these concerns often stepped outside of the contractual design criteria parameters.

Based on the Department's strategy memo discussed above, the contractor's design on the ETI and WTI was suspended by Change Order No. 52 and the Department assumed control over the design. Change Orders No. 49 and 50 were issued to compensate the contractor for design costs related to the ordered design enhancements to the Viaduct. These change orders covered only direct costs associated with the ordered enhancements and no compensation for impact costs resulting from the Department's prior review and approval process of the contractor's design submittals were addressed.

The contractor has submitted 9 separate Notices of Potential Claims (NOPC's) concerning the design of the TBS and the Department's involvement in the design process with all of these NOPC's initially being rejected based on merit. After the adverse DRB findings and recommendation concerning NOPC No. 3, these rejections have now been revisited. Based on the DRB's assessment of the Department's involvement in the design process, the extension of the SFOBB corridor schedule and the Department's eventual assumption of the design for the ETI and WTI, it has been determined that the Department's involvement in the contractor's design process constitutes a change in character of the contemplated work.

The total submitted cost of the 9 NOPC's was $9,158,570, including interest through January of 2007. These costs have been analyzed in accordance with Section 4-1.03 "Change in Character" of the Standard Specifications comparing as-planned cost to those actually incurred. Actual design costs were documented on both a daily and individual basis and subcontracted design costs were documented by the actual invoices billed to the designer. These costs have been found to be supportable based upon the Department's knowledge of the work performed within the design campus environment and by an independent analysis performed by the Bay Area Toll Authority (see below).

THIS CHANGE ORDER PROVIDES FOR:

compensation to the contractor for additional costs related to the contractor's performance based design process.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 under a construction schedule that anticipated a traffic opening on the new east span of the San Francisco Oakland Bay Bridge (SFOBB) in late 2006. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins. In order to facilitate the 2006 SFOBB milestone, and to implement a traffic switch as early as possible on to the transitional structure , several incentives and permissible delivery mechanisms were included in the TBS contract. These included an A + B bid specification to encourage an aggressive construction schedule and a performance based design criteria to allow contractor efficiencies.

Contract Bid Item No. 13 "Contractor Design" consisted of the contractor designing and providing detailed plan sheets, technical special provisions and quantities for the project's three main structures based upon the design criteria set forth in the contract. The contractor bid $5,000,000 to perform this work. The design process was specified to include 3 progressive design submittals called out as the preliminary design submittal, the final design submittal and the construction submittal with the Department able to review and provide comments to each submittal in order to ensure the design met the specified design criteria. The Department would then authorize the design for construction and the plans would become the contract plans for the project.

Based on a review of the CPM schedule and bid documents, the contractor planned on completing this design process and achieving authorization to construct within 9 months after the project's bid opening. The actual design work ending up taking 34 months to achieve authorization to construct the Viaduct with authorization never obtained for the ETI and WTI structures after over 30 months of design effort was expended. The reasons for this extended design period are outlined below:

1) Extended SFOBB Corridor Schedule –
After the award of the TBS project, the Self Anchored Suspension (SAS) structure, the signature structure of the east span SFOBB replacement, was significantly delayed due to funding issues that stemmed from it's May 2004 bid opening. This SAS delay continued into March of 2006 when a revised funding package was implemented and the contract was successfully re-bid. In April 2006 the revised SFOBB corridor schedule anticipated a westbound traffic opening in 2012 (6 years later than the original schedule).

This corridor delay resulted in construction activities on the TBS project being substantially suspended from September 2004 through January 2007. While the design process continued, the urgency to approve the design was eliminated and this allowed the Department additional time to review and comment on the proposed design.

2) Changed Department Strategy -
The extended delay to the corridor schedule presented challenges to the TBS project in that the Department, via the Toll Bridge Program Oversight Committee (TBPOC), expressed concern about the length of time traffic would be utilizing the TBS and indicated that the schedule should be adjusted to more closely tie the use of the transitional structure to the revised corridor schedule. This schedule adjustment along with the design disputes being realized led the Department to take the following action on the TBS project:

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 57	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Remove and dispose of United States Coast Guard Building No. 206, including the building foundation.

Building No. 206 contain asbestos and lead-based paint and shall be handled in accordance with the Special Provisions Section 10-1.38 and Section 7-1.06 "Safety and Health Provisions" of the Standard Specifications.

For demolishing and removing Building No. 206, the contractor is absolved of any responsibility to redesign and reconstruc a building of equal functional utility, as originally required per Special Provisions Section 10-1.38.

For this work the contractor will be paid the agreed lump sum of $22,377.60. This sum constitutes full compensation including all markups, for furnishing all labor, materials, tools, equipment and incidentals for doing all the work stated above in the change.

Estimated cost of Adjustment of Compensation at Lump Sum $22,377.60

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$22,377.60**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: Demolish Building 206	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

LOCATION: IN THE CITY AND COUNTY OF SAN FRANCISCO FROM YERBA BUENA TUNNEL TO 0.6 KM EAST OF THE YERBA BUENA TUNNEL

THIS CHANGE ORDER PROVIDES FOR:

compensation for removal and disposal of United States Coast Guard Building No. 206 including the building foundation.

The Office of Toll Bridge Design provided a memorandum recommending a change order be written to demolish Building No. 206. After consulting with the United States Coast Guard and the Office of Right-of-Way, it was determined that Building No. 206 should be demolished at this time due to space constraints and constructability issues over the construction of the Temporary Bypass Structure.

Per agreement with the United States Coast Guard, the contractor is absolved of any responsibility to redesign and reconstruct a building of equal functional utility, as originally required per Special Provisions Section 10-1.38, for demolishing and removing Building No. 206.

Payment for the work of this change order will be at Adjustment of Compensation at an Agreed Lump Sum of $22,377.60. This price is found to be fair and reasonable based on a force account analysis submitted by the Contractor and verified by the Engineer. This analysis is on file.

No adjustment of contract time is warranted, as this change does not affect the controlling operations.

This change has been discussed with and concurred by Scott Peterein - United States Coast Guard and Mark Shindler - Office of Right-of-Way.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

The Resident Engineer recommends this change order be approved.

475 Day(s)	**0** Day(s)	**381** Day(s)	**80** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

additional funds to develop a detailed and expedited bridge removal plan for the existing concrete viaduct located between Bents 39 and 48. The Contractor shall utilize the necessary means and methods to achieve the desired goal of complete removal within a twenty-four (24) hour period. Once determination to implement said plan has been made, a forthcoming Contract Change Order will administer the costs of the actual work.

The Temporary Bypass Structure (TBS) is being constructed to detour traffic on existing Westbound and Eastbound I-80 to facilitate the completion of the new east span of the San Francisco-Oakland Bay Bridge. This Contract uses a performance based Contractor design and construct delivery method to expedite completion. The TBS is composed of three separate segments, the East Tie-In (ETI), the Viaduct, and the West Tie-In (WTI).

On June 14, 2006, the State formally notified the Contractor that the design responsibility for the ETI and WTI would be transferred from the Contractor to the State.

The type selection executed by the State for the WTI structure determined that the removal of the existing concrete viaduct and the "rolling-in" of a replacement structure would offer the best solution with regards to risk and impacts to future traffic. The original WTI plan as proposed by the Contractor did not require the replacement of the existing concrete viaduct.

As part of the selection process, a feasibility study must be completed to determine if the entire operation can be completed within a set time limit requiring the bridge removal plan be produced by the Contractor. The Office of Structure Design has requested that a Contract Change Order be executed to have the Contractor develop a detailed bridge removal plan as constructability analyses.

This work will be done under extra work at force account for an estimated cost of $ 40,000.00, which can be financed from the contingency fund.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

No time adjustment in contract time will be made since this work is not a controlling item.

Supporting documents and information relative to this change order are on file at the Resident Engineer's office.

475 Day(s)	**0** Day(s)	**381** Day(s)	**80** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Cleaning reinforcement bars for column cages at bents 48, 51L, 52R, 52L, and 53R of the Viaduct section prior to continuing work at these locations.

This Contract originally required that a Temporary Bypass Structure (TBS) be designed and constructed to facilitate the completion of the San Francisco-Oakland Bay Bridge corridor projects by the winter of 2006. The primary goal of the corridor projects is to achieve seismic safety as soon as possible. Due to extensions in the corridor schedule, the TBS will not be required to be in service until late 2009.

The Temporary Bypass Structure is a design and construct project. The Contractor suspended construction of the above-mentioned columns when the Department directed design changes to the contractor's original design. While design changes were being finalized, the reinforcement bars where exposed to the elements and suffered corrosion and chloride accumulation.

The reinforcement bars at bents 51L, 52R, and 52L have chloride accumulation and need to be pressure washed, and the reinforcement bars at bents 48 and 53R have rust and concrete residue and need to be blast cleaned.

This work has been recommend by Andy Rogerson - Office of Chemical Testing and Tom Ostrom - Office of Bridge Design.

This work is not covered under the contract items. Therefore, this work will be done under Extra Work at Force Account for an estimated total of $5,000.00, which can be financed from the contingency plan. A force account analysis is in the project files.

Adjustment to contract time in not warranted as this change does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 59 Suppl. No. 1 Contract No. 04 - 0120R4 Road SF-80-12.6/13.2 FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds to clean column cage reinforcement bars at bents 48, 51L, 52R, 52L, and 53R. Pressure wash reinforcement bars at bents 51L, 52R, and 52L to remove chlorides. Remove surface rust and concrete on exposed reinforcement bars at bents 48, and 53R. Cleaning shall be preformed prior to restarting work at these bents and reinforcement bars shall be protected from further corrosion.

This work will be paid for in accordance with Section 5-1.24 "Force Account Payment" of the Special Provisions and Section 4-1.03D "Extra Work" of the Standard Specifications.

Estimated Cost of Extra Work at Force Account $5,000.00

Estimated Cost: Increase ☑ Decrease ☐ $5,000.00

By reason of this order the time of completion will be adjusted as follows: 0 days

THIS CHANGE ORDER PROVIDES FOR:

Additional funding for the work defined under the original Change Order No. 59.

The original Change Order No. 59 along with Supplement No. 1 provided for the pressure washing and cleaning of reinforcing steel on the Viaduct structure that had been exposed to the elements over an extended period of time due to Department caused delays to the work. The existing funding has now been depleted and additional funds of $15,000 shall be required to complete the work.

The work shall be performed as extra work at force account at an estimated cost of $15,000 and shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the work will not affect the controlling operation.

Maintenance concurrence is not required as this change order does not affect any permanent roadway features.
Concurrence received from Proj. Engr Minh Nguyen and Proj. Manager Alec Melkonians.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 60	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Furnish labor, equipment, material, supplies and other resources as required to modify the Viaduct portion of the South-South Detour Temporary Bypass Structure (Br. No. 34-0006 Temp.) in accordance with the attached plans and specifications (Sheets 3 through 25 of this Contract Change Order) prepared by the Contractor's Engineer under approved CCO No. 50.

The work includes the following:

1) Construct concrete bent caps at Bents 49R/L, 50R/L, 51R/L, and 52R/L.
2) Remove concrete and reconstruct columns at Bents 49R/L, 50R/L, and 51R.
3) Construct concrete stopper blocks and concrete pedestals at Bents 49R/L, 50R/L, 51R/L, and 52R/L.
4) Furnish and install steel stopper blocks at Bents 49R/L, 50R/L, 51R/L, and 52R/L.
5) Furnish and install bearing anchor bolts at Bents 49R/L, 50R/L, 51R/L, and 52R/L.

Items of work not included as part of this change order:

1) Furnish and install stopper blocks at Bents 49 R/L, 50R/L, 51R/L, and 52R/L that attach to the superstructure floor beams as shown on the attached plans shall be compensated for under separate change order.

2) Compensation for all additional SWPPP work associated with this change shall be compensated for separately.

3) Time related costs and impacts, if any, as a result of this change shall be compensated for under separate change orde

Consideration of a time adjustment will be deferred until completion of work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07 Liquidated Damages of the Standard Specifications.

For this work, the Contractor will be paid the sum of $7,435,950.00. This amount constitutes full compensation, including all markups, for all labor, equipment, materials, and incidentals to complete the work of this change.

Total Cost of Extra Work at Lump Sum $7,435,950.00

CONTRACT CHANGE ORDER NO 60

SHEET 4 OF 25

10-5.02 GENERAL DEFINITIONS OF EXISTING HIGHWAY FACILITIES WORK

TYPE OF WORK	DEFINITION
REMOVE	Remove and dispose of.
ABANDON	Render unserviceable, in place, by doing some kind of work.
SALVAGE	Remove, clean, haul, unload, and stack neatly at recycle center.
RESET	Remove and install or place at same station location. May be moved laterally only. No alteration required.
RELOCATE	Remove and install or place in a new location. No alteration required.
RECONSTRUCT	Remove and disassemble and construct again at an existing or new location. New parts or alteration may or may not be required.
ADJUST	Raise or lower a facility to match a new grade line. Generally associated with raising frame and grate or frame and cover of facilities on resurfacing projects. May require some removal. Includes raising or lowering of frame and cover or frame and grate of concrete or brick manholes or circular precast concrete pipe structures by adding or subtracting raising devices only. Any changes to taper of manhole or steps is "remodel."
MODIFY	A change which does not affect the basic framework or structure with an addition and/or subtraction to an appurtenant part. May require some removal. Includes raising or lowering frame and cover or frame and grate of drainage inlets by removing concrete or adding concrete.
REMODEL	Rebuild facility in same location. May require some removal.
RELAY	Remove and lay in an existing or new location. Generally used for pipes or culverts and appurtenances.

10-5.03 RECONSTRUCT SANITARY SEWER

Existing sanitary sewer, at the location shown on the plans, shall be removed and reconstructed to conform to the details shown on the City and County of San Francisco, Department of Public Works, Standard Plans and in accordance with the provisions of the City and County of San Francisco, Department of Public Works, Standard Specifications and these special provisions.

Full compensation for removing and disposing of the existing sanitary sewer and then reconstructing sanitary sewer in its new location shall be considered as included in the contract prices paid for the various items of work involved and no separate payment will be made therefor.

CCO #60

10-5.04 BRIDGE REMOVAL

Removing portions of the As-Built Viaduct substructure shall conform to the provisions in Section 15-4, "Bridge Removal," of the Standard Specifications, the special provisions, and these STSP.

The upper portion, as shown on the plans, of the columns in Bent 49, Bent 50, Bent 51, and Bent 52 shall be removed.

Removed materials that are not to be salvaged or used in the reconstruction shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

10-5.05 ASPHALT CONCRETE

Asphalt concrete shall be Type Open Graded and shall conform to the provisions in Section 39, "Asphalt Concrete," of the Standard Specifications dated May 2006, the special provisions, and these STSP.

Open graded asphalt concrete may be placed when the atmospheric temperature is below 20° C, but above 10° C, provided the following requirements are met:

A. The aggregate grading shall be 12.5-mm maximum.
B. Open graded asphalt concrete shall not be placed in stockpile. Open graded asphalt concrete shall be transferred directly from the hauling vehicle to the asphalt paver hopper.
C. Open graded asphalt concrete shall be not less than 30-mm in compacted thickness except at scuppers as shown on the plans.

consecutive days, and there are no mass concrete elements to be cast adjacent. Data shall be printed and submitted to the Engineer daily.

Methods of concrete consolidation shall prevent damage to the temperature monitoring and recording system. Wiring from temperature sensors cast into the concrete shall be protected to prevent movement. Wire runs shall be kept as short as possible. The ends of the temperature sensors shall not come into contact with either a support or concrete form, or bar reinforcing steel.

When any equipment used in the temperature control and monitoring and recording system fails during the mass concrete construction operation, the Contractor shall take immediate measures to correct the situation as specified in the Thermal Control Plan. Failure to conform to the temperature requirements will be cause for rejection of the concrete.

Acceptance

Mass concrete shall conform to the concrete acceptance criteria and the following temperature requirements:

A. The maximum allowable temperature of mass concrete shall not exceed 70°C.
B. The maximum temperature differential of mass concrete shall not exceed the requirement as determined in the Thermal Control Plan.

If the Contractor fails to conform to any of the temperature requirements above, the mass concrete elements shall be rejected. The rejected mass concrete shall be removed at the Contractor's expense. The Contractor shall modify the Thermal Control Plan and design calculations to correct the problem and resubmit the revised Thermal Control Plan.

The Contractor shall allow the Engineer 2 weeks for review and approval of the revised Thermal Control Plan. Mass concrete placement shall not begin until the Engineer has approved the revised Thermal Control Plan. No extension of time or compensation will be made for any rejected mass concrete element or revisions of the Thermal Control Plan.

Mass concrete will not be measured for payment.

Full compensation for conforming to the above requirements shall be considered as included in the contract prices paid for the various items of work involved and no additional compensation will be allowed therefor.

FALSEWORK

Falsework shall conform to the provisions in Section 51, "Concrete Structures," of the Standard Specifications and these STSP.

Where falsework is supported on the deck of a structure, construction shall conform to the following:

A. Falsework shall bear directly on the girder stems or bent caps of the supporting structure or shall bear on falsework sills which are structurally adequate to transmit the load to the stems or cap without stress to the deck slab.
B. Additional falsework shall be in place beneath the supporting structure whenever construction loads are imposed upon the supporting structure. Such additional falsework shall be designed and constructed to support all construction loads imposed upon the supporting structure from the upper structure.

CCO #60

Welding and Nondestructive Testing

Welding of steel members, except for previously welded splices and except for when fillet welds are used where load demands are less than or equal to 175 N/mm for each 3 mm of fillet weld, shall conform to AWS D1.1 or other recognized welding standard. The welding standard to be utilized shall be specified by the Contractor on the working drawings. Previously welded splices for falsework members are defined as splices made prior to the member being shipped to the project site.

Splices made by field welding of steel beams at the project site shall undergo nondestructive testing (NDT). At the option of the Contractor, either ultrasonic testing (UT) or radiographic testing (RT) shall be used as the method of NDT for each field weld and any repair made to a previously welded splice in a steel beam. Testing shall be performed at locations selected by the Contractor. The length of a splice weld where NDT is to be performed, shall be a cumulative weld length equal to 25 percent of the original splice weld length. The cover pass shall be ground smooth at the locations to be tested. The acceptance criteria shall conform to the requirements of AWS D1.1, Section 6, for cyclically loaded nontubular connections subject to tensile stress. If repairs are required in a portion

CCO #60

of the weld, additional NDT shall be performed on the repaired sections. The NDT method chosen shall be used for an entire splice evaluation including any required repairs.

For all field welded splices, the Contractor shall furnish to the Engineer a letter of certification which certifies that all welding and NDT, including visual inspection, are in conformance with the specifications and the welding standard shown on the approved working drawings. This letter of certification shall be signed by an engineer who is registered as a Civil Engineer in the State of California and shall be provided prior to placing any concrete for which the falsework is being erected to support.

For previously welded splices, the Contractor shall determine and perform all necessary testing and inspection required to certify the ability of the falsework members to sustain the stresses required by the falsework design. This welding certification shall be in writing, shall be signed by an engineer who is registered as a Civil Engineer in the State of California, and shall be provided prior to placing any concrete for which the falsework is being erected to support.

The Contractor's Construction Engineer who signs the falsework drawings shall also certify in writing that the falsework is constructed in conformance with the approved drawings and the contract specifications prior to placing concrete. This certification shall include performing any testing necessary to verify the ability of the falsework members to sustain the stresses required by the falsework design. The engineer who signs the drawings may designate a representative to perform this certification. Where falsework contains openings for railroads, vehicular traffic, or pedestrians, the designated representative shall be qualified to perform this work, shall have at least three years of combined experience in falsework design or supervising falsework construction, and shall be registered as a Civil Engineer in the State of California. For other falsework, the designated representative shall be qualified to perform this work and shall have at least three years of combined experience in falsework design or supervising falsework construction. The Contractor shall certify the experience of the designated representative in writing and provide supporting documentation demonstrating the required experience if requested by the Engineer.

PERMANENT STEEL DECK FORMS

Forms for the deck slabs between girders, shown as permanent corrugated steel deck forms on the plans, shall be constructed and left in place at those locations shown on the plans in conformance with these STSP. Exposed metal deck used for the upper deck of the Viaduct Segment shall have a noise-reducing coating as designated in the special provisions.

Forms for the deck slabs between stringers of the Temporary Bypass Structure, at the option of the Contractor, shall either be constructed and removed as provided in Section 51-1.05, "Forms," of the Standard Specifications, or shall be constructed and left in place in conformance with these STSP.

Permanent steel deck forms and supports shall be steel conforming to the requirements in ASTM Designation: A 653/A 653M (Designation SS, Grades 33 through 80) having a coating designation G 90. The forms shall be mortar-tight, true to line and grade, and of sufficient strength to support the loads applied.

Detailed working drawings for forms shall be submitted to the Engineer for approval in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications. Three sets of drawings shall be submitted. These drawings shall show the grade of steel, the physical and section properties for all deck members, the method of support and grade adjustment, accommodation for skew, and methods of sealing against grout leaks.

Working drawings shall be submitted sufficiently in advance of the start of the affected work to allow time for review by the Engineer and correction by the Contractor of the drawings without delaying the work. Such time shall be proportional to the complexity of the work but in no case shall such time be less than 3 weeks after complete drawings and all support data are submitted.

The design of permanent steel deck forms shall be based on the combined dead load of the forms, reinforcement, and plastic concrete plus an allowance for all anticipated construction loads. The allowance for construction loads prior to concrete placement shall be not less than 2400 Pa. The allowance for construction loads during concrete placement shall not be less than 960 Pa. The combined dead load shall be assumed to be not less than 2560 kg/m^3 for normal concrete and not less than 2080 kg/m^3 for lightweight concrete.

Physical design properties shall be computed in conformance with the requirements of the AISI specification for the "Design of Cold Formed Steel Structural Members."

The maximum allowable stresses and deflections used in the design of steel forms shall be as follows:

A. Tensile stress shall not exceed 0.725 of the specified yield strength of the material furnished or 250 MPa.
B. Deflection due to dead load shall not exceed 0.0056 of form span or 13 mm, whichever is less. In no case shall the dead load for deflection calculations be less than 5750 Pa (120 psf).

CONTACT SURFACES OF BOLTED SURFACES SHALL BE CLASS B COATING.

WELDING:
THE WELDING MUST BE ACCORDING TO ANSI/AWS D1.5.
THE SIZE OF THE FILLET WELDS ARE ACCORDING TO THE TABLE EXCEPT AS NOTED ON THE PLANS.

FILLET WELDS:

BASE METAL THICKNESS OF THICKER PART JOINTED (T)	MINIMUM SIZE OF FILLET WELD*	
T≤20 mm	6 mm	SINGLE-PASS WELDS MUST BE USED
T>20 mm	8 mm	

* THE WELD SIZE NEED NOT EXCEED THE THICKNESS OF THE THINNER PART JOINED

Design Load Specifications for Expansion Joints:

Live Load: AASHTO HS20-44, Load Factor Design

Bent 48: Thermal movement: 53± mm - Longitudinal
Seismic movement: 400± mm - Longitudinal
300± mm - Transverse

Bent 49 & 50: Thermal movement: 45± mm - Longitudinal
Seismic movement: 50± mm - Longitudinal
0 - Transverse

Span 52 (Cantilever):
Thermal movement: 66± mm - Longitudinal
Seismic movement: 550± mm - Longitudinal
0 - Transverse

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 61	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Prepare the jobsite and procure material for the Construction of Phase 1 of the West Tie-In structure in accordance with the attached plans and specifications. This work includes but is not limited to the grading of the site, construction of an access road to USCG Quarters 8, and procurement of foundation materials requiring long lead times.

Prepare and submit the necessary submittals in advance of this work to expedite the construction. This includes but is not limited to Cast-In-Drilled-Hole pile placement plan, shoring plans, soil nails, and as directed by the Department's Engineer. Perform prequalification testing for proposed concrete mix designs.

All work shall be performed in accordance with the attached plans and specifications.

For this work the Contractor shall initially be compensated at Extra Work at Force Account. Contract plan sheets for the various stages of the Phase 1 work shall be issued as developed. At such time, the Contractor shall provide a lump sum estimate for the work and a supplemental Change Order will be issued at the final negotiated lump sum minus any funds previously expended at force account.

No adjustment in contract time will be made since this work is not a controlling item.

Estimated cost of Extra Work at Force Account $400,000.00

RECEIVED
05102 FEB 12 07

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$400,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Submitted by

Signature	Resident Engineer: MAHANTESH ANIGOL	Date 01/29/07

Approval Recommended by

Signature	Construction Engineer: JASON TOM	Date 2/23/07

Engineer Approval by

Signature	(Print name and title) JASON TOM - Chief	Date 2/23/07

We the undersigned contractor, have given careful consideration to the change proposed and agree, if this proposal is approved, that we will provide all equipment, furnish the materials, except as may otherwise be noted above, and perform all services necessary for the work above specified, and will accept as full payment therefor the prices shown above.

NOTE: If you, the contractor, do not sign acceptance of this order, your attention is directed to the requirements of the specifications as to proceeding with the ordered work and filing a written protest within the time therein specified.

Contractor Acceptance by

SHEET 7 OF 85

8-2. PORTLAND CEMENT CONCRETE

Portland cement concrete shall conform to the provisions in Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

Cementitious material to be used in Portland cement concrete shall conform to the provisions for cement and mineral admixtures in Section 90-2, "Materials," of the Standard Specifications, and shall be a combination of "Type II Modified" Portland cement and mineral admixture.

References to Section 90-2.01, "Portland Cement," of the Standard Specifications shall mean Section 90-2.01, "Cement," of the Standard Specifications.

Mineral admixture shall be combined with cement in conformance with the provisions in Section 90-4.08, "Required Use of Mineral Admixtures," of the Standard Specifications for the concrete materials specified in Section 56-2, "Roadside Signs," of the Standard Specifications.

The requirements of Section 90-4.08, "Required Use of Mineral Admixture," of the Standard Specifications shall not apply to Section 19-3.025C, "Soil Cement Bedding," of the Standard Specifications.

The Department maintains a list of sources of fine and coarse aggregate that have been approved for use with a reduced amount of mineral admixture in the total amount of cementitious material to be used. A source of aggregate will be considered for addition to the approved list if the producer of the aggregate submits to the Transportation Laboratory certified test results from a qualified testing laboratory that verify the aggregate complies with the requirements. Prior to starting the testing, the aggregate test shall be registered with the Department. A registration number can be obtained by calling (916) 227-7228. The registration number shall be used as the identification for the aggregate sample in correspondence with the Department. Upon request, a split of the tested sample shall be provided to the Department. Approval of aggregate will depend upon compliance with the specifications, based on the certified test results submitted, together with any replicate testing the Department may elect to perform. Approval will expire 3 years from the date the most recent registered and evaluated sample was collected from the aggregate source.

Qualified testing laboratories shall conform to the following requirements:

A. Laboratories performing ASTM Designation: C 1293 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Concrete Proficiency Sample Program and shall have received a score of 3 or better on all tests of the previous 2 sets of concrete samples.
B. Laboratories performing ASTM Designation: C 1260 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Pozzolan Proficiency Sample Program and shall have received a score of 3 or better on the shrinkage and soundness tests of the previous 2 sets of pozzolan samples.

Aggregates on the list shall conform to one of the following requirements:

A. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1293, the average expansion at one year shall be less than or equal to 0.040 percent; or
B. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1260, the average of the expansion at 16 days shall be less than or equal to 0.15 percent.

The amounts of cement and mineral admixture used in cementitious material shall be sufficient to satisfy the minimum cementitious material content requirements specified in Section 90-1.01, "Description," or Section 90-4.05, "Optional Use of Chemical Admixtures," of the Standard Specifications and shall conform to the following:

A. The minimum amount of cement shall not be less than 75 percent by mass of the specified minimum cementitious material content.
B. The minimum amount of mineral admixture to be combined with cement shall be determined using one of the following criteria:
   1. When the calcium oxide content of a mineral admixture is equal to or less than 2 percent by mass, the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
   2. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass, and any of the aggregates used are not listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 25 percent by mass of the total amount of cementitious material to be used in the mix.
   3. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass and the fine and coarse aggregates are listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
   4. When a mineral admixture that conforms to the provisions for silica fume in Section 90-2.04, "Admixture Materials," of the Standard Specifications is used, the amount of mineral admixture shall not be less than 10 percent by mass of the total amount of cementitious material to be used in the mix.
   5. When a mineral admixture that conforms to the provisions for silica fume in Section 90-2.04, "Admixture Materials," of the Standard Specifications is used and the fine and coarse aggregates are listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 7 percent by mass of the total amount of cementitious material to be used in the mix.
C. The total amount of mineral admixture shall not exceed 35 percent by mass of the total amount of cementitious material to be used in the mix. Where Section 90-1.01, "Description," of the Standard Specifications specifies a maximum cementitious content in kilograms per cubic meter, the total mass of cement and mineral admixture per cubic meter shall not exceed the specified maximum cementitious material content.

CONTRACT NO. 04-0120R4 CONTRACT CHANGE ORDER NO. 61 SHEET 9 OF 85

8-1.__ ENGINEERING FABRICS

Engineering fabrics shall conform to the provisions in Section 88, "Engineering Fabrics," of the Standard Specifications and these special provisions.

Filter fabric for this project shall be ultraviolet (UV) ray protected.

10-1.__ EXISTING HIGHWAY FACILITIES

The work performed in connection with various existing highway facilities shall conform to the provisions in Section 15, "Existing Highway Facilities," of the Standard Specifications and these special provisions.

Electronic copies of plans of the existing bridges may be requested by fax from the Office of Structure Maintenance and Investigations, 1801 30th Street, Sacramento, CA, Fax (916) 227-8357.

Plans of the existing bridges available to the Contractor are electronic reproductions of the original contract plans with significant changes noted and working drawings and do not necessarily show normal construction tolerances and variances. Where dimensions of new construction required by this contract are dependent on the dimensions of the existing bridges, the Contractor shall verify the controlling field dimensions and shall be responsible for adjusting dimensions of the work to fit existing conditions.

BRIDGE REMOVAL (PORTION)

Removing bridges or portions of bridges shall conform to the provisions in Section 15-4, "Bridge Removal," of the Standard Specifications and these special provisions.

This work includes removing portions of the existing Route 80 concrete viaduct. Components to be removed include portion of concrete barriers, metal railing, concrete deck, abutment, retaining wall and other miscellaneous items shown on the plans.

Removed materials that are not to be salvaged or used in the reconstruction shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

The Contractor shall submit a complete bridge removal plan to the Engineer for each bridge listed above, detailing procedures, sequences, and all features required to perform the removal in a safe and controlled manner.

The bridge removal plan shall include, but not be limited to the following:

A. The removal sequence, including staging of removal operations.
B. Equipment locations on the structure during removal operations.
C. Details, locations, and types of protective covers to be used.
D. Details and measures for preventing material, equipment, and debris from falling onto public traffic.

The bridge removal plan shall conform to the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications. The number of sets of drawings, design calculations, and the time for reviewing bridge removal plans shall be the same as specified for falsework working drawings in Section 51-1.06A, "Falsework Design and Drawings," of the Standard Specifications.

Where bridge removal is done adjacent to prestress anchorage, care shall be used to ensure the prestress anchorage is not damaged.

Full compensation for patching cut rebar with epoxy grout shall be considered as included in the contract lump sum price paid for bridge removal (portion), and no additional compensation will be allowed therefor.

10-1.__ EARTHWORK

Earthwork shall conform to the provisions in Section 19, "Earthwork," of the Standard Specifications and these special provisions.

Surplus excavated material not designated or determined to contain aerially deposited lead shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Reinforcement or metal attached to reinforced concrete rubble placed in embankments shall not protrude above the grading plane. Prior to placement within 0.6-m below the grading plane

CONTRACT OR PURCHASE ORDER NO. 6-4-0120R4
SHEET 10 OF 85

of embankments, reinforcement or metal shall be trimmed to no greater than 20 mm from the face of reinforced concrete rubble. Full compensation for trimming reinforcement or metal shall be considered as included in the contract prices paid per cubic meter for the types of excavation shown in the Engineer's estimate, or the contract prices paid for furnishing and placing imported borrow or embankment material, as the case may be, and no additional compensation will be allowed therefor.

SOLDIER PILE WALL EARTHWORK

General

The Contractor shall submit to the Engineer working drawings, and a construction sequence for the proposed method of soldier pile wall construction for the site in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications. The drawings shall be signed by an engineer who is registered as a Civil Engineer in the State of California. One set of the drawings and construction sequence shall be furnished to the Engineer. The working drawings and construction sequence shall include, but not be limited to, defining order of work, traffic control, method of installation of soldier piles, method of placing lagging, limits of structure excavation lifts, and type of drilling and excavation equipment to be used. The Contractor shall allow one week after complete drawings and support data are submitted for the review and approval of the proposed method of soldier pile wall construction.

In the event the Engineer fails to complete the review and approval within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

Structure Excavation (Soldier Pile Wall)

Excavation and construction of the soldier pile wall shall proceed in lifts from the top down.

Care shall be taken in performing structure excavation (soldier pile wall) for placement of lagging such that a minimal void behind the lagging is required to be backfilled.

At the end of the work shift, lagging shall be in place the full height of the exposed excavation face.

Structure Backfill (Soldier Pile Wall)

Material for structure backfill behind lagging shall conform to the provisions in Section 19-3, "Structure Excavation and Backfill," of the Standard Specifications. Structure backfill behind lagging shall be compacted by hand tamping, mechanical compaction, or other means approved by the Engineer.

Structure backfill in fill areas behind the lagging shall be keyed into the existing or excavated back slope.

Concrete Backfill

Concrete backfill of the types listed in the engineer's estimate encasing the steel soldier piles below the lagging shall be Class 3 concrete conforming to the provisions in Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

Pervious backfill material placed within the limits of payment for retaining walls will be measured and paid for as structure backfill (retaining wall).

CONTRACT CHANGE ORDER NO. 61

SHEET 11 OF 85

Concrete backfill encasing steel soldier piles below the lagging will be measured and paid for by the cubic meter as concrete backfill (soldier pile) in the same manner specified for structure backfill in Section 19-3.07, "Measurement," and Section 19-3.08, "Payment," of the Standard Specifications.

Full compensation for structure excavation (soldier pile wall) and structure backfill (soldier pile wall) shall be considered as included in the contract price paid per meter for furnish and install soldier piles and no additional compensation will be allowed therefore.

Full compensation for working drawings and construction sequence, and temporary supports and shoring, if required, for soldier pile wall construction shall be considered as included in the contract price paid per meter for furnish and install soldier piles and no additional compensation will be allowed therefor.

10-1. GEOCOMPOSITE DRAIN

At the soil nail walls , the geocomposite drain shall conform to the details shown on the plans and the following:

A. Attention is directed to "Engineering Fabrics" under "Materials" of these special provisions.

B. Geocomposite drain shall consist of a manufactured core not less than 6.35 mm thick nor more than 50 mm thick with one or both sides covered with a layer of filter fabric that will provide a drainage void. The drain shall produce a flow rate, through the drainage void, of at least 25 liters per minute per meter of width at a hydraulic gradient of 1.0 and a minimum externally applied pressure of 239 kPa.

C. A Certificate of Compliance conforming to the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications shall be furnished for the geocomposite drain certifying that the drain produces the required flow rate and complies with these special provisions. The Certificate of Compliance shall be accompanied by a flow capability graph for the geocomposite drain showing flow rates for externally applied pressures and hydraulic gradients. The flow capability graph shall be stamped with the verification of an independent testing laboratory.

D. Filter fabric for the geocomposite drain shall conform to the provisions for fabric for underdrains in Section 88, "Engineering Fabrics," of the Standard Specifications.

E. The manufactured core shall be either a preformed grid of embossed plastic, a mat of random shapes of plastic fibers, a drainage net consisting of a uniform pattern of polymeric strands forming 2 sets of continuous flow channels, or a system of plastic pillars and interconnections forming a semirigid mat.

F. The core material and filter fabric shall be capable of maintaining the drainage void for the entire height of geocomposite drain. Filter fabric shall be integrally bonded to the side of the core material with the drainage void. Core material manufactured from impermeable plastic sheeting having nonconnecting corrugations shall be placed with the corrugations approximately perpendicular to the drainage collection system.

G. The geocomposite drain shall be installed with the drainage void and the filter fabric facing the embankment. The fabric facing the embankment side shall overlap a minimum of 75 mm at all joints and wrap around the exterior edges a minimum of 75 mm beyond the exterior edge. If additional fabric is needed to provide overlap at joints and wrap-around at edges, the added fabric shall overlap the fabric on the geocomposite drain at least 150 mm and be attached thereto.

CONTRACT NO. 04-0120K4
CONTRACT CHANGE ORDER NO. 1
SHEET 12 OF 85

H. Should the fabric on the geocomposite drain be torn or punctured, the damaged section shall be replaced completely or repaired by placing a piece of fabric that is large enough to cover the damaged area and provide a minimum 150-mm overlap.
I. Plastic pipe shall conform to the provisions for edge drain pipe and edge drain outlets in Section 68-3, "Edge Drains," of the Standard Specifications.

MEASUREMENT AND PAYMENT

Full compensation for furnishing and installing the geocomposite drainage systems behind the soil nail walls shall be considered to be included in the contract price per cubic meter for the structural concrete (retaining wall) and no separate or additional payment will be made therefor.

10-1.__ SOIL NAIL WALL EARTHWORK

Soil nail wall earthwork, consisting of excavating for soil nail wall construction and backfilling around completed soil nail walls, shall conform to the provisions in Section 19-3, "Structure Excavation and Backfill," of the Standard Specifications and these special provisions.

Working Drawings

The Contractor shall submit a complete working drawing submittal for earthwork for each soil nail wall to the Engineer in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications. Working drawings for soil nail wall earthwork shall be 559 mm by 864 mm in size. For initial review, 5 sets of drawings shall be submitted. After review, between 6 and 12 sets, as requested by the Engineer, shall be submitted for final approval and use during construction.

Working drawings for wall earthwork shall show the State assigned designations for the contract number, structure number, full name of the structure as shown on the contract plans, and District-County-Route-Kilometer Post on each drawing and calculation sheet. The Contractor's name, address, and telephone number shall be shown on the working drawings. Each sheet shall be numbered in the lower right hand corner.

The working drawings for soil nail wall earthwork shall contain all information required for the construction and quality control of the earthwork, including the following:

A. A proposed schedule and detailed construction sequence. Construction sequence shall include measures to ensure wall and slope stability during all stages of wall construction including provisions for discontinuous rows of soil nails.
B. Methods of excavation to the staged lifts indicated and types of excavation equipment.
C. Temporary shoring plans.
D. Drilling methods and equipment including proposed drill hole size and any variation of these along the alignments.
E. Information on space requirements for installation equipment.
F. A detailed construction dewatering plan addressing all elements necessary to divert, control, and dispose of surface water and ground water.

A supplement to the working drawings shall include the following:

A. Independently checked calculations for wall and slope stability during all stages of wall construction including geotechnical assessment of information provided by the Department for this contract. At the Contractor's option, the Contractor may conduct

CONTRACT NO. 04-0125R4 CONTRACT CHANGE ORDER NO. 61 SHEET 13 OF 85

additional geotechnical investigation for the purpose of developing soil nail wall earthwork working drawings.

B. Information on provisions for working in the proximity of underground facilities.

The working drawings and supplement shall be stamped and signed by an engineer who is registered as a Civil Engineer in the State of California.

The Contractor shall allow the Engineer 4 weeks to review the working drawings and supplement after a complete submittal has been received.

Should the Engineer fail to review the complete working drawing submittal within the time specified and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in reviewing the soil nail wall earthwork working drawing submittal, an extension of time commensurate with the delay in completion of the work thus caused will be granted in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

Excavation

Care shall be taken during excavation for soil nail walls to prevent disturbing the natural foundation materials behind the face of excavation. During initial mass grading, the Contractor shall not excavate the full wall height to the wall alignment as shown on the plans, but the Contractor shall maintain a working berm of native material in front of the wall to serve as a work bench for the drill equipment. The working berm shall extend out from the wall a minimum distance of 6 m and shall be cut down from that point at the slope shown on the approved wall earthwork working drawings. The original ground beyond the wall alignment for the back or ends of the wall as shown on the plans shall not be over excavated. Any such over excavation shall be restored by the Contractor, at the Contractor's expense, using methods and materials approved in writing by the Engineer. Soil stabilization methods or temporary backing or lagging placed behind the excavation face may be required to prevent disturbing the natural foundation materials.

Excavation for walls shall be limited to that area which can be nailed and covered with shotcrete during the same work shift in which the excavation is done. Subsequent excavation shall not be made within 3 m of previously nailed and covered portions of the wall until those nailed and covered portions are structurally complete. A portion of the wall will be considered structurally complete when the soil nail assemblies have been installed, the shotcrete cover has set, specified testing has been completed for that portion of the wall, and the test results have been furnished to the Engineer.

Excavation to the final wall alignment for the full wall height shall incorporate a working berm which shall be constructed from the top down in a staged lift sequence as shown on the approved wall earthwork working drawings.

At the option of the Contractor, in addition to the working berm described above, the Contractor may maintain a stabilizing berm of undisturbed material to support the excavation face during soil nail installation. The stabilizing berm shall extend horizontally from the bottom of the shotcrete a minimum distance of 0.3-m and shall be cut down from that point at a slope as shown on the approved wall earthwork working drawings.

After soil nails are complete in place for a given lift, the stabilizing berm shall be removed during excavation to the final wall alignment. The complete excavated face shall be cleaned of all loose materials, mud, rebound, and other materials that could prevent or reduce shotcrete bond to the excavated face and soil nails.

CONTRACT NO. 04-0A4804
CONTRACT CHANGE ORDER NO. 161
SHEET 14 OF 85

Temporary backing or lagging for excavation at soil nail walls may be left in place if approved in writing by the Engineer. There shall be no voids behind temporary backing or lagging that is left in place. Fillers used to eliminate voids between the excavation face and temporary backing or lagging shall be dimensionally stable, non-deteriorating material capable of supporting the earth pressures in both water saturated and dry conditions.

Timber backing or lagging at walls which is to remain in place and is greater than 25 mm total thickness shall be pressure treated with wood preservative for soil and fresh water use in conformance with the provisions in Section 58, "Preservative Treatment of Lumber, Timber and Piling," of the Standard Specifications. Wood preservative shall be one of the following: creosote, creosote-coal tar solution, pentachlorophenol, copper naphthenate, ammonia copper arsenate, ammoniacal copper zinc arsenate, acid copper chromate, or chromated copper arsenate.

The Contractor shall remove all cobbles, boulders or portions of boulders, rubble, or debris which are encountered at the final wall alignment during wall face excavation and which protrude from the excavated face more than 50 mm into the design shotcrete thickness as shown on the plans. Such over excavation shall be backfilled with shotcrete.

The Contractor shall immediately notify the Engineer of the occurrence of raveling or local instability of the final wall face excavation due to the presence of groundwater, soil conditions, equipment vibration, or other causes.

Unstable areas shall be temporarily stabilized by means of buttressing the exposed excavation face with an earth berm or other methods approved in writing by the Engineer. Construction of the wall in unstable areas shall be suspended until remedial measures, submitted by the Contractor, and approved by the Engineer, have been taken.

The Contractor shall protect installed soil nails during excavation and subsequent operations. Any soil nails damaged during construction shall be replaced by the Contractor, at the Contractor's expense.

Measurement and Payment

Excavation and backfill for soil nail wall construction will be measured and paid for as structure excavation (soil nail wall) and structure backfill (soil nail wall).

Full compensation for working drawings and supplements, and for furnishing, constructing and removing shoring, working berms, and stabilizing berms, if required, for soil nail wall construction shall be considered as included in the contract price paid per cubic meter for structure excavation (soil nail wall) and no additional compensation will be allowed therefor.

Full compensation for shotcrete used to fill voids created by the removal of cobbles and boulders or other obstructions shall be considered as included in the contract price paid per cubic meter for shotcrete and no additional compensation will be allowed therefor.

10-1.__ SOIL NAIL ASSEMBLY

Soil nail assemblies and test soil nail assemblies, consisting of drilling holes in natural foundation materials, installing and grouting steel bars in drilled holes, anchorage systems, and testing of test soil nail assemblies, shall conform to the details shown on the plans, the provisions of the Standard Specifications, and these special provisions.

Attention is directed to "Soil Nail Wall Earthwork" of these special provisions.

WORKING DRAWINGS

The Contractor shall submit a complete working drawing submittal for soil nail assemblies to the Officeof Structure Design (OSD) in conformance with the provisions in Section 5-1.02,

CONTRACT CHANGE ORDER NO. 04-6 12024 SHEET 15 OF 85

"Plans and Working Drawings," of the Standard Specifications. All working drawings for soil nail assemblies shall be 559 mm by 864 mm in size. For initial review, 5 sets of drawings shall be submitted. After review, between 6 and 12 sets, as requested by the Engineer, shall be submitted to OSDfor final approval and use during construction.

Working drawing submittals for soil nail assemblies shall show the State assigned designations for the contract number, structure number, full name of the structure as shown on the contract plans, and District-County-Route-Kilometer post on each drawing and calculation sheet. The Contractor's name, address, and phone and FAX numbers shall also be shown on the working drawings. Each working drawing sheet shall be numbered in the lower right hand corner of the sheet.

The working drawing submittal for soil nail assemblies shall contain all information required for the construction and quality control of the soil nail wall, including the following:

A. The proposed schedule and detailed construction sequence of the installation and grouting of soil nails, application of shotcrete, and construction of cast-in-place reinforced concrete.
B. Complete details and specifications of the soil nail and test soil nail, including encapsulation materials and method of grouting the encapsulation, anchorage system, and type of packers or other appropriate devices to be used to ensure partial length grouting of test soil nails.
C. Grout mix designs and procedures involved in testing grout.
D. Grout placement procedures and equipment including minimum required cure time.
E. Details of the equipment proposed for testing soil nails, including jacking frame and appurtenant bracing, and the method and equipment for determining any displacement of the test soil nail relative to the grout during application of test loads.
F. Information on space requirements for installation equipment.
G. Drilling methods and equipment.

The working drawing submittal shall be stamped and signed by an engineer who is registered as a Civil Engineer in the State of California.

The Contractor shall allow the Engineer 4 weeks to review the soil nail working drawings after a complete submittal has been received. No soil nails shall be fabricated or installed until the Engineer has approved, in writing, the working drawing submittal for soil nail assemblies.

Should the Engineer fail to review the complete working drawing submittal within the time specified, and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in reviewing the soil nail working drawing submittal, an extension of time commensurate with the delay in completion of the work thus caused will be granted in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

MATERIALS

The materials specified below shall be used for construction of soil nail assemblies and test soil nail assemblies.

Soil Nail

Soil nails shall conform to the provisions for bar reinforcement in Section 52, "Reinforcement," of the Standard Specifications. Grade 420 soil nails shall also conform to the

CONTRACT NO. 04-0120Z4
CONTRACT CHANGE ORDER NO. 61
SHEET 16 OF 85

requirements in ASTM Designation: A 615/A 615M or A706/A706M. The soil nail shall be an epoxy coated reinforcing bar partially encapsulated in a grouted corrugated plastic sheathing. The bar shall be centered in the sheathing and the space between the sheathing and the bar shall be filled with grout. The epoxy coating shall have a minimum thickness of 305 μm.

Soil nail assemblies shall be lengthened or additional soil nail assemblies shall be installed when ordered by the Engineer. The lengthening or addition of soil nail assemblies, when ordered by the Engineer, will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications.

Soil nails shall have a minimum length of 150 mm of thread on the anchorage end. Threading may be continuous spiral deformed ribbing provided by the bar deformations or may be cut into a reinforcing bar. If threads are cut into a reinforcing bar, the bar size shall be the next larger bar designation number from that shown on the plans and coarse threads shall be used. The epoxy coating at the anchorage end of epoxy coated bars may be omitted for a maximum length of 150 mm. Metal surfaces of assembled splices of epoxy coated bars shall be epoxy coated.

Corrugated plastic sheathing shall be either polyvinyl chloride (PVC) or high density polyethylene (HDPE). The minimum sheathing wall thickness shall be 1.0 mm.

HDPE shall have a density between 0.940 and 0.960-g/cm^3 when measured in conformance with the requirements in ASTM Designation: D 792, A-2.

The sheathing shall have sufficient strength to prevent damage during construction operations and shall be watertight, chemically stable without embrittlement or softening, and nonreactive with concrete.

Splicing of soil nails shall be made only at the locations shown on the plans or at ends of soil nails which the Engineer has ordered to be lengthened.

Test Soil Nail

Test soil nails shall conform to the provisions for bar reinforcement in Section 52, "Reinforcement," of the Standard Specifications, and shall be of a size and grade determined by the Contractor.

Test soil nail assemblies shall be lengthened or additional test soil nail assemblies shall be installed when ordered by the Engineer. The lengthening or addition of test soil nail assemblies, when ordered by the Engineer, will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications.

Test soil nails need not be epoxy coated or encapsulated in grouted plastic sheathing.

Splicing of test soil nails shall be made only at locations outside of the bonded length.

Anchorage System

Anchorage for soil nails shall conform to the details shown on the plans and the provisions in Section 75-1.02, "Miscellaneous Iron and Steel," of the Standard Specifications, except that nuts, washers, wedges, and bearing plates to be fully encased in concrete, grout, or shotcrete need not be galvanized. Concrete anchors on the bearing plates shall conform to the provisions for stud connectors in Section 55-2, "Materials," of the Standard Specifications.

The ultimate strength of the soil nail anchorage shall be at least the value shown below for the size of the soil nail bar shown on the plans.

CONTRACT CHANGE ORDER NO. 04-012084 Sal

SHEET 17 OF 85

BAR SIZE	ANCHORAGE ULTIMATE STRENGTH (kilonewtons)	
	Grade 420	Grade 520

No. 19	178	198
No. 22	240	267
No. 25	314	350
No. 29	401	446
No. 32	508	565

Grout

Grout shall conform to the provisions in Section 50-1.09, "Bonding and Grouting," of the Standard Specifications. California Test 541 will not be required nor will the grout be required to pass through a screen with a 1.80-mm maximum clear opening prior to being introduced into the grout pump. Fine aggregate may be added to the grout mixture of portland cement and water in drilled holes 150 mm or greater in diameter, but only to the extent that the cement content of the grout is not less than 600 kilograms per cubic meter of grout. Fine aggregate, if used, shall conform to the provisions in Section 90-2, "Materials," and Section 90-3, "Aggregate Gradings," of the Standard Specifications. Grout with fine aggregate shall have a nominal penetration equal to or greater than 90 mm when measured in conformance with California Test 533, and shall have an air content of equal to or less than 2 percent when measured in conformance with California Test 504. Air entraining admixtures shall not be used for grout with fine aggregate.

The consistency of grout with fine aggregate shall be verified prior to use by producing a batch to be tested. The test batch shall be produced and delivered to the project under conditions and in time periods similar to those expected during the placement of grout in the soil nails. Grout for the test batch shall be placed in an excavated hole or suitable container of adequate size to allow testing in conformance with California Test 533. The test batch shall demonstrate that the proposed grout mix achieves the specified nominal penetration. Upon completion of the testing, the grout shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

CONSTRUCTION

Soil nails shall be installed in drilled holes in an expeditious manner so that caving or deterioration of the drilled hole does not occur. No portion of the drilled hole shall be left open for more than 60 minutes prior to soil nail placement and grouting unless otherwise approved by the Engineer.

Difficult soil nail assembly construction is anticipated due to caving soils,rock, cobbles and boulders, subsurface concrete debris.

Drilling

Drilling equipment shall be designed to drill straight and clean holes. The drilling method and the size and capability of the drilling equipment shall be as approved in the working drawings. Drill rigs shall have the capability of anchorage installation and grout placement through the use of drill casing or hollow-stem augers.

At locations where caving conditions are anticipated, sufficient casing and auger lengths shall be available on site to maintain uninterrupted installation of anchors.

CONTRACT NO. 04-120224
CONTRACT CHANGE ORDER NO. 1
SHEET 18 OF 85

Attention is directed to rock subsurface foundation material at the soil nail wall site. At locations where hard drilling conditions such as rock, cobbles, boulders, or obstructions are anticipated, a down hole pneumatic hammer drill rig and drill bit shall be available on site to drill holes for soil nail assemblies.

Drilled holes for walls shall not extend beyond the right-of-way or easement limits as shown on the plans or as specified in these special provisions.

Holes shall be drilled in the natural foundation materials. Holes for test soil nail assemblies shall be of the same diameter as those for the production soil nail assemblies they represent.

Holes shall be cleaned to remove material resulting from the drilling operations and to remove any other material that would impair the strength of the soil nail assemblies or test soil nail assemblies. Foreign material dislodged or drawn into the holes during construction of the assemblies shall be removed. Water for cleaning holes shall not be used, unless full hole length hollow-stem augers or casing is maintained in the same hole during cleaning and soil nail assembly installation. Soil nail assemblies and test soil nail assemblies shall not be installed in the drilled holes until the holes have been inspected by the Engineer.

Installing Soil Nails and Test Soil Nails

Soil nails and test soil nails shall be installed in the drilled holes using centralizers. Centralizers shall adequately support the bar in the center of the drilled hole and shall be spaced at a maximum of 1.5 m on center along the length of the bar, and 0.5-m from the end of the bar.

Where the soil nail cannot be completely inserted, the Contractor shall remove the bar and clean or redrill the hole to permit unobstructed installation. Partially installed bars shall not be driven or forced into the drilled hole and will be rejected. When open-hole drilling methods are being used, the Contractor shall have hole cleaning tools on-site suitable for cleaning drilled holes along their full length just prior to bar insertion and grouting.

Grouting

The length of drilled hole shall be verified and recorded by the Contractor before grouting.

Grout shall be injected at the low end of the drilled hole and shall fill the drilled hole with a dense grout free of voids or inclusion of foreign material. Cold joints shall not be used in grout placement. Soil nails shall be grouted full length.

Only the bonded length of test soil nails shall be initially grouted. Initial grouting shall be confined to the bonded length by packers or other approved devices. For test soil nails, grouting of the remainder of the drilled hole shall not be done until pullout tests have been completed and approved by the Engineer.

After placing the grout for soil nails and test soil nails, they shall remain undisturbed for the cure time stated in the approved soil nail working drawings.

Securing Soil Nails

Any remaining void at the exterior end of the drilled hole for a soil nail assembly shall be filled with shotcrete and the soil nail secured at the face of the shotcrete. The steel bearing plate shall be seated with full bearing on the shotcrete surface and the nut for the soil nail shall be hand tightened before the initial set of the shotcrete. The nut shall be made wrench tight after the shotcrete has set for 24 hours, unless a shorter time is approved by the Engineer.

Securing Test Soil Nails

Testing shall be performed against a temporary bearing yoke which bears directly on the

CONTRACT CHANGE ORDER NO. 61
04-0120R4
SHEET 19 OF 85

shotcrete facing. Test loads transmitted through the temporary bearing yoke shall not fracture the shotcrete or cause displacement or sloughing of the soil surrounding the drilled hole. No part of the yoke shall bear within 150 mm of the edge of blockout.

Test soil nails shall be removed to behind the front face of the shotcrete after testing has been completed. The remaining length of void in the drilled hole shall be grouted and the blockout in the shotcrete facing filled with either grout or shotcrete.

TESTING

Test soil nail assemblies shall be pullout tested by the Contractor in the presence of the Engineer. A pullout test shall consist of incrementally loading the assembly until either the pullout test load has been held for one minute or the total measured movement of the soil nail exceeds 50 mm, at which point the load shall be recorded as part of the test data and submitted to the Engineer at the conclusion of each test.

The Contractor shall monitor and record total movement of the test soil nail relative to the grout during application of the test load.

Applied test loads shall be determined by using either a calibrated pressure gage or a load cell. Movements of the end of the soil nail, relative to an independent fixed reference point, shall be measured and recorded to the nearest 25 μm at each increment of load, including the ending alignment load, during the load tests.

The pressure gage shall have an accurately reading dial at least 150 mm in diameter. Each jack and its gage shall be calibrated as a unit with the cylinder extension in the approximate position that it will have at final jacking force, and shall be accompanied by a certified calibration chart. Each jack and pressure gage assembly shall be calibrated in conformance with Section 50-1.08, "Prestressing," of the Standard Specifications. The load cell shall be calibrated and shall be provided with an indicator capable of measuring the test load in the soil nail. The range of the load cell shall be such that the lower 10 percent of the manufacturer's rated capacity will not be used in determining the jacking force.

The test load may be verified by State forces with either State-furnished load cells or pressure cells, or with State-furnished Vibra-Tension equipment operated in conformance with the requirements of California Test 677. The Contractor shall provide sufficient labor, equipment, and material to install and support such testing equipment at the soil nails and to remove the testing equipment after the testing is complete, as ordered by the Engineer.

The pullout test procedures shall conform to the following:

A. The pullout test shall be conducted by measuring and recording the test load applied to the test soil nail and the test soil nail end movement at each load listed in the following loading schedule.

PULLOUT TEST LOADING SCHEDULE

AL
0.20M
0.30M
0.40M
0.50M
0.60M
0.70M

CONTRACT NO. 04-012089
CONTRACT CHANGE ORDER NO. 61
SHEET 26 OF 85

0.80M
0.90M
1.00M (PULLOUT TEST LOAD)
AL

(M = MAXIMUM TEST LOAD (kN) = $0.0141\sigma_b D$)
Where σ_b=Ultimate bond stress between grout and drilled hole as shown on the plans, in kPa; and D=actual drilled hole diameter, in millimeters.
(AL = ALIGNMENT LOAD = 0.1M)

B. Each increment of load shall be applied in less than one minute and held for at least one minute but not more than 2 minutes, except that the load equal to 0.70M shall be held for 10 minutes. During the 10-minute load hold, the movement of the end of the soil nail shall be measured at 1, 2, 3, 4, 5, 6, and 10 minutes. The observation period for the 10-minute load hold shall start when the pump begins to apply the increment of load from 0.60M to 0.70M. If the creep movement measured between one minute and 10 minutes at 0.70M is less than one mm, the load shall continue to be increased incrementally to 1.00M, then reduced to the ending alignment load. The test soil nail assembly shall be considered acceptable if 1) the creep movement measured between one minute and 10 minutes is less than one mm, 2) the total measured movement is greater than 80 percent of the theoretical elastic elongation of the test nail unbonded length at the 1.0M load, and 3) the total measured movement is less than 50 mm.
C. If the load of 0.70M cannot be maintained for 10 minutes with one mm or less creep movement, the 0.70M load shall be maintained for an additional 50 minutes. Total movement shall be measured at 15, 20, 25, 30, 45, and 60 minutes. If the test load is held for 60 minutes, a creep curve showing the creep movement between 10 minutes and 60 minutes shall be plotted as a function of the logarithm of time. If the creep curve plotted from the movement data indicates a creep rate of less than 2.0 mm for the last log cycle of time, the load shall continue to be increased incrementally to 1.00M, then reduced to the ending alignment load. The test soil nail assembly shall be considered acceptable if 1) the creep curve plotted from the movement data indicates a creep rate of less than 2.0 mm for the last log cycle of time, 2) the total measured movement is greater than 80 percent of the theoretical elastic elongation of the test nail unbonded length at the 1.0M load, and 3) the total measured movement is less than 50 mm.
D. The soil nail shall be unloaded only after completion of the test.

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO. 61
SHEET 21 OF 85

Test soil nails that fail to meet acceptance criteria shall be extracted when requested by the Engineer. Full compensation for extracting test soil nails shall be considered as included in the contract price paid per meter for soil nail assembly, and no separate payment will be made therefor.

The Contractor shall furnish to the Engineer complete test results for each soil nail assembly tested. Data for each test shall list key personnel, test loading equipment, test soil nail location, hole diameter and depth, bond length, type of soil, method of drilling, and amount of ground water encountered within the bond length. Test data shall also include the dates and times of drilling, test soil nail installation, grouting, and testing. The test load and amount of displacement shall be included in the test data when any displacement of the test soil nail relative to the grout occurs during application of the test load.

MEASUREMENT

Soil nail assembly and test soil nail assembly will be measured and paid for by the meter. The length to be paid for will be the length of soil nail assembly or test soil nail assembly measured along the bar centerline from the back face of shotcrete to the tip end shown on the plans or ordered in writing by the Engineer.

PAYMENT

The contract price paid per meter for soil nail assembly shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in constructing the soil nail assemblies, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

Test soil nail assemblies will be paid for as soil nail assembly.

Full compensation for testing of the test soil nail assemblies shown on the plans shall be considered as included in the contract price paid per meter for soil nail assembly, and no separate payment will be made therefor.

Full compensation for repair of all damage to existing structures, restoration of grade in subsided areas, and all other damage done by drilling shall be considered as included in the contract price paid per meter for soil nail assembly, and no additional compensation will be allowed therefor.

Full compensation for furnishing, installing, and removing casing shall be considered as included in the contract price paid per meter for soil nail assembly, and no additional compensation will be allowed therefor.

Full compensation for drilling in the rock subsurface foundation material shall be considered as included in the contract price paid per meter for soil nail assembly, and no additional compensation will be allowed therefore.

The quantities of trial batch grout will not be included in any contract item of work, and full compensation for furnishing, producing, and disposing of trial batches shall be considered as included in the contract price paid per meter for soil nail assembly, and no additional compensation will be allowed therefor.

10-1.__ PILING

GENERAL

Piling shall conform to the provisions in Section 49, "Piling," of the Standard Specifications, and these special provisions.

Unless otherwise specified, welding of any work performed in conformance with the provisions in Section 49, "Piling," of the Standard Specifications, shall be in conformance with the requirements in AWS D1.1.

STEEL SOLDIER PILING

This work shall consist of furnishing and installing steel piling; securing the piling prior to and during concrete encasement, and shaping the tops of the piles.

CONTRACT CHANGE ORDER NO. 61
SHEET 22 OF 85

Construction

Steel soldier piles shall be placed in a drilled hole and shall be plumbed and aligned before placing concrete backfill. Alignment shall be maintained while placing backfill material in the drilled holes.

MEASUREMENT AND PAYMENT (PILING)

Measurement and payment for the various types and classes of piles shall conform to the provisions in Sections 49-6.01, "Measurement," and 49-6.02, "Payment," of the Standard Specifications and these special provisions.

The contract price paid per meter for furnish and install soldier piles shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in furnishing and installing the steel piles at the site to the required penetration, including securing the piling to maintain accurate alignment prior to and during encasing the pile with concrete, shaping pile tops, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.__ DRILLED HOLES

Holes for steel soldier piles shall be drilled into natural foundation materials at the location shown on the plans and shall conform to the provisions in Section 49, "Piling," of the Standard Specifications and these special provisions.

Drilled holes shall be accurately located and shall be straight and true. When the piles are plumbed and aligned, the steel piles shall be at least 25 mm clear of the sides of the hole for the full length of the hole to be filled with concrete backfill and lean concrete backfill. Holes which do not provide the clearance around steel piles shall be reamed or enlarged at the Contractor's expense.

Temporary casings or tremie seals shall be furnished and placed where necessary to control water or to prevent caving of the hole.

Difficult drilling is anticipated due to the presence of caving soils,cobbles and boulders, .

Attention is directed to rock subsurface foundation material at the soldier pile retaining wall site. At locations where hard drilling conditions such a rock, cobbles, boulders or obstructions are anticipated, suitable drilling equipment shall be available on site to drill holes for soldier piles.

Loose materials existing at the bottom of the hole after drilling operations have been completed shall be removed before placing the pile.

Materials resulting from drilling holes shall be disposed of in conformance with the provisions in Section 19-2.06, "Surplus Material," of the Standard Specifications.

Drilling mud or chemical stabilizers shall not be used. Surface water shall not be permitted to enter the hole and all water in the hole shall be removed before placing concrete therein.

Casing, if used in drilling operations, shall be removed from the hole as concrete is placed therein. The bottom of the casing shall be maintained not more than 1500 mm nor less than 300 mm below the top of the concrete during casing withdrawal and concrete placing operations. Separation of the concrete during withdrawal operations shall be avoided by hammering or otherwise vibrating the casing. The methods used to withdraw temporary casings shall preclude contamination of the concrete and commingling of the soil and concrete or of any ground water and concrete.

The contract price paid per meter for 610 mm_drilled hole (soldier pile)_shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all the work involved in drilling holes for soldier piles, including disposing of the material

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO. 1e1
SHEET 23 OF 85

resulting from drilled holes, dewatering, casing holes and removing casing, and providing tremie seals, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

Full compensation for drilling in the rock subsurface foundation material shall be considered as included in the contract price paid per meter for 610 mm drilled hole, and no additional compensation will be allowed therefor.

10-1.__ CONCRETE STRUCTURES

Portland cement concrete structures shall conform to the provisions in Section 51, "Concrete Structures," of the Standard Specifications and these special provisions.

The cast-in-place concrete facing at soil nail wall shall conform to the provisions in Section 51, "Concrete Structures", of the Standard Specifications and these special provisions.

Shotcrete shall not be used as an alternative construction method for reinforced concrete members unless otherwise specified.

MEASUREMENT AND PAYMENT

Measurement and payment for concrete in structures shall conform to the provisions in Section 51-1.22, "Measurement," and Section 51-1.23, "Payment," of the Standard Specifications and these special provisions.

Concrete for the cast-in-place facing at soil nail wall will be measured and paid for by the cubic meter as structural concrete, retaining wall.

10-1.__ DRILL AND BOND DOWEL (EPOXY CARTRIDGE)

Drilling and bonding dowels with epoxy cartridges shall conform to the details shown on the plans and these special provisions.

Reinforcing steel dowels shall conform to the provisions in "Reinforcement" of these special provisions.

Threaded rods used as dowels shall conform to the provisions in Section 75-1.03, "Miscellaneous Bridge Metal," of the Standard Specifications. The threaded rods shall be installed in conformance with these requirements for dowels specified herein.

The Contractor shall select an epoxy cartridge system which has passed the testing requirements of the International Conference of Building Officials (ICBO) document - AC58 and additional test requirements as specified in the Caltrans Augmentation/Revisions to ICBO AC58. Testing shall be performed by an independent testing facility and the results will be reviewed and approved by the Transportation Laboratory. The Caltrans Augmentation/Revisions to ICBO AC58 document may be obtained by contacting the Transportation Laboratory, telephone: (916) 227-7000.

The epoxy cartridge system used shall be appropriate for the ambient concrete temperature and installation conditions at the time of installation in conformance with the manufacturer's specifications.

Epoxy cartridges shall be accompanied by a Certificate of Compliance as provided in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications. The certificate shall state that the material complies in all respects to the requirements of ICBO AC58 and Caltrans Augmentation/Revisions to ICBO AC58.

Each epoxy cartridge shall be clearly and permanently marked with the manufacturer's name, model number of the epoxy cartridge system, manufacturing date, and lot number. Each carton of epoxy cartridges shall contain the manufacturer's recommended installation procedures, minimum cure time, and such warning or precautions concerning the contents as may be required by State or Federal Laws and Regulations.

CONTRACT CHANGE ORDER NO. 04-0L2054 61
SHEET 24 OF 85

The holes shall be drilled by methods that will not shatter or damage the concrete adjacent to the holes. If reinforcement is encountered during drilling, before the specified depth is attained, the Engineer shall be notified. Unless the Engineer approves, in writing, coring through the reinforcement, the hole will be rejected and a new hole, in which reinforcement is not encountered, shall be drilled adjacent to the rejected hole to the depth recommended by the manufacturer.

The drilled holes shall be cleaned in conformance with the manufacturer's instructions and shall be dry at the time of placing the epoxy cartridge bonding material and the steel dowels. The bonding material shall be a 2-component epoxy system contained in a cartridge having 2 separate chambers and shall be inserted into the hole using a dispensing gun and replaceable mixing nozzle approved by the manufacturer. Unless otherwise specified, the depth of hole and the installation procedure shall be as recommended by the manufacturer. A copy of the manufacturer's recommended installation procedure shall be provided to the Engineer at least 2 days prior to the start of work.

Immediately after inserting the dowels into the epoxy, the dowels shall be supported as necessary to prevent movement during curing and shall remain undisturbed until the epoxy has cured a minimum time as specified by the manufacturer. Dowels that are improperly bonded, as determined by the Engineer, will be rejected. Adjacent new holes shall be drilled, and new dowels shall be placed and securely bonded to the concrete. All work necessary to correct improperly bonded dowels shall be performed at the Contractor's expense.

Unless otherwise provided, dowels to be bonded into drilled holes will be measured and paid for as bar reinforcing steel (bridge).

Unless otherwise provided, drilling and bonding dowels with epoxy cartridges will be measured and paid for by the unit as drill and bond dowel (epoxy cartridge). The number of units to be paid for will be determined from actual count of the completed units in place.

The contract unit price paid for drill and bond dowel (epoxy cartridge) shall include full compensation for furnishing all labor, materials (except dowels), tools, equipment, and incidentals, and for doing all the work involved in drilling the holes and bonding dowels with epoxy cartridges, including coring through reinforcement when approved by the Engineer, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

CONTRACT CHANGE ORDER NO. 61

SHEET 25 OF 85

10-1.__ DRILL AND BOND DOWELS

Drilling and bonding dowels shall conform to the details shown on the plans, the provisions in Section 83-2.02D(1), "General," of the Standard Specifications, and these special provisions.

Dowels shall conform to the provisions for bar reinforcement in "Reinforcement" of these special provisions.

If reinforcement is encountered during drilling before the specified depth is attained, the Engineer shall be notified. Unless the Engineer approves coring through the reinforcement, the hole will be rejected and a new hole, in which reinforcement is not encountered, shall be drilled adjacent to the rejected hole to the depth shown on the plans.

Unless otherwise provided, dowels to be bonded into drilled holes will be paid for as bar reinforcing steel (bridge).

Unless otherwise provided, drilling and bonding dowels will be measured and paid for by the meter determined by the number and the required depth of holes as shown on the plans or as ordered by the Engineer.

The contract price paid per meter for drill and bond dowel shall include full compensation for furnishing all labor, materials (except reinforcing steel dowels), tools, equipment, and incidentals, and for doing all the work involved in drilling the holes, including coring through reinforcement when approved by the Engineer, and bonding the dowels, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.__ REINFORCEMENT

Reinforcement shall conform to the provisions in Section 52, "Reinforcement," of the Standard Specifications and these special provisions.

The Department's mechanical splices prequalified list can be found at the following internet site:

http://www.dot.ca.gov/hq/esc/approved_products_list/

The provisions of "Welding Quality Control" of these special provisions shall not apply to resistance butt welding.

MEASUREMENT AND PAYMENT

Measurement and payment for reinforcement in structures shall conform to the provisions in Section 52-1.10, "Measurement," and Section 52-1.11, "Payment," of the Standard Specifications and these special provisions.

10-1.__ SHOTCRETE

Shotcrete shall conform to the provisions in Section 51, "Concrete Structures," and Section 53, "Shotcrete," of the Standard Specifications and these special provisions.

Shotcrete operations shall completely encase all reinforcement and other obstructions shown on the plans. Exceptional care shall be taken to properly encase the reinforcement and other obstructions with shotcrete.

Except for finish coats, shotcrete shall be applied by the wet-mix process only.

Finish coats, applied by the dry-mix process, may be used only when approved by the Engineer.

Shotcrete shall have a minimum compressive strength of 22.5 MPa at 28 days or as shown on the plans, whichever is greater. No shotcrete work shall be performed prior to verification by the Engineer of the required compressive strength.

Splicing of reinforcing bars No. 22 or larger in shotcrete shall be by butt splicing only.

The Contractor shall be responsible for obtaining and testing all required preconstruction and production test cores. All coring and testing shall be at the Contractor's expense and performed in the presence of the Engineer, unless otherwise directed. The Engineer shall be notified a minimum of 24 hours prior to the Contractor performing any coring or testing operations.

All cores shall be obtained and tested for compressive strength in conformance with the requirements in ASTM Designation: C 42. Cores used for determining compressive strength shall not contain any bar reinforcement or other obstructions. The testing shall be performed at an independent testing facility approved by the Engineer. A copy of the test results shall be furnished to the Engineer within 5 days following completion of testing.

CONTRACT NO. 04-0120F4
CONTRACT CHANGE ORDER NO. 61
SHEET 26 OF 85

All test panels shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

PRECONSTRUCTION REQUIREMENTS

Prior to performing shotcrete work, the Contractor shall construct at least 2 preconstruction shotcrete test panels for each mixture being considered unless otherwise specified.

The nozzleperson shall have a minimum of 3000 hours experience as a nozzleperson on projects with a similar application.

At least 10 working days prior to constructing any shotcrete test panels, the Contractor shall submit to the Engineer for approval, a Quality Control Plan (QCP) for the proposed method of shotcrete placement. The plan shall include the following:

A. The number and qualifications of nozzlepersons available to place shotcrete, the number of nozzlepersons on-site at any time during the shotcrete placement, description of their work schedule, and the procedures for avoiding fatigue of any nozzleperson.
B. The proposed method of placing shotcrete, including, but not limited to, application rates, details of any proposed construction joints and their locations, and methods for achieving the required thickness and surface finish.
C. The procedure for curing shotcrete surfaces.
D. The description of a debris containment system, to be used during the cleaning of bar reinforcing steel and concrete and placing of shotcrete, as required to provide for public safety.

The Engineer shall have 10 working days to review and approve the QCP submittal after a complete plan has been received. No construction of shotcrete test panels shall be performed until the QCP is approved by the Engineer. Should the Engineer fail to complete the review within this time allowance, and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in approving the QCP, the delay will be considered a right of way delay in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

Preconstruction shotcrete test panels shall be constructed by the nozzlepersons and application crew scheduled to do the work, using equipment, materials, mixing proportions, ambient temperatures and procedures proposed for the work. The preconstruction shotcrete test panels shall conform to the following:

A. One shotcrete test panel, of the size determined by the Contractor, shall be unreinforced and shall have 3 cores taken from it and tested for compressive strength. The compressive strength shall be the average strength of the 3 cores, except that, if any core should show evidence of improper coring, the core shall be discarded and the compressive strength shall be the average strength of the remaining cores. The test panel shall be identified and submitted to the Engineer with the test results including a description of the mixture, proportions, and ambient temperature.
B. One shotcrete test panel shall have the same (1) thickness, (2) bar size and amount of bar reinforcement or other obstructions and (3) positioning of bar reinforcement or obstructions as the most heavily reinforced section of shotcrete to be placed. The test panel shall be square with the length of the sides equal to at least 3 times the thickness of

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO. 61
SHEET 21 OF 85

the most heavily reinforced section of shotcrete to be placed, but not less than 750 mm. After a minimum 7 days of cure, the test panel shall be broken by the Contractor, in the presence of the Engineer, into pieces no larger than 250 mm in greatest dimension. The surfaces of the broken pieces shall be dense and free of laminations and sand pockets, and shall verify that the bar reinforcement or other obstructions are completely encased.

C. Both test panels shall be cured under conditions similar to the actual work.

D. At the option of the Contractor, cores to be used for determining the compressive strength may be taken from the reinforced test panel described above in lieu of making a separate unreinforced test panel as described above. The compressive strength shall be the average strength of the 3 cores, except that, if any core should show evidence of improper coring or contains bar reinforcement or other obstructions, the core shall be discarded and the compressive strength shall be the average strength of the remaining cores. If cores are taken from the reinforced test panel, the panel shall not be broken into pieces, as described above, until it has cured for a minimum of 14 days.

The requirements for constructing preconstruction shotcrete test panels may be eliminated, when approved by the Engineer, if a test panel report and certified compressive strength test data are furnished from a State highway project with a similar application of approximately equal thickness, including similar amounts and placement of reinforcement or other obstructions. The nozzle person, proposed to be used, shall have constructed the test panel described in the test panel report. The test panel report shall list the names of the application crew, equipment used, materials, mixing proportions, ambient temperatures and procedures used to make the test panels. The certified compressive strength test data shall be for cores taken from the same test panels.

CONTRACT CHANGE ORDER NO. 191
CONTRACT NO. 04-0120K4
SHEET 28 OF 85

PLACING

An air blowpipe shall be used during shotcrete placement to remove rebound, overspray and other debris from the areas to receive shotcrete.

Construction joints shall be tapered, and shall conform to the provisions in Sections 51-1.13, "Bonding," of the Standard Specifications.

All overspray and rebound shall be removed prior to final set and before placement of shotcrete on adjacent surfaces.

Rebound or any other material which has already exited the nozzle shall not be reused.

Shotcrete shall be cured in conformance with the provisions of Section 90-7.03, "Curing Structures," of the Standard Specifications.

When a finish coat is to be used, all loose, uneven or excess material, glaze, and rebound shall be removed by brooming, scraping, or other means and the surface left scarified. Any surface deposits which take a final set shall be removed by abrasive blasting. Prior to placing the finish coat, the receiving surface shall be washed down with an air-water blast.

Shotcrete extending into the space shown on the plans for cast-in-place concrete shall be removed.

TESTING AND ACCEPTANCE

At least 3 production shotcrete test cores shall be taken from each 30 square meters or portion thereof of shotcrete placed each day. The cores shall be 76 mm in diameter. The location where cores are to be taken will be designated by the Engineer. Test cores shall be identified by the Contractor and a description of the core location and mixture, including

proportions, shall be submitted to the Engineer with the test cores, immediately after coring. Cored holes shall be filled with mortar in conformance with the provisions in Section 51-1.135, "Mortar," of the Standard Specifications.

Upon receipt of the cores, the Engineer will perform a visual examination to determine acceptance, as described below. Within 48 hours after receipt, the Engineer will return the cores to the Contractor for compressive strength testing.

The compressive strength test shall be performed using the shotcrete production test cores described above. The compressive strength shall be the average strength of the 3 cores, except that, if any core should show evidence of improper coring, the core shall be discarded and the compressive strength shall be the average strength of the remaining cores.

The basis of acceptance for production shotcrete test cores shall be (1) that the core is dense and free of laminations and sand pockets, and shows that the reinforcement or other obstructions are completely encased and (2) the same as specified for test cylinders in the fourth and fifth paragraphs of Section 90-9.01, "General," of the Standard Specifications.

If any production test core shows signs of defective shotcrete as described in (1) above, the shotcrete represented by such test core will be rejected, unless the Contractor, at the Contractor's expense, obtains and submits evidence acceptable to the Engineer that the strength and quality of the shotcrete placed in the work are acceptable.

The surface finish of the shotcrete shall conform to the provisions of Section 51-1.18, "Surface Finishes," of the Standard Specifications.

MEASUREMENT AND PAYMENT

Full compensation for the Quality Control Plan, constructing and breaking test panels, furnishing and testing cores and patching cored holes shall be considered as included in the contract price paid per cubic meter for shotcrete and no additional compensation will be allowed therefor.

10-1.__ TIMBER LAGGING

Timber lagging shall conform to the details shown on the plans and the provisions in Sections 57, "Timber Structures," and 58, "Preservative Treatment of Lumber, Timber and Piling," of the Standard Specifications and these special provisions.

All timber members shall be preservative treated Douglas fir of the grades shown on the plans. Timber members shall be full sawn to the dimensions shown on the plans.

Preservative treatment shall conform to AWPA Use Category System: UC4B, Commodity Specification A, except that chromated copper arsenate shall not be used.

Timbers 100 mm thick or less shall be installed with a 10 mm gap between lagging members except where shown on the plans. Timbers greater than 100 mm thick shall be installed with a 13 mm gap between lagging members except where shown on the plans.

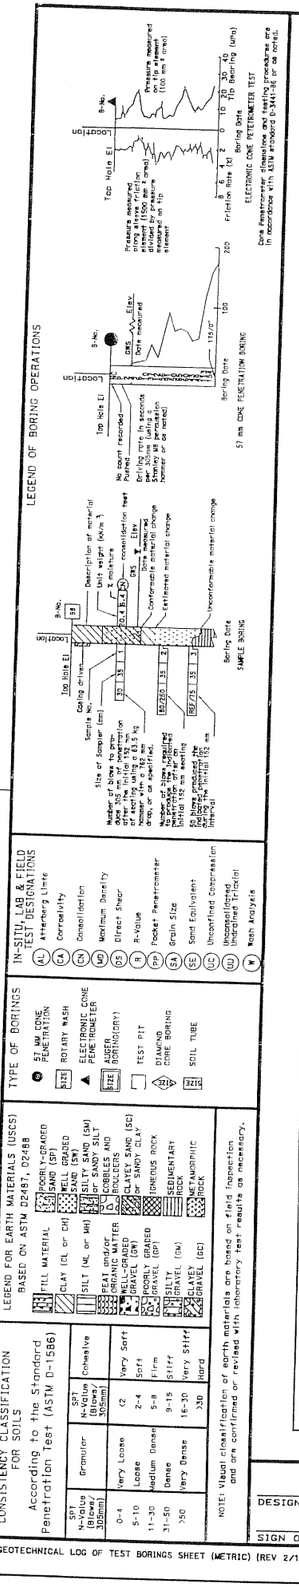
SHEET 6 OF 9



WEATHERING DESCRIPTORS

Modified from United States Bureau of Reclamation, Engineering Geology Field Manual.

Descriptors		Diagnostic features					
		Chemical weathering-Discoloration and/or oxidation		Mechanical weathering-Grain boundary conditions (disaggregation) primarily for granitics and some coarse-grained sediments	Texture and solutioning		General characteristics (strength, excavation, etc.) §
Alphanumeric descriptor	Descriptive term	Body of rock	Fracture surfaces†		Texture	Solutioning	
W1	Fresh	No discoloration, not oxidized.	No discoloration or oxidation.	No separation, intact (tight).	No change.	No solutioning.	Hammer rings when crystalline rocks are struck. Almost always rock excavation except for naturally weak or weakly cemented rocks such as siltstones or shales.
W2	Slightly weathered to fresh○						
W3	Slightly weathered	Discoloration or oxidation is limited to surface of, or short distance from, fractures; some feldspar crystals are dull.	Minor to complete discoloration or oxidation of most surfaces.	No visible separation, intact (tight).	Preserved.	Minor leaching of some soluble minerals may be noted.	Hammer rings when crystalline rocks are struck. Body of rock not weakened. With few exceptions, such as siltstones or shales, classified as rock excavation.
W4	Moderately to slightly weathered ○						
W5	Moderately weathered	Discoloration or oxidation extends from fractures usually throughout; Fe-Mg minerals are "rusty," feldspar crystals are "cloudy."	All fracture surfaces are discolored or oxidized.	Partial separation of boundaries visible.	Generally preserved.	Soluble minerals may be mostly leached.	Hammer does not ring when rock is struck. Body of rock is slightly weakened. Depending on fracturing, usually is rock excavation except in naturally weak rocks such as siltstones or shales.
W6	Intensely to moderately weathered○						
W7	Intensely weathered	Discoloration or oxidation throughout; all feldspars and Fe-Mg minerals are altered to clay to some extent; or chemical alteration produces in-situ disaggregation, see grain boundary conditions.	All fracture surfaces are discolored or oxidized, surfaces friable.	Partial separation, rock is friable; in semiarid conditions granitics are disaggregated.	Texture altered by chemical disintegration (hydration, argillation).	Leaching of soluble minerals may be complete.	Dull sound when struck with hammer, usually can be broken with moderate to heavy manual pressure or by light hammer blow without reference to planes of weakness such as incipient or hairline fractures, or veinlets. Rock is significantly weakened. Usually common excavation.
W8	Very intensely weathered						
W9	Decomposed	Discolored or oxidized throughout, but resistant minerals such as quartz may be unaltered; all feldspars and Fe-Mg minerals are completely altered to clay.		Complete separation of grain boundaries (disaggregated).	Resembles a soil, partial or complete remnant rock structure may be preserved; leaching of soluble minerals usually complete.		Can be granulated by hand. Always common excavation. Resistant minerals such as quartz may be present as "stringers" or "dikes."

Note: This chart and its horizontal categories are more readily applied to rocks with feldspars and mafic minerals. Weathering in various sedimentary rocks, particularly limestones and poorly indurated sediments, will not always fit the categories established. This chart and weathering categories may have to be modified for particular site conditions or alteration such as hydrothermal effects; however, the basic framework and similar descriptors are to be used.

○ Combination descriptors are permissible where equal distribution of both weathering characteristics are present over significant intervals or where characteristics present are "in between" the diagnostic feature. However, dual descriptors should not be used where significant, identifiable zones can be delineated. When given as a range only two adjacent terms may be combined. "Decomposed to slightly weathered," or "moderately weathered to fresh" are not acceptable.

† Does not include directional weathering along shears or faults and their associated features. For example, a shear zone that carried weathering to great depths into a fresh rock mass would not require the rock mass to be classified as weathered.

§ These are generalizations and should not be used as diagnostic features for weathering or excavation classification. These characteristics vary to a large extent based on naturally weak materials or cementation and type of excavation.

FRACTURE DENSITY

Modified from United States Bureau of Reclamation, Engineering Geology Field Manual.

FRACTURE DENSITY- Based on the spacing of all natural fractures in an exposure or core recovery disturbed zones (fracturing outside the shear) are included. Descriptors for fracture density apply to all rock exposures such as tunnel walls, dozer trenches, outcrops, or foundation cut slopes and inverts, as well as boreholes. Descriptive criteria presented below are based on borehole cores where lengths are measured along the core axis, for other exposures the criteria is distance measured between fractures (size of blocks).

UNFRACTURED (FD0): No fractures.

VERY SLIGHTLY FRACTURED (FD1): Core recovered mostly in lengths greater than 1 m.

SLIGHTLY TO VERY SLIGHTLY FRACTURED (FD2)*

SLIGHTLY FRACTURED (FD3): Core recovered mostly in lengths from 300 to 1000 mm, with few scattered lengths less than 300 mm or greater than 1000 mm.

MODERATELY TO SLIGHTLY FRACTURED (FD4)*

MODERATELY FRACTURED (FD5): Core recovered mostly in 100 to 300 mm lengths with most lengths about 200 mm.

INTENSELY TO MODERATELY FRACTURED (FD6)*

INTENSELY FRACTURED (FD7): Lengths average from 30 to 100 mm with scattered fragmented intervals. Core recovered mostly in lengths less than 100 mm.

VERY INTENSELY TO INTENSELY FRACTURED (FD8)*

VERY INTENSELY FRACTURED (FD9): Core recovered mostly as chips and fragments with a few scattered short core lengths.

* Combinations of fracture densities (e.g. very intensely to intensely fractured, or moderately to slightly fractured) are used where equal distribution of both fracture density characteristics are present over a significant interval or exposure, or where characteristics are "in between" the descriptor definitions.

ROCK HARDNESS DESCRIPTORS

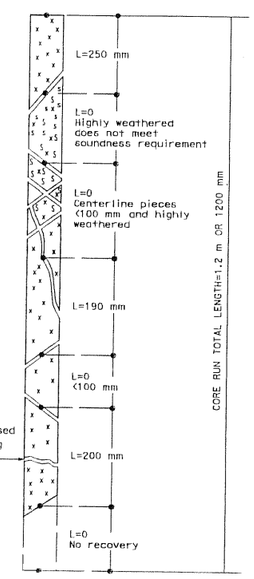
Alphanumeric Descriptor	Descriptor	Criteria
H1	Extremely hard	Core, fragment, or exposure cannot be scratched with knife or sharp pick; can only be chipped with repeated heavy hammer blows.
H2	Very hard	Cannot be scratched with knife of sharp pick. Core or fragment breaks with repeated heavy hammer blows.
H3	Hard	Can be scratched with knife or sharp pick with difficulty (heavy pressure). Heavy hammer blow required to break specimen.
H4	Moderately hard	Can be scratched with knife or sharp pick with light or moderate pressure. Core or fragment breaks with moderate hammer blow.
H5	Moderately soft	Can be grooved 2 mm deep by knife or sharp pick with moderate or heavy pressure. Core or fragment breaks with light hammer blow or heavy manual pressure.
H6	Soft	Can be grooved or gouged easily by knife or sharp pick with light pressure, can be scratched with fingernail. Breaks with light to moderate manual pressure.
H7	Very soft	Can be readily indented, grooved or gouged with fingernail, or carved with a knife. Breaks with light manual pressure.

Any bedrock unit softer than H7, very soft, is to be described using ASTM D-2488 consistency descriptors.

Note: Although "sharp pick" is included in these definitions, descriptions of ability to be scratched, grooved or gouged by a knife is the preferred criteria.

Modified from United States Bureau of Reclamation, Engineering Geology Field Manual.

ROCK QUALITY DESIGNATION (RQD) & PERCENT RECOVERY (REC) LOGGING



RQD (ROCK QUALITY DESIGNATION)	DESCRIPTION OF ROCK QUALITY
0 - 25%	VERY POOR
25 - 50%	POOR
50 - 75%	FAIR
75 - 90%	GOOD
90 - 100%	EXCELLENT

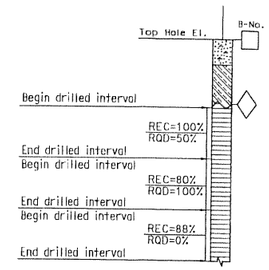
REC = Percent Core Recovery

$$REC = \frac{\sum \text{Length of all core pieces}}{\text{Total core run length}}$$

$$RQD = \frac{\sum \text{Length of sound core pieces } \geq 100 \text{ mm}}{\text{Total core run length}}$$

$$RQD = \frac{250+190+200}{1200} \times 100\%$$

RQD = 53% (fair)



(No Scale)
After Deere & Deere, 1989

BEDDING, FOLIATION, OR FLOW TEXTURE DESCRIPTORS

Descriptors	Thickness / Spacing
Massive	Greater than 3 m
Very thickly (bedded, foliated, or banded)	1 to 3 m
Thickly	300 mm to 1 m
Moderately	100 to 300 mm
Thinly	30 to 100 mm
Very thinly	10 to 30 mm
Laminated (intensely foliated or banded)	Less than 10 mm

Modified from United States Bureau of Reclamation, Engineering Geology Field Manual.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO. 61

SHEET 39 OF 85

(Copied from SAS Bid Package 02/03/03)

5-1.01 WORKING DRAWINGS

Working drawings shall conform to the requirements in Section 5-1.02 " Plans and Working Drawings," of the Standard Specifications and these special provisions. Working drawings shall include supplements and calculations that are in addition to drawings.

Working drawings shall be submitted to the following location:

California Department of Transportation
Office of the Resident Engineer, Contract 04-0120F4
345 Burma Rd.
Oakland, CA 94607

Working drawings shall conform to the following:

A. For initial review, 6 sets of the working drawings, shall be submitted. After the Engineer has determined that a submittal is complete, 12 additional sets shall be submitted.
B. Drawings shall be 559 mm x 864 mm or 279 mm x 432 mm in size. Supplements and calculations shall be 215 mm x 280 mm in size.
C. For drawings, text size shall be nominally 2.8 mm high, minimum. For supplement and calculations, font size shall be 12, minimum.
D. Each working drawing sheet and each page of supplement or calculation, shall include the jobsite name of the structure as shown on the contract plans, District-County-Route-Kilometer Post, bridge number and contract number.
E. Text and details shall be legible and suitable for photocopying and reduction.
F. In addition to the paper copies of the working drawings, electronic files shall be submitted. Electronic files shall be portable document format (PDF) and shall be submitted on compact disk (CD) media. Each plan sheet shall be a separate PDF file on the CD. The electronic copy of the calculations and supplement shall be made into separate PDF files so that no more than 50 pages are included in a single file on the CD. The CD shall contain an index consisting of the file names and a description of the corresponding file contents. The files shall be listed in the sequence of: 1) index, 2) drawings, 3) supplement, and 4) calculations. If more than one CD is used for a given working drawing submittal, the index shall be included on each CD.
G. Microfilms are required for approved shop drawings and shall be only a 24x reduction. The edge of the corrected original tracing image shall be clearly visible and visually parallel with the edges of the page. A clear, legible symbol shall be provided on the upper left side of each page to show the amount of reduction, and a horizontal and vertical scale shall be provided on each reduced print to facilitate enlargement to original scale.
H. At the completion of the contract, one compiled set of all approved working drawings (in electronic form and including all corrections and revisions) shall be furnished to the Engineer. The index shall be the first file on the CD.
I. At the completion of the contract, one set of reduced prints on 75-g/m2 (minimum) bond paper, 279 mm x 432 mm in size, of the corrected original tracings of all approved working drawings, including all corrections and revisions shall be furnished to the Engineer. Reduced prints that are common to more than one structure shall be submitted

CONTRACT NO. 04-0120F4
CONTRACT CHANGE ORDER NO. 61
SHEET 41 OF 85

Plans of the existing bridges may be requested by fax from the Office of Structure Maintenance and Investigations, 1801 30th Street, Sacramento, CA, Fax (916) 227-8357.

Plans of the existing bridges available to bidders and Contractors are reproductions of the original contract plans, with significant changes noted, and working drawings, and do not necessarily show normal construction tolerances and variances. Where dimensions of new construction required by this contract are dependent on the dimensions of the existing bridges, the Contractor shall verify the controlling field dimensions and shall be responsible for adjusting dimensions of the work to fit existing conditions.

SECTION 8. MATERIALS

8-1.01 SUBSTITUTION OF NON-METRIC MATERIALS AND PRODUCTS

Only materials and products conforming to the requirements of the specifications shall be incorporated in the work. When metric materials and products are not available, and when approved by the Engineer, and at no cost to the State, materials and products in the United States Standard Measures which are of equal quality and of the required properties and characteristics for the purpose intended, may be substituted for the equivalent metric materials and products, subject to the following provisions:

A. Materials and products shown on the plans or in the special provisions as being equivalent may be substituted for the metric materials and products specified or detailed on the plans.

B. Before other non-metric materials and products will be considered for use, the Contractor shall furnish, at the Contractor's expense, evidence satisfactory to the Engineer that the materials and products proposed for use are equal to or better than the materials and products specified or detailed on the plans. The burden of proof as to the quality and suitability of substitutions shall be upon the Contractor and the Contractor shall furnish necessary information as required by the Engineer. The Engineer will be the sole judge as to the quality and suitability of the substituted materials and products and the Engineer's decision will be final.

C. When the Contractor elects to substitute non-metric materials and products, including materials and products shown on the plans or in the special provisions as being equivalent, the list of sources of material specified in Section 6-1.01, "Source of Supply and Quality of Materials," of the Standard Specification shall include a list of substitutions to be made and contract items involved. In addition, for a change in design or details, the Contractor shall submit plans and working drawings in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications. The plans and working drawings shall be submitted at least 7 days before the Contractor intends to begin the work involved.

SHEET 49 OF 85

the producer of the aggregate submits to the Transportation Laboratory certified test results from a qualified testing laboratory that verify the aggregate complies with the requirements. Prior to starting the testing, the aggregate test shall be registered with the Department. A registration number can be obtained by calling (916) 227-7228. The registration number shall be used as the identification for the aggregate sample in correspondence with the Department. Upon request, a split of the tested sample shall be provided to the Department. Approval of aggregate will depend upon compliance with the specifications, based on the certified test results submitted, together with any replicate testing the Department may elect to perform. Approval will expire 3 years from the date the most recent registered and evaluated sample was collected from the aggregate source.

Qualified testing laboratories shall conform to the following requirements:

A. Laboratories performing ASTM Designation: C 1293 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Concrete Proficiency Sample Program and shall have received a score of 3 or better on all tests of the previous 2 sets of concrete samples.
B. Laboratories performing ASTM Designation: C 1260 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Pozzolan Proficiency Sample Program and shall have received a score of 3 or better on the shrinkage and soundness tests of the previous 2 sets of pozzolan samples.

Aggregates on the list shall conform to one of the following requirements:

A. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1293, the average expansion at one year shall be less than or equal to 0.040 percent; or
B. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1260, the average of the expansion at 16 days shall be less than or equal to 0.15 percent.

The amounts of cement and mineral admixture used in cementitious material shall be sufficient to satisfy the minimum cementitious material content requirements specified in Section 90-1.01, "Description," or Section 90-4.05, "Optional Use of Chemical Admixtures," of the Standard Specifications and shall conform to the following:

A. The minimum amount of cement shall not be less than 75 percent by mass of the specified minimum cementitious material content.
B. The minimum amount of mineral admixture to be combined with cement shall be determined using one of the following criteria:

    1. When the calcium oxide content of a mineral admixture is equal to or less than 2 percent by mass, the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
    2. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass, and any of the aggregates used are not listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 25 percent by mass of the total amount of cementitious material to be used in the mix.
    3. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass and the fine and coarse aggregates are listed on the approved list as specified in

The QC Inspector shall be the duly designated person who acts for and on behalf of the Contractor for inspection, testing, and quality related matters for all welding.

Quality Assurance (QA) is the prerogative of the Engineer. The QA Inspector is the duly designated person who acts for and on behalf of the Engineer.

The QC Inspector shall be responsible for quality control acceptance or rejection of materials and workmanship, and shall be currently certified as an AWS Certified Welding Inspector (CWI) in conformance with the requirements in AWS QC1, "Standard for AWS Certification of Welding Inspectors."

The QC Inspector may be assisted by an Assistant QC Inspector provided that this individual is currently certified as an AWS Certified Associate Welding Inspector (CAWI) in conformance with the requirements in AWS QC1, "Standard for AWS Certification of Welding Inspectors." The Assistant QC Inspector may perform inspection under the direct supervision of the QC Inspector provided the assistant is always within visible and audible range of the QC Inspector. The QC Inspector shall be responsible for signing all reports and for determining if welded materials conform to workmanship and acceptance criteria. The ratio of QC Assistants to QC Inspectors shall not exceed 5 to 1.

When the term "Inspector" is used without further qualification, it shall refer to the QC Inspector.

When any work is welded in conformance with the provisions in Section 75, "Miscellaneous Metal," of the Standard Specifications, not including Section 75-1.035, "Bridge Joint Restrainer Units," of the Standard Specifications, Section 6.1.4 of AWS D1.1 is replaced with the following:

The QC Inspector shall be responsible for quality control acceptance or rejection of materials and workmanship and shall be currently certified as an AWS CWI in conformance with the requirements in AWS QC1, "Standard for AWS Certification of Welding Inspectors," or as a Welding Inspector Specialist (WIS) in conformance with the requirements in AWS B5.2, "Specification for the Qualification of Welding Inspector Specialists and Welding Inspector Assistants."

Section 6.14.6, "Personnel Qualification," of AWS D1.1, Section 7.8, "Personnel Qualification," of AWS D1.4, and Section 6.1.3.4, "Personnel Qualification," of AWS D1.5 are replaced with the following:

Personnel performing nondestructive testing (NDT) shall be qualified and certified in conformance with the requirements of the American Society for Nondestructive Testing (ASNT) Recommended Practice No. SNT-TC-1A and the Written Practice of the NDT firm. The Written Practice of the NDT firm shall meet or exceed the guidelines of the ASNT Recommended Practice No. SNT-TC-1A. Individuals who perform NDT, review the results, and prepare the written reports shall be either:

A. Certified NDT Level II technicians, or;
B. Level III technicians who hold a current ASNT Level III certificate in that discipline and are authorized and certified to perform the work of Level II technicians.

Section 6.5.4 of AWS D1.5 is replaced with the following:

for the entire period of the contract, as long as the welder's or welding operator's work remains satisfactory.

In addition to the requirements of AWS D1.1, welding procedures qualification for work welded in conformance with that code shall conform to the following requirements:

A. The travel speed, amperage, and voltage values that are used for tests conducted per AWS D1.1, Section 4.1.1, shall be consistent for each pass in a weld joint and shall in no case vary by more than ±10 percent for travel speed, ±10 percent for amperage, and ±7 percent for voltage as measured from a predetermined target value or average within each weld pass. The travel speed shall in no case vary by more than ±15 percent when using submerged arc welding.
B. When a nonstandard weld joint is to be made using a combination of WPSs, a single test may be conducted combining the WPSs to be used in production, provided the essential variables, including weld bead placement, of each process are limited to those established in Table 4.5.

In addition to the requirements of AWS D1.5, Section 5.12 or 5.13, welding procedures qualification for work welded in conformance with that code shall conform to the following requirements:

A. Unless considered prequalified, fillet welds shall be qualified in each position. The fillet weld soundness test shall be conducted using the essential variables of the WPS as established by the Procedure Qualification Record (PQR).
B. For qualification of joints that do not conform to Figures 2.4 and 2.5 of AWS D1.5, a minimum of two WPS qualification tests are required. The tests shall be conducted using both Figure 5.1 and Figure 5.3. The test conforming to Figure 5.1 shall be conducted in conformance with AWS D1.5, Section 5.12 or 5.13. The test conforming to Figure 5.3 shall be conducted using the welding electrical parameters that were established for the test conducted conforming to Figure 5.1. The ranges of welding electrical parameters established during welding per Figure 5.1 in conformance with AWS D1.5, Section 5.12, shall be further restricted according to the limits in Table 5.3 during welding per Figure 5.3.
C. Multiple zones within a weld joint may be qualified. The travel speed, amperage, and voltage values that are used for tests conducted per AWS D1.5 Section 5.13 shall be consistent for each pass in a weld joint, and shall in no case vary by more than ±10 percent for travel speed, ±10 percent for amperage, and ±7 percent for voltage as measured from a predetermined target value or average within each weld pass or zone. The travel speed shall in no case vary by more than ±15 percent when using submerged arc welding.
D. For a WPS qualified in conformance with AWS D1.5 Section 5.13, the values to be used for calculating ranges for current and voltage shall be based on the average of all weld passes made in the test. Heat input shall be calculated using the average of current and voltage of all weld passes made in the test for a WPS qualified in conformance with Section 5.12 or 5.13.
E. Macroetch tests are required for WPS qualification tests, and acceptance shall be per AWS D1.5 Section 5.19.3.
F. When a nonstandard weld joint is to be made using a combination of WPSs, a test conforming to Figure 5.3 may be conducted combining the WPSs to be used in

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO. 61
SHEET 55 OF 85

be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications. The Contractor shall notify the Engineer one week prior to performing any qualification tests. Witnessing of qualification tests by the Engineer shall not constitute approval of the intended joint locations, welding parameters, or essential variables.

The Contractor shall designate in writing a welding Quality Control Manager (QCM). The QCM shall be responsible directly to the Contractor for the quality of welding, including materials and workmanship, performed by the Contractor and subcontractors.

The QCM shall be the sole individual responsible to the Contractor for submitting, receiving, reviewing, and approving all correspondence, required submittals, and reports to and from the Engineer. The QCM shall be a registered professional engineer or shall be currently certified as a CWI.

Unless the QCM is hired by a subcontractor providing only QC services, the QCM shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project. The QCM may be an employee of the Contractor.

Welding inspection personnel or NDT firms to be used in the work shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project, except for the following conditions:

A. The work is welded in conformance with AWS D1.5 and is performed at a permanent fabrication or manufacturing facility that is certified under the AISC Quality Certification Program, Category Cbr, Major Steel Bridges and Fracture Critical endorsement F, when applicable.
B. The welding is performed on pipe pile material at a permanent pipe manufacturing facility authorized to apply the American Petroleum Institute (API) monogram for API 5L pipe.

For welding performed at such facilities, the inspection personnel or NDT firms may be employed or compensated by the facility performing the welding provided the facility maintains a QC program that is independent from production.

Prior to submitting the Welding Quality Control Plan (WQCP) required herein, a prewelding meeting between the Engineer, the Contractor's QCM, and a representative from each entity performing welding or inspection for this project, shall be held to discuss the requirements for the WQCP.

The Contractor shall submit to the Engineer, in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications, 2 copies of a separate WQCP for each subcontractor or supplier for each item of work for which welding is to be performed.

The Contractor shall allow the Engineer 2 weeks to review the WQCP submittal after a complete plan has been received. No welding shall be performed until the WQCP is approved in writing by the Engineer. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

An amended WQCP or any addendum to the approved WQCP shall be submitted to, and approved in writing by the Engineer, for proposed revisions to the approved WQCP. An

CONTRACT NO. 01-0K2604
CONTRACT CHANGE ORDER NO. 61
SHEET 57 OF 85

The Engineer will review the Welding Report to determine if the Contractor is in conformance with the WQCP. Unless otherwise specified, the Engineer shall be allowed 2 weeks to review the report and respond in writing after the complete Welding Report has been received. Prior to receiving notification from the Engineer of the Contractor's conformance with the WQCP, the Contractor may encase in concrete or cover welds for which the Welding Report has been submitted. However, should the Contractor elect to encase or cover those welds prior to receiving notification from the Engineer, it is expressly understood that the Contractor shall not be relieved of the responsibility for incorporating material in the work that conforms to the requirements of the plans and specifications. Material not conforming to these requirements will be subject to rejection. Should the Contractor elect to wait to encase or cover welds pending notification by the Engineer, and in the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

In addition to the requirements in AWS D1.1 and AWS D1.5, second-time excavations of welds or base metal to repair unacceptable discontinuities, regardless of NDT method, and all repairs of cracks require prior approval of the Engineer.

The Engineer shall be notified immediately in writing when welding problems, deficiencies, base metal repairs, or any other type of repairs not submitted in the WQCP are discovered, and also of the proposed repair procedures to correct them. For requests to perform second-time repairs or repairs of cracks, the Contractor shall include an engineering evaluation of the proposed repair. The engineering evaluation, at a minimum, shall address the following:

A. What is causing each defect?
B. Why the repair will not degrade the material properties?
C. What steps are being taken to prevent similar defects from happening again?

The Contractor shall allow the Engineer one week to review these procedures. No remedial work shall begin until the repair procedures are approved in writing by the Engineer. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

The QCM shall sign and furnish to the Engineer, a Certificate of Compliance in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications for each item of work for which welding was performed. The certificate shall state that all of the materials and workmanship incorporated in the work, and all required tests and inspections of this work, have been performed in conformance with the details shown on the plans, the Standard Specifications, and these special provisions.

PAYMENT

Full compensation for conforming to the requirements of "Welding" shall be considered as included in the contract prices paid for the various items of work involved and no additional compensation will be allowed therefor.

CONTRACT NO. 04-0W604
CONTRACT CHANGE ORDER NO. 61
SHEET 59 OF 85

Removed materials that are not to be salvaged or used in the reconstruction shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

The Contractor shall submit a complete bridge removal plan to the Engineer for each bridge listed above, detailing procedures, sequences, and all features required to perform the removal in a safe and controlled manner.

The bridge removal plan shall include, but not be limited to the following:

A. The removal sequence, including staging of removal operations.
B. Equipment locations on the structure during removal operations.
CLocations where work is to be performed over traffic or utilities.
D. Measures to assure that people, property, utilities, and improvements will not be endangered.

The bridge removal plan shall conform to the provisions in Section "Working drawings" of these special provisions. The number of sets of drawings, design calculations, and unless otherwise specified in the following table, the time for reviewing bridge removal plans shall be the same as specified for falsework working drawings in Section 51-1.06A, "Falsework Design and Drawings," of the Standard Specifications.

10-1.__ EARTHWORK

Earthwork shall conform to the provisions in Section 19, "Earthwork," of the Standard Specifications and these special provisions.

CAST-IN-DRILLED-HOLE CONCRETE PILES

Cast-in-drilled-hole concrete piling shall conform to the provisions in Section 49-4, "Cast-In-Place Concrete Piles," of the Standard Specifications and these special provisions.

The provisions of "Welding" of these special provisions shall not apply to temporary steel casings.

Cast-in-drilled-hole concrete piles 600 mm in diameter or larger may be constructed by excavation and depositing concrete under slurry.

Materials

Concrete deposited under slurry shall have a nominal penetration equal to or greater than 90 mm. Concrete shall be proportioned to prevent excessive bleed water and segregation.

Concrete deposited under slurry shall contain not less than 400 kg of cementitious material per cubic meter.

The combined aggregate grading used in concrete for cast-in-drilled-hole concrete piling shall be either the 25-mm maximum grading, the 12.5-mm maximum grading, or the 9.5-mm maximum grading and shall conform to the requirements in Section 90-3, "Aggregate Gradings," of the Standard Specifications.

Mineral Slurry

Mineral slurry shall be mixed and thoroughly hydrated in slurry tanks, and slurry shall be sampled from the slurry tanks and tested before placement in the drilled hole.

Slurry shall be recirculated or continuously agitated in the drilled hole to maintain the specified properties.

Recirculation shall include removal of drill cuttings from the slurry before discharging the slurry back into the drilled hole. When recirculation is used, the slurry shall be sampled and tested at least every 2 hours after beginning its use until tests show that the samples taken from the slurry tank and from near the bottom of the hole have consistent specified properties. Subsequently, slurry shall be sampled at least twice per shift as long as the specified properties remain consistent.

Slurry that is not recirculated in the drilled hole shall be sampled and tested at least every 2 hours after beginning its use. The slurry shall be sampled mid-height and near the bottom of the hole. Slurry shall be recirculated when tests show that the samples taken from mid-height and near the bottom of the hole do not have consistent specified properties.

Slurry shall also be sampled and tested prior to final cleaning of the bottom of the hole and again just prior to placing concrete. Samples shall be taken from mid-height and near the bottom of the hole. Cleaning of the bottom of the hole and placement of the concrete shall not start until tests show that the samples taken from mid-height and near the bottom of the hole have consistent specified properties.

Synthetic Slurry

Synthetic slurries shall be used in conformance with the manufacturer's recommendations and these special provisions. The following synthetic slurries may be used:

PRODUCT	MANUFACTURER
SlurryPro CDP	KB Technologies Ltd. 3648 FM 1960 West Suite 107 Houston, TX 77068 (800) 525-5237
Super Mud	PDS Company c/o Champion Equipment Company 8140 East Rosecrans Ave. Paramount, CA 90723 (562) 634-8180
Shore Pac GCV	CETCO Drilling Products Group 1350 West Shure Drive Arlington Heights, IL 60004 (847) 392-5800
Novagel Polymer	Geo-Tech Drilling Fluids 220 N. Zapata Hwy, Suite 11A Laredo, TX 78043 (210) 587-4758

Inclusion of a synthetic slurry on the above list may be obtained by meeting the Department's requirements for synthetic slurries. The requirements can be obtained from the Office of Structure Design, P.O. Box 942874, Sacramento, CA 94274-0001.

Synthetic slurries listed may not be appropriate for a given site.

Synthetic slurries shall not be used in holes drilled in primarily soft or very soft cohesive soils as determined by the Engineer.

A manufacturer's representative, as approved by the Engineer, shall provide technical assistance for the use of their product, shall be at the site prior to introduction of the synthetic slurry into a drilled hole, and shall remain at the site until released by the Engineer.

Synthetic slurries shall be sampled and tested at both mid-height and near the bottom of the drilled hole. Samples shall be taken and tested during drilling as necessary to verify the control of the properties of the slurry. Samples shall be taken and tested when drilling is complete, but prior to final cleaning of the bottom of the hole. When samples are in conformance with the requirements shown in the following tables for each slurry product, the bottom of the hole shall be cleaned and any loose or settled material removed. Samples shall be obtained and tested after final cleaning and immediately prior to placing concrete.

Super Mud synthetic slurries shall be tested for conformance to the requirements shown in the following table:

SUPER MUD PDS Company		
PROPERTY	REQUIREMENT	TEST
Density (kg/m^3) - prior to final cleaning - just prior to placing concrete	less than or equal to 1025*	Mud Weight (Density) API 13B-1 Section 1
Viscosity (seconds/liter) - during drilling - prior to final cleaning - just prior to placing concrete	34 to 64 less than or equal to 64	Marsh Funnel and Cup API 13B-1 Section 2.2
pH	8 to 10.0	Glass Electrode pH Meter or pH Paper
Sand Content (percent) - prior to final cleaning -just prior to placing concrete	less than or equal to 0.5	Sand API 13B-1 Section 5
*When approved by the Engineer, slurry may be used in salt water, and the allowable densities may be increased up to 32 kg/m^3. Slurry temperature shall be at least 4°C when tested.		

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO. 61

SHEET 67 OF 85

Novagel Polymer synthetic slurries shall be tested for conformance to the requirements shown in the following table:

NOVAGEL POLYMER Geo-Tech Drilling Fluids		
PROPERTY	REQUIREMENT	TEST
Density (kg/m^3) - during drilling - prior to final cleaning - just prior to placing concrete	 less than or equal to 1075* less than or equal to 1025*	Mud Weight (Density) API 13B-1 Section 1
Viscosity (seconds/liter) - during drilling - prior to final cleaning - just prior to placing concrete	 48 to 110 less than or equal to 110	Marsh Funnel and Cup API 13B-1 Section 2.2
pH	6.0 to 11.5	Glass Electrode pH Meter or pH Paper
Sand Content (percent) - prior to final cleaning -just prior to placing concrete	 less than or equal to 0.5	Sand API 13B-1 Section 5
*When approved by the Engineer, slurry may be used in salt water, and the allowable densities may be increased up to 32 kg/m^3. Slurry temperature shall be at least 4°C when tested.		

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO. 61

SHEET 69 OF 85

2. Concrete batching, delivery, and placing systems, including time schedules and capacities therefor. Time schedules shall include the time required for each concrete placing operation at each pile.
3. Concrete placing rate calculations. When requested by the Engineer, calculations shall be based on the initial pump pressures or static head on the concrete and losses throughout the placing system, including anticipated head of slurry and concrete to be displaced.
4. Suppliers' test reports on the physical and chemical properties of the slurry and any proposed slurry chemical additives, including Material Safety Data Sheet.
5. Slurry testing equipment and procedures.
6. Methods of removal and disposal of excavation, slurry, and contaminated concrete, including removal rates.
7. Methods and equipment for slurry agitating, recirculating, and cleaning.

In addition to compressive strength requirements, the consistency of the concrete to be deposited under slurry shall be verified before use by producing a test batch. The test batch shall be produced and delivered to the project under conditions and in time periods similar to those expected during the placement of concrete in the piles. Concrete for the test batch shall be placed in an excavated hole or suitable container of adequate size to allow for testing as specified herein. Depositing of test batch concrete under slurry will not be required. In addition to meeting the specified nominal penetration, the test batch shall meet the following requirements:

A. For piles where the time required for each concrete placing operation, as submitted in the placing plan, will be 2 hours or less, the test batch shall demonstrate that the proposed concrete mix design achieves either a penetration of at least 50 mm or a slump of at least 125 mm after twice that time has elapsed.
B. For piles where the time required for each concrete placing operation, as submitted in the placing plan, will be more than 2 hours, the test batch shall demonstrate that the proposed concrete mix design achieves either a penetration of at least 50 mm or a slump of at least 125 mm after that time plus 2 hours has elapsed.

The time period shall begin at the start of placement. The concrete shall not be vibrated or agitated during the test period. Penetration tests shall be performed in conformance with the requirements in California Test 533. Slump tests shall be performed in conformance with the requirements in ASTM Designation: C 143. Upon completion of testing, the concrete shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

The concrete deposited under slurry shall be carefully placed in a compact, monolithic mass and by a method that will prevent washing of the concrete. Concrete deposited under slurry need not be vibrated. Placing concrete shall be a continuous operation lasting not more than the time required for each concrete placing operation at each pile, as submitted in the placing plan, unless otherwise approved in writing by the Engineer. The concrete shall be placed with concrete pumps and delivery tube system of adequate number and size to complete the placing of concrete in the time specified. The delivery tube system shall consist of one of the following:

A. A tremie tube or tubes, each of which are at least 250 mm in diameter, fed by one or more concrete pumps.
B. One or more concrete pump tubes, each fed by a single concrete pump.

CONTRACT NO. 04-0120K4
CONTRACT CHANGE ORDER NO. 61
SHEET 11 OF 85

shall not apply to permanent steel casings. Permanent casings shall be watertight and of sufficient strength to withstand the loads from installation procedures.

Acceptance Testing and Mitigation

Vertical inspection pipes for acceptance testing shall be provided in all cast-in-drilled-hole concrete piles that are 600 mm in diameter or larger, except when the holes are dry or when the holes are dewatered without the use of temporary casing to control ground water.

Inspection pipes shall be Schedule 40 polyvinyl chloride pipes with a nominal inside diameter of 50 mm. Each inspection pipe shall be capped top and bottom and shall have watertight couplers to provide a clean, dry and unobstructed 50-mm diameter clear opening from 1.0 m above the pile cutoff down to the bottom of the reinforcing cage.

If the Contractor drills the hole below the specified tip elevation, the reinforcement and the inspection pipes shall be extended to 75 mm clear of the bottom of the drilled hole.

Inspection pipes shall be placed around the pile, inside the outermost spiral or hoop reinforcement, and 75 mm clear of the vertical reinforcement, at a uniform spacing not exceeding 840 mm measured along the circle passing through the centers of inspection pipes. A minimum of 2 inspection pipes per pile shall be used. When the vertical reinforcement is not bundled and each bar is not more than 26 mm in diameter, inspection pipes may be placed 50 mm clear of the vertical reinforcement. The inspection pipes shall be placed to provide the maximum diameter circle that passes through the centers of the inspection pipes while maintaining the clear spacing required herein. The pipes shall be installed in straight alignment, parallel to the main reinforcement, and securely fastened in place to prevent misalignment during installation of the reinforcement and placing of concrete in the hole.

The Contractor shall log the location of the inspection pipe couplers with respect to the plane of pile cut off, and these logs shall be delivered to the Engineer upon completion of the placement of concrete in the drilled hole.

After placing concrete and before requesting acceptance tests, each inspection pipe shall be tested by the Contractor in the presence of the Engineer by passing a 48.3-mm diameter rigid cylinder 610 mm long through the complete length of pipe. If the 48.3-mm diameter rigid cylinder fails to pass any of the inspection pipes, the Contractor shall attempt to pass a 32.0-mm diameter rigid cylinder 1.375 m long through the complete length of those pipes in the presence of the Engineer. If an inspection pipe fails to pass the 32.0-mm diameter cylinder, the Contractor shall immediately fill all inspection pipes in the pile with water.

The Contractor shall replace each inspection pipe that does not pass the 32.0-mm diameter cylinder with a 50.8-mm diameter hole cored through the concrete for the entire length of the pile. Cored holes shall be located as close as possible to the inspection pipes they are replacing and shall be no more than 150 mm inside the reinforcement. Coring shall not damage the pile reinforcement. Cored holes shall be made with a double wall core barrel system utilizing a split tube type inner barrel. Coring with a solid type inner barrel will not be allowed. Coring methods and equipment shall provide intact cores for the entire length of the pile concrete. The coring operation shall be logged by an Engineering Geologist or Civil Engineer licensed in the State of California and experienced in core logging. Coring logs shall include complete descriptions of inclusions and voids encountered during coring, and shall be delivered to the Engineer upon completion. Concrete cores shall be preserved, identified with the exact location the core was recovered from within the pile, and made available for inspection by the Engineer.

Acceptance tests of the concrete will be made by the Engineer, without cost to the Contractor. Acceptance tests will evaluate the homogeneity of the placed concrete. Tests will include gamma-gamma logging. Tests may also include crosshole sonic logging and other means of

CONTRACT CHANGE ORDER NO. 61
SHEET 73 OF 85

A. The designation and location of the pile addressed by the mitigation plan.
B. A review of the structural, geotechnical, and corrosion design requirements of the rejected pile.
C. A step by step description of the mitigation work to be performed, including drawings if necessary.
D. An assessment of how the proposed mitigation work will address the structural, geotechnical, and corrosion design requirements of the rejected pile.
E. Methods for preservation or restoration of existing earthen materials.
F. A list of affected facilities, if any, with methods and equipment for protection of these facilities during mitigation.
G. The State assigned contract number, bridge number, full name of the structure as shown on the contract plans, District-County-Route-Kilometer Post, and the Contractor's (and Subcontractor's if applicable) name on each sheet.
H. A list of materials, with quantity estimates, and personnel, with qualifications, to be used to perform the mitigation work.
I. The seal and signature of an engineer who is licensed as a Civil Engineer by the State of California.

For rejected piles to be repaired, the Contractor shall submit a pile mitigation plan that contains the following additional information:

A. An assessment of the nature and size of the anomalies in the rejected pile.
B. Provisions for access for additional pile testing if required by the Engineer.

For rejected piles to be replaced or supplemented, the Contractor shall submit a pile mitigation plan that contains the following additional information:

A. The proposed location and size of additional piling.
B. Structural details and calculations for any modification to the structure to accommodate the replacement or supplemental piling.

All provisions for cast-in-drilled-hole concrete piling shall apply to replacement piling.

The Contractor shall allow the Engineer 25 days to review the mitigation plan after a complete submittal has been received.

Should the Engineer fail to review the complete pile mitigation submittal within the time specified, and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in reviewing the pile mitigation plan, an extension of time commensurate with the delay in completion of the work thus caused will be granted in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

When repairs are performed, the Contractor shall submit a mitigation report to the Engineer within 10 days of completion of the repair. This report shall state exactly what repair work was performed and quantify the success of the repairs relative to the submitted mitigation plan. The mitigation report shall be stamped and signed by an engineer that is licensed as a Civil Engineer by the State of California. The mitigation report shall show the State assigned contract number, bridge number, full name of the structure as shown on the contract plans, District-County-Route-Kilometer Post, and the Contractor (and subcontractor if applicable) name on each sheet. The Engineer will be the sole judge as to whether a mitigation proposal is acceptable, the mitigation

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO. 01
SHEET 75 OF 85

MEASUREMENT AND PAYMENT (PILING)

Measurement and payment for the various types and classes of piles shall conform to the provisions in Sections 49-6.01, "Measurement," and 49-6.02, "Payment," of the Standard Specifications and these special provisions.

Payment for cast-in-place concrete piling shall conform to the provisions in Section 49-6.02, "Payment," of the Standard Specifications and these special provisions except that, when the diameter of cast-in-place concrete piling is shown on the plans as 600 mm or larger, reinforcement in the piling will be paid for by the kilogram as bar reinforcing steel (bridge).

Full compensation for slurry, depositing concrete under slurry, test batches, inspection pipes, filling inspection holes and pipes with grout, drilling oversized cast-in-drilled-hole concrete piling, filling cave-ins and oversized piles with concrete, and redrilling through concrete, shall be considered as included in the contract prices paid per meter for cast-in-drilled-hole concrete piling of the types and sizes listed in the Engineer's Estimate, and no additional compensation will be allowed therefor.

The contract price paid per meter for place permanent steel casing of the sizes listed in the Engineer's Estimate shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in installing permanent steel casing, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

Full compensation for furnishing and installing steel plate cap to permanent steel casing at Bent 41 shall be considered as included in the contract price paid per meter for place permanent steel casing and no additional compensation will be allow

ELASTOMERIC BEARING PADS

Elastomeric bearing pads shall conform to the provisions in Section 51-1.12H, "Elastomeric Bearing Pads," of the Standard Specifications and these special provisions.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 64	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Improve the existing access road located to the north of the W3L footing to create an all-weather access road, perform site improvements to create a temporary parking lot adjacent to Macalla Road and the Caltrans field office, and any other necessary work as directed by the Engineer.

For this work, payment will be in accordance with Section 4-1.03D, Extra Work, of the Standard Specifications, and Sectior 5-1.24, Force Account Payment, of the Special Provisions, and no other compensation will be allowed therefor.

No adjustment in contract time will be made since this work is not a controlling operation.

Estimated cost of Extra Work at Force Account $150,000.00

RECEIVED

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 64	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer, and in accordance with Section 5-1.01, "Working Drawings", and Section 5-1.02 "Integrated Shop Drawings" of the Special Provisions for Contract Change Order No. 64, produce integrated shop drawings (ISD) for the column to footing and column to bent cap interfaces for the YBI Transition Structures, Bridge Nos. 34-0006 L/R, at Bent W3L.

The attached contract plans and specifications are for Bent W3L only.

This work shall be completed prior to the start of column reinforcing steel fabrication. The Contractor shall ensure that all reinforcement be placed in accordance with the conflict-free ISD drawings.

For this work, payment will be in accordance with Section 4-1.03D, Extra Work, of the Standard Specifications, and Section 5-1.24, Force Account Payment, of the Special Provisions, and no other compensation will be allowed therefor.

No adjustment in contract time will be made since this work is not a controlling operation.

Estimated cost of Extra Work at Force Account $80,000.00

Extra Work at Lump Sum:

Construct the footing, and column for the Yerba Buena Island Transition Structures at Bent W3 Left to the elevation of 16M above the top of footing in accordance with the attached plans and specifications, and as authorized by the Engineer. Supply and install tie-downs and backfill the footing to finished grade. The attached contract plans and specifications are for Bent W3L only.

This work shall be completed by March 15, 2007. Should the work not be completed, at no additional cost to the State, the partially completed footing and column shall be protected in place from exposure to the elements and corrosion, and the area shall be backfilled and restored to the existing elevation. At the next available work window, the balance of the outstanding work shall be completed with no additional compensation allowed.

For this work, the Contractor will be paid the sum of $5,755,000.00. This amount constitutes full compensation, including markups, for all labor, equipment, materials, and all incidentals, including concrete washouts, to complete the work of this change except for the following items:

1) All associated SWPPP work, except for concrete washouts, to be paid for separately under their respective bid items, or force account as agreed to in advance between parties.

2) The remaining 50% of all flagging work done under this change order is to be paid by Contract Change Order No. 1

All work shall be performed in accordance with the contract documents.

Total Cost of Extra Work at Lump Sum $5,755,000.00

CHANGE
CCO # 64 s1

CONTRACT NO. 64-0120R4

CONTRACT CHANGE ORDER NO. 64-S1

SHEET 3 OF 150

5-1.02 INTEGRATED SHOP DRAWINGS

Difficult reinforcement placement is anticipated at the

A. Reinforcement at column penetrations for drain pipes and electrical conduits
B. Reinforcement at column to footing intersections.
C. Reinforcement at column to bent cap intersections.

These locations are highly congested with reinforcing steel, high strength rods, post-tensioning strand tendons, anchor bolts, and other concrete embedded items as shown on the plans. It is anticipated that various dimensional conflicts may be encountered between the planned locations of these embedded items.

The Contractor shall develop three-dimensional integrated shop drawings (ISD's) for all locations listed above in accordance with the details shown on the plans and the requirements of this section. ISD's shall conform to Section "Working Drawings," of these special provisions. ISD's shall be prepared under the supervision of an engineer who is registered as a Civil Engineer in the State of California. ISD's shall be composite placing drawings to scale and in sufficient detail to show the relative positions of all items that are to be embedded in the concrete and their embedment depth as necessary to demonstrate compatibility of items within the concrete.

Prior to commencing work on the ISD, the Contractor (including any sub-consultants hired to work on the ISD) shall attend a meeting with the Engineer to discuss the ISD work.

Embedded items that are to be shown on the ISD's shall include but are not limited to, the following:

A. Bar reinforcing steel and splices including lap, welded, and mechanical splices
B. Prestressing ducts
C. Drainage pipe
D. Other items, as shown on the plans or added by the Contractor

The three-dimensional ISD's shall be adequate to ensure that there will be no conflict between the planned positions of any embedded items and that concrete cover will be adequate.

If conflicts are discovered during the preparation of ISD's, the Contractor shall revise the working drawings for one or more of the embedded items to eliminate the conflict or provide proper cover or spacing. If a conflict requires that bar reinforcement locations be adjusted, the Contractor shall proceed with performing reinforcing steel adjustments in the ISD's prior to submitting the changes to the Engineer.

The ISD's to be submitted to the Engineer shall include the following:

A. ISD submittal shall be in two-dimensional format utilizing the three-dimensional layouts as input.
B. Three sets of the ISD's corresponding to the details as shown on the plans with incorporation of any Contractor's adjustments in the locations of embedded items. These ISD's shall resolve all conflicts and satisfy concrete cover requirements as shown on the plans. The initial ISD submittal for a particular area shall clearly identify all adjustments to the locations of embedded items made as part of the Contractor's conflict resolution process.
C. Three copies of the ISD's in electronic form on compact discs or tape for use by the Engineer.

CAD files of the contract drawings will not be made available to the Contractor.

After completed ISD's are received by the Engineer, the Contractor shall allow the Engineer 1 week for review and approval. For each revised ISD's submitted by the Contractor, the Contractor shall allow the Engineer an additional 1 week for review and approval. Construction of the items listed above shall not begin until the Engineer reviews and approves the complete ISD's with all conflicts resolved.

No extension of time will be permitted for the Contractor's failure to identify all conflicts or to complete the ISD's as required by these special provisions.

Full compensation for preparing ISD's, including all revisions necessary due to conflict resolution measures taken by the Contractor, shall be considered as included in the contract prices paid for the various items of work involved and no additional compensation will be allowed therefor.

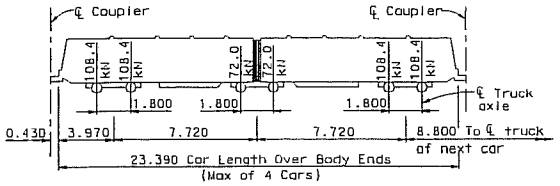
BRIDGE DECK DRAINAGE SYSTEM	487	341	830 KG

GENERAL NOTES

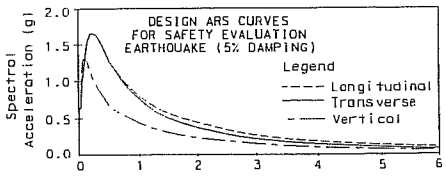
Load Factor Design

Design: Caltrans Design Specifications-April 2000 (LFD)
(1996 AASHTO with interims and revisions by Caltrans)
Dead Load: Includes 1675 N/m2 for future wearing surface on roadbed
Live Load: HS20-44 and alternative and permit design load
Bike Path Live Load: 4000 N/m2
Future Mass Transit Loading:



Seismic Loading: Refer to project specific seismic design criteria for San Francisco Oakland Bay Bridge East Span Seismic Safety Project Dated 01-08-00 See "Site Specific Response Spectra"

Reinforced Concrete: Fy = 420 MPa
F'c = See "Concrete Strength & Type Limits"



SITE SPECIFIC RESPONSE SPECTRA

SCOPE OF WORK (CCO No. 64)

Scope of the work for Contract Change Order No. 64 for the construction consists of the following facilities:

1. Bridge No. 34-0006L/R: Only Bents W3, W4, W5, W6 of the westbound and eastbound Yerba Buena Island Transition Structures, and Bent 7 of the eastbound on-ramp as shown on the plans
2. Electrical Duct Bank at locations a shown on the plans.
3. Miscellaneous roadway work, including utilities as shown on the plans

5-1.01 WORKING DRAWINGS

Working drawings shall conform to the requirements in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications and these special provisions. Working drawings shall include supplements and calculations that are in addition to drawings.

Working drawings shall be submitted to the following location:

California Department of Transportation
Office of the Resident Engineer, Contract 04-0120R4
280 Beale Street
San Francisco, CA 94105

Working drawings shall conform to the following:

A. For initial review, 6 sets of the working drawings, shall be submitted. After the Engineer has determined that a submittal is complete, 12 additional sets shall be submitted.
B. Drawings shall be 559 mm x 864 mm or 279 mm x 432 mm in size. Supplements and calculations shall be 216 mm x 280 mm n size.
C. For drawings, text size shall be nominally 2.8 mm high, minimum. For supplement and calculations, font size shall be 12, minimum.
D. Each working drawing sheet and each page of supplement or calculation, shall include the jobsite name of the structure as shown on the contract plans, District-County-Route-Kilometer Post, bridge number and contract number.
E. Text and details shall be legible and suitable for photocopying and reduction.
F. In addition to the paper copies of the working drawings, electronic files shall be submitted. Electronic files shall be portable document format (PDF) and shall be submitted on compact disk (CD) media. Each plan sheet shall be a separate PDF file on the CD. The electronic copy of the calculations and supplement shall be made into separate PDF files so that no more than 50 pages are included in a single file on the CD. The CD shall contain an index consisting of the file names and a description of the corresponding file contents. The files shall be listed in the sequence of: 1) index, 2) drawings, 3) supplement, and 4) calculations. If more than one CD is used for a given working drawing submittal, the index shall be included on each CD.
G. Microfilms are required for approved shop drawings and shall be only a 24x reduction. The edge of the corrected original tracing image shall be clearly visible and visually parallel with the edges of the page. A clear, legible symbol shall be provided on the upper left side of each page to show the amount of reduction, and a horizontal and vertical scale shall be provided on each reduced print to facilitate enlargement to original scale.
H. At the completion of the contract, one compiled set of all approved working drawings (in electronic form and including all corrections and revisions) shall be furnished to the Engineer. The index shall be the first file on the CD.
I. At the completion of the contract, one set of reduced prints on 75-g/m2 (minimum) bond paper, 279 mm x 432 mm in size, of the corrected original tracings of all approved working drawings, including all corrections and revisions shall be furnished to the Engineer. Reduced prints that are common to more than one structure shall be submitted for each structure. An

index prepared specifically for the drawings for each structure containing sheet numbers and titles shall be included on the first reduced print in the set for each structure. Reduced prints for each structure shall be arranged in the order of drawing numbers shown in the index.

Working drawings shall be stamped and signed by an engineer who is registered as a Civil Engineer in the State of California. When independently checked calculations are required, these calculations shall be stamped and signed by another engineer who is registered as a Civil Engineer in the State of California.

Working drawings shall be submitted sufficiently in advance of the start of the affected work to allow time for review by the Engineer and correction by the Contractor of the drawings without delaying the work. The time shall be proportional to the complexity of the work, but in no case shall the time be less than the review time as specified for the type of working drawings as required elsewhere in these special provisions.

The Engineer will review a working drawing submittal for completeness. Within ten working days of the receipt of the submittal by the Engineer, the Engineer will notify the Contractor in writing if the submittal is determined to be incomplete. If the submittal is determined to be complete, thirty working days from the day of receipt shall be allowed for approval or return for correction of each submittal or resubmittal, unless specified otherwise in the special provisions.

Should the Engineer fail to review the complete working drawing submittal within the time specified, and the Contractor's controlling operation on the critical path is delayed (as determined by the Engineer) by the Engineer's failure to review within the time specified, an extension of time will be granted in conformance with the provisions in Section 8-1.07, "Liquidated Damages," of the Standard Specifications and in "Progress Schedule (Critical Path Method)," of these special provisions. Should the Engineer fail to review the complete working drawing submittal within the time specified, compensation, if any, will be made in accordance with Section 8-1.09, "Right of Way Delays," of the Standard Specifications, and "Time Related Overhead," of these special provisions.

5-1.02 INTEGRATED SHOP DRAWINGS

Difficult reinforcement placement is anticipated at the:

A. Reinforcement at column penetrations for drain pipes and electrical conduits
B. Reinforcement at column/footing intersections.

These locations are especially highly congested with reinforcing steel, high strength rods, post-tensioning strand tendons, anchor bolts, and other concrete embedded items as shown on the plans. It is anticipated that various dimensional conflicts may be encountered between the planned locations of these embedded items.

The Contractor shall develop three-dimensional integrated shop drawings (ISD's) for all locations listed above in accordance with the details shown on the plans and the requirements of this section. ISD's shall conform to Section "Working Drawings," of these special provisions. ISD's shall be prepared under the supervision of an engineer who is registered as a Civil Engineer in the State of California. ISD's shall be composite placing drawings to scale and in sufficient detail to show the relative positions of all items that are to be embedded in the concrete and their embedment depth as necessary to demonstrate compatibility of items within the concrete.

Prior to commencing work on the ISD, the Contractor (including any sub-consultants hired to work on the ISD) shall attend a meeting with the Engineer to discuss the ISD work.

Embedded items that are to be shown on the ISD's shall include but are not limited to, the following:

A. Bar reinforcing steel and splices including lap, welded, and mechanical splices
B. Drainage pipe
C. Other items, as shown on the plans or added by the Contractor

The three-dimensional ISD's shall be adequate to ensure that there will be no conflict between the planned positions of any embedded items and that concrete cover will be adequate.

If conflicts are discovered during the preparation of ISD's, the Contractor shall revise the working drawings for one or more of the embedded items to eliminate the conflict or provide proper cover or spacing. If a conflict requires that bar reinforcement locations be adjusted, the Contractor shall proceed with performing reinforcing steel adjustments in the ISD's prior to submitting the changes to the Engineer.

The ISD's to be submitted to the Engineer shall include the following:

A. ISD submittal shall be in two-dimensional format utilizing the three-dimensional layouts as input.
B. Three sets of the ISD's corresponding to the details as shown on the plans with incorporation of any Contractor's adjustments in the locations of embedded items. These ISD's shall resolve all conflicts and satisfy concrete cover requirements as shown on the plans. The initial ISD submittal for a particular area shall clearly identify all adjustments to the locations of embedded items made as part of the Contractor's conflict resolution process.
C. Three copies of the ISD's in electronic form on compact discs or tape for use by the Engineer.

CAD files of the contract drawings will not be made available to the Contractor.

After completed ISD's are received by the Engineer, the Contractor shall allow the Engineer 8 weeks for review and approval. For each revised ISD's submitted by the Contractor, the Contractor shall allow the Engineer an additional 2 weeks for review and approval. Construction of the items listed above shall not begin until the Engineer reviews and approves the complete ISD's with all conflicts resolved.

No extension of time will be permitted for the Contractor's failure to identify all conflicts or to complete the ISD's as required by these special provisions.

Full compensation for preparing ISD's, including all revisions necessary due to conflict resolution measures taken by the Contractor, shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

5-1.03 PAYMENTS

Attention is directed to Sections 9-1.06, "Partial Payments," and 9-1.07, "Payment After Acceptance," of the Standard Specifications and these special provisions.

In determining the partial payments to be made to the Contractor, only the following listed materials will be considered for inclusion in the payment as materials furnished but not incorporated in the work:

A. Steel Piling
B. Tiedown anchor
C. Bar reinforcing steel
D. Bridge deck drainage system

5-1.04 PROJECT INFORMATION

The information in this section has been compiled specifically for this project and is made available for bidders and Contractors. Other information referenced in the Standard Specifications and these special provisions do not appear in this section. The information is subject to the conditions and limitations set forth in Section 2-1.03, "Examination of Plans, Specifications, Contract, and Site of Work," and Section 6-2, "Local Materials," of the Standard Specifications. Bidders and Contractors shall be responsible for knowing the procedures for obtaining information.

Information attached to the project plans is as follows:

A. Log of Test Borings

Information available for inspection at the District Office is as follows:

Cross sections are available in paper copy.

Bidders and Contractors may contact the Transportation Laboratory to request viewing rock cores via electronic mail at the following address:

Coreroom@dot.ca.gov

Request shall be submitted at least 5 working days before the intended date for viewing, and shall include the District-County-Route, bridge number, contract number, viewing date, and contact information including telephone number.

Plans of the existing bridges may be requested by fax from the Office of Structure Maintenance and Investigations, 1801 30th Street, Sacramento, CA, Fax (916) 227-8357.

Plans of the existing bridges may be requested by fax from the Office of Structure Maintenance and Investigations, 1801 30th Street, Sacramento, CA, Fax (916) 227-8357, and are available at the Office of Structure Maintenance and Investigations, Los Angeles, CA, Telephone (213) 897-0877.

5-1.05 AREAS FOR CONTRACTOR'S USE

Attention is directed to the requirements specified in Section 7-1.19, "Rights in Land and Improvements," of the Standard Specifications, plans and these special provisions.

The highway right of way shall be used only for purposes that are necessary to perform the required work. The Contractor shall not occupy the right of way, or allow others to occupy the right of way, for purposes which are not necessary to perform the required work.

The Contractor's attention is directed to "Cooperation," of these special provisions, and the Contractor shall use only the designated areas for Contractor's use as specified in this section, and as shown on the plans and as follows:

1. **Area PR:** it is available for the contractor's use for the entire contract period except as limited by other areas as defined on the contract plans and these special provisions. The Contractor shall permit access by other contractors as directed by the Engineer.

2. **Area FPR:** it. is primarily available to Contract 04-0120R4 until May 1, 2007. Prior to May 1, 2007, the Contractor shall coordinate any planned work in area FPR with the Engineer and Contract 04-0120R4 contractor. After May 1, 2007, area FPR shall be considered a part of area FP.
3. **Area FP:** it is available for use by the 04-0120F4 contract until November 30, 2007. The area FP shall then be made available to the contractor constructing the YBI transition structures under contract 04-0120S4 until May 1, 2009.
4. **Area EF:** is primarily available to Contract 04-0120E4 until March 31, 2008, and then to this contract after that date. Prior to March 31, 2008, the Contractor shall coordinate any planned work in area EF with the Engineer and Contract 04-0120E4 contractor. Additionally, footings at tower T1 and footing and piers at Pier E2 to be constructed by others under Contract 04-0120E4 will be substantially complete by March 31, 2008, to allow the Contractor to complete the tower and E2 work specified under the contract.
5. **Area CE:** is designated for use by Contract 04-0120E4 until March 31, 2008. The Contractor shall have access through area CE to the work area at Pier W2. After March 31, 2008, the area CE becomes a part of the area provided to the Yerba Buena Island Structures contractor on contract 04-0120S4. The Contractor shall continue to have access through the area to the work area at Pier W2.

The Contractor shall maintain access to the Torpedo Factory area at the east end of Yerba Buena Island at all times during the contract. Access may be via the existing Torpedo Factory Road or other routing as approved by the Engineer.

No area is available within the contract limits for the exclusive use of the Contractor. However, temporary storage of equipment and materials on State property may be arranged with the Engineer, subject to the prior demands of State maintenance forces and to other contract requirements. Use of the Contractor's work areas and other State-owned property shall be at the Contractor's own risk. The State shall not be held liable for damage to or loss of materials or equipment located within these areas.

Toll plaza parking lots shall not be used for the Contractor's employees private vehicles and the Contractor's equipment and vehicles.

The Contractor shall remove the equipment, materials, and rubbish from the work areas and other State-owned property which the Contractor occupies and shall leave the areas in a presentable condition, in conformance with the provisions in Section 4-1.02, "Final Cleaning Up," of the Standard Specifications.

The Contractor shall secure, at the Contractor's own expense, areas required for storage of plant, equipment, and materials, or for other purposes if sufficient area is not available to the Contractor within the contract limits.

5-1.06 UTILITIES

The Contractor shall make arrangements to obtain electrical power, water or compressed air or other utilities required for the Contractor's operations and shall make and maintain the necessary service connections at the Contractor's own expense.

5-1.07 SANITARY PROVISIONS

State sanitary facilities will not be available for use by the Contractor's employees.

5-1.08 BRIDGE TOLLS

Toll-free passage on the San Francisco-Oakland Bay Bridge will be granted only for cars, trucks and special construction equipment which are clearly marked on the exterior with the Contractor's identification and which are being operated by the Contractor exclusively for the project, and which are used for the purpose of transporting materials and workers directly to and from the project site.

The Contractor shall make application to the Engineer in advance for toll-free passage. The Contractor will be held accountable for the proper use of passes issued, and upon completion of the work, shall return unused passes to the Engineer.

Attention is directed to Section 23302, "Evasion of Toll," of the Vehicle Code.

5-1.09 PERMITS AND LICENSES

Attention is directed to Section 7-1.04, "Permits and Licenses," of the Standard Specifications and these special provisions.

The Department has obtained the permits and licenses from the following agencies for this project:

A. California Regional Water Quality Control Board (RWQCB)
B. U.S. Army Corps of Engineers (ACOE)
C. San Francisco Bay Conservation Development Commission (BCDC)
D. United States Coast Guard (USCG)
E. California Department of Fish and Game (CDFG)

These permits has been made available to the Contractor as part of the information handout for the 04-0120R4 Contract.

For updated versions of environmental permits, the Contractor shall visit the website:

www.biomitigation.org

Full compensation for conforming to the requirements in these permits and licenses shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

5-1.10 HAZARDOUS MATERIAL, GENERAL

Attention is directed to "Earthwork" of these special provisions regarding the removal and disposal of hazardous material described in this section.

Contaminants have been discovered through testing within the project limits. Testing consisted of collecting and analyzing in situ samples from within the project limits. Summary tables of the test results are included in the "Materials Information." The complete report entitled "Site Investigation Report, SFOBB East Span Seismic Safety Project, Yerba Buena Island" is available for inspection at the office of the Duty Senior, 111 Grand Avenue, Oakland, CA 94612, email: , telephone (510) 286-5209, and fax number: (510) 622-1805. These test results have been used for disposal characterization of material within the excavation limits and shall not be construed as identifying all locations within the project limits that contain contaminants.

Wherever the following terms are used in the contract documents, the meaning and intent shall be interpreted as provided below:

A. Hazardous material – Material that contains contaminants at concentrations equal to or greater than the threshold limit concentrations listed in Section 66261.24 of Title 22 of the California Code of Regulations.
B. Class II material – Material that contains contaminants, typically petroleum hydrocarbons, at concentrations that require handling of the material as a Designated Waste as defined in Section 13173 of the California Water Code but does not contain contaminants at concentrations equal to or greater than the threshold limit concentrations listed in Section 66261.24 of Title 22 of the California Code of Regulations. This material is unsuitable for reuse within the project limits.

Characterization and disposal of additional material resulting from excavations performed outside of the pay limits shown on the plans, specified in the Standard Specifications, or specified or directed by the Engineer, for the Contractor's convenience, shall be at the Contractor's expense. This resultant material shall be presumed to be either non-hazardous material or hazardous material if the test results for the location indicate that the material being excavated is non-hazardous material or hazardous material. The Contractor shall dispose of the resultant material in conformance with the provisions in "Earthwork" of these special provisions. When the material must be removed from highway right of way, the Contractor shall furnish replacement material suitable for the purpose intended in conformance with the provisions in Section 19, "Earthwork," of the Standard Specifications.

APPLICABLE RULES AND REGULATIONS

Excavation, transport and disposal of hazardous material shall be in conformance with the rules and regulations of the following agencies:

United States Department of Transportation (USDOT)
United States Environmental Protection Agency (USEPA)
California Environmental Protection Agency (CAL-EPA)
1. Department of Toxic Substance Control (DTSC)
2. Integrated Waste Management Board
3. Regional Water Quality Control Board, Region 2 (RWQCB)
4. State Air Resources Board

Bay Area Air Quality Management District (BAAQMD)
California Division of Occupational Safety and Health Administration (CAL-OSHA)

PERMITS AND LICENSES

The Contractor shall procure all permits and licenses, pay all charges and fees, and give all notices necessary and incident to the due and lawful prosecution of the work, including registration for transporting vehicles carrying hazardous material, in conformance with the provisions in Section 7-1.04, "Permits and Licenses," of the Standard Specifications.

The Engineer will obtain the Environmental Protection Agency Generator Identification Number and Board of Equalization Identification Number and sign all manifests as the Generator.

SITE HEALTH AND SAFETY PLAN

The Contractor shall prepare a detailed Site Health and Safety Plan for all site personnel, including State personnel, that identifies potential health and safety hazards associated with each operation and specifies work practices that will be used to protect workers from those hazards in conformance with the DTSC and CAL-OSHA regulations. At a minimum, the Site Health and Safety Plan shall identify key site safety personnel, describe risks associated with the work, describe training requirements, describe appropriate personal protective equipment, describe any site-specific medical surveillance requirements, describe any periodic air monitoring requirements, define appropriate site work zones, and describe any decontamination requirements. The Site Health and Safety Plan shall be submitted at least 15 working days prior to beginning any excavation work for review and acceptance by the Engineer. Prior to submittal, the Contractor shall have the Site Health and Safety Plan approved by an Industrial Hygienist certified by the American Board of Industrial Hygiene. Subcontractors shall use the Site Health and Safety Plan prepared by the Contractor or prepare and submit a separate Site Health and Safety Plan in conformance with the provisions in this section.

SAFETY TRAINING

Prior to performing any work, all personnel, including State personnel, shall complete a safety training program that communicates the potential health and safety hazards associated with work on the site and instructs the personnel in procedures for doing the work safely. The level of training provided shall be consistent with the personnel's job function and conform to CAL-OSHA regulations. The training, including subsequent training required until completion of the project, shall be provided by the Contractor. The Contractor shall provide a certification of completion of the Safety Training Program to all personnel. Personal protective equipment required by State personnel to inspect the work shall be provided by the Contractor. The number of State personnel requiring the above mentioned safety training program and personal protective equipment will be 25.

PAYMENT

Full compensation for conforming to the requirements of this section shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

5-1.11 ENVIRONMENTALLY SENSITIVE AREAS (GENERAL)

A. ENVIRONMENTALLY SENSITIVE AREAS

Environmentally sensitive areas (ESA) shall consist of areas within and near the limits of construction where access is prohibited or limited for the preservation of archeological site, historic architectural resource or existing vegetation, or protection of biological habitat as shown on the plans. The Engineer will determine the exact location of the boundaries of the ESAs. No work shall be conducted within the ESAs, except ESAs 1a and 1b:

1. ESA 1a and 1b, Environmentally Sensitive Areas
   ESA 1a consists of asphalt concrete paved area and unpaved slope area.
   ESA 1b is located within the asphalt concrete paved area.

The boundaries of the paved areas of the ESAs 1a and 1b shall be installed with a 200-mm white thermoplastic delineation.

Within the paved areas and delineated boundaries of the ESAs 1a and 1b, no work involving asphalt removal or earth disturbance and/or removal, including but not limited to driving posts for fencing, signing, or utility trenching, shall be allowed.. Limited access to these ESAs may be allowed for vehicle and equipment access, storage or transport of materials or equipment vehicle or equipment access, storage and stockpiling, or transport of materials, when approved in writing by the Engineer.

Within the unpaved slope area of ESA 1a, no work involving earth disturbance, including but not limited to driving posts for fencing, or signing, shall be allowed. The Contractor shall submit to the Engineer the protection plans including the scope of the work, in conformance with the requirements in "Working Drawings," of these special provisions. The Contractor equipment access will not be allowed, unless the Contractor has obtained a written approval from the Engineer.

2. ESA 2a, 2b and 2c
   ESA 2a consists of Building No. 262 (Torpedo Factory), Historic Architectural Resource
   ESA 2b consists of the Senior Officers' Quarters Historic District (Quarters 1 through 7), Historic Architectural Resource, and grounds.
   ESA 2c consists of Quarters 8, and grounds
3. ESA 3, Quarters 10, Building 267 (garage), and grounds.
4. ESA 5, Vegetation, Environmentally Sensitive Areas, including mature vegetation screen located on slope southwest of Quarters 1 (Nimitz House), and pittosporum trees
5. ESA 6, Tidal wetlands, water-based ESA (by others), located on the north side of YBI
6. ESA 7, Eelgrass beds, water-based ESA (by others), located on the south sides of YBI
7. ESA 8, Eelgrass beds, water-based ESA (by others), located on the north sides of YBI
8. ESA 9a and 9b, concrete retaining walls and weir,Historic Architectural Resource

Attention is directed to Section 7—1.01 "Laws to be Observed," and Section 7—1.04 "Permits and Licenses," of the Standard Specifications regarding State and Federal regulations, permits, or agreements which pertain to an ESA.

Water-based ESA boundaries have been marked with USCG-approved buoys, and have been established and will be maintained by others.

Land-based ESA boundaries shall be clearly marked by either the installation of Temporary Fence (Type ESA) or thermoplastic pavement delineation as specified elsewhere in these special provisions. The boundaries shall be checked periodically and the markings repaired or replaced as necessary during construction.

Within the boundaries of land-based ESAs 1a (unpaved area), ESAs 2b and 2c, ESA 3, ESA 5, and ESA 9a and 9b and water-based ESAs 6, 7, and 8, no project related activities shall take place, without the written approval from the Engineer. This specifically prohibits vehicle and barge access, storage or transport of any materials, including hydrocarbon and lead contaminated material, or any other project related activities. The Contractor shall take such measures, including the posting of written notices to his employees and subcontractors, to ensure that ESAs are not entered or disturbed.

The Contractor shall mitigate damage or impacts to the ESAs caused by the Contractor's operations, at the Contractor's expense in accordance with Section 7-1.11 of the Standard Specifications. Any additional mitigation assessed to the Department will be the responsibility of

the Contractor. If necessary, deductions from moneys due or to become due the Contractor will be made for the mitigation costs.

RESOURCE REGULATIONS AND MANDATES

In compliance with Section 106 of the National Historic Preservation Act of 1966, any archaeological resource discovered during construction activities must be evaluated by the Department of Transportation Archaeologist.

The California Public Resources Code (PRC) Sections 5097.00 and 5097.98 require protection of Native American remains which might be discovered and outlines procedures for handling any burials found. The California PRC Section 5097.9 and Health and Safety Code Section 7050 require coordination with the Native American Heritage Commission.

Under California PRC, Chapter 1.7, Section 5097.5, it is a misdemeanor charge for anyone to knowingly disturb a historical feature or steal an archaeological resource. The California Administrative Code, Title 14, Section 4307, mandates that no person shall disfigure any object of historical interest or value. Under California Penal Code, Title 14, Part 1, Section 622-1.2, it is a misdemeanor to destroy anything of historical value within any public place.

All archaeological resources located on Department of Transportation property are property of the State of California. All archaeological resources located on Federal property are property of the Federal government and are governed by federal environmental laws, such as, but not limited to, the Antiquities Act of 1906, the Archaeological Resources Protection Act, and the Native American Graves Protection and Repatriation Act.

PROTECTION OF ESA 2a, BUILDING No. 262

Attention is directed to Section 7-1.12, "Preservation of Property," and Section 7-1.12, "Responsibility for Damage," of the Standard Specifications, and the provisions in "Photo Survey of Existing Facilities," and "Vibration Monitoring," of these special provisions, regarding Building No. 262, a historical building that is included in ESA 2.

Attention is directed to "Project Information," of the special provisions, regarding the as-built plans of Building No. 262.

The Contractor shall take measures to protect the building from damage caused by the Contractor's operations. The Contractor shall submit a building protection plan for the Engineer's review at least 30 days prior to the start of adjacent or overhead construction. The Contractor shall also notify the Engineer at least 48 hours prior to the start of adjacent or overhead construction.

The Contractor shall bear full liability for any damage to Building No. 262 caused by the Contractor's operations.

Should any damage to Building No. 262 occur, the Contractor shall notify the Engineer within 24 hours. The Engineer may order the suspension of construction operations until the Contractor takes all necessary measures to prevent further damage to the building, and until an approved repair is completed. The Contractor shall submit a repair plan to the Engineer for approval prior to the start of such work. The Engineer will review the plan within 90 days. All repairs must follow the Secretary of the Interior's Standards for the Treatment of Historic Properties (http://www2.cr.nps.gov/tps/standguide/index.htm), and must be undertaken by a licensed preservation architect who meets the Secretary of the Interior's Professional Qualifications Standards for Historic Architecture (http://www.cr.nps.gov/local-law/arch_stnds_9.htm). The Department may

retain not less than $2,100,000 from moneys due or that may become due the Contractor under the contract, until an approved repair or reconstruction is complete.

B. AREA TO BE MONITOR (ATM)

The Department Archeologist will monitor the delineated ATM area.

No construction activities involving asphalt removal or earth disturbance and/or removal shall be allowed within the ATM area shown on the plans, unless the Contractor has obtained a writing approval from the Engineer.

The Contractor shall obtained the Engineer's approval in writing at least 20 days in advance of the beginning of the removal of the top 0.6-m in depth of roadway excavation within the ATM, in order to have the Department Archaeologist begin to mobilize

CONSTRUCTION

The Department Archaeologist shall have the authority to halt construction operations in the vicinity of an archaeological find, if significant or potentially significant cultural resources are exposed or if the find will be adversely affected by construction operations.

In the event that human skeletal material or archaeological resources should be uncovered within the ATM area and/or contract limits, the Contractor shall immediately notify the Engineer, who in turn will notify the Department Archaeologist and the State may conduct an archaeological investigation. The Contractor's construction activities within 15-m of the find shall be halted immediately and shall not be resumed until so permitted, in writing by the Engineer.

When determined by the Department Archeologist that an archeological investigation is required, and as requested by the Engineer, the Contractor shall provide construction equipment and operators and/or laborers and shall cooperate with and assist Department Archaeologist(s) in their conducting of any of the archaeological work, if necessary.

The Contractor shall provide, within 24 hours at the request of the Engineer:

1. A grading bucket with flat blade.
2. Suitable access/egress ramp or ladders or stairs in the ATM area as directed by the Engineer.

The above equipment and material items required for the archaeological work as specified in this section will be paid for as extra work as provided in Section 4-1.03D of the Standard Specifications.

If, in the opinion of the Engineer, the Contractor's operations are delayed or interfered with by reason of such discoveries, the State will compensate the Contractor for the delays to the extent provided in Section 8-1.09, "Right of Way Delays," of the Standard Specifications, and not otherwise, except as provided in Section 8-1.10, "Utility and Non-Highway Facilities," of the Standard Specifications.

C. SPECIAL CONSTRUCTION AREA (SCA)

The special construction area is designated as the landscaping restoration area to be constructed by others.

The Contractor will be allowed inside SCA area. The Contractor shall not encroach into the designated ESA area bounded by ESA 2b, the Senior Officers' Quarters Historic District (Quarters 1

through 7), as shown on the plans. Damages to the existing pavement, sidewalk and cub caused by the Contractor's operations, shall be replaced in kind at the Contractor's expenses.

PAYMENT

Full compensation for checking, repairing or replacing the land-based ESA marking shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no separate payment will be made therefor.

Full compensation for protecting and submitting the protection plan for the unpaved slope area of the ESA 1a shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no separate payment will be made therefor.

5-1.12 SOUND CONTROL REQUIREMENTS

Sound control shall conform to the provisions in Section 7-1.01I, "Sound Control Requirements," of the Standard Specifications and these special provisions.

The noise level from the Contractor's operations, between the hours of 7:00 p.m. and 7:00 a.m., shall not exceed 78 dbA at a distance of 15 m from the source. Impact-type mechanical operations, such as pile-driving and jack-hammering shall not be conducted between the hours of 7:00 p.m. and 7:00 a.m. At all times, the Contractor shall be responsible for complying with local ordinances regulating noise levels as well as the sound requirements of this section.

The noise level requirement shall apply to the equipment on the job or related to the job, including but not limited to trucks, transit mixers or transient equipment that may or may not be owned by the Contractor. The use of loud sound signals shall be avoided in favor of light warnings except those required by safety laws for the protection of personnel.

Full compensation for conforming to the requirements of this section shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

Noise monitoring activities will be conducted by the Department of Transportation. The Contractor shall coordinate with the Department of Transportation monitors and allow them access to noise monitoring locations.

8-1.01 SUBSTITUTION OF NON-METRIC MATERIALS AND PRODUCTS

Only materials and products conforming to the requirements of the specifications shall be incorporated in the work. When metric materials and products are not available, and when approved by the Engineer, and at no cost to the State, materials and products in the United States Standard Measures which are of equal quality and of the required properties and characteristics for the purpose intended, may be substituted for the equivalent metric materials and products, subject to the following provisions:

A. Materials and products shown on the plans or in the special provisions as being equivalent may be substituted for the metric materials and products specified or detailed on the plans.
B. Before other non-metric materials and products will be considered for use, the Contractor shall furnish, at the Contractor's expense, evidence satisfactory to the Engineer that the materials and products proposed for use are equal to or better than the materials and products specified or detailed on the plans. The burden of proof as to the quality and suitability of

substitutions shall be upon the Contractor and the Contractor shall furnish necessary information as required by the Engineer. The Engineer will be the sole judge as to the quality and suitability of the substituted materials and products and the Engineer's decision will be final.

C. When the Contractor elects to substitute non-metric materials and products, including materials and products shown on the plans or in the special provisions as being equivalent, the list of sources of material specified in Section 6-1.01, "Source of Supply and Quality of Materials," of the Standard Specification shall include a list of substitutions to be made and contract items involved. In addition, for a change in design or details, the Contractor shall submit plans and working drawings in conformance with the provisions in Section "Working Drawings," of these special provisions. The plans and working drawings shall be submitted at least 7 days before the Contractor intends to begin the work involved.

Unless otherwise specified, the following substitutions of materials and products will be allowed:

8-2.02 PORTLAND CEMENT CONCRETE

Portland cement concrete shall conform to the provisions in Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

Cementitious material to be used in portland cement concrete shall conform to the provisions for cement and mineral admixtures in Section 90-2, "Materials," of the Standard Specifications, and shall be a combination of "Type II Modified" Portland cement and mineral admixture.

References to Section 90-2.01, "Portland Cement," of the Standard Specifications shall mean Section 90-2.01, "Cement," of the Standard Specifications.

Mineral admixture shall be combined with cement in conformance with the provisions in Section 90-4.08, "Required Use of Mineral Admixtures," of the Standard Specifications for the concrete materials specified in Section 56-2, "Roadside Signs," of the Standard Specifications.

The requirements of Section 90-4.08, "Required Use of Mineral Admixture," of the Standard Specifications shall not apply to Section 19-3.025C, "Soil Cement Bedding," of the Standard Specifications.

The Department maintains a list of sources of fine and coarse aggregate that have been approved for use with a reduced amount of mineral admixture in the total amount of cementitious material to be used. A source of aggregate will be considered for addition to the approved list if the producer of the aggregate submits to the Transportation Laboratory certified test results from a qualified testing laboratory that verify the aggregate complies with the requirements. Prior to starting the testing, the aggregate test shall be registered with the Department. A registration number can be obtained by calling (916) 227-7228. The registration number shall be used as the identification for the aggregate sample in correspondence with the Department. Upon request, a split of the tested sample shall be provided to the Department. Approval of aggregate will depend upon compliance with the specifications, based on the certified test results submitted, together with any replicate testing the Department may elect to perform. Approval will expire 3 years from the date the most recent registered and evaluated sample was collected from the aggregate source.

Qualified testing laboratories shall conform to the following requirements:

A. Laboratories performing ASTM Designation: C 1293 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Concrete Proficiency Sample Program and shall have received a score of 3 or better on all tests of the previous 2 sets of concrete samples.
B. Laboratories performing ASTM Designation: C 1260 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Pozzolan Proficiency Sample Program and shall have received a score of 3 or better on the shrinkage and soundness tests of the previous 2 sets of pozzolan samples.

Aggregates on the list shall conform to one of the following requirements:

A. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1293, the average expansion at one year shall be less than or equal to 0.040 percent; or
B. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1260, the average of the expansion at 16 days shall be less than or equal to 0.15 percent.

The amounts of cement and mineral admixture used in cementitious material shall be sufficient to satisfy the minimum cementitious material content requirements specified in Section 90-1.01, "Description," or Section 90-4.05, "Optional Use of Chemical Admixtures," of the Standard Specifications and shall conform to the following:

A. The minimum amount of cement shall not be less than 75 percent by mass of the specified minimum cementitious material content.
B. The minimum amount of mineral admixture to be combined with cement shall be determined using one of the following criteria:

    1. When the calcium oxide content of a mineral admixture is equal to or less than 2 percent by mass, the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
    2. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass, and any of the aggregates used are not listed on the approved list as specified in these

special provisions, then the amount of mineral admixture shall not be less than 25 percent by mass of the total amount of cementitious material to be used in the mix.

3. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass and the fine and coarse aggregates are listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
4. When a mineral admixture that conforms to the provisions for silica fume in Section 90-2.04, "Admixture Materials," of the Standard Specifications is used, the amount of mineral admixture shall not be less than 10 percent by mass of the total amount of cementitious material to be used in the mix.
5. When a mineral admixture that conforms to the provisions for silica fume in Section 90-2.04, "Admixture Materials," of the Standard Specifications is used and the fine and coarse aggregates are listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 7 percent by mass of the total amount of cementitious material to be used in the mix.

C. The total amount of mineral admixture shall not exceed 35 percent by mass of the total amount of cementitious material to be used in the mix. Where Section 90-1.01, "Description," of the Standard Specifications specifies a maximum cementitious content in kilograms per cubic meter, the total mass of cement and mineral admixture per cubic meter shall not exceed the specified maximum cementitious material content.

8-2.03 CORROSION CONTROL FOR PORTLAND CEMENT CONCRETE

Permanent structures with portland cement concrete in contact with soil or rock including that utilized for cast-in-drilled-hole concrete piles, footings, retaining walls and columns, are considered to be in a corrosive environment and shall conform to the provisions in Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

Cementitious material to be used in portland cement concrete shall conform to the provisions for cement and mineral admixtures in Section 90-2, "Materials," of the Standard Specifications, and shall be a combination of "Type II Modified" portland cement and mineral admixture.

Concrete in a corrosive environment shall contain not less than 400 kg of cementitous material per cubic meter.

No reduction in the cementitious material content specified or ordered, in conformance with the provisions in Section 90-4.05, "Optional Use of Chemical Admixtures," of the Standard Specifications, will be allowed for concrete in a corrosive environment.

Unless otherwise specified, for concrete in a corrosive environment, the amount of cement shall be 75 percent by mass, and the amount of mineral admixture to be combined with cement shall be 25 percent by mass, of the total amount of cementitious material to be used in the concrete mix. The calcium oxide content of mineral admixtures shall not exceed 10 percent.

Mineral admixture for concrete in a corrosive environment shall conform to ASTM Designation: C618 Class F or N.

The amount of free water used in concrete in a corrosive environment shall not exceed 160 kg/ m^3, plus 40 kg for each 100 kg of cementitious material in excess of 400 kg/ m^3.

Full compensation for conforming to the above requirements shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

SECTION 8-3. WELDING

8-3.01 WELDING

GENERAL

Flux core welding electrodes conforming to the requirements of AWS A5.20 E6XT-4 or E7XT-4 shall not be used to perform welding for this project.

Wherever reference is made to the following AWS welding codes in the Standard Specifications, on the plans, or in these special provisions, the year of adoption for these codes shall be as listed:

AWS Code	Year of Adoption
D1.1	2002
D1.4	1998
D1.5	2002
D1.6	1999

Requirements of the AWS welding codes shall apply unless specified otherwise in the Standard Specifications, on the plans, or in these special provisions. Wherever the abbreviation AWS is used, it shall be equivalent to the abbreviations ANSI/AWS or AASHTO/AWS.

Section 6.1.1.1 of AWS D1.5 is replaced with the following:

Quality Control (QC) shall be the responsibility of the Contractor. As a minimum, the Contractor shall perform inspection and testing of each weld joint prior to welding, during welding, and after welding as specified in this section and as necessary to ensure that materials and workmanship conform to the requirements of the contract documents.

Sections 6.1.3 through 6.1.4.3 of AWS D1.1, Section 7.1.2 of AWS D1.4, and Sections 6.1.1.2 through 6.1.3.3 of AWS D1.5 are replaced with the following:

The QC Inspector shall be the duly designated person who acts for and on behalf of the Contractor for inspection, testing, and quality related matters for all welding.

Quality Assurance (QA) is the prerogative of the Engineer. The QA Inspector is the duly designated person who acts for and on behalf of the Engineer.

The QC Inspector shall be responsible for quality control acceptance or rejection of materials and workmanship, and shall be currently certified as an AWS Certified Welding Inspector (CWI) in conformance with the requirements in AWS QC1, " Standard for AWS Certification of Welding Inspectors."

The QC Inspector may be assisted by an Assistant QC Inspector provided that this individual is currently certified as an AWS Certified Associate Welding Inspector (CAWI) in conformance with the requirements in AWS QC1, "Standard for AWS Certification of Welding Inspectors." The Assistant QC Inspector may perform inspection under the direct supervision of the QC Inspector provided the Assistant is always within visible and audible range of the QC Inspector. The QC Inspector shall be responsible for signing all reports and for determining if welded materials conform to workmanship and acceptance criteria. The ratio of QC Assistants to QC Inspectors shall not exceed 5 to 1.

When the term "Inspector" is used without further qualification, it shall refer to the QC Inspector.

Section 6.14.6, "Personnel Qualification," of AWS D1.1, Section 7.8, "Personnel Qualification," of AWS D1.4, and Section 6.1.3.4, "Personnel Qualification," of AWS D1.5 are replaced with the following:

Personnel performing nondestructive testing (NDT) shall be qualified and certified in conformance with the requirements of the American Society for Nondestructive Testing (ASNT) Recommended Practice No. SNT-TC-1A and the Written Practice of the NDT firm. The Written Practice of the NDT firm shall meet or exceed the guidelines of the ASNT Recommended Practice No. SNT-TC-1A. Individuals who perform NDT, review the results, and prepare the written reports shall be either:

A. Certified NDT Level II technicians, or;
B. Level III technicians who hold a current ASNT Level III certificate in that discipline and are authorized and certified to perform the work of Level II technicians.

Section 6.5.4 of AWS D1.5 is replaced with the following:

The QC Inspector shall inspect and approve each joint preparation, assembly practice, welding technique, joint fit-up, and the performance of each welder, welding operator, and tack welder to make certain that the applicable requirements of this code and the approved Welding Procedure Specification (WPS) are met. The QC Inspector shall examine the work to make certain that it meets the requirements of Sections 3 and 6.26. The size and contour of all welds shall be measured using suitable gages. Visual inspection for cracks in welds and base metal, and for other discontinuities should be aided by strong light magnifiers, or such other devices as may be helpful. Acceptance criteria different from those specified in this code may be used when approved by the Engineer.

Section 6.6.5, "Nonspecified NDT Other than Visual," of AWS D1.1, Section 6.6.5 of AWS D1.4 and Section 6.6.5 of AWS D1.5 shall not apply.

For any welding, the Engineer may direct the Contractor to perform NDT that is in addition to the visual inspection or NDT specified in the AWS or other specified welding codes, in the Standard Specifications, or in these special provisions. Additional NDT required by the Engineer will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications. Should any welding deficiencies be discovered by this additional NDT, all costs associated with the repair of the deficient area, including NDT of the weld and of the weld repair, and any delays caused by the repair, shall be at the Contractor's expense.

Repair work to correct welding deficiencies discovered by visual inspection or NDT, or by additional NDT directed or performed by the Engineer, and any associated delays or expenses caused to the Contractor by performing these repairs, shall be at the Contractor's expense.

The Engineer shall have the authority to verify the qualifications or certifications of any welder, QC Inspector, or NDT personnel to specified levels by retests or other means approved by the Engineer.

Continuous inspection shall be provided when any welding is being performed. Continuous inspection, as a minimum, shall include having a QC Inspector within such close proximity of all

welders or welding operators so that inspections by the QC Inspector of each welding operation at each welding location shall not lapse for a period exceeding 30 minutes.

Inspection and approval of all joint preparations, assembly practices, joint fit-ups, welding techniques, and the performance of each welder, welding operator, and tack welder shall be documented by the QC Inspector on a daily basis for each day welding is performed. For each inspection, including fit-up, Welding Procedure Specification (WPS) verification, and final weld inspection, the QC Inspector shall confirm and document compliance with the requirements of the AWS or other specified code criteria and the requirements of these special provisions on all welded joints before welding, during welding, and after the completion of each weld.

When joint weld details that are not prequalified to the details of Section 3 of AWS D1.1 or to the details of Figure 2.4 or 2.5 of AWS D1.5 are proposed for use in the work, the joint details, their intended locations, and the proposed welding parameters and essential variables, will be approved by the Engineer. The Engineer shall have 2 weeks to complete the review of the proposed joint detail locations. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications. Upon approval of the proposed joint detail locations and qualification of the proposed joint details, welders and welding operators using these details shall perform a qualification test plate using the WPS variables and the joint detail to be used in production. The test plate shall have the maximum thickness to be used in production and a minimum length of 180 mm and minimum finish welded width 460 mm. The test plate shall be mechanically and radiographically tested. Mechanical and radiographic testing and acceptance criteria shall be as specified in the applicable AWS codes.

In addition to the requirements specified in the applicable code, the period of effectiveness for a welder's or welding operator's qualification shall be a maximum of 3 years for the same weld process, welding position, and weld type. If production welding will be performed without gas shielding, then qualification shall also be without gas shielding. Excluding welding of fracture critical members, a valid qualification at the beginning of work on a contract will be acceptable for the entire period of the contract, as long as the welder's or welding operator's work remains satisfactory.

The Engineer will witness all qualification tests for WPSs that were not previously approved by the Department. An approved independent third party will witness the qualification tests for welders or welding operators. The independent third party shall be a current CWI and shall not be employed by the contractor performing the welding. The Engineer shall have 2 weeks to review the qualifications and copy of the current certification of the independent third party. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications. The Contractor shall notify the Engineer one week prior to performing any qualification tests. Witnessing of qualification tests by the Engineer shall not constitute approval of the intended joint locations, welding parameters, or essential variables.

In addition to the requirements of AWS D1.5 Section 5.12 or 5.13, welding procedures qualification, for work welded in conformance with that code, shall conform to the following requirements:

A. Unless considered prequalified, fillet welds, including reinforcing fillet welds, shall be qualified in each position. The fillet weld soundness test shall be conducted using the essential variables of the WPS as established by the Procedure Qualification Record (PQR.)
B. For qualification of joints that do not conform to Figures 2.4 and 2.5 of AWS D1.5, two WPS qualification tests are required. The tests conforming to AWS D1.5 Section 5.13 shall be conducted using both Figure 5.1 and Figure 5.3. The test conforming to Figure 5.3 shall be conducted using the same welding electrical parameters that were established for the test conducted conforming to Figure 5.1.
C. The travel speed, current, and voltage values that are used for tests conducted per AWS D1.5 Section 5.12 or 5.13 shall be consistent for each weld joint, and shall in no case vary by more than 10 percent for travel speed, 10 percent for current, and 7 percent for voltage.
D. For a WPS qualified in conformance with AWS D1.5 Section 5.13, the values to be used for calculating ranges for current and voltage shall be based on the average of all weld passes made in the test. Heat input shall be calculated using the average of current and voltage of all weld passes made in the test for a WPS qualified in conformance with Section 5.12 or 5.13.
E. To qualify for unlimited material thickness, two qualification tests are required for WPSs utilized for welding material thicknesses greater than 38 mm. One test shall be conducted using 20-mm thick test plates, and one test shall be conducted using test plates with a thickness between 38 mm and 50 mm. Two maximum heat input tests may be conducted for unlimited thickness qualification.
F. Macroetch tests are required for WPS qualification tests, and acceptance shall be per AWS D1.5 Section 5.19.3.
G. When a weld joint is to be made using a combination of qualified WPSs, each process shall be qualified separately.
H. When a weld joint is to be made using a combination of qualified and prequalified processes, the WPS shall reflect both processes and the limitations of essential variables, including weld bead placement, for both processes.
I. Prior to preparing mechanical test specimens, the PQR welds shall be inspected by visual and radiographic tests. Backing bar shall be 75 mm in width and shall remain in place during NDT testing. Results of the visual and radiographic tests shall comply with AWS D1.5 Section 6.26.2, excluding Section 6.26.2.2. Test plates that do not comply with both tests shall not be used.

WELDING QUALITY CONTROL

Welding quality control shall conform to the requirements in the AWS or other specified welding codes, the Standard Specifications, and these special provisions.

Unless otherwise specified, welding quality control shall apply when any work is welded in conformance with the provisions in Section 49, "Piling," Section 52, "Reinforcement," Section 55, "Steel Structures," or Section 75-1.035, "Bridge Joint Restrainer Units," of the Standard Specifications.

The welding of fracture critical members (FCMs) shall conform to the provisions specified in the Fracture Control Plan (FCP) and herein.

The Contractor shall designate in writing a welding Quality Control Manager (QCM). The QCM shall be responsible directly to the Contractor for the quality of welding, including materials and workmanship, performed by the Contractor and subcontractors.

The QCM shall be the sole individual responsible to the Contractor for submitting, receiving, reviewing, and approving all correspondence, required submittals, and reports to and from the Engineer. The QCM shall be a registered professional engineer or shall be currently certified as a CWI or a CAWI.

The QCM shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project. The QCM may be an employee of the Contractor.

Welding inspection personnel or NDT firms to be used in the work shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project, except for the following conditions:

A. The work is welded in conformance with AWS D1.5 and is performed at a permanent fabrication or manufacturing facility which is certified under the AISC Quality Certification Program, Category Cbr, Major Steel Bridges and Fracture Critical endorsement F.
B. The welding is performed on pipe pile material at a permanent pipe manufacturing facility authorized to apply the American Petroleum Institute (API) monogram for API 5L pipe.

For welding performed at such facilities, the inspection personnel or NDT firms may be employed or compensated by the facility performing the welding.

Prior to submitting the Welding Quality Control Plan (WQCP) required herein, a pre-welding meeting between the Engineer, the Contractor's QCM, and a representative from each entity performing welding or inspection for this project, shall be held to discuss the requirements for the WQCP.

The Contractor shall submit to the Engineer, in conformance with the provisions in "Working Drawings," of these special provisions, 2 copies of a separate WQCP for each subcontractor or supplier for each item of work for which welding is to be performed.

The Contractor shall allow the Engineer 2 weeks to review the WQCP submittal after a complete plan has been received. No welding shall be performed until the WQCP is approved in writing by the Engineer. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

An amended WQCP or any addendum to the approved WQCP shall be submitted to, and approved in writing by the Engineer, for proposed revisions to the approved WQCP. An amended WQCP or addendum will be required for revisions to the WQCP, including but not limited to a revised WPS; additional welders; changes in NDT firms, QC, or NDT personnel or procedures; or updated systems for tracking and identifying welds. The Engineer shall have 1 week to complete the review of the amended WQCP or addendum. Work affected by the proposed revisions shall not be performed until the amended WQCP or addendum has been approved. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will

be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

Information regarding the contents, format, and organization of a WQCP, is available at the Transportation Laboratory or the following website:

http://www.dot.ca.gov/hq/esc/Translab/smbresources.htm

After final approval of the WQCP, amended WQCP, or addendum, the Contractor shall submit 7 copies to the Engineer of the approved documents. A copy of the Engineer approved document shall be available at each location where welding is to be performed.

A daily production log for welding shall be kept for each day that welding is performed. The log shall clearly indicate the locations of all welding. The log shall include the welders' names, amount of welding performed, any problems or deficiencies discovered, and any testing or repair work performed, at each location. The daily report from each QC Inspector shall also be included in the log.

The following items shall be included in a Welding Report that is to be submitted to the Engineer within 10 days following the performance of any welding:

A. Reports of all visual weld inspections and NDT.
B. Radiographs and radiographic reports, and other required NDT reports.
C. Documentation that the Contractor has evaluated all radiographs and other nondestructive tests and corrected all rejectable deficiencies, and all repaired welds have been reexamined by the required NDT and found acceptable.
D. Daily production log.

The following information shall be clearly written on the outside of radiographic envelopes: name of the QCM, name of the nondestructive testing firm, name of the radiographer, date, contract number, complete part description, and all included weld numbers or a report number, as detailed in the WQCP. In addition, all innerleaves shall have clearly written on them the part description and all included weld numbers, as detailed in the WQCP.

Reports regarding NDT shall be signed by both the NDT technician and the person that performed the review, and then submitted directly to the QCM for review and signature prior to submittal to the Engineer. Corresponding names shall be clearly printed or typewritten next to all signatures.

The Engineer will review the Welding Report to determine if the Contractor is in conformance with the WQCP. Unless otherwise specified, the Engineer shall be allowed 10 days to review the report and respond in writing after a complete Welding Report has been received. Prior to receiving notification from the Engineer of the Contractor's conformance with the WQCP, the Contractor may encase in concrete or cover welds for which a Welding Report has been submitted. However, should the Contractor elect to encase or cover those welds prior to receiving notification from the Engineer, it is expressly understood that the Contractor shall not be relieved of the responsibility for incorporating material in the work that conforms to the requirements of the plans and specifications. Material not conforming to these requirements will be subject to rejection. Should the Contractor elect to wait to encase or cover welds pending notification by the Engineer, and in the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing

the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

The QC Inspector shall provide reports to the QCM on a daily basis for each day that welding is performed.

Except for noncritical weld repairs, the Engineer shall be notified immediately in writing when welding problems, deficiencies, base metal repairs, or any other type of repairs not submitted in the WQCP are discovered, and also of the proposed repair procedures to correct them. The Contractor shall allow the Engineer one week to review these procedures. No remedial work shall begin until the repair procedures are approved in writing by the Engineer. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

The QCM shall sign and furnish to the Engineer, a Certificate of Compliance in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications for each item of work for which welding was performed. The certificate shall state that all of the materials and workmanship incorporated in the work, and all required tests and inspections of this work, have been performed in conformance with the details shown on the plans, the Standard Specifications, and these special provisions.

PAYMENT

Full compensation for conforming to the requirements of "Welding" shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements involved and no additional compensation will be allowed therefor.

SECTION 9. DESCRIPTION OF BRIDGE WORK

The bridge work to be done consists, in general, of constructing portions of the following structures as shown on the plans:

SAN FRANCISCO OAKLAND BAY BRIDGE EAST SPAN
YBI TRANSITION STRUCTURES
SUBSTRUCTURE ONLY
(Bridge No. 34-0006 L/R)

SAN FRANCISCO OAKLAND BAY BRIDGE EAST SPAN
YBI EB ON-RAMP STRUCTURE (INITIAL)
SUBSTRUCTURE FOR BENT W7 ONLY
(Bridge No. 34-0006 R)

SECTION 10. CONSTRUCTION DETAILS

SECTION 10-1. GENERAL

10-1.01 ORDER OF WORK

Order of work shall conform to the provisions in Section 5-1.05, "Order of Work," of the Standard Specifications and these special provisions.

Attention is directed to "Thermoplastic Delineation (EAS)," of these special provisions.

The first order of work shall be to install the 200-mm thermoplastic delineation (ESA) along boundaries of the paved areas of the ESA 1a and 1b, before excavation and piling work is begun.

Temporary railing (Type K) and temporary crash cushions shall be secured in place prior to commencing work for which the temporary railing and crash cushions are required.

Attention is directed to "Replace Concrete Pavement (Rapid Strength Concrete)" of these special provisions in regards to providing Pre-Operation Conference and the Just-In-Time Training prior to commencing pavement replacement operations.

Attention is directed to "Environmentally Sensitive Area (General)"of these special provisions. Prior to beginning work, the boundaries of the Environmentally Sensitive Areas (ESA) shall be clearly delineated in the field. The boundaries shall be delineated by the installation of temporary fence (Type ESA).

Attention is directed to "Water Pollution Control" of these special provisions for an amendment to the Storm Water Pollution Prevention Plan Preparation, which is required for the scope of work for the Contract Change Order, prior to performing work having potential to cause water pollution.

Not less than 60 days prior to applying seeds, the Contractor shall furnish the Engineer a statement from the vendor that the order for the seed required for this contract has been received and accepted by the vendor. The statement from the vendor shall include the names and quantity of seed ordered and the anticipated date of delivery.

10-1.02 WATER POLLUTION CONTROL

The Contractor shall fully comply with "Water Pollution Control," of the contract special provisions for the Contract 04-0120R4 for preparation of an amendment to the existing Storm Water Pollution Prevention Plan (SWPPP) and amending the Sampling and Analysis Plan (SAP) to cover the scope of work for the Contract Change Order.

Attention is directed to "Retention of Funds", "SWPPP Implementation", "Maintenance", "Reporting Requirements", "Sampling and Analytical Requirements" within "Water Pollution Control," of the contract special provisions for the Contract 04-0120R4.

The SWPPP amendment shall conform to the Section "Storm Water Pollution Prevention Plan Preparation, Approval and Amendments," of Section 10-1.02 "Water Pollution Control, of the Contract special provisions.

The Contractor shall develop a Water Pollution Control Schedule that describes the timing of grading or other work activities that could affect water pollution. The Water Pollution Control Schedule shall be updated by the Contractor to reflect changes in the Contractor's operations that would affect the necessary implementation of water pollution control practices.

The Contractor shall complete the "Construction Site BMPs Consideration Checklist" presented in the Preparation Manual and shall incorporate water pollution control practices into the SWPPP amendment. Water pollution control practices include the "Minimum Requirements" and other

Contractor-selected water pollution control practices from the "Construction Site BMPs Consideration Checklist" and the "Project-Specific Minimum Requirements" identified in the Water Pollution Control Cost Break-Down of this section.

The following contract items of work shall be incorporated into the SWPPP amendment as "Temporary Water Pollution Control Practices": Temporary Cover, Temporary Silt Fence, Temporary Drainage Inlet Protection, Temporary Concrete Washout Facility, Temporary Construction Entrance. The Contractor's attention is directed to the special provisions provided for Temporary Water Pollution Control Practices.

The following contract items of work, as shown on the project plans or as specified elsewhere in these special provisions, shall be identified in the SWPPP amendment as permanent water pollution control practices: Erosion Control Netting, and Fiber Rolls. These permanent water pollution control practices shall be constructed as specified in these special provisions, and utilized during the construction period. The Contractor shall maintain and protect the permanent water pollution control practices throughout the duration of the project and shall restore these controls to the lines, grades and condition shown on the plans prior to acceptance of the contract.

The SWPPP amendment shall include, but not be limited to, the items described in the Manuals, Permits and related information contained in the contract documents.

The Contractor shall prepare an amendment to the SWPPP when there is a change in construction activities or operations which may affect the discharge of pollutants to surface waters, ground waters, municipal storm drain systems, or when the Contractor's activities or operations violate a condition of the Permits, or when directed by the Engineer. Amendments shall identify additional water pollution control practices or revised operations, including those areas or operations not identified in the initially approved SWPPP. Amendments to the SWPPP shall be prepared and submitted for review and approval within a time approved by the Engineer, but in no case longer than the time specified for the initial submittal and review of the SWPPP. At a minimum, the SWPPP shall be amended annually and submitted to the Engineer 25 days prior to the defined rainy season.

The Contractor shall keep one copy of the approved SWPPP and approved amendments at the project site. The SWPPP shall be made available upon request by a representative of the Regional Water Quality Control Board, State Water Resources Control Board, United States Environmental Protection Agency, or the local storm water management agency. Requests by the public shall be directed to the Engineer.

COST BREAK-DOWN

The Contractor shall include a Water Pollution Control Cost Break-Down in the SWPPP amendment which itemizes the contract lump sum for water pollution control work. The Contractor shall use the Water Pollution Control Cost Break-Down provided in this section as the basis for the cost break-down submitted with the SWPPP amendment. The Contractor shall use the Water Pollution Control Cost Break-Down to identify items, quantities and values for water pollution control work, excluding Temporary Water Pollution Control Practices for which there are separate bid items. The Contractor shall be responsible for the accuracy of the quantities and values used in the cost break-down submitted with the SWPPP amendment. Partial payment for the item of water pollution control will not be made until the Water Pollution Control Cost Break-Down is approved by the Engineer.

Line items indicated in the Water Pollution Control Cost Break-Down in this section with a specified Estimated Quantity shall be considered "Project-Specific Minimum Requirements." The

Contractor shall incorporate Project-Specific Minimum Requirements with Contractor-designated quantities and values into the Water Pollution Control Cost Break-Down submitted with the SWPPP amendment.

Line items indicated in the Water Pollution Control Cost Break-Down in this section without a specified Estimated Quantity shall be considered by the Contractor for selection to meet the applicable "Minimum Requirements" as defined in the Manuals, or for other water pollution control work as identified in the "Construction Site BMPs Consideration Checklist" presented in the Preparation Manual. In the Water Pollution Control Cost Break-Down submitted with the SWPPP amendment, the Contractor shall list only those water pollution control practices selected for this Contract Change Order , including quantities and values required to complete the work for those items.

The sum of the amounts for the items of work listed in the Water Pollution Control Cost Break-Down shall be equal to the contract lump sum price bid for water pollution control. Overhead and profit, shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

WATER POLLUTION CONTROL COST BREAK-DOWN

(CCO No. 64)

ITEM	ITEM DESCRIPTION	UNIT	ESTIMATED QUANTITY	VALUE	AMOUNT
SS-8	Wood Mulching	M2			
SS-9	Earth Dikes/Drainage Swales & Lined Ditches	M			
SS-10	Outlet Protection/Velocity Dissipation Devices	EA

WM-6	Hazardous Waste Management	LS			
WM-9	Sanitary/Septic Waste Management	LS			

TOTAL _____

Adjustments in the items of work and quantities listed in the approved cost break-down shall be made when required to address amendments to the SWPPP, except when the adjusted items are paid for as extra work.

No adjustment in compensation will be made to the contract lump sum price paid for water pollution control due to differences between the quantities shown in the approved cost break-down and the quantities required to complete the work as shown on the approved SWPPP amendment. No adjustment in compensation will be made for ordered changes to correct SWPPP work resulting from the Contractor's own operations or from the Contractor's negligence.

The approved cost break-down will be used to determine partial payments during the progress of the work and as the basis for calculating the adjustment in compensation for the item of water pollution control due to increases or decreases of quantities ordered by the Engineer. When an ordered change increases or decreases the quantities of an approved cost break-down item, the adjustment in compensation will be determined in the same manner specified for increases and decreases in the quantity of a contract item of work in conformance with the provisions in Section 4-1.03B, "Increased or Decreased Quantities," of the Standard Specifications. If an ordered change requires a new item which is not on the approved cost break-down, the adjustment in compensation will be determined in the same manner specified for extra work in conformance with Section 4-1.03D, "Extra Work," of the Standard Specifications.

If requested by the Contractor and approved by the Engineer, changes to the water pollution control practices listed in the approved cost break-down, including addition of new water pollution control practices, will be allowed. Changes shall be included in the approved amendment of the SWPPP. If the requested changes result in a net cost increase to the lump sum price for water pollution control, an adjustment in compensation will be made without change to the water pollution control item. The net cost increase to the water pollution control item will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications.

PAYMENT

The contract lump sum price paid for prepare storm water pollution prevention plan amendment shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, for furnishing all labor, materials, tools, equipment, and incidentals for doing all the work involved in developing, preparing, obtaining approval of, revising, and amending the SWPPP, as specified in the Standard Specifications and these special provisions, as directed by the Engineer, and no additional compensation will be allowed therefor.

Attention is directed to Section 9-1.06, "Partial Payments," and Section 9-1.07, "Payment After Acceptance," of the Standard Specifications. Payments for prepare storm water pollution prevention plan will be made as follows:

A. After the SWPPP Amendment has been approved by the Engineer, 75 percent of the contract item price for prepare storm water pollution prevention plan will be included in the monthly partial payment estimate.
B. After acceptance of the contract in conformance with the provisions in Section 7-1.17, "Acceptance of Contract," of the Standard Specifications, payment for the remaining 25 percent of the contract item price for prepare storm water pollution prevention plan amendment will be made in conformance with the provisions in Section 9-1.07.

The contract lump sum price paid for water pollution control shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in installing, constructing, removing, and disposing of water pollution control practices, including non-storm water management, and waste management and materials pollution water pollution control practices, except those for which there is a contract item of work as specified in the Standard Specifications and these special provisions, as directed by the Engineer, and no additional compensation will be allowed therefor.

Storm water sampling and analysis will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications. No payment will be made for the preparation, collection, analysis, and reporting of storm water samples required where appropriate BMPs are not implemented prior to a rain event, or if a failure of a BMP is not corrected prior to a rain event.

For items identified on the approved Water Pollution Control Cost Break-Down, the cost of maintaining the temporary water pollution control practices shall be divided equally by the State and the Contractor as follows:

Soil Stabilization

Temporary water pollution control practices except:
SS-1 Scheduling
SS-2 Preservation of Existing Vegetation

Sediment Control

Temporary water pollution control practices except:
SC-7 Street Sweeping and Vacuuming

Wind Erosion Control

No sharing of maintenance costs will be allowed.

Tracking Control

No sharing of maintenance costs will be allowed.

Non-Storm Water Management

No sharing of maintenance costs will be allowed.

Waste Management & Materials Pollution Control

No sharing of maintenance costs will be allowed.

The division of cost will be made by determining the cost of maintaining water pollution control practices in conformance with the provisions in Section 9-1.03, "Force Account Payment," of the Standard Specifications and paying to the Contractor one-half of that cost. Cleanup, repair, removal, disposal, improper installation, and replacement of water pollution control practices damaged by the Contractor's negligence, shall not be considered as included in the cost for performing maintenance.

The provisions for sharing maintenance costs shall not relieve the Contractor from the responsibility for providing appropriate maintenance on items with no shared maintenance costs.

Full compensation for non-shared maintenance costs of water pollution control practices, as specified in this section, "Water Pollution Control," shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

Water pollution control practices for which there is a contract item of work, will be measured and paid for as that contract item of work.

10-1.03 NON-STORM WATER DISCHARGES

Non-storm water discharges shall conform to the requirements in Section 7-1.01G, "Water Pollution" of the Standard Specifications, "Water Pollution Control" of these special provisions, and these special provisions.

MARINE EXCAVATION DEWATERING

The discharge of floating oil or other floating materials is prohibited. Suspended solids shall be removed to the extent that deleterious bottom deposits, turbidity, and discoloration are not caused by the discharge. Turbidity shall be measured in Nephelometric Turbidity Units (NTU). The point of effluent discharge shall not cause bottom sediments or aquatic vegetation to become dislodged or disturbed.

The Contractor shall describe dewatering operation in the Dewatering Plan as specified under "Land-Based Excavation Dewatering."

The Contractor shall monitor both the discharge and the receiving water body in conformance with the provisions in Order No. R2-2002-0011, "Waste Discharge Requirements for San Francisco-Oakland Bay Bridge East Span Seismic Safety Project (East Span Project), City and County of San Francisco and City of Oakland, Alameda County," issued by the San Francisco Bay Regional Water Quality Control Board and these special provisions. Copies of the permit are available for inspection at the Department of Transportation, Duty Senior's Desk, 111 Grand Avenue, Oakland, California, email; duty_senior_district04@dot.ca.gov, telephone (510) 286-5209 The observations made during monitoring shall include the color difference, presence of suspended material, presence of water fowl or aquatic wildlife, wind direction and velocity, tidal condition, atmospheric condition, time, and date. In addition, the Contractor shall supplement the observations with photographs. During monitoring events, the Contractor shall obtain depth-averaged turbidity, dissolved oxygen, and pH measurements for the discharge and receiving water. Depth-averaged measurements shall be obtained by taking measurements from 3 points within the water column and averaging the 3 measurements: one at 0.3 m below the surface, one at mid depth, and one at 0.3 m above the bottom. In receiving waters that are less than 1.0 meter in depth, only one measurement shall be taken at 0.3 m below the surface. All field recorded data shall be obtained and recorded in the presence of the Engineer. Only meters that are approved by the Engineer shall be used for obtaining field

measurements. The Contractor shall submit a copy of the manufacturer specifications for all measuring instruments used including the operating instructions, the calibration instructions and calibration log. All calibrations shall be done in accordance with the manufacturer's instructions and in the presence of the Engineer.

The Contractor shall conduct monitoring, at a minimum, one hour before discharge, ten minutes after initiating discharge, four hours after initiating discharge, once daily after the initial startup monitoring, and upon cessation of discharge. The receiving water turbidity, dissolved oxygen, and pH shall be measured at a location that is unaffected by the discharge at the same frequency as the discharge monitoring. The observations, turbidity, dissolved oxygen, and pH measurements shall be recorded daily in a tabular format provided within the Storm Water Pollution Prevention Plan, as described within "Water Pollution Control" of these special provisions. The daily report shall include photographs and shall be provided daily to the Engineer prior to close of business for each working day.

The following increases in natural background turbidity, pH, and dissolved oxygen of the receiving water will be allowed:

Water Quality Parameter	Water Quality Limit
Natural Background Turbidity	
0 to 49 NTU	Receiving water turbidity may be increased to 50 NTU
50 NTU and greater	10 percent incremental increase
Natural background pH	± 0.5 pH units
Natural Background Dissolved Oxygen	5 mg/L minimum

In the event that observations and measurements indicate that a discharge is having an effect on receiving water by more than allowed and the effect is confirmed by an additional measurement obtained no less than 15 minutes and no more than 1 hour after the initial measurement, the discharge activity shall immediately cease, and corrective actions undertaken to modify, repair, or replace the equipment used for the discharge. The resumption of discharge activities will be allowed upon approval of the corrective measures by the Engineer.

LAND-BASED EXCAVATION DEWATERING

This work shall include discharging water from land-based excavations including, but not limited to, excavations for pile caps or footings, piles, storm drainage systems, sanitary sewer systems, utility facilities, walls and appurtenances. These provisions shall not apply to seepage from seasonal percolation of rainwater at elevations greater than 6.0 m, except that those dewatering operations shall be described in the Dewatering Plan as specified herein. Discharges from elevations greater than 6.0 m shall be performed in conformance with Order No. R2-2002-0011, including allowable increases in natural background turbidity, pH, and dissolved oxygen, and "Water Pollution Control" of these special provisions.

Excavation dewatering shall be performed in conformance with the requirements of San Francisco - Public Utilities Commission (SF-PUC) Batch Discharge Permit and Authorization Letter issued on October 5, 2004.

The Contractor shall be fully informed of the provisions of the permit and conduct the work accordingly.

At the option of the Contractor, water removed from the excavation may be hauled off site to an appropriately licensed liquid disposal facility in accordance with Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Surface runoff shall not be allowed to enter the excavation. Groundwater contaminated by the Contractor's operations, such as the use of slurry to construct cast-in-place piles, shall be treated to meet the permit requirements for discharge or removed from the site to an appropriately licensed liquid disposal facility in accordance with Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Based on the material type and groundwater gradients within the project limits, it is expected that the groundwater flow rate will be up to 180.0 L/minute. The treatment facility shall be designed to accommodate this flow rate. Continuous pumping from well points outside the excavations will not be allowed. The Contractor shall use construction methods that prevent cross-contamination of water-bearing zones caused by the flow of contaminated groundwater into piling excavations including, but not limited to, sheet piling, pipe pile extensions, and casing or shells. Seal course and cofferdams shall be used to control water in conformance with the provisions of Section 19-3.04, "Water Control and Foundation Treatment," of the Standard Specifications from "WD1" 52+40 to "WD1" 54+80 when groundwater is to be encountered. A meter that has been approved by the Engineer shall be used to measure all excavation discharges.

Treated groundwater shall be used for dust control up to the extent that sheet flow or ponding becomes imminent. When further use of the treated water as dust control would result in sheet flow or ponding, the water shall be discharged at an approved dedicated discharge point.

Analysis results of grab samples from groundwater within the limits of the project are summarized in the following table:

GROUNDWATER CONTAMINANT SUMMARY

Sample ID.	W5LC	EB6R	EB7R

SVOCs Semi-Volatile Organic Compounds
TPHg Total Petroleum Hydrocarbons as gasoline
TPHd Total Petroleum Hydrocarbons as diesel
TPHmo Total Petroleum Hydrocarbons as motor oil

The Contractor shall submit to the Engineer, as specified in "Working Drawing," of these special provisions, a Dewatering Plan that includes the following:

A. Dewatering Operation Description - written description of all dewatering operations that shall include, but is not limited to, start up date of discharge, an estimate of the discharge volume, flow rate, frequency, and maximum capacity of the treatment facility.
B. Certification of Treatment Facility Design - report describing the adequacy of (1) the process and design of the treatment facility to meet treatment objectives, (2) the startup and operation instruction manuals, (3) the treatment facility maintenance and testing program; and (4) the influent and effluent sampling locations. This certification shall be prepared and signed by an engineer who is registered as a Civil Engineer in the State of California.

C. Treatment Facility Operation and Maintenance Manual - manual of operation for the treatment facility that describes staffing and training, quality control and assurance, inspection and maintenance, monitoring, records keeping, and preventative and contingency plans for controlling accidental discharges.

D. Working Drawings - working drawings of dewatering operations showing both a sectional and plan view that details the removal techniques for suspended solids and known or introduced groundwater contaminants. The drawings shall define the flow path and placement of pipes, hoses, pumps, treatment systems, holding tanks, and other equipment used to convey the discharge; the general position of the dewatering measures relative to the excavations undergoing dewatering; and the point of effluent discharge.

The plan shall be submitted 25 working days before beginning dewatering operations for review and approval by the Engineer. Excavation operations that require dewatering will not be allowed until the plan has been approved by the Engineer. At the time of approval, the Contractor shall incorporate the dewatering plan into the approved SWPPP via the established amendment process as described within "Water Pollution Control" of these special provisions.

Monitoring of discharges shall conform to the requirements of the SF-PUC Batch Discharge Permit and Authorization Letter and these special provisions.

In addition to the monitoring requirements of the SF-PUC Batch Discharge Permit and Authorization Letter, the Contractor shall monitor the discharge for turbidity. Turbidity shall be measured in Nephelometric Turbidity Units (NTU).

In the event of a violation of the maximum daily limits or turbidity measurement greater than 50 NTU occurs and is confirmed by an additional measurement obtained no less than 15 minutes and no more than 1 hour after the initial measurement, the discharge activity shall be shutdown and corrective actions shall be taken to modify, repair, or replace the equipment used for the discharge. The resumption of discharge activities shall be allowed upon approval of the corrective measures by the Engineer.

EFFLUENT TREATMENT FACILITY

An effluent treatment facility shall be provided to treat petroleum contaminated water discharged from dewatering operations. Effluent shall be considered as the water and any other material discharged from the dewatering operations.

The Contractor shall use the effluent treatment facility to treat water from excavations before discharging to an approved discharge site in accordance with the SF-PUC Batch Discharge Permit and Authorization Letter and these special provisions.

Materials shall conform to the provisions in Section 6, "Control of Materials," Section 7-1.16, "Contractor's Responsibility for the Work and Materials," Section 20-5.03E, "Pipe," and Section 74-2, "Drainage Pump Equipment" of the Standard Specifications and these special provisions.

Holding tanks for pretreatment storage shall be transportable and totally enclosed, with a minimum holding capacity sufficient to prevent delay of other work and capable of connecting multiple tanks in series. Holding tanks shall have an inlet and outlet capable of receiving and discharging minimum flows, at a rate sufficient to reach the treatment goals. Holding tanks shall be able to accommodate temporary installation of submersible pumps. All tanks shall remain within the project limits until dewatering operations are no longer necessary as determined by the Engineer.

Granulated activated carbon (GAC) shall be used as the medium to treat groundwater contaminated with petroleum hydrocarbons as noted in the contaminant summary table. The GAC

treatment system shall be designed to meet the treatment goals specified in the SF-PUC Batch Discharge Permit and Authorization Letter. The GAC treatment vessels shall be readily removed and replaced or interchanged when required. The GAC treatment system shall have appropriate fittings for pipe connections designed to accommodate the required flow rate. Throughout the operation, the Contractor shall have additional GAC treatment vessels available for transport and use at the site if the monitoring results indicate that the GAC treatment vessels currently in use will not continue to meet the treatment goals of the SF-PUC Batch Discharge Permit and Authorization Letter. Pretreatment of the groundwater to prevent sediment build up within the GAC treatment vessels shall be provided when necessary.

Sampling ports shall be spigots attached to the piping system and capable of obtaining a representative sample of water at locations within the effluent treatment facility where constituent concentrations are needed to ensure compliance with the SF-PUC Batch Discharge Permit and Authorization Letter and to inspect the efficiency of the facility. The effluent treatment facility shall be capable of sustaining temporary fluctuations in water pressure due to monitoring activities.

Pumps shall be capable of being submerged in water and discharging water and other materials including, but not limited to small rocks, gravel, sand and sediments. The submersible pumps shall be capable, at all times, of discharging at a flow rate that will match the flow rate through the GAC vessels. An additional submersible pump shall be provided by the Contractor that is capable of discharging treated effluent from a temporary holding container to the dedicated discharge location.

The Contractor shall be responsible for providing and installing all piping required to circulate the effluent through the treatment facility and all piping required to convey the treated effluent from the temporary holding container to the point of release at the dedicated discharge location.

A holding tank shall be provided between the GAC treatment system outlet and the discharge location with a minimum storage capacity of 1800 L. The holding container shall have an inlet and outlet capable of receiving and discharging minimum flows that can match the flow rate through the GAC vessels. The holding container shall be open to the air and sealed on all sides and the bottom to prevent any leakage.

Sediments removed during maintenance of the treatment facility shall be characterized by laboratory analysis before disposal. Contaminated sediments shall be removed from the site to an appropriately licensed waste management facility in accordance with Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications. Disposal of contaminated sediments, as determined by analysis, will be paid for as extra work as provided in Section 4-1.03D of the Standard Specifications.

INSPECTION

The Contractor shall conduct a daily inspection of the dewatering equipment, when in use, and ensure that all components are functional and routinely maintained to prevent leakage before removal of suspended solids and petroleum hydrocarbons. If any component of the dewatering equipment is damaged so that the performance of the equipment is diminished below allowable operational levels, the dewatering operation shall be discontinued and the component shall be repaired or replaced with substitute equipment.

SPILL CONTINGENCY

The Contractor shall prepare and submit to the Engineer a contingency plan for the management of spills or leaks of any materials or wastes that may impact the water quality of the San Francisco Bay.

The spill contingency plan shall be incorporated within the SWPPP, as specified in "Water Pollution Control (Storm Water Pollution Prevention Plan)" of these special provisions.

The contingency plan shall include instructions and procedures for reporting spills, and a list of spill containment and collection materials and equipment to be maintained onsite. The contingency plan shall be reviewed and updated quarterly.

LIQUIDS, RESIDUES AND DEBRIS

The Contractor shall prevent the discharge of slurries, liquids, residues, or debris produced during the work to storm water facilities or surface waters of the State. The SWPPP shall, at a minimum, depict and describe the procedural and structural methods of containing, collecting, and disposing of all slurries, liquids, residues, and debris associated with the operations. Sufficient redundancy shall be incorporated into the procedural and structural methods such that the slurries, liquids, residues, and debris are not conveyed into or become present in drainage systems, San Francisco Bay, or other water bodies.

PAYMENT

The contract lump sum price paid for non-storm water shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, for furnishing all labor, materials, tools, equipment, and incidentals and for doing all the work involved in non-storm water discharges, complete in place, as shown on the plans, as specified in the Standard Specifications, and these special provisions, and as directed by the Engineer.

10-1.04 TEMPORARY DRAINAGE INLET PROTECTION

Temporary drainage inlet protection shall be constructed, maintained, and removed from all drainage inlets exposed to construction activity and at the locations shown on the approved Storm Water Pollution Prevention Plan (SWPPP) in accordance with "Water Pollution Control" of these special provisions, and in accordance with the details shown on the plans and these special provisions.

Temporary drainage inlet protection shall be one of the water pollution control practices for sediment control. The amendment to the SWPPP shall include the use of temporary drainage inlet protection.

The Contractor shall select the appropriate drainage inlet protection in accordance with the details to meet the conditions around the drainage inlet. Throughout the duration of the contract, the Contractor shall provide protection to meet the changing conditions around the drainage inlet.

Temporary drainage inlet protection shall be Type 1,3A,3B,4A,4B or 5.

MATERIALS

Erosion Control Blanket

The erosion control blanket shall be a rolled erosion control product (RECP) and shall be classified either as temporary and degradable or long-term and nondegradable, and shall conform to one of the following:

A. Temporary and degradable:

1. Machine produced mats consisting of curled wood excelsior with 80 percent of the fiber 150 mm or longer. The excelsior blanket shall be of consistent thickness with wood fiber evenly distributed over the entire area of the blanket. The top surface of the blanket shall be covered with an extruded photodegradable plastic netting or lightweight nonsynthetic netting. The blanket shall be smolder resistant without the use of chemical additives and shall be nontoxic and noninjurious to plant and animal life. The excelsior blanket shall be furnished in rolled strips with a minimum mass per unit area of 0.40-kg/m^2.
2. Machine produced mats consisting of 70 percent straw and 30 percent coconut fiber with an extruded photodegradable plastic netting or lightweight nonsynthetic netting on the top and bottom surfaces of the blanket. The straw and coconut shall adhere to the netting using thread or glue strip. The straw and coconut blanket shall be of consistent thickness, and straw and coconut fiber shall be evenly distributed over the entire area of the blanket. The straw and coconut fiber blanket shall be furnished in rolled strips with a minimum mass per unit area of 0.27-kg/m^2.
3. Machine produced mats that are 100 percent coir consisting of coconut fiber with an extruded photodegradable plastic netting or lightweight nonsynthetic netting on the top and bottom surfaces of the blanket. The coconut fiber shall adhere to the netting using thread or glue strip. The coconut blanket shall be of consistent thickness, with coconut fiber evenly distributed over the entire area of the blanket. The coconut fiber blanket shall be furnished in rolled strips with a minimum mass per unit area of 0.27-kg/m^2.
4. Machine woven netting that is 100 percent spun coir consisting of coconut fiber with an average open area of 63 percent to 70 percent. Coconut coir netting shall be furnished in rolled strips with a minimum mass per unit area of 0.40-kg/m^2.

B. Long-term and nondegradable:

1. Geotextile blanket shall conform to the provisions for rock slope protection fabric (Type A) in Section 88-1.04, "Rock Slope Protection Fabric," of the Standard Specifications.

Staples

Staples shall be as shown on the plans. An alternative attachment device such as geotextile pins or plastic pegs may be used instead of staples. The Contractor shall submit a sample of the alternative attachment device for the Engineer's approval before installation.

Rocks

Rocks shall conform to the requirements in Section 72-2.02, "Materials," of the Standard Specifications except that grading shall conform to the following sizes:

Square Screen Size (mm)	Percentage Passing	Percentage Retained
150	100	0
75	0	100

Fiber Roll

A fiber roll shall be one of the following:

A. Constructed with a premanufactured blanket made of one material or a combination of materials consisting of wood excelsior, rice or wheat straw, or coconut fibers. The blanket shall be between 2.0 m and 2.4 m in width and between 20 m and 29 m in length. Wood excelsior shall be individual fibers, of which 80 percent shall be 150 mm or longer in length. The blanket shall have a photodegradable plastic netting or biodegradable jute, sisal, or coir fiber netting on at least one side. The blanket shall be rolled along the width and secured with jute twine spaced 2 m apart along the full length of the roll and placed 150 mm from the ends of each roll. The finished roll shall be between 200 mm and 250 mm in diameter, between 3 m and 6 m in length, and shall weigh at least 0.81-kg/m. More than one blanket may be required to achieve the finished roll diameter. When more than one blanket is required, blankets shall be jointed longitudinally with an overlap of 150 mm along the length of the blanket.

B. A premanufactured roll of rice or wheat straw, wood excelsior, or coconut fiber encapsulated within a photodegradable plastic or biodegradable jute, sisal, or coir fiber netting. The rolls shall be between 200 mm and 250 mm in diameter, between 3 m and 6 m in length, and shall weigh at least 1.6 kg/m. The netting shall have a minimum durability of one year after installation. The netting shall be secured tightly at each end of the roll.

Wood Stakes

Wood stakes shall be a minimum of 19 mm x 19 mm x 450 mm in size for Type 1 installation, or shall be a minimum of 19 mm x 38 mm x 450 mm in size for Type 2 installation. Wood stakes shall be untreated fir, redwood, cedar, or pine and cut from sound timber. They shall be straight and free of loose or unsound knots and other defects which would render them unfit for the purpose intended.

Rope

Rope shall be biodegradable, such as sisal or manila, with a minimum diameter of 6.35 mm.

Gravel-filled Bags

Gravel-filled bag fabric shall be nonwoven polypropylene geotextile or polymer material and shall conform to the following requirements:

Specification	Requirements
Mass per unit area, grams per square meter, minimum. ASTM Designation: D 5261	270
Grab tensile strength (25-mm grip), kilonewtons, minimum. ASTM Designation: D4632*	0.89
Ultraviolet stability, percent tensile strength retained after 500 hours, ASTM Designation: D4355, xenon arc lamp method	70

* or appropriate test method for specific polymer

Gravel-filled bags shall be between 600 mm and 800 mm in length, and between 400 mm and 500 mm in width.

Yarn used for binding gravel bags shall be as recommended by the manufacturer or bag supplier and shall be of a contrasting color.

Gravel shall be between 10 mm and 20 mm in diameter, and shall be clean and free from clay balls, organic matter, and other deleterious materials. The opening of gravel-filled bags shall be secured to prevent gravel from escaping. Gravel-filled bags shall be between 13 kg and 22 kg in mass.

Silt Fence

At the Contractor's option, temporary silt fence shall be prefabricated or constructed with silt fence fabric, posts, and fasteners.

Silt fence fabric shall conform to the following requirements:

Specification	Requirements
Width, mm, min.	900
Grab tensile strength (25-mm grip), kilonewtons, minimum. in each direction ASTM Designation: D 4632 or appropriate test method for specific polymer	0.55
Elongation, percent minimum in each direction ASTM Designation: D 4632 or appropriate test method for specific polymer	15
Permittivity, 1/sec., minimum. ASTM Designation: D 4491	1.5
Flow rate, liters per minute per square meter, minimum. ASTM Designation: D 4491	400
Ultraviolet stability, percent tensile strength retained after 500 hours, minimum. ASTM Designation: D 4355 (xenon-arc lamp and water spray weathering method)	70

Silt fence fabric shall be geotextile manufactured from woven polypropylene or polymer material. Silt fence fabric may be made of recycled materials. No materials shall contain biodegradable filler materials that can degrade the physical or chemical characteristics of the finished fabric. The Engineer may order tests to confirm the absence of biodegradable filler materials in conformance to the requirements in ASTM Designation: E 204.

Posts for temporary silt fences shall be one of the following:

A. Posts shall be untreated fir, redwood, cedar, or pine, shall be cut from sound timber, and shall be straight and free of loose or unsound knots and other defects which would render them unfit for the purpose intended. Wood post shall be a minimum of 34 mm x 40 mm in size, and 4 feet in length. The end of the post to be embedded in the soil shall be pointed.

B. Posts shall be steel and have a "U," "T," "L," or other cross sectional shape that can resist failure from lateral loads. The steel posts shall have a minimum mass per length of 1.1 kg/m and a minimum length of 1.2 m. One end of the steel posts shall be pointed and the other end shall be capped with an orange or red plastic safety cap which fits snugly to the steel post. The Contractor shall submit to the Engineer for approval a sample of the capped steel post before installation.

Fasteners for attaching silt fence fabric to posts shall be as follows:

A. When prefabricated silt fence is used, posts shall be inserted into sewn pockets.
B. Silt fence fabric shall be attached to wooden posts with nails or staples as shown on the plans or as recommended by the manufacturer or supplier. Tie wire or locking plastic fasteners shall be used to fasten the silt fence fabric to steel posts. Maximum spacing of fasteners shall be 200 mm along the length of the steel post.

Foam Barriers

The foam barrier fabric cover and skirt shall be a woven polypropylene fabric with a minimum tensile strength of 0.44-kN, conforming to ASTM Designation: D 4632. The prefabricated fabric shall be high visibility orange in color that is integral to the fabric; painting shall not be allowed. The fabric shall have an ultraviolet stability exceeding 70 percent.

The foam core shall be urethane foam and shall be shaped and dimensioned as shown on the plans.

Adhesive for foam barriers shall be a solvent-free rubber modified asphalt emulsion. The color of the emulsion shall be brown when wet and shall have a drying period of not more than 3 hours.

Anchoring nails or spikes for foam barriers shall be a minimum of 25 mm in length and capable of penetrating concrete or asphalt surfaces.

Sediment Filter Bag

Sediment filter bag fabric shall be geotextile manufactured from woven polypropylene or polymer material. Sediment filter bag fabric may be made from recycled polymer materials. Polymer materials shall not contain biodegradable filler materials and shall conform to the requirements in ASTM Designation: E 204.

Sediment filter bag fabric shall conform to the following requirements:

Specification	Requirements
Grab tensile strength (25-mm grip), kilonewtons, minimum. in each direction ASTM Designation: D 4632 or appropriate test method for specific polymer	1.35
Elongation, percent minimum in each direction ASTM Designation: D 4632 or appropriate test method for specific polymer	15
Permittivity, 1/sec., minimum. ASTM Designation: D 4491	1.5
Flow rate, liters per minute per square meter, minimum. ASTM Designation: D 4491	8140
Ultraviolet stability, percent tensile strength retained after 500 hours, minimum. ASTM Designation: D 4355 (xenon-arc lamp and water spray weathering method)	80

The sediment filter bag shall be sized to fit the catch basin or drainage inlet and shall be complete with lifting loops and dump straps attached at the bottom to facilitate emptying of the sediment filter bag. The sediment filter bags shall have a restraint cord approximately halfway up the bag to keep the sides away from the catch basin walls.

INSTALLATION

Temporary drainage inlet protection shall be installed at drainage inlets in paved and unpaved areas as follows:

A. Temporary drainage inlet protection shall be installed such that ponded runoff does not encroach on the traveled way or overtop the curb or dike. Gravel-filled bags shall be placed to control ponding and prevent runoff from overtopping the curb or dike.
B. The bedding area for the temporary drainage inlet protection shall be cleared of obstructions including rocks, clods, and debris greater than 25 mm in diameter before installation.
C. A temporary linear sediment barrier shall be installed up-slope of the existing drainage inlet and parallel with the curb, dike, or flow line to prevent sediment from entering the drainage inlet.

Erosion Control Blanket and Geotextile Fabric

The erosion control blanket and geotextile fabric shall be secured to the surface of the excavated sediment trap with staples and embedded in a trench adjacent to the drainage inlet. The perimeter edge of the erosion control blanket and geotextile fabric shall be anchored in a trench.

Silt Fence

Silt fence shall be installed along the perimeter of the erosion control blanket or geotextile fabric, with the posts facing the drainage inlet. The trench shall be backfilled and tamped to secure the silt fence fabric in the bottom of the trench.

Gravel-filled Bags

Gravel-filled bags shall be stacked to form a gravel bag barrier. The gravel-filled bags shall be placed so that the bags are tightly abutted and overlap the joints in adjacent rows. A spillway shall be created by removing one or more gravel-filled bags from the upper layer of the gravel bag barrier.

Gravel-filled bags shall only be use within shoulder areas when placed behind temporary railing (Type K).

Fiber Rolls

Fiber rolls shall be placed over the erosion control blanket or geotextile fabric with the ends of the fiber roll abutted tightly together. Fiber rolls shall be secured with stakes installed along the length of the fiber rolls. Stakes shall not be installed within 300 mm of the end of the rolls.

Foam Barriers

Foam barriers shall be installed in individual sections adjacent to existing drainage inlets. Foam barriers shall be securely attached to the pavement according to the angle and spacing shown on the plans. Foam barriers shall be installed flush against the sides of concrete or asphalt concrete curbs,

dikes, and pavement with the inner material and fabric cover cut smoothly and evenly to provide a tight flush joint.

Sediment Filter Bags

Sediment filter bags shall be installed by removing the drainage inlet grate, placing the sediment bag in the opening, and replacing the grate to secure the sediment filter bag in place.

MAINTENANCE

Temporary drainage inlet protection shall be maintained to provide sediment holding capacity and to reduce runoff velocities. Temporary drainage inlet protection shall be repaired or replaced immediately after the damage occurs.

Sediment deposits, trash, and debris shall be removed from temporary drainage inlet protection as needed or when directed by the Engineer. Removed sediment shall be deposited within the project limits so that the sediment is not subject to erosion by wind or by water. Trash and debris shall be removed and disposed of in accordance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

At locations where rills and other evidence of concentrated runoff have occurred beneath the drainage inlet protection, the protection shall be adjusted to prevent another occurrence.

Temporary silt fence shall be repaired or replaced when silt fence fabric becomes split, torn, or unraveled. Sagging or slumping silt fence shall be repaired with additional stakes or replaced. Broken or split stakes shall be replaced. Temporary silt fence shall be maintained to provide a sediment holding capacity of approximately 1/3 the height of the silt fence fabric above ground.

Sediment in excess of 50 mm above the surface of the erosion control blanket or geotextile fabric shall be removed.

Sediment deposits shall be removed when the deposit is 1/3 the height of the gravel bag barrier or one half the height of the spillway; whichever is less.

Gravel-filled bags shall be replaced when the bag material ruptures or when the binding fails.

Split, torn, unraveling, sagging, or slumping fiber rolls shall be replaced or repaired.

Foam barriers shall be repaired or replaced when the geotextile fabric cover becomes split, torn, or unraveled. Foam barriers that become detached or dislodged shall be reattached to the pavement. Sediment deposits shall be removed when the deposit reaches 1/3 of the foam barrier height.

Sediment filter bags shall be emptied when the restraint cords are no longer visible. Sediment filter bags shall be emptied by placing 25 mm steel reinforcing bars through the lifting loops. The bag shall be emptied of its contents and rinsed before replacement in the drainage inlet.

REMOVAL

When the temporary drainage inlet protection is no longer required the protection materials shall be removed and disposed of in accordance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Holes, depressions, or other ground disturbance caused by the removal of the temporary drainage inlet protection shall be backfilled and repaired in accordance with the provisions in Section 15-1.02, "Preservation of Property," of the Standard Specifications.

MEASUREMENT

Quantities of temporary drainage inlet protection will be determined from actual count in place. The protection will be measured one time only and no additional measurement will be recognized.

PAYMENT

The contract unit price paid for temporary drainage inlet protection shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in constructing the temporary drainage inlet protection, complete in place, including maintenance, removal of materials, including cleanup and disposal of retained sediment and debris, and backfilling and repairing holes, depressions and other ground disturbance, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

No additional compensation will be made if the temporary drainage inlet protection changes during the course of construction.

10-1.05 TEMPORARY COVER

Temporary cover shall be furnished, installed, maintained, and later removed at the locations shown on the approved Storm Water Pollution Prevention Plan in conformance with "Water Pollution Control" of these special provisions, and in conformance with details shown on the plans and these special provisions.

Temporary cover shall be one of the water pollution control practices for soil stabilization. The Storm Water Pollution Prevention Plan shall include the use of temporary cover.

MATERIALS

Temporary Cover Fabric

Temporary cover fabric shall be either a geotextile (engineering fabric) or a geomembrane (plastic sheeting) conforming to the following requirements:

A. Geotextile shall be a woven, slit film fabric which is also known as woven tape. The fabric shall be nonbiodegradable, resistant to deterioration by sunlight, and inert to most soil chemicals. Edges of the film fabric shall be selvage or serge to prevent unraveling. The film fabric shall also conform to the following requirements:

Specification	Requirements
Grab tensile strength (25-mm grip), kilonewtons, min. ASTM Designation: D4632*	0.89
Elongation at break, percent min. ASTM Designation: D4632*	15
Toughness, kilonewtons, min. (percent elongation x grab tensile strength)	13.3
Permittivity, 1/sec, max. (liters per minute per square meter) ASTM Designation: D 4491	0.08 (244)
Ultraviolet light stability, percent tensile strength retained after 500 hours, min. ASTM Designation: D 4355 (xenon arc lamp method)	70

* or appropriate test method for specific polymer

B. The geomembrane shall consist of 0.25-mm thick, single-ply material in conformance with the requirements in ASTM Designation: D 5199.

Temporary cover fabric shall be manufactured from polyethylene, polypropylene, or comparable polymers. The polymer materials may be virgin, recycled, or a combination of virgin and recycled materials. The polymer materials shall not contain biodegradable filler materials that can degrade the physical or chemical characteristics of the finished fabric. The Engineer may order tests to confirm the absence of biodegradable filler materials in conformance with the requirements in ASTM Designation: E 204 (Fourier Transformed Infrared Spectroscopy-FTIR).

Restrainers

Restrainers for securing the temporary cover fabric on slopes and stockpiles shall consist of one or a combination of the following:

A. Gravel-filled bags used as restrainers shall be knotted, roped, and placed at a maximum of 2 m apart on the temporary cover fabric as shown on the plans. Gravel-filled bags shall be between 13 kg and 22 kg in mass, between 600 mm and 800 mm in length, and between 400 mm and 500 mm in width. Gravel bag fabric shall be nonwoven polypropylene geotextile with a minimum unit weight of 270 g/m^2. The fabric shall have a minimum grab tensile strength (25-mm grip) of 0.89-kN in conformance with the requirements in ASTM Designation: D 4632, and an ultraviolet (UV) stability of 70 percent tensile strength retained after 500 hours in conformance with the requirements in ASTM Designation: D 4355, xenon arc lamp method. Gravel shall consist of noncohesive material between 10 mm and 20 mm in diameter, free of clay balls, organic matter, and other deleterious material. The openings of gravel-filled bags shall be secured to prevent escape of gravel.
B. Restrainers consisting of a steel anchor with a wooden lath shall be fabricated and placed as shown on the plans. Wooden lath shall conform to the provisions in Section 20-2.12, "Lumber," of the Standard Specifications and shall be fir or pine, 38 mm x 89 mm in size, and 2.4 m in length. The wooden lath shall be secured to the temporary cover with steel anchors placed 1.2 m apart along the lath.

The Contractor may use an alternative restrainer if approved by the Engineer in writing. The Contractor shall submit details for an alternative restrainer to the Engineer prior to installation. The alternative restrainer shall be installed and maintained in conformance with these special provisions.

INSTALLATION

Temporary cover shall be installed as follows:

A. Temporary cover fabric shall be placed and anchored as shown on the plans.
B. Abutting edges of the temporary cover fabric shall overlap a minimum of 600 mm. Nonabutting edges shall be embedded in the soil a minimum of 150 mm.
C. Restrainers shall be placed at the overlap area and along the toe of the slope. Restrainers outside the overlap areas shall be placed at a maximum spacing of 2.4 m.
D. Steel anchors shall be installed to allow the leg of the steel anchor to pierce through the temporary cover fabric into the slope with the crown section securing the wooden lath firmly against the slope.
E. Earthen berm, a linear sediment barrier, shall be constructed adjacent to the toe of the slope with a minimum height of 200 mm and a minimum width of 940 mm. The earthen berm shall be hand or mechanically compacted. Alternative linear sediment barrier may be used at the Contractor's expense if approved by the Engineer in writing.

If the Contractor removes the temporary cover in order to facilitate other work, the temporary cover shall be replaced and secured at the Contractor's expense.

When no longer required as determined by the Engineer, temporary cover shall become the property of the Contractor and be removed and disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Ground disturbances, including holes and depressions, caused by the installation and removal of the temporary cover shall be backfilled and repaired in conformance with the provisions in Section 15-1.02, "Preservation of Property," of the Standard Specifications.

MAINTENANCE

The Contractor shall maintain the temporary cover throughout the contract to prevent displacement or migration of the material on the slope or stockpiled.

Temporary cover shall be maintained to minimize exposure of the protected area. Restrainers shall be relocated and secured as needed to restrain the temporary cover fabric in place. Temporary cover that breaks free shall be immediately secured. Holes, tears, and voids in the temporary cover fabric shall be patched, repaired, or replaced. When patches or repairs are unacceptable as determined by the Engineer, the temporary cover shall be replaced.

Temporary cover shall be repaired or replaced on the same day when the damage occurs. Damage to the temporary cover resulting from the Contractor's vehicles, equipment, or operations shall be repaired at the Contractor's expense.

MEASUREMENT AND PAYMENT

The quantity of temporary cover to be paid for will be measured by the square meter for the actual area covered.

The contract price paid per square meter for temporary cover shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in installing temporary cover, complete in place, including trench excavation and backfill, maintenance, and removal of temporary cover, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.06 TEMPORARY CONCRETE WASHOUT FACILITY

Temporary concrete washout facilities shall be constructed, maintained, and later removed at the locations shown on the approved Storm Water Pollution Prevention Plan in conformance with "Water Pollution Control" of these special provisions, and in conformance with details shown on the plans and these special provisions.

Temporary concrete washout facilities shall be one of the water pollution control practices for waste management and materials pollution control. The Storm Water Pollution Prevention Plan shall include the use of temporary concrete washout facilities.

MATERIALS

Plastic Liner

Plastic liners shall be single ply, new polyethylene sheeting, a minimum of 0.25-mm thick and shall be free of holes, punctures, tears or other defects that compromise the impermeability of the material. Plastic liners shall not have seams or overlapping joints.

Gravel-filled Bags

Gravel bag fabric shall be nonwoven polypropylene geotextile (or comparable polymer) and shall conform to the following requirements:

Specification	Requirements
Mass per unit area, grams per square meter, min. ASTM Designation: D 5261	270
Grab tensile strength (25-mm grip), kilonewtons, min. ASTM Designation: D4632*	0.89
Ultraviolet stability, percent tensile strength retained after 500 hours, ASTM Designation: D4355, xenon arc lamp method	70

* or appropriate test method for specific polymer

Gravel bags shall be between 600 mm and 800 mm in length, and between 400 mm and 500 mm in width.

Yarn used for binding gravel bags shall be as recommended by the manufacturer or bag supplier and shall be of a contrasting color.

Gravel shall be between 10 mm and 20 mm in diameter, and shall be clean and free from clay balls, organic matter, and other deleterious materials.

The opening of gravel-filled bags shall be secured to prevent gravel from escaping. Gravel-filled bags shall be between 13 kg and 22 kg in mass.

Straw Bales

Straw for straw bales shall conform to the provisions in Section 20-2.06, "Straw," of the Standard Specifications.

Straw bales shall be a minimum of 360 mm in width, 450 mm in height, 900 mm in length and shall have a minimum mass of 23 kg. The straw bale shall be composed entirely of vegetative matter, except for binding material.

Straw bales shall be bound by either wire, nylon or polypropylene string. Jute or cotton binding shall not be used. Baling wire shall be a minimum 1.57 mm in diameter. Nylon or polypropylene string shall be approximately 2 mm in diameter with 360 N of breaking strength.

Stakes

Stakes shall be wood or metal. Wood stakes shall be untreated fir, redwood, cedar, or pine and cut from sound timber. They shall be straight and free of loose or unsound knots or other defects which would render them unfit for the purpose intended. Wood stakes shall be a minimum 50 mm x 50 mm in size. Metal stakes may be used as an alternative, and shall be a minimum 13 mm in diameter. Stakes shall be a minimum 1.2 m in length. The tops of the metal stakes shall be bent at a 90-degree angle or capped with an orange or red plastic safety cap that fits snugly to the metal stake. The Contractor shall submit a sample of the metal stake and plastic cap, if used, for the Engineer's approval prior to installation.

Staples

Staples shall be as shown on the plans. An alternative attachment device such as geotextile pins or plastic pegs may be used instead of staples. The Contractor shall submit a sample of the alternative attachment device for the Engineer's approval prior to installation.

Signs

Wood posts for signs shall conform to the provisions in Section 56-2.02B, "Wood Posts," of the Standard Specifications. Lag screws shall conform to the provisions in Section 56-2.02D, "Sign Panel Fastening Hardware," of the Standard Specifications.

Plywood shall be freshly painted for each installation with not less than 2 applications of flat white paint. Sign letters shown on the plans shall be stenciled with commercial quality exterior black paint. Testing of paint will not be required.

INSTALLATION

Temporary concrete washout facilities shall be as follows:

A. Temporary concrete washout facilities shall be installed prior to beginning placement of concrete and located a minimum of 15 m from storm drain inlets, open drainage facilities, and water courses unless determined infeasible by the Engineer. Temporary concrete washout facilities shall be located away from construction traffic or access areas at a location determined by the Contractor and approved by the Engineer.

B. A sign shall be installed adjacent to each washout facility at a location determined by the Contractor and approved by the Engineer. Signs shall be installed in conformance with the provisions in Section 56-2.03, "Construction," and Section 56-2.04, "Sign Panel Installation," of the Standard Specifications.

C. The length and width of a temporary concrete washout facility may be increased from the minimum dimensions shown on the plans, at the Contractor's expense and upon approval of the Engineer.

D. Temporary concrete washout facilities shall be constructed in sufficient quantity and size to contain liquid and concrete waste generated by washout operations for concrete wastes. These facilities shall be constructed to contain liquid and concrete waste without seepage, spills, or overflow.
E. Berms for below grade temporary concrete washout facilities shall be constructed from compacted native material. Gravel may be used in conjunction with compacted native material.
F. A plastic liner shall be installed in below grade temporary concrete washout facilities.

Details for an alternative temporary concrete washout facility shall be submitted to the Engineer for approval at least 7 days prior to installation.

When temporary concrete washout facilities are no longer required for the work, as determined by the Engineer, the hardened concrete and liquid residue shall be removed and disposed of in conformance with the provisions in Section 15-3.02, "Removal Methods," of the Standard Specifications. Temporary concrete washout facilities shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Ground disturbance, including holes and depressions, caused by the installation and removal of the temporary concrete washout facilities shall be backfilled and repaired in conformance with the provisions in Section 15-1.02, "Preservation of Property," of the Standard Specifications.

MAINTENANCE

Temporary concrete washout facilities shall be maintained to provide adequate holding capacity with a minimum freeboard of 300 mm. Maintaining temporary concrete washout facilities shall include removing and disposing of hardened concrete and returning the facilities to a functional condition. Hardened concrete materials shall be removed and disposed of in conformance with the provisions in Section 15-3.02, "Removal Methods," of the Standard Specifications. Holes, rips, and voids in the plastic liner shall be patched and repaired by taping or the plastic liner shall be replaced. The plastic liner shall be replaced when patches or repairs compromise the impermeability of the material as determined by the Engineer.

Gravel bags shall be replaced when the bag material is ruptured or when the yarn has failed, allowing the bag contents to spill out.

Temporary concrete washout facilities shall be repaired or replaced on the same day the damage occurs. Damage to temporary concrete washout facilities resulting from the Contractor's vehicles, equipment, or operations shall be repaired at the Contractor's expense.

MEASUREMENT AND PAYMENT

Quantities of temporary concrete washout facilities will be measured as units determined from actual count in place.

The contract unit price paid for temporary concrete washout facility shall include full compensation for furnishing all labor, materials, tools, equipment and incidentals, and for doing all the work involved in constructing a temporary concrete washout facility, complete in place, including excavation and backfill, maintenance, and removal, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.07 TEMPORARY SILT FENCE

Temporary silt fence shall be furnished, installed, maintained, and later removed at the locations shown on the approved Storm Water Pollution Prevention Plan in conformance with "Water Pollution Control" of these special provisions, and in conformance with details shown on the plans and these special provisions.

Temporary silt fence shall be one of the water pollution control practices for sediment control. The Storm Water Pollution Prevention Plan shall include the use of temporary silt fence.

MATERIALS

At the Contractor's option, temporary silt fence shall be prefabricated or constructed with silt fence fabric, posts, and fasteners.

Silt Fence Fabric

Silt fence fabric shall be geotextile manufactured from woven polypropylene or polymer material. Silt fence fabric may be virgin, recycled, or a combination of virgin and recycled polymer materials. No virgin or recycled polymer materials shall contain biodegradable filler materials that can degrade the physical or chemical characteristics of the finished fabric. The Engineer may order tests to confirm the absence of biodegradable filler materials in conformance to the requirements in ASTM Designation: E 204 (Fourier Transformed Infrared Spectroscopy-FTIR).

Silt fence fabric shall conform to the following requirements:

Specification	Requirements
Width, mm, min.	900
Grab tensile strength (25-mm grip), kilonewtons, min. in each direction ASTM Designation: D 4632*	0.55
Elongation, percent minimum in each direction ASTM Designation: D 4632*	15
Permittivity, 1/sec., min. ASTM Designation: D 4491	0.05
Flow rate, liters per minute per square meter, min. ASTM Designation: D 4491	400
Ultraviolet stability, percent tensile strength retained after 500 hours, min. ASTM Designation: D 4355 (xenon-arc lamp and water spray weathering method)	70

* or appropriate test method for specific polymer

Posts

Posts for temporary silt fence shall be one of the following:

A. Untreated fir or pine, a minimum of 34 mm x 40 mm in size, and 1.2 m in length. One end of the post shall be pointed.
B. Steel and have a "U," "T," "L," or other cross sectional shape that can resist failure from lateral loads. The steel posts shall have a minimum mass per length of 1.1 kg/m and a minimum length of 1.2 m. One end of the steel posts shall be pointed and the other end shall be capped with an orange or red plastic safety cap which fits snugly to the steel post. The Contractor shall submit to the Engineer for approval a sample of the capped steel post prior to installation.

Fasteners

Fasteners for attaching silt fence fabric to posts shall be as follows:

A. When prefabricated silt fence is used, posts shall be inserted into sewn pockets.
B. Silt fence fabric shall be attached to wooden posts with nails or staples as shown on the plans or as recommended by the manufacturer or supplier. Tie wire or locking plastic fasteners shall be used to fasten the silt fence fabric to steel posts. Maximum spacing of fasteners shall be 200 mm along the length of the steel post.

INSTALLATION

Temporary silt fence shall be installed parallel with the slope contour in reaches not to exceed 150 m. A reach is considered a continuous run of temporary silt fence from end to end or from an end to an opening, including joined panels. Each reach shall be constructed so that the elevation at the base of the fence does not deviate from the contour more than 1/3 of the fence height.

The silt fence fabric shall be installed on the side of the posts facing the slope. The silt fence fabric shall be anchored in a trench as shown on the plans. The trench shall be backfilled and mechanically or hand tamped to secure the silt fence fabric in the bottom of the trench.

Mechanically pushing 300 mm of the silt fence fabric vertically through the soil may be allowed if the Contractor can demonstrate to the Engineer that the silt fence fabric will not be damaged and will not slip out of the soil resulting in sediment passing under the silt fence fabric.

At the option of the Contractor, the maximum post spacing may increase to 3 m if the fence is reinforced by a wire or plastic material by prefabrication or by field installation. The field-assembled reinforced temporary silt fence shall be able to retain saturated sediment without collapsing.

Temporary silt fence shall be joined as shown on the plans. The tops of the posts shall be tied together by minimum of 2 wraps of tie wire of a minimum 1.5 mm diameter. The silt fence fabric shall be attached to the posts at the joint as specified in these special provisions.

When no longer required as determined by the Engineer, temporary silt fence shall be removed and disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications. Trimming the silt fence fabric and leaving it in place will not be allowed.

Ground disturbance, including holes and depressions, caused by the installation and removal of the temporary silt fence shall be backfilled and repaired in conformance with the provisions in Section 15-1.02, "Preservation of Property," of the Standard Specifications.

MAINTENANCE

Temporary silt fence shall be maintained to provide a sediment holding capacity of approximately 1/3 the height of the silt fence fabric above ground. When sediment exceeds this height or when directed by the Engineer, sediment shall be removed. The removed sediment shall be deposited within the project limits so that the sediment is not subject to erosion by wind or by water.

Temporary silt fence shall be repaired or replaced the same day the damage occurs. Damage to the temporary silt fence resulting from the Contractor's vehicles, equipment, or operations shall be repaired at the Contractor's expense.

MEASUREMENT AND PAYMENT

Quantities of temporary silt fence to be paid for will be determined by the meter, measured parallel with the ground slope along the line of the installed temporary silt fence, deducting the widths of openings.

The contract price paid per meter for temporary silt fence shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in installing temporary silt fence, complete in place, including trench excavation and backfill, maintenance, and removal, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.08 TEMPORARY CONSTRUCTION ENTRANCE

Temporary construction entrances shall be constructed, maintained, and later removed at the locations shown on the approved Storm Water Pollution Prevention Plan in conformance with "Water Pollution Control" of these special provisions, and in conformance with details shown on the plans and these special provisions.

Temporary construction entrances shall be one of the water pollution control practices for tracking control. The Storm Water Pollution Prevention Plan shall include the use of temporary construction entrances.

At the option of the Contractor, temporary construction entrances shall be Type 1 or Type 2.

MATERIALS

Temporary Entrance Fabric

Temporary entrance fabric shall be manufactured from polyester, nylon, or polypropylene material, or any combination thereof. Temporary entrance fabric shall be a nonwoven, needle-punched fabric, free of needles which may have broken off during the manufacturing process. Temporary entrance fabric shall be permeable and shall not act as a wicking agent.

Temporary entrance fabric shall be manufactured from virgin, recycled, or a combination of virgin and recycled polymer materials. No virgin or recycled materials shall contain biodegradable filler materials that can degrade the physical or chemical characteristics of the finished fabric. The Engineer may order tests to confirm the absence of biodegradable filler materials in conformance to the requirements in ASTM Designation: E 204 (Fourier Transformed Infrared Spectroscopy-FTIR).

Temporary entrance fabric shall conform to the following requirements:

Specification	Requirements
Mass per unit area, grams per square meter, min. ASTM Designation: D 5261	235
Grab tensile strength (25-mm grip), kilonewtons, min. ASTM Designation: D4632*	0.89
Elongation at break, percent min. ASTM Designation: D4632*	50
Toughness, kilonewtons, min. (percent elongation x grab tensile strength)	53

* or appropriate test method for specific polymer

Rocks

Rocks shall conform to the material quality requirements in Section 72-2.02, "Materials," of the Standard Specifications for shape and for apparent specific gravity, absorption, and durability index. Rocks used for the temporary entrance shall conform to the following sizes:

Square Screen Size (mm)	Percentage Passing	Percentage Retained
150	100	0
75	0	100

Corrugated Steel Panels

Corrugated steel panels shall be prefabricated and shall be pressed or shop welded, with a slot or hooked section to facilitate coupling at the ends of the panels.

INSTALLATION

Temporary construction entrances shall be installed as follows:

A. Prior to placing the temporary entrance fabric, the areas shall be cleared of all trash and debris. Vegetation shall be removed to the ground level. Trash, debris, and removed vegetation shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.
B. A sump shall be constructed within 6 m of each temporary construction entrance as shown on the plans.
C. Before placing the temporary entrance fabric, the ground shall be graded to a uniform plane. The relative compaction of the top 0.5-m shall be not less than 90 percent. The ground surface shall be free of sharp objects that may damage the temporary entrance fabric, and shall be graded to drain to the sump as shown on the plans.
D. Temporary entrance fabric shall be positioned longitudinally along the alignment of the entrance, as directed by the Engineer.
E. The adjacent ends of the fabric shall be overlapped a minimum length of 300 mm.
F. Rocks to be placed directly over the fabric shall be spread in the direction of traffic, longitudinally and along the alignment of the temporary construction entrance.
G. During spreading of the rocks, vehicles or equipment shall not be driven directly on the fabric. A layer of rocks a minimum 150 mm thick shall be placed between the fabric and the spreading equipment to prevent damage to the fabric.
H. For Type 2 temporary construction entrances, a minimum of 6 coupled panel sections shall be installed for each temporary construction entrance. Prior to installing the panels, the ground surface shall be cleared of all debris to ensure uniform contact with the ground surface.

Fabric damaged during rock placement shall be repaired by placing a new piece of fabric over the damaged area. The piece of fabric shall be large enough to cover the damaged area and provide a minimum 450-mm overlap on all edges.

Details for a proposed alternative temporary construction entrance or alternative sump shall be submitted to the Engineer for approval at least 7 days prior to installation. The Contractor may eliminate the sump if approved in writing by the Engineer.

If buildup of soil and sediment deter the function of the temporary construction entrance, the Contractor shall immediately remove and dispose of the soil and sediment, and install additional corrugated steel panels and spread additional rocks to increase the capacity of the temporary construction entrance at the Contractor's expense.

When no longer required as determined by the Engineer, temporary construction entrances shall be removed and disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Ground disturbance, including holes and depressions, caused by the installation and removal of the temporary construction entrance, including the sumps, shall be backfilled and repaired in conformance with the provisions in Section 15-1.02, "Preservation of Property," of the Standard Specifications.

While the temporary construction entrance is in use, pavement shall be cleaned and sediment removed at least once a day, and as often as necessary when directed by the Engineer. Soil and sediment or other extraneous material tracked onto existing pavement shall not be allowed to enter drainage facilities.

MAINTENANCE

The Contractor shall maintain temporary construction entrances throughout the contract or until removed. The Contractor shall prevent displacement or migration of the rock surfacing or corrugated steel panels. Significant depressions resulting from settlement or heavy equipment shall be repaired by the Contractor, as directed by the Engineer.

Temporary construction entrances shall be maintained to minimize tracking of soil and sediment onto existing public roads.

Temporary construction entrances shall be repaired or replaced on the same day the damage occurs. Damage to the temporary construction entrance resulting from the Contractor's vehicles, equipment, or operations shall be repaired at the Contractor's expense.

MEASUREMENT AND PAYMENT

Quantities of temporary construction entrances will be determined from actual count in place.

The contract unit price paid for temporary construction entrance shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in constructing temporary construction entrance, complete in place, including excavation and backfill, maintenance, and removal, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

The cost of maintaining the temporary construction entrance will be borne equally by the State and the Contractor. The division of cost will be made be determining the cost of maintaining temporary construction entrance in conformance with the provisions in Section 9-1.03, "Force Account Payment," of the Standard Specifications and paying to the Contractor one-half of that cost.

Cleanup, repair, removal, disposal, or replacement due to improper installation or the Contractor's negligence will not be considered as included in the cost for performing maintenance.

10-1.09 EROSION CONTROL (NETTING)

Erosion control (netting) shall conform with the details as shown on the plans, as specified in these special provisions, and as directed by the Engineer.

Erosion control (netting) work shall consist of furnishing, installing, and maintaining control netting in ditches or swales, on embankment slopes, excavation slopes and other locations as shown on the plans.

Following the installation of erosion control (netting), erosion control materials shall be applied onto the netting face as specified in "Erosion Control (Type D)," of these special provisions.

MATERIALS

Materials for the erosion control (netting) shall conform to the provisions in Section 20-2, "Materials," of the Standard Specifications and these special provisions.

Erosion Control Netting

Erosion control netting shall consist of 100 percent spun coir fiber and shall conform to the following:

Specification	Requirement
Weight, grams per square meter ASTM Designation: D 3776	400
Minimum Tensile Strength, kilonewtons, ASTM Designation: D 4595-86	9.0 to 11.3 kN/m in longitudinal direction (dry) 5.0 to 10.7 kN/m in cross-direction (dry) 6.0 to 9.8 kN/m in longitudinal direction (wet) 4.0 to 9.4 kN/m in cross- direction (wet)
Roll Width, meters, min.	4
Area/Roll, square meters, min.	200
Open Area, percent	63-70

Staples

Staples shall be as shown on the plans.

INSTALLATION

Erosion control (netting) shall be installed in ditches or swales, on embankment slopes, or excavation slopes as follows:

A. Erosion control (netting) strips shall be placed loosely along the ditch or swale with the longitudinal edges and joints parallel to the centerline of the ditch or swale. Longitudinal joints of netting shall be overlapped and stapled. Transverse joints of netting shall be secured in intermediate joint trenches. Staples shall be driven perpendicular to the slopes. Ends of the netting shall be secured in place in key trenches.

B. Erosion control (netting) strips shall be placed loosely on the embankment or excavation slope with the longitudinal joints perpendicular to the slope contour lines. Longitudinal and transverse joints of netting shall be overlapped and stapled. Staples shall be driven perpendicular to the slopes. Ends of the netting shall be secured in place in key trenches.

MAINTENANCE

Erosion control (netting) shall be repaired or replaced on the same day the damage occurs. Damaged netting shall be replaced. Washouts between joints or beneath the erosion control (netting) shall be repaired.

Erosion control (netting) damaged during the progress of work or resulting from the Contractor's vehicles, equipment, or operations shall be repaired or replaced at the expense of the Contractor.

MEASUREMENT AND PAYMENT

The quantity of erosion control (netting) will be measured by the square meter as determined from actual slope measurements of the areas covered by the erosion control (netting) excluding overlaps.

The contract price paid per square meter for erosion control (netting) shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in installing erosion control (netting), complete in place, including trench excavation and backfill, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.10 OBSTRUCTIONS

Attention is directed to Section 8-1.10, "Utility and Non-Highway Facilities," and Section 15, "Existing Highway Facilities," and Section 51-1.19, "Utility Facilities," of the Standard Specifications and these special provisions.

Attention is directed to the existence of certain underground facilities that may require special precautions be taken by the Contractor to protect the health, safety and welfare of workers and of the public. Facilities requiring special precautions include, but are not limited to: conductors of petroleum products, oxygen, chlorine, and toxic or flammable gases; natural gas in pipelines greater than 150 mm in diameter or pipelines operating at pressures greater than 415 kPa (gage); underground electric supply system conductors or cables, with potential to ground of more than 300 V, either directly buried or in a duct or conduit which do not have concentric grounded or other effectively grounded metal shields or sheaths.

The Contractor shall notify the Engineer and the appropriate regional notification center for operators of subsurface installations at least 2 working days, but not more than 14 calendar days, prior to performing any excavation or other work close to any underground pipeline, conduit, duct, wire or other structure. Regional notification centers include, but are not limited to, the following:

Notification Center	Telephone Number
Underground Service Alert-Northern California (USA)	1-800-642-2444 1-800-227-2600
Underground Service Alert-Southern California (USA)	1-800-422-4133 1-800-227-2600

The following utility facilities will be relocated during the progress of the contract. The Contractor shall notify the Engineer, in writing, prior to doing work in the vicinity of the facility. The utility facility will be relocated within the listed working days, as defined in Section 8-1.06, "Time of Completion," of the Standard Specifications, after the notification is received by the Engineer:

Utility	Location	Working Days
TV Cable (Comcast)	East of Bent W6	15

The Contractor shall notify the Engineer and Comcast at (415) 503-4505, at least 48 hours before excavation and piling work is begun.

Installation of the water mains will require coordination with the Contractor's operations. The Contractor shall make the necessary arrangements with the San Francisco Public Utilities Commission/Water Department (SFWD), through the Engineer, and shall submit a schedule of work, verified by a representative of the utility company, to the Engineer. The schedule of work shall provide not less than the following number of working days, as defined in Section 8-1.06, "Time of Completion," of the Standard Specifications for the utility company to complete their work:

Utility (address)	Work Performed by the SFWD	Working Days
Water Main	Making a connection to an existing main	5
	Chlorination test including laboratory results	5
	Service change over services larger than 50-mm (per each service)	5
	Service change over services less than 50 mm (for up to 6 services)	1
	Excavation Safety Plans review	15

The Contractor shall notify in writing the Engineer and SFWD, at least 15 working days in advance before any work to be performed by SFWD forces for disconnecting, and connecting of the water main, and disinfection. Furthermore, the Contractor shall confirm the scheduled work with the Engineer, and SFWD at (415)550-4956, at least 3 working days before the actual field work by SFWD.

The existing ground seismographic station, and sanitary sewer lift pump station, including pump station, underground vault and sanitary main system, will remain in service for the duration of this contract. The Contractor shall notify the Engineer and City and County of San Francisco Public Utilities Commission at (415) 648-6882 x 1290, and the Berkeley Seismology Specialist at (510) 486-7314 or 882-9816, at least 10 working days before excavation and piling work is begun. The Contractor shall field verify the location of the cable and ensure that the monitoring cable shall not damaged.

The existing electrical concrete duct bank (2.4 kV, 4.1 kV, and 12 kV) shown on the plans, will remain in service for the duration of this contract. The Contractor shall notify the Engineer and City and County of San Francisco Public Utilities Commission at (415) 648-6882 x 1290, at least 10 working days before excavation and piling work is begun. The electrical line shall be physically located in the presence of the authorized representative from the City and County of San Francisco Public Utilities Commission. The Contractor shall not perform any excavation of piling close to the electrical line without the utility owner.

Full compensation for protecting the existing ground seismographic station and monitoring cable, and sanitary sewer lift pump station, including pump station, underground vault and sanitary

main system, and electrical concrete duct bank (2.4 kV, 4.1 kV, and 12 kV) shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no separate payment will be made therefor.

In the event that the utility facilities mentioned above are not removed or relocated by the date specified and, if in the opinion of the Engineer, the Contractor's operations are delayed or interfered with by reason of the utility facilities not being removed or relocated by the date specified, the State will compensate the Contractor for the delays to the extent provided in Section 8-1.09, "Right of Way Delays," of the Standard Specifications, and not otherwise, except as provided in Section 8-1.10, "Utility and Non-Highway Facilities," of the Standard Specifications.

10-1.11 DUST CONTROL

Dust control shall conform to the provisions in Section 10, "Dust Control," of the Standard Specifications .

10-1.12 CONSTRUCTION AREA SIGNS

Construction area signs for temporary traffic control shall be furnished, installed, maintained, and removed when no longer required in conformance with the provisions in Section 12, "Construction Area Traffic Control Devices," of the Standard Specifications and these special provisions.

Attention is directed to "Furnish Sign" of these special provisions.

Attention is directed to the provisions in "Prequalified and Tested Signing and Delineation Materials" of these special provisions. Type II retroreflective sheeting shall not be used on construction area sign panels. Type III, IV, VII, VIII, or IX retroreflective sheeting shall be used for stationary mounted construction area sign panels.

Unless otherwise shown on the plans or specified in these special provisions, the color of construction area warning and guide signs shall have black legend and border on orange background, except W10-1 or W47(CA) (Highway-Rail Grade Crossing Advance Warning) sign shall have black legend and border on yellow background.

Orange background on construction area signs shall be fluorescent orange.

Repair to construction area sign panels will not be allowed, except when approved by the Engineer. At nighttime under vehicular headlight illumination, sign panels that exhibit irregular luminance, shadowing or dark blotches shall be immediately replaced at the Contractor's expense.

The Contractor shall notify the appropriate regional notification center for operators of subsurface installations at least 2 working days, but not more than 14 calendar days, prior to commencing excavation for construction area sign posts. The regional notification centers include, but are not limited to, the following:

Notification Center	Telephone Number
Underground Service Alert-Northern California (USA)	(800) 642-2444 (800) 227-2600
Underground Service Alert-Southern California (USA)	(800) 422-4133

Excavations required to install construction area signs shall be performed by hand methods without the use of power equipment, except that power equipment may be used if it is determined there are no utility facilities in the area of the proposed post holes. The post hole diameter, if

backfilled with portland cement concrete, shall be at least 100 mm greater than the longer dimension of the post cross-section.

Construction area signs placed within 4.6 m from the edge of the travel way shall be mounted on stationary mounted sign supports as specified in "Construction Area Traffic Control Devices" of these special provisions.

The Contractor shall maintain accurate information on construction area signs. Signs that are no longer required shall be immediately covered or removed. Signs that convey inaccurate information shall be immediately replaced or the information shall be corrected. Covers shall be replaced when they no longer cover the signs properly. The Contractor shall immediately restore to the original position and location any sign that is displaced or overturned, from any cause, during the progress of work.

10-1.13 MAINTAINING TRAFFIC

Attention is directed to Sections 7-1.08, "Public Convenience," 7-1.09, "Public Safety," and 12, "Construction Area Traffic Control Devices," of the Standard Specifications and to the provisions in "Public Safety" of these special provisions and these special provisions. Nothing in these special provisions shall be construed as relieving the Contractor from the responsibilities specified in Section 7-1.09.

Lane closures shall conform to the provisions in section "Traffic Control System for Lane Closure," of these special provisions.

Personal vehicles of the Contractor's employees shall not be parked on the traveled way or shoulders including any section closed to public traffic, except in the area proposed by the Contractor and approved by the Engineer .

The Contractor shall notify United States of Coast Guard Officer, at (415) 399-3504 of the Contractor's intent to begin work at least 5 working days before work is begun. The Contractor shall cooperate with United States of Coast Guard relative to handling traffic on USCG Road., through the area and shall make arrangements relative to keeping the working area clear of parked vehicles.

The Contractor shall provide and maintain a minimum of one paved traffic lane, not less than 3.6 m wide on USCG Road, during the construction of the electrical duct bank and drainage system across the USCG Road, and bridge bent adjacent to the USCG Road.

The Contractor shall provide and maintain a 3.6 m lane access road to Sanitary Sewer Lift Pump Station, at all time. The Contractor shall submit a written request for an approval from San Francisco Public Utilities Commission through the Engineer at least 96 hours in advance for any construction operation that may block the access road to the sanitary sewer lift pump station.

Full compensation for providing and maintaining the above access shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements involved and no additional compensation will be allowed therefor.

Attention is directed to "Bridge Tolls" of these special specifications. The access of the contractor's trucks hauling materials to the project site, from westbound Route 80 and westbound bus lanes, located along north side of San Francisco-Oakland Bay Bridge toll plaza, shall not be allowed, during the peak periods from 5:00 a.m. to 10:00 a.m., and 3:00 p.m. to 7:00 p.m., on weekdays.

Designated legal holidays are: January 1st, the third Monday in February, the last Monday in May, July 4th, the first Monday in September, November 11th, Thanksgiving Day, and December 25th. When a designated legal holiday falls on a Sunday, the following Monday shall be a

designated legal holiday. When November 11th falls on a Saturday, the preceding Friday shall be a designated legal holiday.

Minor deviations from the requirements of this section concerning hours of work which do not significantly change the cost of the work may be permitted upon the written request of the Contractor if, in the opinion of the Engineer, public traffic will be better served and the work expedited. These deviations shall not be adopted by the Contractor until the Engineer has approved the deviations in writing. Other modifications will be made by contract change order.

10-1.14 TRAFFIC CONTROL SYSTEM FOR LANE CLOSURE

A traffic control system shall consist of closing traffic lanes in conformance with the details shown on the plans, the provisions in Section 12, "Construction Area Traffic Control Devices," of the Standard Specifications, the provisions under "Maintaining Traffic" and "Construction Area Signs" of these special provisions, and these special provisions.

The provisions in this section will not relieve the Contractor from the responsibility to provide additional devices or take measures as may be necessary to comply with the provisions in Section 7-1.09, "Public Safety," of the Standard Specifications.

If components in the traffic control system are displaced or cease to operate or function as specified, from any cause, during the progress of the work, the Contractor shall immediately repair the components to the original condition or replace the components and shall restore the components to the original location.

When lane closures are made for work periods only, at the end of each work period, components of the traffic control system, except portable delineators placed along open trenches or excavation adjacent to the traveled way, shall be removed from the traveled way and shoulder. If the Contractor so elects, the components may be stored at selected central locations designated by the Engineer within the limits of the highway right of way.

One-way traffic shall be controlled on USCG Road., during the construction of the electrical duct bank and drainage system across the USCG Road, and bridge bent adjacent to the USCG Road, in conformance with the plan entitled "Traffic Control System for Lane Closure on Two Lane Conventional Highways" and these special provisions.

Additional advance flaggers will be required.

Utilizing a pilot car will be at the option of the Contractor. If the Contractor elects to use a pilot car, the cones shown along the centerline on the plan need not be placed. The pilot car shall have radio contact with personnel in the work area. The maximum speed of the pilot car through the traffic control zone shall be 40 kilometers per hour (25 mph).

The contract lump sum price paid for traffic control system shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, for furnishing all labor (except for flagging costs), materials (including signs), tools, equipment, and incidentals, and for doing all the work involved in placing, removing, storing, maintaining, moving to new locations, replacing, and disposing of the components of the traffic control system and for furnishing and operating the pilot car, (including driver, radios, other equipment, and labor required), as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer. Flagging costs will be paid for as provided in Section 12-2.02, "Flagging Costs," of the Standard Specifications.

The adjustment provisions in Section 4-1.03, "Changes," of the Standard Specifications shall not apply to the item of traffic control system. Adjustments in compensation for traffic control system will be made only for increased or decreased traffic control system required by changes ordered by

the Engineer and will be made on the basis of the cost of the increased or decreased traffic control necessary. The adjustment will be made on a force account basis as provided in Section 9-1.03, "Force Account Payment," of the Standard Specifications for increased work and estimated on the same basis in the case of decreased work.

Traffic control system required by work which is classed as extra work, as provided in Section 4-1.03D of the Standard Specifications, will be paid for as a part of the extra work.

10-1.15 EXISTING HIGHWAY FACILITIES

The work performed in connection with various existing highway facilities shall conform to the provisions in Section 15, "Existing Highway Facilities," of the Standard Specifications and these special provisions.

ABANDON PIPE LINE

Existing water mains, and sewers, where shown on the plans to be abandoned, shall be abandoned in place or, at the option of the Contractor, the water mains, and sewers shall be removed and disposed of. Resulting openings into existing structures that are to remain in place shall be plugged with commercial quality concrete containing not less than 300 kg of cement per cubic meter.

Abandoning water mains, and sewers in place shall conform to the following:

A. Water mains, and sewers that intersect the side slopes shall be removed to a depth of not less than one meter measured normal to the plane of the finished side slope, before being abandoned.
B. Water mains, and sewers 300 mm in diameter and larger, shall, at the Contractor's option, be backfilled with either sand, controlled low strength material or slurry cement backfill conforming to the provisions in Section 19-3.062, "Slurry Cement Backfill," of the Standard Specifications by any method acceptable to the Engineer that completely fills the pipe. Sand backfill material shall be clean, free draining, and free from roots and other deleterious substances.
C. The ends of water mains, and sewers shall be securely closed by a 150 mm thick tight fitting plug or wall of commercial quality concrete.

Water mains, and sewers shall not be abandoned until their use is no longer required. The Contractor shall notify the Engineer in advance of any intended culvert or pipeline abandonment.

Full compensation for concrete plugs, pipe removal, structure excavation, and backfill (including sand, controlled low strength material or slurry cement backfill) shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

REMOVE FIRE HYDRANT

Existing fire hydrants, at locations shown on the plans to be removed, shall be removed. Holes at the existing locations shall be backfilled and graded to conform to adjacent conditions where necessary.

The contract unit price paid for remove fire hydrant shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved

in remove fire hydrant, complete, including removal, transportation and disposal of fire hydrant, related pipes, fittings, valves and accessories, and backfilling and grading the area to match existing conditions and to drain, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

RELOCATE FIRE HYDRANT

Existing fire hydrants, at locations shown on the plans to be relocated, shall be relocated. Holes at the existing locations shall be backfilled and graded to conform to adjacent conditions where necessary.

The contract unit price paid for relocate fire hydrant shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in remove fire hydrant, complete, including removal, transportation and disposal of fire hydrant, related pipes, fittings, valves and accessories, and backfilling and grading the area to match existing conditions and to drain, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

REMOVE ABADON UTILITY AND NON-HIGHWAY FACILITIES

Attention is directed to Section 8-1.10, "Utility and Non-Highway Facilities," and Section 15, "Existing Highway Facilities," and Section 51-1.19, "Utility Facilities," of the Standard Specifications and these special provisions, and "Obstructions," of the special provisions.

Existing abandon utilities and non-highway facilities to be removed as shown on the plans within the limits of structure excavation for the bridge footings, and electrical duct bank as shown on the plan, shall be removed and disposed of, except for the removal and relocation of the fire hydrants.

Full compensation for removing abandon utilities and non-highway facilities within the limits of structure excavation for the bridge footings, and electrical duct bank, shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

Removed existing abandon utilities and non-highway facilities shall be disposed of outside the highway right of way in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

REMOVE TRAFFIC STRIPE ANDPAVEMENT MARKER

Existing traffic stripe and pavement markers, including under lying adhesive, shall be removed at the locations where the electrical duct bank is to be constructed across USCG Road, as shown on the plans and as directed by the Engineer.

Attention is directed to "Water Pollution Control" of these special provisions.

Full compensation for removing traffic stripe, and removing and disposing of pavement markers and underlying adhesive shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

REMOVE DRAINAGE FACILITY

Existing culvert, and Inlet where shown on the plans to be removed, shall be completely removed and disposed of.

Full compensation for salvaging existing frames and grates shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

REPLACE EXISTING PAVEMENT DELINEATION

Whenever existing pavement delineation is removed, or damaged due to the work involved in installing the electrical duct bank crossing the USCG Road at locations shown on the plans, the Contractor shall replace the pavement delineation in kind to match the existing pavement delineation. Replacement delineation shall be installed at existing or new locations, shall conform to the design of the existing delineation and shall be equal in all respects to the best portions of the existing delineation. The work of replacing existing delineation shall be performed in conformance with the requirements for new work of similar character as specified in the specifications.

Full compensation for replacing or repairing pavement delineation shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no separate payment will be made therefor.

10-1.16 SEWER VIDEO SURVEY

This work shall consist of investigating, sewer cleaning as necessary to facilitate the survey, documenting, and reporting on the structural condition of the existing sewer lines both before and after seismic retrofit construction from manhole to manhole at the following locations:

SEWER VIDEO SURVEY LOCATIONS

No.	Location	Sewer Pipe Size
1	West of Bent W4	300-mm VCP
2	West of Bent W4	150-mm VCP
3	North of Bent W3	200-mm VCP

The Contractor shall videotape with narration the condition of the sewer to show any and all structural deficiencies including cracks, holes, exposed aggregates and reinforcing bars, honey combed areas, damaged construction joints, deteriorated concrete surfaces, infiltrations, root intrusions and missing pieces. The locations of all deficiencies shall be shown by stationing with reference points agreed upon by the Contractor and the Engineer. The Contractor shall provide the dimensions of all major structural deficiencies and provide supplemental photographs of such deficiencies when requested by the City and County of San Francisco, Bureau of Engineering.

For all the sewer locations as listed above and for all other sewer locations subjected to live loads exceeding AASHTO Standard HS-20, the Contractor shall investigate, document and report the sewer conditions before commencement and after final completion of the project.

At least 10 working days prior to investigation, the Contractor shall submit for acceptance 5 copies of the proposed operations and safety procedure to the Engineer.

The Engineer will either accept or reject such procedures within 5 working days of receipt. Approval of the procedures will be contingent on them being satisfactory to the City and County of San Francisco. Such procedures must comply with the Safety Procedures Section of this special provision.

The Contractor shall call the general foreman of the City and County of San Francisco Bureau of Street and Sewer Repair two days in advance at (415) 695-2095 for coordination and to gain access to the sewer.

The Contractor shall cooperate with local authorities relative to handling traffic through the area and shall make his own arrangements relative to keeping the working area clear of parked vehicles.

The Contractor shall prepare for the Engineer's approval, a written report documenting the results of its investigation. Approval of the report will be contingent on it being satisfactory to the City and County of San Francisco. In this report, the Contractor shall place its emphasis on; first, the deficiencies discovered during the investigation; secondly; the proposed measures to remedy such deficiencies and; thirdly, the serviceability of the present sewer.

The Contractor shall: (a) after the pre-construction sewer investigation, deliver 2 copies of the report and 2 copies of the videotape 5 working days before actual start of construction and; (b) after post-construction sewer investigation, deliver 5 copies of the final report and 2 copies of the post-construction videotape, all to the Manager of the Hydraulics Section, Bureau of Engineering, City and County of San Francisco.

SAFETY PROCEDURES

Except to the extent that more explicit or more stringent requirements are stated herein, the Contractor shall comply with all applicable federal, State and local safety and health requirements and standards.

PRE-ENTRY AND CONFINED SPACE OPERATIONS

Pre-entry and confined space operations shall be performed in accordance with the provisions of Article 108 of the General Industry Safety Orders and Section 1532 of the Construction Safety Orders of Title 8 of the California Code of Regulations. These provisions shall govern:

A. Blocking of laterals.
B. Testing for the existence of dangerous water and air contamination.
C. Ventilation requirements.
D. Entry rate work within confined spaces.
E. Precautions for emergencies involving work in the sewer.
F. Other related work.

Testing shall take place for the following suspected conditions prior to entering the sewer, and at times during inspection:

1. Oxygen deficiencies.
2. Carbon dioxide.
3. Combustible gases.
4. Contaminated and infectious waste.

ADDITIONAL REQUIREMENTS

The Contractor shall provide safeguards, including traffic barriers, warning signs, barricades, temporary fences and other similar safeguards that are required for the protection of all personnel during the performance of this contract.

The Contractor shall provide to all workers and inspectors, protective, disposable clothing for sewage conditions consisting of fullbody coveralls, gloves, boot type covers on reusable footwear, eye protection, hardhats and safety tools as required by job conditions and CAL-OSHA safety rules and regulations.

The Contractor shall provide air ventilation and respiratory protection to workers and inspectors in accordance with an operation and safety procedures plan required by CAL-OSHA and accepted by the City and County of San Francisco.

The Contractor shall provide a plan for rescue of workers and investigators for review by the Engineer and for approval by the City and County of San Francisco.

PAYMENT

The contract lump sum price paid for sewer video survey shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, for furnishing all labor, materials, tools, equipment, sewer cleaning as necessary to facilitate the survey, and incidentals, and for doing all the work involved in conducting the sewer video survey, including providing plans, reports and video tape, safety devices and precautions, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer, and no other compensation will be allowed therefor.

10-1.17 CLEARING AND GRUBBING

Clearing and grubbing shall conform to the provisions in Section 16, "Clearing and Grubbing," of the Standard Specifications and these special provisions.

Attention is directed to "Hazardous Material Excavation" of "Earthwork," of these specifications.

Clearing and grubbing operations shall result in no visible dust.

Vegetation shall be cleared and grubbed only within the excavation and embankment slope line.

At locations adjacent to a bridge or other structure, clearing and grubbing of vegetation shall be limited to 1.5 m outside the physical limits of the bridge or structure except as specified herein except as specified herein.

Trees, bushes, and shrubs at locations where there is no temporary or permanent grading adjacent to or beneath the temporary bypass structure shall be protected in place from injury or damage resulting from the construction activities. Trees, bushes, and shrubs protected in-place beneath the temporary bypass structure shall be topped or pruned to a level that is 3000 mm, plus or minus 1000 mm, below the lowest elevation of the bridge at the point of the pruning.

Pruning and topping shall be performed under the continuous field supervision of an arborist with current certification by the International Society of Arboriculture (ISA) or as directed by the Engineer. In cases where the arborist concludes that topping or pruning may result in permanent damage to vegetation, the Contractor shall be instructed to clear the vegetation.

Existing vegetation outside the areas to be cleared and grubbed shall be protected from injury or damage resulting from the Contractor's operations. Existing vegetation and trees within the limits of the Environmentally Sensitive Areas (ESA) shall be protected throughout the duration of the Contract.

Activities controlled by the Contractor, except cleanup or other required work, shall be confined within the graded areas of the roadway.

Nothing herein shall be construed as relieving the Contractor of the Contractor's responsibility for final cleanup of the highway as provided in Section 4-1.02, "Final Cleaning Up," of the Standard Specifications.

The area of clearing and grubbing shown on the plans includes all areas of clearing and grubbing, pruning, and topping. Full compensation for pruning and topping, and providing an arborist shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

10-1.18 EARTHWORK

Earthwork shall conform to the provisions in Section 19, "Earthwork," of the Standard Specifications and these special provisions.

Attention is directed to "Hazardous Material Excavation," of these special provisions.

Surplus excavated material shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Where a portion of the existing surfacing is to be removed, the outline of the area to be removed shall be cut on a neat line with a power-driven saw to a minimum depth of 50 mm before removing the surfacing. Full compensation for cutting the existing surfacing shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

Reinforcement or metal attached to reinforced concrete rubble placed in embankments shall not protrude above the grading plane. Prior to placement within 0.6-m below the grading plane of embankments, reinforcement or metal shall be trimmed to no greater than 20 mm from the face of reinforced concrete rubble. Full compensation for trimming reinforcement or metal per cubic meter for the types of excavation shown in the Engineer's estimate, or the contract prices paid for furnishing and placing imported borrow or embankment material, as the case may be, shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

At the option of the Contractor, slurry cement backfill, conforming to the provisions in Section 19-3.062, "Slurry Cement Backfill," of the Standard Specifications, may be used as structure backfill for pipe culverts, including aluminum and aluminum coated pipe culverts.

COMPACTION FOR DUCK BANK BACKFILL

Duck bank backfill shall conform to the provisions in Section 19-3, "Structure Excavation and Backfill," of the Standard Specifications. Backfill placed in duct bank trenches which are to be outside of slope lines and not under pavement shall be compacted to a relative compaction of not less than 90 percent. Backfill on slopes and in areas where pavement is to be constructed shall be compacted to a relative compaction of not less than 95 percent.

If structure excavation or structure backfill for bridges is not otherwise designated by type and payment for the structure excavation or structure backfill has not otherwise been provided for in the Standard Specifications or these special provisions, the structure excavation or structure backfill will be measured and paid for as structure excavation (bridge) or structure backfill (bridge), respectively.

Structure excavation designated as (Type D), for footings at the locations shown on the plans, will be measured and paid for as structure excavation (Type D). Ground water or surface water is

expected to be encountered at these locations, but seal course concrete is not shown or specified. Structure excavation for footings at locations not designated on the plans as structure excavation (Type D), and where ground or surface water is encountered, will be measured and paid for as structure excavation (bridge).

Structure excavation designated as (Type H), for footings at the locations shown on the plans, will be measured and paid for as structure excavation (Type H). Hazardous materials are expected to be encountered during excavation.

Structure excavation designated as (Class II), for footings at the locations shown on the plans, will be measured and paid for as structure excavation (Class II). Petroleum contamination is expected to be encountered during excavation.

HAZARDOUS MATERIAL EXCAVATION

Hazardous material excavation shall consist of excavating hazardous material and Class II material identified on the plans as being within excavation limits shown on the plans, specified in the Standard Specifications, or specified or directed by the Engineer and stockpiling and disposing of the material as specified in this section.

Excavated hazardous material and Class II material shall be managed as follows:

A. Hazardous material – Haul and dispose of the material at a permitted hazardous waste management facility in conformance with Section 2521 of Title 23 of the California Code of Regulations, Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications, and these special provisions.
B. Class II material – Haul and dispose of the material at a permitted Class II waste management facility in conformance with Section 20210 of Title 27 of the California Code of Regulations, Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications, and these special provisions.

Hazardous materials shall be transferred directly from the excavation to a registered transport vehicle, a storage container approved for transport of hazardous waste by the United States Department of Transportation, or a stockpile location approved by the Engineer. Class II material shall be transferred directly from the excavation to a transport vehicle, a storage container, or a stockpile location approved by the Engineer. Stockpile locations for Class II material shall be maintained in conformance with the provisions in "Water Pollution Control" of these special provisions. Stockpile locations for hazardous material shall be maintained as follows:

A. The material shall not contain free liquids that separate readily from the material. The presence or absence of free liquids shall be demonstrated by United States Environmental Protection Agency Method 9095 as modified by Section 66264.314 of Title 22 of the California Code of Regulations.
B. The material shall be stored on undamaged 1.5-mm high-density polyethylene or an equivalent impermeable barrier unless the stockpiling location is on a paved surface. If the location is on a paved surface the thickness of the barrier can be reduced to 0.5-mm high-density polyethylene or its equivalent. The dimensions of the barrier shall exceed the dimensions of the stockpile at all times. Any seams in the barrier shall be sealed to prevent leakage.

C. At the end of each day or prior to a storm event the material shall be covered with undamaged 0.3-mm polyethylene or an equivalent impermeable barrier to prevent windblown dispersion and precipitation run-off and run-on. When more than one sheet is required to cover the material, the sheets shall be overlapped a minimum of 0.45-m in a manner that prevents water from flowing onto the material. The cover shall be secured in a manner that keeps it in place at all times. Driven anchors shall not be used except at the perimeter of the stockpile. The cover shall be inspected and maintained in conformance with the provisions in "Water Pollution Control" of these special provisions.

These stockpiling requirements apply to temporary storage outside of an excavation or a transport container including, but not limited to, staging of excavated material next to the excavation prior to pick up by loading equipment, accumulating material for full transport loads, and awaiting test results required by a disposal facility. The removal of hazardous material stockpiles shall begin within 90 days of accumulating 100 kg of hazardous material. After final removal has occurred the Contractor shall be responsible for any cleanup deemed necessary by the Engineer.

Hazardous material and Class II material on exteriors of transport vehicles shall be removed and placed either into the current transport vehicle or the excavation prior to the vehicle leaving the loading area. No hazardous material shall be deposited on public roads. The Contractor shall indemnify the State from any costs due to spillage during the transport of the hazardous material to the disposal facility.

Attention is directed to "Hazardous Material, General" of these special provisions.

SAMPLING AND ANALYSIS

The Contractor shall test the material to be excavated for any additional acceptance requirements of the disposal facility. Sampling and analysis shall be performed using the sampling and analysis procedure approved by the Engineer and the disposal facility.

The Contractor may perform additional tests on the material to be excavated for confirmation of the classification as hazardous material or Class II material. Sampling and analysis shall be based on guidelines in USEPA, SW 846, "Test Methods for Evaluating Solid Waste, Volume II: Field Manual Physical/Chemical Methods." Changes in classification of materials will be handled in accordance with Section 4-1.03, "Changes," of the Standard Specifications.

The Contractor shall submit, for approval by the Engineer, a Sampling and Analysis Plan that describes the scope of the investigation, along with the name, address, and certification number of the testing laboratory, 15 working days prior to beginning any sampling or analysis for additional disposal facility requirements, reclassification of material, characterization of material outside of the excavation pay limits or the horizontal limits of the classification zones shown on the plans. The Sampling and Analysis Plan shall be prepared under the guidance of a registered professional experienced in site characterization. The Engineer will make the final decision on reclassification or characterization of material after review of the test data. Six working days shall be allowed for review of test data.

Sampling and analysis of material excavated from outside the horizontal limits of the material classification zones shown on the plans will be paid for as extra work as provided in Section 4-1.03D of the Standard Specifications

Operations shall be conducted in a manner that prevents increases in the quantities of hazardous material resulting from mixing with material containing lower contaminant concentrations. No

additional compensation will be made for material requiring reclassification due to failure to segregate the material after excavation.

Hazardous material and Class II material will be measured in conformance with the Standard Specifications and these special provisions for the type of excavation involved.

The contract price paid per cubic meter for structure excavation (Duct Bank) (Type H) and structure excavation (Type H) shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all the work involved in excavating, stockpiling, loading, sampling and analyzing, hauling, and disposing of hazardous material, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

The contract price paid per cubic meter for structure excavation (Class II) shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all the work involved in excavating, stockpiling, loading, sampling and analyzing, hauling, and disposing of Class II material, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

Full compensation for all excavation work involving loading, stockpiling, transporting, and disposing of hazardous material and Class II material, which is not otherwise designated by type or class, and is not otherwise paid for under separate contract items, shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

10-1.19 STRUCTURE EXCAVATION (ROCK)

Structure excavation (rock) shall conform to the provisions in Section 19, "Earthwork," of the Standard Specifications and these special provisions.

Structure excavation (rock) shall be performed using mechanical expansion devices and mechanical impact equipment. The use of explosives or chemical expansion devices will not be allowed.

The Contractor shall submit a rock excavation plan to the Engineer for approval a minimum of 20 working days prior to commencing rock excavation operations. The Contractor shall not perform rock excavation prior to approval of the rock excavation plan. The rock excavation plan shall, at a minimum, include a list of materials and equipment to be used, methods to be used to control and confine the excavated materials, and proposed haul routes to remove the excavated materials from the site.

The Contractor shall remove overburden soil and loose weathered rock for a distance that will be adequate to prevent caving of these materials during rock excavation. The removal of the overburden shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no separate payment will be made therefor.

Where hazardous materials are encountered during rock excavation, excavation shall conform to the additional requirements for special testing, handling, and disposal as specified for Type H excavation in "Earthwork" of these special provisions.

When footing concrete or masonry is to rest upon rock, the rock shall be fully uncovered and the surface thereof shall be removed to a depth sufficient to expose sound (moderately hard) rock. The rock shall be roughly leveled or cut to steps, and shall be roughened. Seams in the rock shall be grouted under pressure or treated as the Engineer may direct and the cost thereof will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications.

For footing construction on or in rock adjacent to existing footings or other structures, excavation limits shall match the limits shown on the plans as closely as possible. Rock shall not be overexcavated beneath existing footings or closer to existing footings than shown on the plans.

Where groundwater is encountered during rock excavation, it shall be the Contractor's responsibility to provide adequate means for groundwater control and removal as necessary to accomplish construction of the work.

Quantities to be paid for as structure excavation (rock) will be determined from limits shown on the plans. Removal of material entering the excavation as a result of slides or slip-outs shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, for the various types of excavation involved and no separate payment will be made therefor.

The contract price paid per cubic meter for structure excavation (rock) shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all the work involved in structure excavation (rock) complete in place, including groundwater control and removal, special testing, handling and disposal where required, rock surface preparation and preparing and submitting the work plan and disposal of the excavated materials, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.20 MOVE-IN/MOVE-OUT (EROSION CONTROL)

Move-in/move-out (erosion control) shall include moving onto the project when an area is ready to receive erosion control as determined by the Engineer, setting up all required personnel and equipment for the application of erosion control materials and moving out all personnel and equipment when erosion control in that area is completed.

When areas are ready to receive applications of erosion control (Types D), as determined by the Engineer, the Contractor shall begin erosion control work in that area within 5 working days of the Engineer's notification to perform the erosion control work.

Attention is directed to the requirements of erosion control (Types D) elsewhere in these special provisions.

Quantities of move-in/move-out (erosion control) will be determined as units from actual count as determined by the Engineer. For measurement purposes, a move-in followed by a move-out will be considered as one unit.

The contract unit price paid for move-in/move-out (erosion control) shall include full compensation for furnishing all labor, materials (excluding erosion control materials), tools, equipment, and incidentals and for doing all the work involved in moving in and removing from the project all personnel and equipment necessary for application of erosion control ((Types D), installation of Fiber Rolls, and installation of Erosion Control (Netting), , as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

No adjustment of compensation will be made for any increase or decrease in the quantities of move-in/move-out (erosion control) required, regardless of the reason for the increase or decrease. The provisions in Section 4-1.03B, "Increased or Decreased Quantities," of the Standard Specifications shall not apply to the item of move-in/move-out (erosion control).

10-1.21 EROSION CONTROL (TYPE D)

Erosion control (Type D) shall conform to the provisions in Section 20-3, "Erosion Control," of the Standard Specifications and these special provisions and shall consist of applying erosion control materials to embankment and excavation slopes and all other areas disturbed by construction activities.

Erosion control (Type D) shall be applied when an area is ready to receive erosion control as determined by the Engineer and in conformance with the provisions in "Move-in/Move-out (Erosion Control)" of these special provisions.

Prior to installing erosion control materials, soil surface preparation shall conform to the provisions in Section 19-2.05, "Slopes," of the Standard Specifications, except that rills and gullies exceeding 50 mm in depth or width shall be leveled. Vegetative growth, temporary erosion control materials, and other debris shall be removed from areas to receive erosion control.

MATERIALS

Materials shall conform to the provisions in Section 20-2, "Materials," of the Standard Specifications and these special provisions.

Seed

Seed shall conform to the provisions in Section 20-2.10, "Seed," of the Standard Specifications. Individual seed species shall be measured and mixed in the presence of the Engineer.

Seed shall be delivered to the project site in unopened separate containers with the seed tag attached. Containers without a seed tag attached will not be accepted.

A sample of approximately 30 g of seed will be taken from each seed container by the Engineer.

Legume Seed

Legume seed shall be pellet-inoculated or industrial-inoculated and shall conform to the following:

A. Inoculated seed shall be inoculated in conformance with the provisions in Section 20-2.10, "Seed," of the Standard Specifications.
B. Inoculated seed shall have a calcium carbonate coating.
C. Industrial-inoculated seed shall be inoculated with Rhizobia and coated using an industrial process by a manufacturer whose principal business is seed coating and seed inoculation.
D. Industrial-inoculated seed shall be sown within 180 calendar days after inoculation.
E. Legume seed shall consist of the following:

LEGUME SEED

Botanical Name (Common Name)	Percent Germination (Minimum)	Kilograms Pure Live Seed Per Hectare (Slope Measurement)
Lupinus albinfrons (Silver Bush Lupine)	40	10
Lupinus bicolor (Pygmy-leaf Lupine)	40	5
Trifolium tridentatum (Tomcat Clover)	50	5

Non-Legume Seed

Non-legume seed shall consist of the following:

NON-LEGUME SEED

Botanical Name (Common Name)	Percent Germination (Minimum)	Kilograms Pure Live Seed Per Hectare (Slope Measurement)
Achillea millefolium (White Yarrow)	50	2
Bromus carinatus* (California Brome)	40	10
Eschscholzia californica* (California Poppy)	35	6
Festuca californa (California Fescue)	30	8
Festuca rubra molate (Red Fescue Molate))	40	10
Nassella cernua (Nodding Needlegrass)	40	11

Straw

Straw shall conform to the provisions in Section 20-2.06, "Straw," of the Standard Specifications and these special provisions.

Wheat and barley straw shall be derived from irrigated crops.

Prior to delivery of wheat or barley straw to the project site, the Contractor shall provide the name, address and telephone number of the grower.

Straw shall be free of plastic, glass, metal, rocks, and refuse or other deleterious material.

Compost

At the option of the Contractor, compost may be either A, B, or any combination of both:

A. Green material consisting of chipped, shredded, or ground vegetation; or clean processed recycled wood products.

B. Class A , exceptional quality biosolids composts, conforming to the requirements in United States Environmental Protection Agency (EPA) regulation 40 CFR, Part 503c.

Compost shall not contain paint, petroleum products, herbicides, fungicides or other chemical residues harmful to plant or animal life. Other deleterious material, plastic, glass, metal or rock shall not exceed 0.1-percent by weight or volume.

Compost shall be thermophilically processed for 15 days. During this process, the compost shall be maintained at minimum internal temperature of 55°C and be thoroughly turned at least 5 times. A 90-day curing period shall follow the thermophilic process.

Compost shall be screened through a screen no larger than 12 mm.

Compost shall measure at least 6 on the maturity and stability scale with a Solvita test kit.

A Certificate of Compliance for compost shall be furnished to the Engineer in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications. The Certificate of Compliance shall state the Solvita maturity and stability scale test result of the compost.

Stabilizing Emulsion

Stabilizing emulsion shall conform to the provisions in Section 20-2.11, "Stabilizing Emulsion," of the Standard Specifications and these special provisions.

Stabilizing emulsion shall be in a dry powder form, may be reemulsifiable, and shall be a processed organic adhesive used as a soil tackifier.

APPLICATION

Erosion control materials shall be applied in separate applications in the following sequence:

A. Legume seed shall be applied by a dry method at the rate of __ kg per hectare (slope measurement). Legume seed shall not be applied with hydro-seeding equipment.

B. The following mixture in the rates indicated shall be applied with hydro-seeding equipment within 60 minutes after the seed has been added to the mixture:

Material	Kilograms Per Hectare (Slope Measurement)
Legume Seed	20
Non-Legume Seed	47
Fiber	47

Material	Cubic Meter Per Hectare (Slope Measurement)
Compost	2

D. Straw shall be applied at the rate of 4.0 tonnes per hectare based on slope measurements. Incorporation of straw will not be required. Straw shall be distributed evenly without clumping or piling.

E. The following mixture in the rates indicated shall be applied with hydro-seeding equipment:

Material	Kilograms Per Hectare (Slope Measurement)
Fiber	320
Stabilizing Emulsion (Solids)	140

Material	Cubic Meter Per Hectare (Slope Measurement)
Compost	2

The ratio of total water to total stabilizing emulsion in the mixture shall be as recommended by the manufacturer.

Once straw work is started in an area, stabilizing emulsion applications shall be completed in that area on the same working day.

The rates of erosion control materials may be changed by the Engineer to meet field conditions.

MEASUREMENT AND PAYMENT

Compost (erosion control) will be measured by the cubic meter in the vehicle at the point of delivery in conformance with the provisions in Section 9-1.01, "Measurement of Quantities," of the Standard Specifications.

The contract price paid per cubic meter for compost (erosion control) shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in applying compost for erosion control, complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.22 AGGREGATE BASE

Aggregate base shall be Class 3 and shall conform to the provisions in Section 26, "Aggregate Bases," of the Standard Specifications and these special provisions.

The restriction that the amount of reclaimed material included in Class 3 aggregate base not exceed 50 percent of the total volume of the aggregate used shall not apply. Aggregate for Class 3 aggregate base may include reclaimed glass. Aggregate base incorporating reclaimed glass shall not be placed at locations where surfacing will not be placed over the aggregate base.

Aggregate for Class 3 aggregate base shall conform to the following requirements:

Grading Requirements (Percentage Passing)

Sieve Sizes	19 mm Maximum		37.5 mm Maximum	
	Operating Range	Contract Compliance	Operating Range	Contract Compliance
50-mm			100	100
37.5-mm			90-100	87-100
25-mm	100	100	-----	-----
19-mm	90-100	87-100	50-85	45-90
4.75-mm	35-60	35-65	25-45	20-50
600-µm	10-30	5-35	10-25	6-29
75-µm	2-11	0-14	2-11	0-14

Quality Requirements

Tests	Operating Range	Contract Compliance
Sand Equivalent	25 Min.	22 Min.
Resistance (R-value)	-	78 Min.
Durability Index	-	35 Min.

The aggregate shall not be treated with lime, cement or other chemical material before the Durability Index test is performed. Untreated reclaimed asphalt concrete and portland cement concrete will not be considered to be treated with lime, cement or other chemical material for purposes of performing the Durability Index test.

10-1.23 ASPHALT CONCRETE

Asphalt concrete shall be Type A and shall conform to the provisions in Section 39, "Asphalt Concrete," of the Standard Specifications and these special provisions.

The amount of asphalt binder used in asphalt concrete placed in dikes and overside drains shall be increased one percent by mass of the aggregate over the amount of asphalt binder determined for use in asphalt concrete placed on the traveled way.

The asphalt content of the asphalt mixture will be determined in conformance with the requirements in California Test 379, or in conformance with the requirements in California Test 382.

Paint binder (tack coat) shall be applied to existing surfaces to be surfaced and between layers of asphalt concrete, except when eliminated by the Engineer.

Paint binder (tack coat) shall be, at the option of the Contractor, either slow-setting type asphaltic emulsion, rapid setting asphaltic emulsion or paving asphalt. Slow-setting type asphaltic emulsion and rapid setting asphaltic emulsion shall conform to the provisions in Section 39-4.02, "Prime Coat and Paint Binder (Tack Coat)," and the provisions in Section 94, "Asphaltic Emulsions," of the Standard Specifications. When paving asphalt is used for paint binder, the grade will be determined by the Engineer. Paving asphalt shall conform to the provisions in Section 39-4.02, "Prime Coat and Paint Binder (Tack Coat)," and the provisions in Section 92, "Asphalts," of the Standard Specifications.

Paint binder (tack coat) shall be applied in the liter per square meter range limits specified for the surfaces to receive asphalt concrete in the tables below. The exact application rate within the range will be determined by the Engineer.

Application Rates for Asphaltic Emulsion Paint Binder (Tack Coat) for Asphalt Concrete (except Open Graded) and on Portland Cement Concrete Pavement		
Type of surface to receive paint binder (tack coat)	Slow-Setting Asphaltic Emulsion L/m^2(Note A)	Rapid-Setting Asphaltic Emulsion L/m^2(Note B)
Dense, compact surfaces, between layers, and on PCCP	0.20 – 0.35	0.10 – 0.20
Open textured, or dry, aged surfaces	0.35 – 0.90	0.20 – 0.40

Note A: Slow-setting asphaltic emulsion is asphaltic emulsion diluted with additional water. Water shall be added and mixed with the asphaltic emulsion (containing up to 43 percent water) so the resulting mixture contains one part asphaltic emulsion and not more than one part added water. The water shall be added by the emulsion producer or at a facility that has the capability to mix or agitate the combined blend.

Note B: Undiluted rapid-setting asphaltic emulsion.

Application Rates for Paint Binder (Tack Coat) for Asphalt Concrete (except Open Graded)	
Type of surface to receive paint binder (tack coat)	Paving Asphalt L/m^2
Dense, compact surfaces and between layers	0.05 – 0.10
Open textured, or dry, aged surfaces	0.10 – 0.25

When asphaltic emulsion is used as paint binder (tack coat), asphalt concrete shall not be placed until the applied asphaltic emulsion has completely changed color from brown to black.

The miscellaneous areas to be paid for at the contract price per square meter for place asphalt concrete (miscellaneous area), in addition to the prices paid for the materials involved, shall be limited to the areas listed on the plans.

In addition to the provisions in Section 39-5.01, "Spreading Equipment," of the Standard Specifications, asphalt paving equipment shall be equipped with automatic screed controls and a sensing device or devices.

When placing asphalt concrete to the lines and grades established by the Engineer, the automatic controls shall control the longitudinal grade and transverse slope of the screed. Grade and slope references shall be furnished, installed, and maintained by the Contractor. Should the Contractor elect to use a ski device, the minimum length of the ski device shall be 9 m. The ski device shall be a rigid one piece unit and the entire length shall be utilized in activating the sensor.

When placing the initial mat of asphalt concrete on existing pavement, the end of the screed nearest the centerline shall be controlled by a sensor activated by a ski device not less than 9 m long. The end of the screed farthest from centerline shall be controlled by an automatic transverse slope device set to reproduce the cross slope designated by the Engineer.

When paving contiguously with previously placed mats, the end of the screed adjacent to the previously placed mat shall be controlled by a sensor that responds to the grade of the previously placed mat and will reproduce the grade in the new mat within a 3-mm tolerance. The end of the screed farthest from the previously placed mat shall be controlled in the same way it was controlled when placing the initial mat.

Should the methods and equipment furnished by the Contractor fail to produce a layer of asphalt concrete conforming to the provisions, including straightedge tolerance, of Section 39-6.03, "Compacting," of the Standard Specifications, the paving operations shall be discontinued and the Contractor shall modify the equipment or methods, or furnish substitute equipment.

Should the automatic screed controls fail to operate properly during a day's work, the Contractor may manually control the spreading equipment for the remainder of that day. However, the equipment shall be corrected or replaced with alternative automatically controlled equipment conforming to the provisions in this section before starting another day's work.

The area to which paint binder has been applied shall be closed to public traffic. Care shall be taken to avoid tracking binder material onto existing pavement surfaces beyond the limits of construction.

A drop-off of more than 45 mm will not be allowed at any time between adjacent lanes open to public traffic.

Half-width surfacing operations shall be performed in a manner that, at the end of each day's work, the distance between the ends of adjacent surfaced lanes shall not be greater than can be completed in the following day of normal surfacing operations.

Where the existing pavement is to be widened by constructing a new structural section adjacent to the existing pavement, the new structural section shall be completed to match the elevation of the

edge of the existing pavement at each location prior to spreading and compacting asphalt concrete over the adjacent existing pavement.

Asphalt concrete surfacing shall be placed on existing surfacing, including curve widening, chain control lanes, turnouts, left turn lanes, and public and private road connections shown on the plans, unless otherwise directed by the Engineer.

10-1.24 PILING

GENERAL

Piling shall conform to the provisions in Section 49, "Piling," of the Standard Specifications, and these special provisions.

Unless otherwise specified, welding of any work performed in conformance with the provisions in Section 49, "Piling," of the Standard Specifications, shall be in conformance with the requirements in AWS D1.1.

Epoxy coated reinforcement for pile anchorages shall conform to "Epoxy-Coated Prefabricated Reinforcement," of these special provisions.

Foundation recommendations are included in the "Information Handout" available to the Contractor as provided for in Section 2-1.03, "Examination of Plans, Specifications, Contract, and Site of Work," of the Standard Specifications.

Attention is directed to "Welding" of these special provisions.

If at any time during pile driving the blow count exceeds three times the required blow count as determined from Section 49, "Piling," of the Standard Specifications, the Contractor shall discontinue driving and notify the Engineer. Driving shall not resume until so ordered by the Engineer.

Difficult pile installation is anticipated due to the presence of caving soils, hazardous and contaminated materials, high ground water, cobbles and boulders, rock cuttings, timber piles, subsurface concrete debris, underground utilities, and the requirements of pile embedment into rock.

Drill cuttings from areas within the limits of hazardous materials shall be managed in conformance with the provisions of "Hazardous Material Excavation" in "Earthwork," of these special provisions.

When a calculated ultimate geotechnical capacity is shown on the plans for piling, that value shall be utilized in lieu of nominal resistance in Section 49, "Piling," of the Standard Specifications, and these special provisions.

Jetting and Drilling

Jetting to obtain the specified penetration in conformance with the provisions in Section 49-1.05, "Driving Equipment," of the Standard Specifications shall not be used for driven type piles.

Drilling to obtain the specified penetration in conformance with the provisions in Section 49-1.05, "Driving Equipment," of the Standard Specifications shall not be used for driven type piles except at the locations shown in the following table or where obstructions to pile penetration are encountered. Should such obstructions be encountered, the Contractor shall provide special driving tips or heavier pile sections, subexcavate below the bottom of footing, predrill or core holes not greater than the least dimension of the pile to the proper depth, spud the piles, or take other measures to prevent damage to the pile during driving.

Materials resulting from jetting or drilling holes shall be disposed of in conformance with the provisions in Section 19-2.06, "Surplus Material," of the Standard Specifications.

Bridge Name or Number	Abutment Number	Bent Number	Elevation of Bottom of Jet or Hole
	--		

Full compensation for providing special tips, heavier sections, or for subexcavating, predrilling, coring, spudding or employing other measures to prevent damage to the piles shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, paid per unit for drive steel pile of the size shown on the plans, and no additional compensation will be allowed therefor.

CAST-IN-DRILLED-HOLE CONCRETE PILES

Cast-in-drilled-hole concrete piling shall conform to the provisions in Section 49-4, "Cast-In-Place Concrete Piles," of the Standard Specifications and these special provisions.

Cast-in-drilled-hole concrete piling (rock socket) shall consist of drilling or coring sockets in bedrock to the depths or lengths specified and filling with reinforced concrete in conformance with the details shown on the plans and these special provisions. Cored holes, if used, shall conform to the provisions of Section 49-4.03, "Drilled Holes," of the Standard Specifications.

The provisions of "Welding" of these special provisions shall not apply to temporary steel casings.

Cast-in-drilled-hole concrete piles 600 mm in diameter or larger may be constructed by excavation and depositing concrete under slurry.

Materials

Concrete deposited under slurry shall have a nominal penetration equal to or greater than 90 mm. Concrete shall be proportioned to prevent excessive bleed water and segregation.

Concrete deposited under slurry shall contain not less than 400 kg of cementitious material per cubic meter.

Attention is directed to "Corrosion Control for Portland Cement Concrete," of these special provisions.

The combined aggregate grading used in concrete for cast-in-drilled-hole concrete piling shall be either the 25-mm maximum grading, the 12.5-mm maximum grading, or the 9.5-mm maximum grading and shall conform to the requirements in Section 90-3 "Aggregate Gradings," of the Standard Specifications.

Mineral Slurry

Mineral slurry shall be mixed and thoroughly hydrated in slurry tanks, and slurry shall be sampled from the slurry tanks and tested before placement in the drilled hole.

Slurry shall be recirculated or continuously agitated in the drilled hole to maintain the specified properties.

Recirculation shall include removal of drill cuttings from the slurry before discharging the slurry back into the drilled hole. When recirculation is used, the slurry shall be sampled and tested at least every 2 hours after beginning its use until tests show that the samples taken from the slurry tank and

from near the bottom of the hole have consistent specified properties. Subsequently, slurry shall be sampled at least twice per shift as long as the specified properties remain consistent.

Slurry that is not recirculated in the drilled hole shall be sampled and tested at least every 2 hours after beginning its use. The slurry shall be sampled mid-height and near the bottom of the hole. Slurry shall be recirculated when tests show that the samples taken from mid-height and near the bottom of the hole do not have consistent specified properties.

Slurry shall also be sampled and tested prior to final cleaning of the bottom of the hole and again just prior to placing concrete. Samples shall be taken from mid-height and near the bottom of the hole. Cleaning of the bottom of the hole and placement of the concrete shall not start until tests show that the samples taken from mid-height and near the bottom of the hole have consistent specified properties.

Mineral slurry shall be tested for conformance to the requirements shown in the following table:

MINERAL SLURRY		
PROPERTY	REQUIREMENT	TEST
Density (kg/m^3) - before placement in the drilled hole - during drilling - prior to final cleaning - immediately prior to placing concrete	1030* to 1110* 1030* to 1200*	Mud Weight (Density) API 13B-1 Section 1
Viscosity (seconds/liter) bentonite attapulgite	29 to 53 29 to 42	Marsh Funnel and Cup API 13B-1 Section 2.2
pH	8 to 10.5	Glass Electrode pH Meter or pH Paper
Sand Content (percent) - prior to final cleaning - immediately prior to placing concrete	less than or equal to 4.0	Sand API 13B-1 Section 5
*When approved by the Engineer, slurry may be used in salt water, and the allowable densities may be increased up to 32 kg/m^3. Slurry temperature shall be at least 4°C when tested.		

Any caked slurry on the sides or bottom of hole shall be removed before placing reinforcement. If concrete is not placed immediately after placing reinforcement, the reinforcement shall be removed and cleaned of slurry, the sides of the drilled hole cleaned of caked slurry, and the reinforcement again placed in the hole for concrete placement.

Synthetic Slurry

Synthetic slurries shall be used in conformance with the manufacturer's recommendations and these special provisions. The following synthetic slurries may be used:

PRODUCT	MANUFACTURER
SlurryPro CDP	KB Technologies Ltd. 3648 FM 1960 West Suite 107 Houston, TX 77068 (800) 525-5237
Super Mud	PDS Company c/o Champion Equipment Company 8140 East Rosecrans Ave. Paramount, CA 90723 (562) 634-8180

Inclusion of a synthetic slurry on the above list may be obtained by meeting the Department's requirements for synthetic slurries. The requirements can be obtained from the Office of Structure Design, P.O. Box 942874, Sacramento, CA 94274-0001.

Synthetic slurries listed may not be appropriate for a given site.

Synthetic slurries shall not be used in holes drilled in primarily soft or very soft cohesive soils as determined by the Engineer.

A manufacturer's representative, as approved by the Engineer, shall provide technical assistance for the use of their product, shall be at the site prior to introduction of the synthetic slurry into a drilled hole, and shall remain at the site until released by the Engineer.

Synthetic slurries shall be sampled and tested at both mid-height and near the bottom of the drilled hole. Samples shall be taken and tested during drilling as necessary to verify the control of the properties of the slurry. Samples shall be taken and tested when drilling is complete, but prior to final cleaning of the bottom of the hole. When samples are in conformance with the requirements shown in the following tables for each slurry product, the bottom of the hole shall be cleaned and any loose or settled material removed. Samples shall be obtained and tested after final cleaning and immediately prior to placing concrete.

SlurryPro CDP synthetic slurries shall be tested for conformance to the requirements shown in the following table:

SLURRYPRO CDP KB Technologies Ltd.		
PROPERTY	REQUIREMENT	TEST
Density (kg/m^3) - during drilling - prior to final cleaning - just prior to placing concrete	 less than or equal to 1075* less than or equal to 1025*	Mud Weight (Density) API 13B-1 Section 1
Viscosity (seconds/liter) - during drilling -prior to final cleaning - just prior to placing concrete	 53 to 127 less than or equal to 74	Marsh Funnel and Cup API 13B-1 Section 2.2
pH	6 to 11.5	Glass Electrode pH Meter or pH Paper
Sand Content (percent) - prior to final cleaning - just prior to placing concrete	 less than or equal to 0.5	Sand API 13B-1 Section 5
*When approved by the Engineer, slurry may be used in salt water, and the allowable densities may be increased up to 32 kg/m^3. Slurry temperature shall be at least 4°C when tested.		

Super Mud synthetic slurries shall be tested for conformance to the requirements shown in the following table:

SUPER MUD PDS Company		
PROPERTY	REQUIREMENT	TEST
Density (kg/m^3) - prior to final cleaning - just prior to placing concrete	less than or equal to 1025*	Mud Weight (Density) API 13B-1 Section 1
Viscosity (seconds/liter) - during drilling - prior to final cleaning - just prior to placing concrete	34 to 64 less than or equal to 64	Marsh Funnel and Cup API 13B-1 Section 2.2
pH	8 to 10.0	Glass Electrode pH Meter or pH Paper
Sand Content (percent) - prior to final cleaning -just prior to placing concrete	less than or equal to 0.5	Sand API 13B-1 Section 5
*When approved by the Engineer, slurry may be used in salt water, and the allowable densities may be increased up to 32 kg/m^3. Slurry temperature shall be at least 4°C when tested.		

Shore Pac GCV synthetic slurries shall be tested for conformance to the requirements shown in the following table:

Shore Pac GCV CETCO Drilling Products Group		
PROPERTY	REQUIREMENT	TEST
Density (kg/m^3) - prior to final cleaning - just prior to placing concrete	less than or equal to 1025*	Mud Weight (Density) API 13B-1 Section 1
Viscosity (seconds/liter) - during drilling - prior to final cleaning - just prior to placing concrete	35 to 78 less than or equal to 60	Marsh Funnel and Cup API 13B-1 Section 2.2
pH	8.0 to 11.0	Glass Electrode pH Meter or pH Paper
Sand Content (percent) - prior to final cleaning -just prior to placing concrete	less than or equal to 0.5	Sand API 13B-1 Section 5
*When approved by the Engineer, slurry may be used in salt water, and the allowable densities may be increased up to 32 kg/m^3. Slurry temperature shall be at least 4°C when tested.		

Novagel Polymer synthetic slurries shall be tested for conformance to the requirements shown in the following table:

NOVAGEL POLYMER Geo-Tech Drilling Fluids		
PROPERTY	REQUIREMENT	TEST
Density (kg/m^3) - during drilling - prior to final cleaning - just prior to placing concrete	 less than or equal to 1075* less than or equal to 1025*	Mud Weight (Density) API 13B-1 Section 1
Viscosity (seconds/liter) - during drilling - prior to final cleaning - just prior to placing concrete	 48 to 110 less than or equal to 110	Marsh Funnel and Cup API 13B-1 Section 2.2
pH	6.0 to 11.5	Glass Electrode pH Meter or pH Paper
Sand Content (percent) - prior to final cleaning -just prior to placing concrete	 less than or equal to 0.5	Sand API 13B-1 Section 5
*When approved by the Engineer, slurry may be used in salt water, and the allowable densities may be increased up to 32 kg/m^3. Slurry temperature shall be at least 4°C when tested.		

Water Slurry

At the option of the Contractor, water may be used as slurry when casing is used for the entire length of the drilled hole.

Water slurry shall be tested for conformance to the requirements shown in the following table:

WATER SLURRY		
PROPERTY	REQUIREMENT	TEST
Density (kg/m^3) - prior to final cleaning - just prior to placing concrete	1017 *	Mud Weight (Density) API 13B-1 Section 1
Sand Content (percent) - prior to final cleaning -just prior to placing concrete	less than or equal to 0.5	Sand API 13B-1 Section 5
*When approved by the Engineer, salt water slurry may be used, and the allowable densities may be increased up to 32 kg/m^3.		

Construction

The Contractor shall submit a placing plan to the Engineer for approval prior to producing the test batch for cast-in-drilled-hole concrete piling and at least 10 working days prior to constructing piling. The plan shall include complete descriptions, details, and supporting calculations as listed below:

A. Requirements for all cast-in-drilled hole concrete piling:

1. Concrete mix design, certified test data, and trial batch reports.
2. Drilling or coring methods and equipment.
3. Proposed method for casing installation and removal when necessary.
4. Plan view drawing of pile showing reinforcement and inspection pipes, if required.
5. Methods for placing, positioning, and supporting bar reinforcement.
6. Methods and equipment for accurately determining the depth of concrete and actual and theoretical volume placed, including effects on volume of concrete when any casings are withdrawn.
7. Methods and equipment for verifying that the bottom of the drilled hole is clean prior to placing concrete.
8. Methods and equipment for preventing upward movement of reinforcement, including the Contractor's means of detecting and measuring upward movement during concrete placement operations.

B. Additional requirements when concrete is placed under slurry:

1. Concrete batching, delivery, and placing systems, including time schedules and capacities therefor. Time schedules shall include the time required for each concrete placing operation at each pile.
2. Concrete placing rate calculations. When requested by the Engineer, calculations shall be based on the initial pump pressures or static head on the concrete and losses throughout the placing system, including anticipated head of slurry and concrete to be displaced.

3. Suppliers' test reports on the physical and chemical properties of the slurry and any proposed slurry chemical additives, including Material Safety Data Sheet.
4. Slurry testing equipment and procedures.
5. Methods of removal and disposal of excavation, slurry, and contaminated concrete, including removal rates.
6. Methods and equipment for slurry agitating, recirculating, and cleaning.

In addition to compressive strength requirements, the consistency of the concrete to be deposited under slurry shall be verified before use by producing a test batch. The test batch shall be produced and delivered to the project under conditions and in time periods similar to those expected during the placement of concrete in the piles. Concrete for the test batch shall be placed in an excavated hole or suitable container of adequate size to allow for testing as specified herein. Depositing of test batch concrete under slurry will not be required. In addition to meeting the specified nominal penetration, the test batch shall meet the following requirements:

A. For piles where the time required for each concrete placing operation, as submitted in the placing plan, will be 2 hours or less, the test batch shall demonstrate that the proposed concrete mix design achieves either a penetration of at least 50 mm or a slump of at least 125 mm after twice that time has elapsed.
B. For piles where the time required for each concrete placing operation, as submitted in the placing plan, will be more than 2 hours, the test batch shall demonstrate that the proposed concrete mix design achieves either a penetration of at least 50 mm or a slump of at least 125 mm after that time plus 2 hours has elapsed.

The time period shall begin at the start of placement. The concrete shall not be vibrated or agitated during the test period. Penetration tests shall be performed in conformance with the requirements in California Test 533. Slump tests shall be performed in conformance with the requirements in ASTM Designation: C 143. Upon completion of testing, the concrete shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

The concrete deposited under slurry shall be carefully placed in a compact, monolithic mass and by a method that will prevent washing of the concrete. Concrete deposited under slurry need not be vibrated. Placing concrete shall be a continuous operation lasting not more than the time required for each concrete placing operation at each pile, as submitted in the placing plan, unless otherwise approved in writing by the Engineer. The concrete shall be placed with concrete pumps and delivery tube system of adequate number and size to complete the placing of concrete in the time specified. The delivery tube system shall consist of one of the following:

A. A tremie tube or tubes, each of which are at least 250 mm in diameter, fed by one or more concrete pumps.
B. One or more concrete pump tubes, each fed by a single concrete pump.

The delivery tube system shall consist of watertight tubes with sufficient rigidity to keep the ends always in the mass of concrete placed. If only one delivery tube is utilized to place the concrete, the tube shall be placed near the center of the drilled hole. Multiple tubes shall be uniformly spaced in

the hole. Internal bracing for the steel reinforcing cage shall accommodate the delivery tube system. Tremies shall not be used for piles without space for a 250-mm tube.

Spillage of concrete into the slurry during concrete placing operations shall not be allowed. Delivery tubes shall be capped with a watertight cap, or plugged above the slurry level with a good quality, tight fitting, moving plug that will expel the slurry from the tube as the tube is charged with concrete. The cap or plug shall be designed to be released as the tube is charged. The pump discharge or tremie tube shall extend to the bottom of the hole before charging the tube with concrete. After charging the delivery tube system with concrete, the flow of concrete through a tube shall be induced by slightly raising the discharge end. During concrete placement, the tip of the delivery tube shall be maintained as follows to prevent reentry of the slurry into the tube. Until at least 3 m of concrete has been placed, the tip of the delivery tube shall be within 150 mm of the bottom of the drilled hole, and then the embedment of the tip shall be maintained at least 3 m below the top surface of the concrete. Rapid raising or lowering of the delivery tube shall not be permitted. If the seal is lost or the delivery tube becomes plugged and must be removed, the tube shall be withdrawn, the tube cleaned, the tip of the tube capped to prevent entrance of the slurry, and the operation restarted by pushing the capped tube 3 m into the concrete and then reinitiating the flow of concrete.

When slurry is used, a fully operational standby concrete pump, adequate to complete the work in the time specified, shall be provided at the site during concrete placement. The slurry level shall be maintained within 300 mm of the top of the drilled hole.

A log of concrete placement for each drilled hole shall be maintained by the Contractor when concrete is deposited under slurry. The log shall show the pile location, tip elevation, dates of excavation and concrete placement, total quantity of concrete deposited, length and tip elevation of any casing, and details of any hole stabilization method and materials used. The log shall include a 215 mm x 280 mm sized graph of the concrete placed versus depth of hole filled. The graph shall be plotted continuously throughout placing of concrete. The depth of drilled hole filled shall be plotted vertically with the pile tip oriented at the bottom and the quantity of concrete shall be plotted horizontally. Readings shall be made at least at each 1.5 m of pile depth, and the time of the reading shall be indicated. The graph shall be labeled with the pile location, tip elevation, cutoff elevation, and the dates of excavation and concrete placement. The log shall be delivered to the Engineer within one working day of completion of placing concrete in the pile.

After placing reinforcement and prior to placing concrete in the drilled hole, if drill cuttings settle out of the slurry, the bottom of the drilled hole shall be cleaned. The Contractor shall verify that the bottom of the drilled hole is clean.

If temporary casing is used, concrete placed under slurry shall be maintained at a level at least 1.5 m above the bottom of the casing. The withdrawal of casings shall not cause contamination of the concrete with slurry.

Material resulting from using slurry shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Acceptance Testing and Mitigation

Vertical inspection pipes for acceptance testing shall be provided in all cast-in-drilled-hole concrete piles that are larger than 600 mm in diameter, except when the holes are dry or when the holes are dewatered without the use of temporary casing to control ground water.

Inspection pipes shall be Schedule 40 polyvinyl chloride pipes with a nominal inside diameter of 50 mm. Each inspection pipe shall be capped top and bottom and shall have watertight couplers to provide a clean, dry and unobstructed 50-mm diameter clear opening from 1.0 m above the pile cutoff down to the bottom of the reinforcing cage.

If the Contractor drills the hole below the specified tip elevation, the reinforcement and the inspection pipes shall be extended to 75 mm clear of the bottom of the drilled hole.

Inspection pipes shall be placed around the pile, inside the outermost spiral or hoop reinforcement, and 75 mm clear of the vertical reinforcement, at a uniform spacing not exceeding 840 mm measured along the circle passing through the centers of inspection pipes. A minimum of 2 inspection pipes per pile shall be used. When the vertical reinforcement is not bundled and each bar is not more than 26 mm in diameter, inspection pipes may be placed 50 mm clear of the vertical reinforcement. The inspection pipes shall be placed to provide the maximum diameter circle that passes through the centers of the inspection pipes while maintaining the clear spacing required herein. The pipes shall be installed in straight alignment, parallel to the main reinforcement, and securely fastened in place to prevent misalignment during installation of the reinforcement and placing of concrete in the hole.

The Contractor shall log the location of the inspection pipe couplers with respect to the plane of pile cut off, and these logs shall be delivered to the Engineer upon completion of the placement of concrete in the drilled hole.

After placing concrete and before requesting acceptance tests, each inspection pipe shall be tested by the Contractor in the presence of the Engineer by passing a 48.3-mm diameter rigid cylinder 610 mm long through the complete length of pipe. If the 48.3-mm diameter rigid cylinder fails to pass any of the inspection pipes, the Contractor shall attempt to pass a 32.0-mm diameter rigid cylinder 1.375 m long through the complete length of those pipes in the presence of the Engineer. If an inspection pipe fails to pass the 32.0-mm diameter cylinder, the Contractor shall immediately fill all inspection pipes in the pile with water.

The Contractor shall replace each inspection pipe that does not pass the 32.0-mm diameter cylinder with a 50.8-mm diameter hole cored through the concrete for the entire length of the pile. Cored holes shall be located as close as possible to the inspection pipes they are replacing and shall be no more than 150 mm inside the reinforcement. Coring shall not damage the pile reinforcement. Cored holes shall be made with a double wall core barrel system utilizing a split tube type inner barrel. Coring with a solid type inner barrel will not be allowed. Coring methods and equipment shall provide intact cores for the entire length of the pile concrete. The coring operation shall be logged by an Engineering Geologist or Civil Engineer licensed in the State of California and experienced in core logging. Coring logs shall include complete descriptions of inclusions and voids encountered during coring, and shall be delivered to the Engineer upon completion. Concrete cores shall be preserved, identified with the exact location the core was recovered from within the pile, and made available for inspection by the Engineer.

Acceptance tests of the concrete will be made by the Engineer, without cost to the Contractor. Acceptance tests will evaluate the homogeneity of the placed concrete. Tests will include gamma-gamma logging. Tests may also include crosshole sonic logging and other means of inspection selected by the Engineer. The Contractor shall not conduct operations within 8.0 m of the gamma-gamma logging operations. The Contractor shall separate reinforcing steel as necessary to allow the Engineer access to the inspection pipes to perform gamma-gamma logging or other acceptance testing. After requesting acceptance tests and providing access to the piling, the Contractor shall allow 3 weeks for the Engineer to conduct these tests and make determination of acceptance if the

48.3-mm diameter cylinder passed all inspection pipes, and 4 weeks if only the 32.0-mm diameter cylinder passed all inspection pipes. Should the Engineer fail to complete these tests within the time allowance, and if in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in inspection, the delay will be considered a right of way delay as specified in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

All inspection pipes and cored holes in a pile shall be dewatered and filled with grout after notification by the Engineer that the pile is acceptable. Placement and removal of water in the inspection pipes shall be at the Contractor's expense. Grout shall conform to the provisions in Section 50-1.09, "Bonding and Grouting," of the Standard Specifications. The inspection pipes and holes shall be filled using grout tubes that extend to the bottom of the pipe or hole or into the grout already placed.

If acceptance testing performed by the Engineer determines that a pile does not meet the requirements of the specifications, then that pile will be rejected and all depositing of concrete under slurry or concrete placed using temporary casing for the purpose of controlling groundwater shall be suspended until written changes to the methods of pile construction are approved in writing by the Engineer.

The Contractor shall submit to the Engineer for approval a mitigation plan for repair, supplementation, or replacement for each rejected cast-in-drilled-hole concrete pile, and this plan shall conform to the provisions in Section "Working drawings," of these special provisions. Prior to submitting this mitigation plan, the Engineer will hold a repair feasibility meeting with the Contractor to discuss the feasibility of repairing rejected piling. The Engineer will consider the size of the defect, the location of the defect, and the design information and corrosion protection considerations for the pile. This information will be made available to the Contractor, if appropriate, for the development of the mitigation plan. If the Engineer determines that it is not feasible to repair the rejected pile, the Contractor shall not include repair as a means of mitigation and shall proceed with the submittal of a mitigation plan for replacement or supplementation of the rejected pile.

If the Engineer determines that a rejected pile does not require mitigation due to structural, geotechnical, or corrosion concerns, the Contractor may elect to 1) repair the pile per the approved mitigation plan, or 2) not repair anomalies found during acceptance testing of that pile. For such unrepaired piles, the Contractor shall pay to the State, $400 per cubic meter for the portion of the pile affected by the anomalies. The volume, in cubic meters, of the portion of the pile affected by the anomalies, shall be calculated as the area of the cross-section of the pile affected by each anomaly, in square meters, as determined by the Engineer, multiplied by the distance, in meters, from the top of each anomaly to the specified tip of the pile. If the volume calculated for one anomaly overlaps the volume calculated for additional anomalies within the pile, the calculated volume for the overlap shall only be counted once. In no case shall the amount of the payment to the State for any such pile be less than $400. The Department may deduct the amount from any moneys due, or that may become due the Contractor under the contract.

Pile mitigation plans shall include the following:

A. The designation and location of the pile addressed by the mitigation plan.
B. A review of the structural, geotechnical, and corrosion design requirements of the rejected pile.
C. A step by step description of the mitigation work to be performed, including drawings if necessary.

D. An assessment of how the proposed mitigation work will address the structural, geotechnical, and corrosion design requirements of the rejected pile.
E. Methods for preservation or restoration of existing earthen materials.
F. A list of affected facilities, if any, with methods and equipment for protection of these facilities during mitigation.
G. The State assigned contract number, bridge number, full name of the structure as shown on the contract plans, District-County-Route-Kilometer Post, and the Contractor's (and Subcontractor's if applicable) name on each sheet.
H. A list of materials, with quantity estimates, and personnel, with qualifications, to be used to perform the mitigation work.
I. The seal and signature of an engineer who is licensed as a Civil Engineer by the State of California.

For rejected piles to be repaired, the Contractor shall submit a pile mitigation plan that contains the following additional information:

A. An assessment of the nature and size of the anomalies in the rejected pile.
B. Provisions for access for additional pile testing if required by the Engineer.

For rejected piles to be replaced or supplemented, the Contractor shall submit a pile mitigation plan that contains the following additional information:

A. The proposed location and size of additional piling.
B. Structural details and calculations for any modification to the structure to accommodate the replacement or supplemental piling.

All provisions for cast-in-drilled-hole concrete piling shall apply to replacement piling.

The Contractor shall allow the Engineer 3 weeks to review the mitigation plan after a complete submittal has been received.

Should the Engineer fail to review the complete pile mitigation submittal within the time specified, and if, in the opinion of the Engineer, the Contractor's controlling operation is delayed or interfered with by reason of the delay in reviewing the pile mitigation plan, an extension of time commensurate with the delay in completion of the work thus caused will be granted in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

When repairs are performed, the Contractor shall submit a mitigation report to the Engineer within 10 days of completion of the repair. This report shall state exactly what repair work was performed and quantify the success of the repairs relative to the submitted mitigation plan. The mitigation report shall be stamped and signed by an engineer that is licensed as a Civil Engineer by the State of California. The mitigation report shall show the State assigned contract number, bridge number, full name of the structure as shown on the contract plans, District-County-Route-Kilometer Post, and the Contractor (and Subcontractor if applicable) name on each sheet. The Engineer will be the sole judge as to whether a mitigation proposal is acceptable, the mitigation efforts are successful, and to whether additional repairs, removal and replacement, or construction of a supplemental foundation is required.

MEASUREMENT AND PAYMENT (PILING)

Measurement and payment for the various types and classes of piles shall conform to the provisions in Sections 49-6.01, "Measurement," and 49-6.02, "Payment," of the Standard Specifications and these special provisions.

Payment for cast-in-place concrete piling shall conform to the provisions in Section 49-6.02, "Payment," of the Standard Specifications and these special provisions except that, when the diameter of cast-in-place concrete piling is shown on the plans as 600 mm or larger, reinforcement in the piling will be paid for by the kilogram as bar reinforcing steel (bridge).

Full compensation for slurry, depositing concrete under slurry, test batches, inspection pipes, filling inspection holes and pipes with grout, drilling oversized cast-in-drilled-hole concrete piling, filling cave-ins and oversized piles with concrete, and redrilling through concrete, shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, per meter for cast-in-drilled-hole concrete piling of the types and sizes listed in the Engineer's Estimate, and no additional compensation will be allowed therefor.

The contract price paid per meter for cast-in-drilled-hole concrete piling (rock socket) of the sizes listed in the Engineer's Estimate shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in drilling or coring holes, disposing of the material resulting from drilling or coring holes, and furnishing and placing concrete , complete in place, to the required penetration, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer. Reinforcement in cast-in-drilled-hole concrete piling (rock socket) will be paid for by the kilogram as bar reinforcement steel (bridge).

When the elevation of the moderately hard rock surface is lower than anticipated on the bridge plans, the additional cast-in-drilled-hole concrete piling, including inspection pipes, and bar reinforcing steel, required to maintain the length of cast-in-drilled-hole concrete piling (rock socket) into bedrock, as shown on the plans, will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications.

When the elevation of the moderately hard rock surface is higher than anticipated on the bridge plans, the additional rock drilling or coring, required to extend the piling to the specified tip elevation, as shown on the plans, will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications.

Full compensation for conforming to the provisions in "Steel Pipe Piling" and "Nondestructive Testing" of these special provisions shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

10-1.25 TIEDOWN ANCHORS

Tiedown anchors in bridge footings; consisting of steel bar tendons with anchorage assemblies that are grouted in cored, formed, and drilled holes; shall conform to the provisions in Section 50, "Prestressing Concrete," of the Standard Specifications, these special provisions, and the details shown on the plans.

Whenever "member" is referred to in Section 50, "Prestressing Concrete," of the Standard Specifications it shall be considered to mean tiedown anchor.

Foundation recommendations are included in the "Materials Information" available to the Contractor in conformance with the provisions in Section 2-1.03, "Examination of Plans, Specifications, Contract, and Site of Work," of the Standard Specifications.

Difficult tiedown installation is anticipated due to the presence of caving soils, hazardous and contaminated materials, high ground water, cobbles and boulders, subsurface concrete debris, rock cuttings, timber piles, low overhead clearance, underground utilities, overhead utilities, and the requirements of tiedown embedment into rock.

The Contractor shall determine the bond length necessary to meet acceptance criteria specified herein.

The submittal of microfilms will not be required for tiedown anchor installations.

Alternative details for the anchorage enclosure device may be submitted to the Engineer for approval if necessary to accommodate the anchorage assembly being used.

MATERIALS

The steel tube and bearing plate of the anchorage assembly shall conform to the provisions of Section 75-1.03, "Miscellaneous Bridge Metal," of the Standard Specifications. The steel tube and bearing plate shall be galvanized after fabrication.

Grout shall conform to the provisions in Section 50-1.09, "Bonding and Grouting," of the Standard Specifications. The grout will not be required to pass through a screen with a 1.7 mm maximum clear opening prior to being introduced into the grout pump. Fine aggregate may be added to the grout mixture of portland cement and water outside of the grouted sheathing in drilled holes that are 200 mm or greater in diameter, but only to the extent that the cement content of the grout is not less than 500 kg/m^3 of grout. Fine aggregate, if used, shall conform to the provisions in Section 90-2, "Materials," and Section 90-3, "Aggregate Gradings," of the Standard Specifications.

When a bond breaker is shown on the plans near the bearing plate, the bond breaker shall be a 6 mm premolded joint filler conforming to the provisions in Section 51-1.12C, "Premolded Expansion Joint Fillers," of the Standard Specifications.

Smooth and corrugated plastic sheathing, including joints, shall be watertight. Polyvinyl chloride (PVC) sheathing shall conform to ASTM Designation: D 1784, Class 13464-B. High density polyethylene (HDPE) sheathing shall have a density between 0.940 and 0.960-g/cm^3 as measured in accordance with ASTM Designation: D 792, A-2. Corrugated plastic sheathing shall be PVC or HDPE.

The transition between the corrugated plastic sheathing and the anchorage assembly shall be an approved detail that allows stressing to the design force without evidence of distress in the corrugated plastic sheathing.

Corrugated sheathing for bar tendons shall have a nominal wall thickness of 1.0 mm.

Strand type tendons shall not be used.

CONSTRUCTION

Tiedown anchors shall be installed in accordance with the manufacturer's recommendations. In case of a conflict between the manufacturer's recommendations and these special provisions, these special provisions shall prevail.

Water and grout from tiedown anchor construction operations shall not be permitted to fall on public traffic, to flow across shoulders or lanes occupied by public traffic, or to flow into

landscaping, gutters, or other drainage facilities. Excessive amounts of water shall not be used in any of the drilling and the tiedown anchor installation procedures.

The holes drilled in the foundation materials shall be drilled to a depth sufficient to provide the necessary bond length beyond the minimum unbonded length shown on the plans. The diameter of the hole shall be large enough to provide a minimum of 25 mm grout cover over the corrugated plastic sheathing for the full-length of the tendon. Centralizers shall be used full-length of the tendon.

Tiedown anchor holes in foundation material shall be drilled by either the rotary or percussion drilling method.

Prior to installing each tiedown anchor into the anchor hole, the anchor shall be clean and free of oil, grease, dirt, or other extraneous substance.

The transition between the corrugated plastic sheathing and the anchorage assembly shall be an approved detail that allows stressing to the design force without evidence of distress in the corrugated plastic sheathing.

Tiedown anchor steel shall be protected prior to completion of all grouting against rust, corrosion, and physical damage in conformance with the provisions in Section 50, "Prestressing Concrete," of the Standard Specifications. In addition, there shall be no evidence of distress in the plastic sheathing or crushing of the cement grout within the sheathing.

Pregrouting shall occur at least 48 hours before placing the tendon in the drilled hole.

Tiedown anchor grout placed in the drilled hole shall be placed using grout tubes.

Grout for all stages shall be injected at the low end of the void being filled and shall be expelled at the high end until there is no evidence of entrapped air, water, or diluted grout.

After initial grouting, the tiedown anchor shall remain undisturbed until the grout has reached a strength sufficient to provide anchorage during load testing.

Secondary grouting shall be completed after the tiedown anchor has been locked off at the required load.

The bar tendons in the unbonded area shall be sheathed with smooth plastic that extends into the steel tube of the permanent tiedown anchorage assembly, as shown on the plans. For this portion of smooth sheathing there is no minimum wall thickness and the sheathing shall be either PVC or HDPE.

In addition, bar tendons shall be sheathed full-length with corrugated plastic where shown on the plans. The annular space between the bar and the corrugated sheathing shall be pregrouted prior to placing the tendons in the drilled hole.

There shall be a seal between the smooth sheathing and the corrugated sheathing at the top and bottom of the length of smooth sheathing.

For bar tendons, the initial grout in the drilled hole may be placed before or after insertion of the bar tendons.

For drilled holes 150 mm in diameter or less, the initial grouting outside of the corrugated plastic sheathing shall extend to 600 mm below the end of the steel tube of the anchorage assembly. For drilled holes greater than 150 mm in diameter the initial grouting outside of the corrugated plastic sheathing shall be within the limits of the bonded length.

Testing

All tiedowns shall be load tested by either a performance test or a proof test. The magnitude of applied test loads shall be determined with a calibrated pressure gauge or a load cell. Movements of the end of the tiedown anchor, relative to an independent fixed reference point, shall be measured

and recorded to the nearest 0.025-mm at each load increment during the load tests. The Contractor shall perform the measuring and recording.

At the completion of testing tiedown anchors, or when requested by the Engineer, the Contractor shall furnish to the Engineer complete test results for each tiedown anchor tested. Data for each test shall list key personnel, test loading equipment, tiedown anchor location, hole diameter, method of drilling, and bonded and unbonded length of tiedown anchor. Test data shall also list quantity of grout and grout pressure used within the bonded length of the tiedown anchor, amount of ground water encountered, the time and dates of drilling, tiedown anchor installation, grouting, and testing. The tiedown anchor end movements at each increment of load or at each increment of time during the load hold period of the loading schedule shall be included in the test data.

Load testing shall be performed against temporary bearing yokes that bear directly against the permanent bearing plate. Tiedown anchors shall not be stressed against new footing concrete until the concrete has attained a compressive strength of 18 MPa. Temporary yokes shall remain the property of the Contractor.

A minimum of 10 percent of the total number of tiedown anchors, but not less than two anchors shall be performance tested at each footing. The Engineer shall determine the location of the tiedown anchors to be performance tested.

The performance test or proof test shall be conducted by measuring the test load applied to the tiedown anchor and recording the tiedown anchor end movement (measured at the end of the tiedown anchor) during incremental loading and unloading the tiedown anchor in accordance with the loading schedule. The test load shall be held constant for 10 minutes. During the load hold, the movement of the end of the tiedown anchor shall be measured at 1, 2, 3, 4, 5, 6, and 10 minutes. If the total recorded movement between one minute and 10 minutes exceeds 1.0 mm, the test load shall be held for an additional 50 minutes. Total movement shall be measured at 15, 20, 25, 30, 45, and 60 minutes. If the load is held for 60 minutes, a creep curve showing the creep movement between one minute and 60 minutes shall be plotted as a function of the logarithm of time.

LOADING SCHEDULES		
PERFORMANCE TEST		PROOF TEST
	(CONT'D)	
AL	AL	AL
0.25T	0.25T	0.25T
AL	0.50T	0.50T
0.25T	0.75T	0.75T
0.50T	1.00T	1.00T
AL	1.25T	1.25T
0.25T	AL	1.50T (TEST LOAD)
0.50T	0.25T	AL
0.75T	0.50T	
AL	0.75T	
0.25T	1.00T	
0.50T	1.25T	
0.75T	1.50T (TEST LOAD)	
1.00T (CONT'D)	AL	
T = Design force for the anchor shown on the plans		
AL = Alignment load		

For performance and proof tests, each increment of load shall be applied in less than one minute and held for at least one minute but not more than 2 minutes or as specified above. The observation period for the load hold shall start when the pump begins to apply the last increment of load.

The jacking equipment, including the tiedown anchor movement measuring system, shall be stable during all phases of the tiedown anchor loading operations.

All tiedown anchors not performance tested shall be proof tested. If 1.5 times the design force cannot be obtained, the tiedown anchor shall be replaced. Tiedown anchors shall not be retested unless the tiedown bond length is post-grouted after the unacceptable test.

A performance tested or proof tested tiedown anchor shall conform to the following acceptance criteria:

A. The measured elastic movement of the end of the tiedown tendon exceeds 0.80 of the theoretical elongation of the unbonded length plus the jacking length at the maximum test load; and
B. The creep movement of the end of the tiedown anchor, between one and 10 minutes, is less than 1.0 mm.

Lock-off

After successful testing of the tiedown anchors, the tiedown anchors shall be locked off at the force shown on the plans. The lock-off force is the load on the jacks that is maintained while the tiedown anchor head or anchor nuts on the tiedown anchor are permanently set. Immediately after lock-off, a lift-off test shall be performed to demonstrate that the specified lock-off force was obtained. Adjustments in the shim thickness shall be made if required to achieve the specified lock-off force.

After lock-off, the grout shall be extended to the secondary grout level shown on the plans. At least 24 hours after the secondary grout has set, the remaining void in the steel tube and bearing plate shall be filled with grout. Grout shall be injected at the low end and expelled at the high end until there is no evidence of entrapped air or water. A minimum grout head of 600 mm shall be maintained until the grout has set.

MEASUREMENT AND PAYMENT

No payment will be made for tiedown anchors that do not pass the specified testing requirements.

Tiedown anchors will be measured and paid for by the unit, and the number for payment will be determined by the requirements of the details shown on the plans.

The contract unit price paid for tiedown anchor shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in constructing the tiedown anchors (including testing), complete in place, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

10-1.25 CONCRETE STRUCTURES

Portland cement concrete structures shall conform to the provisions in Section 51, "Concrete Structures," of the Standard Specifications and these special provisions.

Shotcrete shall not be used as an alternative construction method for reinforced concrete members unless otherwise specified.

In particularly congested areas of the structures, such as the columns, a maximum combined aggregate grading of 12.5-mmconforming to the requirements in Section 90-3, "Aggregate Gradings," of the Standard Specifications may be used when approved by the Engineer.

MASS CONCRETE

Mass concrete shall conform to the requirements of Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions. Mass concrete construction shall include modeling, providing temperature control and monitoring during placement.

Components listed in the table below shall be considered mass concrete:

Location	Mass Concrete Components
Bents W3L, W4L, W5L, W6L, W3R, W4R, W5R, W6R (North), and Bent 7	Footing

The Contractor shall control the internal and surface temperature of mass concrete during curing in accordance with the Thermal Control Plan specified herein. Temperature modeling and temperature monitoring is required for the placement of mass concrete. The maximum internal temperature of the mass concrete once placed shall not exceed 65°C and the maximum temperature difference between any surface of the mass concrete and the calculated hottest point will be controlled as described in the Thermal Control Plan.

The concrete temperature shall be monitored by thermocouples or other temperature sensors placed into the concrete, as required in the Thermal Control Plan. Use of ice, liquid nitrogen, insulated curing blankets, insulated forms, cooling pipes and other measures may be necessary to satisfy the temperature requirements.

Materials

Cementitious material for mass concrete may be a combination of mineral admixture conforming to Section 90-2.04 of the Standard Specifications and portland cement or a combination of slag cement mineral admixture conforming to Grade 100 or 120 of ASTM Designation: C989 and portland cement.

The cement content for mass concrete not containing slag cement mineral admixtures shall be a minimum of 50 percent by mass, and the content of mineral admixture conforming to Section 90-2.04 of the Standard Specifications shall be a maximum of 50 percent by mass, of the cementitious material content.

The cement content for mass concrete containing a slag cement mineral admixture shall be a minimum of 40 percent by mass, and the content of slag cement mineral admixture shall be from 40 percent to 60 percent by mass of the total cementitious material to be used in the mix.

Whenever the cementitious material content of mass concrete is composed of more than 35% mineral admixture by mass as provided in these special provisions, an additional 62 days will be allowed to obtain the specified compressive strength shown on the plans.

Thermal Control Plan

Prior to commencing any mass concrete placement, the Contractor shall submit a Thermal Control Plan with design calculations in conformance with the provisions in "Working Drawings" of these special provisions to the Engineer for approval for each mass concrete structure component. The number of sets of the Thermal Control Plan and design calculations shall be the same as those specified for falsework working drawings in Section 51-1.06A, "Falsework Design and Drawings," of the Standard Specifications. After the final Thermal Control Plan is submitted, the Contractor shall allow the Engineer 20 working days for review and acceptance. The Thermal Control Plan shall be based on the design assumption that cracking of the concrete as a result of heat of hydration shall not occur. Analysis shall be performed to determine the maximum allowable temperature differentials between the hottest point of the concrete and the exterior faces. The Thermal Control Plan shall include the following:

A. Mix design.
B. Duration and method of curing.
C. Procedures to control concrete temperature at time of placement.
D. Methods of controlling temperature differentials.
E. Temperature sensor types and locations.
F. Temperature monitoring and recording system.
G. Dimensions of each typical mass concrete placement, including all locations in the structure to be represented by that placement.
H. Types and dimensions of materials to be used for mass concrete forms and insulation, and time frames for when the concrete forms and insulation will be removed, including time periods for removal and reinstallation of insulation where required as part of the thermal control plan
I. Assumptions for average ambient air and average surface rock temperature for time period of placement and curing of each typical mass concrete element.
J. If multiple lifts with time delay are proposed, provide lift height and define time delay between lifts.
K. Include a placing diagram showing the typical mass concrete placement sequence and construction joint locations, if any.
L. Identify areas where steep cooling gradients may occur, and how cracking will be avoided.
M. Predict peak temperature, peak differential temperatures and at what approximate times they will occur.
N. Define allowable time periods for placing or removing insulation and or forms.
O. A summary of the modeling assumptions used in the analysis.
P. Field measures to ensure conformance with the maximum concrete temperature and temperature differential requirements.
Q. Identify contingency operations to be implemented to control the internal temperature of the concrete should the maximum allowable or the maximum allowable differential temperature be exceeded. For post cooling systems after the peak internal temperature is reached, include the maximum cooling rate at which cracking will not occur.

Temperature modeling for each typical placement shall be included with each thermal control plan submittal. As a minimum, the modeling for each typical placement shall consist of performing a two-dimensional finite-difference analysis (see ACI 207.1R-96). The analysis shall be based on the Contractor's actual mix designs. The coefficient of thermal expansion of the concrete used in the modeling shall be determined by testing of the proposed mixes in accordance with US Army Corps of Engineer's Method CRD-C39-81, "Test Method of Coefficient of Linear Thermal Expansion of Concrete." The heat of hydration used in the modeling for the cementitious blend used in the proposed mix designs shall be tested at 1, 3, 7, and 28 days in accordance with the requirements in ASTM Designation: C 186, "Heat of Hydration of Hydraulic Cement".

Construction

Prior to mass concrete placement, an engineer for the Contractor who is registered as a Civil Engineer in the State of California shall inspect and test the temperature monitoring and recording system. The Contractor's registered engineer shall be present at the jobsite when the mass concrete operation is in progress and shall report to the Engineer in writing on a daily basis the progress of the operation. A copy of the daily report shall be available at the jobsite.

If the Contractor elects to use a mechanical cooling system, the mechanical cooling system shall be designed in conformance with the Thermal Control Plan and the following requirements:

A. The mechanical cooling system shall be embedded within mass concrete elements and surface connections to cooling pipes shall be removable to a depth of 100 mm from the surface.
B. Aluminum, copper, or any other dissimilar metal that can cause a corrosion cell with the steel reinforcing shall not be used as cooling pipes.
C. Forms shall be designed so that removal of the forms shall not disrupt the cooling or temperature monitoring.
D. Cooling pipes shall not break or deform during mass concrete placement and shall be secured to prevent movement. Damaged cooling pipes shall be removed and replaced immediately.
E. The mechanical cooling system shall be pressure tested in the presence of the Engineer at 120 percent of the maximum service pressure. The test pressure shall be held for 15 minutes. All leaks shall be repaired and the cooling pipe system shall be retested by the Contractor until the system is free of leaks.
F. After cooling is completed the cooling water shall be discharged and the cooling pipes shall be thoroughly flushed with potable water. Cooling water and wash water shall be discharged in conformance with "Non-Storm Water Discharges" of these special provisions.
G. After the mechanical cooling system is no longer needed the cooling pipes shall be fully grouted under pressure with a nonshrink grout mixture in conformance with ASTM Designation: C 1107 and ASTM Designation: C 827 for 0.0 percent shrinkage, and 0.0 percent minimum and 4.0 percent maximum expansion. The placement of nonshrink grout shall be in conformance with the manufacturer's recommendations.
H. After surface connections to the cooling pipes are removed, the holes shall be reamed and filled with mortar conforming to Section 51-1.135, "Mortar," of the Standard Specifications.

The Contractor may use seawater as cooling water provided that the final temperature of the seawater before discharging back into the bay does not exceed the permit requirements. Holding tanks may be used to cool the water to the required temperature before discharging back into the bay.

The Contractor shall house the pump intake in a manner that prevents injury to fish or other aquatic species and prevent fish entrapment.

Temperature sensors shall be located such that the maximum temperature difference within a mass concrete element can be monitored. As a minimum, the concrete temperature shall be monitored at the calculated hottest point of the concrete, on at least two vertical faces, two corners, and at the center of the top and bottom faces of each pour. For all mass concrete placements, air temperature shall be measured and recorded. If a post-cooling system is used, inlet and outlet water temperatures shall be measured and recorded. The outlet sensors shall be placed within 75 mm of the concrete surface.

Temperature readings shall be automatically recorded on an hourly basis. A redundant set of sensors shall be installed near the primary set. Provision shall be made for recording the redundant set, but records of the redundant sensors need not be made if the primary set is operational. Temperature monitoring may be discontinued when the maximum internal temperature is falling, the maximum allowable temperature difference is greater than the difference between the interior concrete temperature and the average daily temperature for three consecutive days, and there are no mass concrete elements to be cast adjacent.

Methods of concrete consolidation shall prevent damage to the temperature monitoring and recording system. Wiring from thermocouples that must be cast into the concrete shall be protected to prevent movement. Wire runs shall be as short as possible. The ends of the temperature sensors shall not come into contact with either a support or concrete form, or bar reinforcing steel. Temperature monitoring equipment shall be capable of printing and storing data and shall be able to download monitoring data to a computer. Data shall be downloaded and submitted daily to the Engineer.

After the mass concrete pour has been topped out and finished, it shall be revibrated and refinished. Revibration shall extend below the top mat of reinforcement and shall be done as late as the concrete will again respond to vibration. For concrete pours without top reinforcement, revibration shall extend to a depth of 150 mm.

During monitoring, should the specified maximum internal temperature of the mass concrete be exceeded or the maximum allowable temperature difference between any surface of the mass concrete and the hottest point be exceeded, the Contractor shall take immediate measures to correct the situation as specified in the Thermal Control Plan. At the completion of monitoring, the actual readings for the mass concrete element shall be compared with those predicted by the modeling and a summary report shall be prepared by the Contractor's engineer. The report shall include all supplementary or contingency measures implemented and suggested corrections to any future modeling or monitoring to be performed. The summary report shall contain all the temperature data collected for each instrument, both in hard copy and in digital form on diskette. Digital data shall be in Microsoft Excel format or as otherwise approved by the Engineer. The summary report shall also have the data shown in a graphical format with all instruments for a given mass concrete element shown on the same page with time as the horizontal axis. The summary report shall be submitted within one week of completing the monitoring of the mass concrete element.

Acceptance

Mass concrete shall conform to the concrete acceptance criteria and the following temperature requirements:

A. The maximum allowable temperature of mass concrete shall not exceed 65°C.
B. The maximum temperature differential of mass concrete shall not exceed the requirement as determined in the Thermal Control Plan.

If the Contractor fails to conform to any of the temperature requirements above, the mass concrete elements will be rejected. The rejected mass concrete shall be removed at the Contractor's expense. The Contractor shall modify the Thermal Control Plan and design calculations to correct the problem and resubmit the revised Thermal Control Plan.

The Contractor shall allow the Engineer 2 weeks for review and approval of the revised Thermal Control Plan. Mass concrete placement shall not begin until the Engineer has approved the revised Thermal Control Plan. No extension of time or compensation will be made for any rejected mass concrete element or revisions of the Thermal Control Plan.

The Contractor shall remove all equipment and materials from the mass concrete element and clean the surface for the Engineer to measure the crack intensity. Surface crack intensity will be determined after monitoring shows the maximum internal temperature has dropped to within 5°C of the outer concrete temperature. Cracking shall be considered excessive if a surface crack intensity on any face of a concrete surface where cracks greater than 0.15 mm in width measure more than 1.0 m in cumulative length within any 2 m square area or where individual cracks greater than 0.15 mm in width measure more than 300 mm in length.

In case of excessive cracking, the Contractor shall suspend further work on members of similar size and configuration, submit a written explanation of the thermal cracking and additional steps to be taken in future to eliminate excessive cracking, and submit proposed modifications in writing to the Engineer for review. Concrete placement shall not be resumed until the Engineer approves the proposed modifications.

Cracks greater than 0.15 mm in width shall be repaired. Cracks greater than 0.15 mm in width and longer than 300 mm shall be filled with pressure-injected epoxy. Cracks to be filled shall be cleaned and filled by pressure injection methods so that all portions of the crack are completely filled with epoxy. No repairs shall begin until the Engineer has approved the repair plan.

Core drilling may be necessary, as determined by the Engineer and at the Contractor's expense, to sample and examine the extent of the cracking and crack filling. The minimum depth of core sampling for mass concrete shall be 0.6 m and the number of cores taken per mass concrete element shall be in accordance with ASTM Designation: C 823. Prior to coring, the Contractor shall identify the location of the main reinforcing steel. The holes shall be cored by methods that will not shatter or damage the concrete adjacent to the holes. Water for core drilling operations shall be fresh water. The coring water shall be disposed in conformance with the requirements in "Non-Storm Water Discharges" of these special provisions. Immediately after coring, the concrete cores shall be identified by the Contractor with a description of the core locations and submitted to the Engineer for inspection.

If any reinforcement is cut during coring, coring operations shall be terminated, and the Contractor shall submit to the Engineer for approval, the procedure proposed to repair the cut reinforcement and to prevent further cutting of reinforcement. All cored holes shall be filled with nonshrink grout. Cracks not showing full penetration with epoxy shall be reinjected.

Full compensation for conforming to the above requirements shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no additional compensation will be allowed therefor.

MEASUREMENT AND PAYMENT

Measurement and payment for concrete in structures shall conform to the provisions in Section 51-1.22, "Measurement," and Section 51-1.23, "Payment," of the Standard Specifications and these special provisions.

10-1.26 REINFORCEMENT

Reinforcement shall conform to the provisions in Section 52, "Reinforcement," of the Standard Specifications and these special provisions.

The Department's mechanical splices prequalified list can be found at the following internet site:

http://www.dot.ca.gov/hq/esc/approved_products_list/

The provisions of "Welding Quality Control" of these special provisions shall not apply to resistance butt welding.

MEASUREMENT AND PAYMENT

Measurement and payment for reinforcement in structures shall conform to the provisions in Section 52-1.10, "Measurement," and Section 52-1.11, "Payment," of the Standard Specifications and these special provisions.

Full compensation for couplers as shown on the plans shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, paid per kilogram for bar reinforcing steel (bridge) and no additional compensation will be allowed therefor.

10-1.27 ROADSIDE SIGNS

Roadside signs shall be furnished and installed at the locations shown on the plans or where designated by the Engineer and in conformance with the provisions in Section 56-2, "Roadside Signs," of the Standard Specifications and these special provisions.

The Contractor shall furnish roadside sign panels in conformance with the provisions in "Furnish Sign" of these special provisions.

Wood posts shall be pressure treated after fabrication in conformance with the provisions in Section 58, "Preservative Treatment of Lumber, Timber and Piling," of the Standard Specifications and AWPA Use Category System: UC4A, Commodity Specification A or B.Type N, Type P, and Type R marker panels mounted on a post with a roadside sign shall be considered to be sign panels and will not be paid for as markers.

10-1.28 FURNISH SIGN

Signs shall be fabricated and furnished in accordance with details shown on the plans, the Traffic Sign Specifications, and these special provisions.

Traffic Sign Specifications for California sign codes are available for review at the Department's internet site:

http://www.dot.ca.gov/hq/traffops/signtech/signdel/specs.htm

Traffic Sign Specifications for signs referenced with Federal MUTCD sign codes can be found in Standard Highway Signs Book, administered by the Federal Highway Administration, which is available for review at the following Internet website:

http://mutcd.fhwa.dot.gov/ser-pubs.htm

Information on cross-referencing California sign codes with the Federal MUTCD sign codes is available at the Department's internet site:

http://www.dot.ca.gov/hq/traffops/signtech/signdel/specs.htm

Temporary or permanent signs shall be free from blemishes that may affect the serviceability and detract from the general sign color and appearance when viewing during daytime and nighttime from a distance of 8 m. The face of each finished sign shall be uniform, flat, smooth, and free of defects, scratches, wrinkles, gel, hard spots, streaks, extrusion marks, and air bubbles. The front, back, and edges of the sign panels shall be free of router chatter marks, burns, sharp edges, loose rivets, delaminated skins, excessive adhesive over spray and aluminum marks.

QUALITY CONTROL FOR SIGNS

The requirements of "Quality Control for Signs" in this section shall not apply to construction area signs.

No later than 14 days before sign fabrication, the Contractor shall submit a written copy of the quality control plan for signs to the Transportation Laboratory, Materials Engineering and Testing Services (METS), Telephone (916) 227-7291. METS will have 10 days to review the quality control plan. Sign fabrication shall not begin until METS approves the Contractor's quality control plan in writing. The Contractor shall submit to the Engineer at least 3 copies of the approved quality control plan. The quality control plan shall include, but not be limited to the following requirements:

1. Identification of the party responsible for quality control of signs,
2. Basis of acceptance for incoming raw materials at the fabrication facility,
3. Type, method and frequency of quality control testing at the fabrication facility,
4. List (by manufacturer and product name) of process colors, protective overlay film, retroreflective sheeting and black non-reflective film,
5. Recommended cleaning procedure for each product,
6. Method of packaging, transport and storage for signs.

No legend shall be installed at the project site. Legend shall include letters, numerals, tildes, bars, arrows, route shields, symbols, logos, borders, artwork, and miscellaneous characters. The style, font, size, and spacing of the legend shall conform to the Standard Alphabets published in the FHWA Standard Highway Signs Book. The legend shall be oriented in the same direction in accordance with the manufacturer's orientation marks found on the retroreflective sheeting.

On multiple panel signs, legend shall be placed across joints without affecting the size, shape, spacing, and appearance of the legend. Background and legend shall be wrapped around interior edges of formed panel signs as shown on plans to prevent delamination.

The following notation shall be placed on the lower right side of the back of each sign where the notation will not be blocked by the sign post or frame:

1. PROPERTY OF STATE OF CALIFORNIA.
2. Name of the sign manufacturer.
3. Month and year of fabrication.
4. Type of retroreflective sheeting
5. Manufacturer's identification and lot number of retroreflective sheeting.

The above notation shall be applied directly to the aluminum sign panels in 6-mm upper case letters and numerals by die-stamp and applied by similar method to the fiberglass reinforced plastic signs. Painting, screening, or engraving the notation will not be allowed. The notation shall be applied without damaging the finish of the sign.

Signs with a protective overlay film shall be marked with a dot of 10 mm diameter. The dot placed on white border shall be black while the dot placed on black border shall be white. The dot shall be placed on the lower border of the sign before application of the protective overlay film and shall not be placed over the legend and bolt holes. The application method and exact location of the dot shall be determined by the manufacturer of the signs.

For sign panels that have a minor dimension of 1220 mm or less, no splice will be allowed in the retroreflective sheet except for the splice produced during the manufacturing of the retroreflective sheeting. For sign panels that have a minor dimension greater than 1220 mm, only one horizontal splice will be allowed in the retroreflective sheeting.

Unless specified by the manufacturer of the retroreflective sheeting, splices in retroreflective sheeting shall overlap by a minimum of 25 mm. Splices shall not be placed within 50 mm from edges of the panels. Except at the horizontal borders, the splices shall overlap in the direction from top to bottom of the sign to prevent moisture penetration. The retroreflective sheeting at the overlap shall not exhibit a color difference under the incident and reflected light.

Signs exhibiting a significant color difference between daytime and nighttime shall be replaced immediately at the Contractor's expenses.

Repairing sign panels will not be allowed except when approved by the Engineer.

The Department will inspect signs at the Contractor's facility and delivery location, and in accordance with Section 6, "Control of Materials," of the Standard Specifications. The Engineer will inspect signs for damage and defects before and after installation.

Regardless of kind, size, type, or whether delivered by the Contractor or by a common carrier, signs shall be protected by thorough wrapping, tarping, or other methods to ensure that signs are not damaged by weather conditions and during transit. Signs shall be dry during transit and shipped on palettes, in crates, or tier racks. Padding and protective materials shall be placed between signs as appropriate. Finished sign panels shall be transported and stored by method that protects the face of signs from damage. The Contractor shall replace wet, damaged, and defective signs at the Contractor's expense.

Signs shall be stored in dry environment at all times. Signs shall not rest directly on the ground or become wet during storage. Signs, whether stored indoor or outdoor, shall be in free standing. When stored outdoor, signs shall be placed at a minimum spacing of 100 mm apart. In areas of high

heat and humidity signs shall be stored in enclosed climate-controlled trailers or containers. Signs shall be stored indoor if duration of the storage will exceed 30 days.

Screen processed signs shall be protected, transported and stored as recommended by the manufacturer of the retroreflective sheeting.

When requested, the Contractor shall provide the Engineer test samples of signs and materials used at various stages of production. Sign samples shall be 300 mm x 300 mm in size with applied background, letter or numeral, and border strip.

The Contractor shall assume the costs and responsibilities resulting from the use of patented materials, equipment, devices, and processes for the Contractor's work.

SHEET ALUMINUM

Alloy and temper designations for sheet aluminum shall be in accordance with ASTM Designation: B209.

The Contractor shall furnish the Engineer a Certificate of Compliance in accordance to Section 6-1.07, "Certificates of Compliance," of the Standard Specifications for the sheet aluminum.

Sheet aluminum shall be pretreated in accordance to ASTM Designation: B449. Surface of the sheet aluminum shall be cleaned, deoxidized, and coated with a light and tightly adherent chromate conversion coating free of powdery residue. The conversion coating shall be Class 2 with a mass between 108 mg/m^2 and 377 mg/m^2, and an average mass of 269 mg/m^2. Following the cleaning and coating process, the sheet aluminum shall be protected from exposure to grease, oils, dust, and contaminants.

Sheet aluminum shall be free of buckles, warps, dents, cockles, burrs, and defects resulting from fabrication.

Base plate for standard route marker shall be die cut.

RETROREFLECTIVE SHEETING

The contractor shall furnish retroreflective sheeting for sign background and legend in accordance with ASTM Designation: D4956 and "Prequalified and Tested Signing and Delineation Materials" of these special provisions.

Retroreflective sheeting shall be applied to sign panels as recommended by the retroreflective sheeting manufacturer without stretching, tearing, and damage.

Class 1, 3, or 4 adhesive backing shall be used for Type II, III, IV, VII, VIII, and IX retroreflective sheeting. Class 2 adhesive backing may also be used for Type II retroreflective sheeting. The adhesive backing shall be pressure sensitive and fungus resistant.

When the color of the retroreflective sheeting determined from instrumental testing is in dispute, the Engineer's visual test will govern.

PROCESS COLOR AND FILM

The Contractor shall furnish and apply screened process color, non-reflective opaque black film, and protective overlay film of the type, kind, and product that are approved by the manufacturer of the retroreflective sheeting.

The Contractor shall furnish the Engineer a Certificate of Compliance in accordance to Section 6-1.07, "Certificates of Compliance," of the Standard Specifications for the screened process color, non-reflective opaque black film, and protective overlay film.

The surface of the screened process color shall be flat and smooth. When the screened process colors determined from the instrumental testing in accordance to ASTM Designation: D4956 are in dispute, the Engineer's visual test will govern.

The Contractor shall provide patterns, layouts, and set-ups necessary for the screened process.

The Contractor may use green, red, blue, and brown reverse-screened process colors for background and non-reflective opaque black film or black screened process color for legend. The coefficient of retroreflection for reverse-screened process colors on white retroreflective sheeting shall not be less than 70 percent of the coefficient of retroreflection specified in ASTM Designation: D4956.

The screened process colors and non-reflective opaque black film shall have the same outdoor weatherability as that of the retroreflective sheeting.

After curing, screened process colors shall withstand removal when tested by applying 3M Company Scotch Brand Cellophane Tape No. 600 or equivalent tape over the color and removing with one quick motion at 90°angle.

10-1.29 ALTERNATIVE PIPE

Alternative pipe culverts shall conform to the provisions in Section 62, "Alternative Culverts," of the Standard Specifications and these special provisions.

10-1.30 PLASTIC PIPE

Plastic pipe shall conform to the provisions in Section 64, "Plastic Pipe," of the Standard Specifications and these special provisions.

10-1.31 REINFORCED CONCRETE PIPE

Reinforced concrete pipe shall conform to the provisions in Section 65, "Reinforced Concrete Pipe," of the Standard Specifications and these special provisions.

Where embankment will not be placed over the top of the pipe, a relative compaction of not less than 85 percent shall be required below the pipe spring line for pipe installed using Method 1 backfill in trench, as shown on Standard Plan A62D. Where the pipe is to be placed under the traveled way, a relative compaction of not less than 90 percent shall be required unless the minimum distance between the top of the pipe and the pavement surface is the greater of 1.2 m or one half of the outside diameter of the pipe.

Except as otherwise designated by classification on the plans or in the specifications, joints for culvert and drainage pipes shall conform to the plans or specifications for standard joints.

When reinforced concrete pipe is installed in conformance with the details shown on Standard Plan A62DA, the fifth paragraph of Section 19-3.04, "Water Control and Foundation Treatment," of the Standard Specifications shall not apply.

When solid rock or other unyielding material is encountered at the planned elevation of the bottom of the bedding, the material below the bottom of the bedding shall be removed to a depth of 1/50 of the height of the embankment over the top of the culvert, but not less than 150 mm nor more than 300 mm. The resulting trench below the bottom of the bedding shall be backfilled with structure backfill material in conformance with the provisions in Section 19-3.06, "Structure Backfill," of the Standard Specifications.

The excavation and backfill below the planned elevation of the bottom of the bedding will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications.

The Outer Bedding shown on Standard Plan A62DA shall not be compacted prior to placement of the pipe.

10-1.32 CORRUGATED METAL PIPE

Corrugated steel pipe culverts shall conform to the provisions in Section 66, "Corrugated Metal Pipe," of the Standard Specifications and these special provisions.

Attention is directed to "Earthwork" and "Controlled Low Strength Material" of these special provisions regarding structure backfill for pipe culverts.

Asphaltic mastic coating or polymeric sheet coating substituted for bituminous coating shall be placed on the outside and inside surfaces of the pipe.

Timber bulkheads shall be constructed and placed across the ends of unconnected alternative pipe culverts as shown on the plans. Wood for timber bulkheads shall be construction heart grade redwood at least 25 mm thick. Full compensation for constructing and placing timber bulkheads shall be considered as included in the contract price paid per meter for the size of alternative pipe culverts involved and no separate payment will be made therefor.

Pipe reducers will be measured and paid for by the meter as the corrugated metal pipe of the larger diameter connected to the reducer.

10-1.33 WELDED STEEL PIPE

Welded steel pipe shall conform to the provisions in Section 70, "Miscellaneous Facilities," of the Standard Specifications and these special provisions.

Wrapping will not be required.

10-1.34 BRIDGE DECK DRAINAGE SYSTEM

Bridge deck drainage systems shall conform to the provisions for miscellaneous bridge metal in Section 75, "Miscellaneous Metal," of the Standard Specifications and these special provisions.

Self-tapping screws used for sleeve connections shall be hex-head stainless steel, installed in holes drilled to fit the self-tapping screws, conforming to the requirements of ASTM Designation: A 276, Type 316.

At the Contractor's option, fiberglass pipes and fittings with the same diameter and minimum bend radius as those shown on the plans, may be substituted for welded steel pipe in deck drain systems.

Fiberglass pipe and fittings shall conform to the requirements in ASTM Designation: D 2996, and shall have a minimum short-term rupture strength of 207 MPa. The adhesive type recommended by the manufacturer shall be used for joining pipe and fittings. Fiberglass pipe not enclosed in a box girder cell or encased in concrete shall be manufactured from ultraviolet-resistant resin pigmented with concrete-gray color, or be coated with a concrete-gray resin-rich exterior coating. Paint shall not be used. Fiberglass pipe treated with ultraviolet protection shall withstand a minimum of 2500 hours of accelerated weathering when tested in conformance with the requirements in ASTM Designation: G 154. Lamps shall be UV-B (313 nm wavelength). The resting cycle shall be 4 hours of ultraviolet exposure at 60°C, and then 4 hours of condensate exposure at 50°C. After testing, the surface of the pipe shall exhibit no fiber exposure, crazing, or checking, and only a slight chalking or color change.

Support spacing for fiberglass pipe shall be the same as shown on the plans for welded steel pipe. Pipe supports shall have a width of not less than 38 mm.

A Certificate of Compliance for fiberglass pipe and fittings shall be furnished to the Engineer in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications. The Certificate of Compliance shall include all laboratory test results conforming to the provisions specified herein.

For drainage piping NPS 8 or smaller, which is: (1) enclosed in a box girder cell and exposed for a length not greater than 6 m within the cell, or (2) encased in concrete, the Contractor shall have the option of substituting polyvinyl chloride (PVC) plastic pipe and fittings, with the same diameter and minimum bend radius as shown on the plans, for welded steel pipe.

The PVC plastic pipe and fittings shall be Schedule 40 conforming to the requirements of ASTM Designations: D 1785. The maximum support spacing for PVC plastic pipe shall be 2 m.

Couplings used to connect PVC plastic pipe or fiberglass pipe to steel shall be threaded or flanged. The sleeve connections shown on the plans shall not be used for either PVC plastic pipe or fiberglass pipe.

If PVC plastic pipe or fiberglass pipe is substituted for welded steel pipe, the quantity of drainage piping will be computed on the basis of the dimensions and details shown on the plans, and no change in the quantities to be paid for will be made because of the use of PVC plastic pipe or fiberglass pipe.

Bridge deck drainage systems will be measured and paid for by the kilogram in the same manner specified for miscellaneous metal (bridge) in Section 75-1.06, "Measurement," and Section 75-1.07, "Payment," of the Standard Specifications.

10-1.35 COMPRESSED AIR PIPE

Steel pipe for compressed air shall conform to the requirements in ASTM Designation: A 53 (Grade B), standard weight, galvanized, except that the zinc coating shall be not less than 90 percent of the amount specified in that ASTM Designation. Fittings, shall be galvanized malleable iron, banded and threaded, conforming to the requirements in ANSI standard: B16.3, Class 150. The pipe ends shall be grooved to accept mechanical couplings.

Mechanical Coupling

Mechanical couplings shall be galvanized iron body, 2-piece type with zinc electroplated bolts. The coupling shall allow 6.4 mm end separation and a minimum of 1 degree of angular deflection. The couplings shall have a minimum pressure rating of 5500 kPa. Rigid couplings and flange adaptors shall match the mechanical couplings except that the pressure rating for the flange adaptors and rigid couplings shall be a minimum of 2000 kPa.

10-1.36 WATER MAINS

PART 1-GENERAL

SUMMARY

Scope.-This work shall consist of furnishing and installing water main for US Navy (200 mm) complete with pipes, fittings, valves, accessories and incidentals necessary to complete the work for a ready to operate domestic water distribution system.

The work includes excavating, trenching, backfilling, pavement restoration and testing with the exception of disinfection for water main for US Navy, in accordance with the details shown on the plans, as specified in the Standard Specifications, and these special provisions.

For US Navy, the San Francisco Public Utilities Commission/Water Department (SFWD) is the jurisdictional water utility district.

Attention is directed to "Obstructions," of these special provisions, regarding schedule and coordination for the installation of SFWD water mains.

SFWD Work

SFWD will make all connections and disconnections to and from the existing US Navy water main, connections of existing service pipes to new mains (retap), connections of Contractor installed new service pipes to existing meters and all other work that involves cutting or otherwise disturbing the existing water system.

SFWD will also provide disinfection of the US Navy water main by chlorination as specified in these special provisions.

For all work to be done by SFWD, the Contractor shall perform all excavation and backfill, steel plating/removal and pavement restoration.

REFERENCE STANDARDS

The regulatory requirements which govern the work of this Section include the following governing Codes and Standards, besides the State water work standards:

A. American Society for Testing and Materials (ASTM):

1. ASTM Designation B88 Seamless Copper Water Tube
2. ASTM Designation D1557 Test Methods for Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 10-lb (4.54-kg) Rammer and 18-in. (457-mm) Drop

B. American Water Works Association (AWWA):

1. AWWA C104 Cement Mortar Lining for Ductile-Iron Pipe and Fittings for Water
2. AWWA C105 Polyethylene Encasement for Ductile-Iron Pipe Systems
3. AWWA C110 Ductile-Iron and Gray-Iron Fittings, 3 In. through 48 In. (75 mm through 1200 mm), for Water and Other Liquids
4. AWWA C151 Ductile-Iron Pipe, Centrifugally Cast, for Water or Other Liquids
5. AWWA C153 Errata Nov 1996) Ductile-Iron Compact Fittings, 3 In. through 24 In. (76 mm through 610 mm) and 54 In. through 64 In. (1,400 mm through 1,600 mm) for Water Service
6. AWWA C111 Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings
7. AWWA C504 Rubber-Seated Butterfly Valves
8. AWWA C509 Resilient-Seated Gate Valves for Water Supply Service
9. AWWA C600 Installation of Ductile-Iron Water Mains and Their Appurtenances
10. AWWA C800 Underground Service Line Valves and Fittings

C. American Society of Mechanical Engineers (ASME): ASME B16.26 Cast Copper Alloy Fittings for Flared Copper Tubes.

SUBMITTALS

General Submittals:

General.-.Submit listed submittals in accordance with the provisions of the Contract Documents.

Product Data.-.Submit respective manufacturer's product data including catalog cuts, descriptive drawings, and literature, with all exceptions to the Specifications noted for each equipment item to be furnished under this Section including, but not limited to, ductile iron pipe, copper tubing, fittings, gaskets, valves, polyethylene encasement material and appurtenances.

Shoring Plans.-Submit Shoring Plans and calculations for excavation depths greater than 1.5 meters. Shoring plans shall be signed and stamped by a licensed Civil or Structural Engineer if plans deviate from Caltrans Standards. Work in the field can start only after the submittals have been approved.

Construction Schedule:

Attention is directed to "Obstructions" of these special provisions, regarding duration and work to be performed by SFWD personnel, regarding to the water mains relocation.

The Contractor shall submit Construction Schedule that will include time for the SFWD personnel to complete their work as specified herein. The Contractor shall incorporate the SFWD required times in his/her schedule. The Contractor shall confer with the Engineer in the preparation of the schedule that needs to satisfy the water distribution operation and minimize disruption of the services. No construction for water work shall be started until the Engineer approves the schedule.

The Contractor shall complete the excavation of the trench and install appropriate shoring to the satisfaction of the Engineer before SFWD personnel can do any work.

Quality Assurance Submittals:

Test Reports.-Certified test reports showing compliance with specified performance characteristics and physical properties.

Manufacturer's Instructions.-.Manufacturer's installation instructions.

Closeout Submittals:

Record Drawings.-Record actual location of distribution mains, valves, connections, and invert elevations for review.

DELIVERY, STORAGE & HANDLING

Ordering.-Comply with manufacturer's ordering instructions and lead time requirements to avoid construction delays.

Storage and Protection.-.Store materials protected from exposure to harmful weather conditions and at temperature and humidity conditions recommended by manufacturer.

SITE CONDITIONS

Excavations in which products will be buried shall be dry.

Coordinate the installation of the water supply system with the SFPUC/SFWD.

PART 2. – PRODUCTS

MATERIALS

Pipe.--Pipe sizes of 100 mm and larger in diameter, shall be ductile iron, Class 53 with Tyton bell and spigot ends conforming to ANSI/AWWA C151/A21.51, latest editions. Pipe sizes of less than 100 mm in diameter shall be copper tubing, conforming to ASTM Designation B 88, Type K, annealed. Pipe sizes of less than 100 mm in diameter shall be copper tubing, conforming to ASTM Designation B 88, Type K, annealed.

Fittings

Fittings for pipe 100 mm and larger.-Ductile Iron Push-On Tyton compact fittings shall conform to the applicable requirements of ANSI/AWWA C110/A21.10, or ANSI/AWWA C153/A21.53, latest revisions, unless otherwise specified herein. Fitting for pipe less than 100 mm in diameter shall be bronze/copper conforming to ASME B16.26. Fittings shall accommodate a "Field-Lok" type gasket.

Lining and Coating.-Ductile iron pipe, and fittings shall be lined with double cement-mortar lining with an asphaltic seal coating, 0.03 mm (1 mil), in accordance with AWWA C104. The exterior of ductile iron pipe, specials, and fittings shall be coated with a 0.03-mm (1-mil) asphaltic coating in accordance with AWWA C151, section 51-9.

Pipe Joints

Joint for ductile iron pipe 100 mm and larger, "Field-Lok" type of gaskets shall be used. Joints for less than 100 mm in diameter copper tubing shall be sweated, flared, flanged or screw-in as required per SFWD.

Valves

Valves 100 mm and larger in size shall be push-on (Tyton by Tyton ends) and can accommodate "Field-Lok" gaskets, resilient seated, non-rising stem, right turn open and nut operated.

Service Valves and fittings less than 100 mm in size shall be bronze/brass and shall comply with AWWA C800. Connections shall be screw-in, flared, or flanged as required.

Corporation Stops.-Corporation Stops shall be brass, in compliance with AWWA C800, copper tubing flare connection.

Polyethylene Encasement.-Polyethylene encasement for pipe and fittings shall conform to AWWA C105. 8 mil low density polyethylene tubes shall be used.

MISCELLANEOUS METAL

All connecting devices, including Tie Rods, Rod Couplings, Pipe Clamps, Restraints and related hardware shall be as shown on plans.

Saddle shall feature brass body with stainless steel straps and hardware.

TRENCH BEDDING AND BACKFILL

Sand Bed.-All pipe shall be constructed on a prepared or natural sand bed the width of which shall be at least 300 mm plus the full width of the pipe, and not less than 100 mm thick below the pipe after installation.

Sand Backfill.-Backfill around all pipes from the bottom of the trench to a height 150 mm above the top of pipes for the full width of the trench shall be sand only. Sand backfill material shall be in accordance with the applicable requirements of the Standard Specifications.

Backfill Above Required Sand.-Backfill material above the required sand shall be in accordance with the applicable Standard Specifications.

PART 3. - EXECUTION

MAINTAINING WATER SERVICES

Maintain water service and conduct operations at times selected to minimize the duration and inconvenience of service interruption.

Keep existing water mains that will be replaced by new water mains in service until new water mains are ready for service.

Water valves in service shall be operated only by SFWD personnel.

CUTTING OF PIPE

Cutting of pipe shall be done in a neat and workmanlike manner without damage to the pipe. Unless otherwise recommended by the manufacturer and authorized by the Engineer, cutting shall be done with an approved type mechanical cutter. Wheel cutter shall be used when practicable.

PIPE INSTALLATION

A. No pipe shall be installed before the street or roadway sub-base is built.

B. Before any trench is excavated, the Contractor shall make openings in the roadway or sidewalk as directed by the Engineer to verify a suitable alignment of the main.
The trench shall be excavated so that a 100 mm thick layer of sand bedding can be installed beneath the pipe bottom such that the barrel of the pipe will have an even bearing along its entire length and with sufficient clearance provided for any necessary operations in connection with the laying of the pipe. Bell holes shall be excavated for each pipe bell or joint.

C. Before any pipe may be installed, the grade of the trench bottom shall be to the satisfaction of the Engineer. Immediately prior to installing the pipe, the Contractor shall remove all loose rocks and other objectionable material from the bottom of the trench and bell holes. When the trench is properly prepared, the pipe shall be lowered therein, singly, without jar or strain, and assembled by piece inside the trench.

D. Joints for ductile iron pipe shall be fastened by use of "Field-Lok" gaskets, in accordance with AWWA C600, unless otherwise directed by the Engineer.

E. The pipe shall be joined in strict adherence to the pipe manufacturer's printed installation instructions.

F. When the ductile iron pipe is cut in the field, the outside of the cut end shall be beveled about 6 mm at an angle of about 30 degrees and the leading edge rounded. The prepared cut end shall be marked at 84 mm for a 300 mm main and 83 mm for a 100 mm water line.

G. If the joint assembly is not accomplished with the application of reasonable force, the plain end of the pipe shall be removed to check the proper position of the gasket. At the end of each day, the Contractor shall plug the end of the laid pipe.

H. All connections to existing water mains will be made by SFWD. Contractor shall coordinate with SFWD to facilitate connection of the new and existing system.

I. Contractor shall provide locating/marking tape in the trench continuously over the centerline of the pipe per applicable requirements of these Specifications

J The entire piping system (main and service) shall be encased with polyethylene tubes or sheets in accordance with AWWA C105. Tapes shall be used to seal the wrapping at joints and tees.

K. The Contractor shall paint all tie rods, lugs, restraining rings assembly and all miscellaneous metal attached to the pipeline installed by the Contractor and SFWD with two coats of Koppers Bitumastic No. 505 or two coats of Proteco Wrap CA160 or approved equal, applied in accordance with the manufacturer's directions.

L. Insulating flanges and/or couplings shall be installed to electrically isolate the newly installed portion of pipeline from existing metallic pipelines.

M. Water lines shall not be laid in the same trench with sewer lines, gas lines, fuel lines, or electric wiring. Water lines shall be 3.3 m horizontally and 0.3 m vertically from sewer lines. Water lines shall in all cases cross above sewage force mains or inverted siphons and shall be not less than 0.3 m above the sewer main. Submit proposals for the Engineer's approval if these requirements can not be met due to field conditions.

N. The maximum allowable joint deflection shall be as given by the pipe manufacturer. If the alignment requires deflection in excess of the above limitations, a sufficient number of shorter lengths of pipe shall be installed to provide angular deflections within the limit set forth.

O. Restrained Joints.-Plugs, caps, tees and bends deflecting 11.25 degrees or more, either vertically or horizontally, on waterlines larger than 300 mm in diameter shall be provided with restrained joints. Valves shall be securely anchored or shall be provided with restrained joints to prevent movement. All joints on lateral and dead end of 100 mm in diameter or larger pipes shall be restrained.

P. The Contractor shall complete the excavation of the pit and install appropriate shoring to the satisfaction of the Engineer before SFWD personnel can do any work.

IDENTIFICATION OF PUSH-ON GASKET JOINTS

The Contractor shall identify all joints with Push-On gaskets by spraying white marking paint on top of each bell and also by taping a direct burial tape around the spigot end of each pipe just in front of the bell.

INSTALLING PIPE FITTINGS

The Contractor shall include the procurement, placing, restraining, and protecting of all fittings, valves, joint restraints, and all other appurtenances to be incorporated in the work, as indicated in the Contract Documents or as directed by the Engineer.

Installation.-Bends, tees, and gates of 100 mm and larger in diameter shall be fastened to the pipe or to each other by use of "Field-Lok" type gaskets. Caps shall be fastened to the pipe by use of tie rods and lugs or restrainers as shown on plans or directed by the Engineer. Additional lug and tie rod joint restraints shall be installed at locations directed by the Engineer.

Valve Boxes.-Over each valve, a piece of ductile iron pipe of such size as may be required by SFWD shall be placed vertically to form a valve box. A suitable cover shall be placed on top of the pipe or box. The bottom of the box shall rest on a steel plate so placed as to prevent the box from bearing on the gate. Contractor shall cut the box to such lengths that the top of the gate cover will be flush with the surface of the finished pavements shown on plans. The word "WATER" shall be cast in the cover. The box length shall adapt, without full extension, to the depth of cover required over the pipe at the valve location.

INSTALLING SHORING

The Contractor shall install an approved shoring system for all excavations 1.5 meters or more in depth, in conformance with "Excavation Safety Plans," of these special provisions.

In locations where the SFWD crews will install service lines or connections to other lines, regardless of depth, the Contractor shall install a solid sheeting type shoring system, approved by the Engineer, that is capable of protecting all excavations from excessive water that may be present and give ample access to the crews to perform the installation. This shoring system is more stringent than Cal/OSHA standards.

Shoring materials and equipment shall be removed from the excavation prior to completion of work.

INSTALLATION OF SCREW TAPS

The Contractor shall drill, tap, and install all screw taps and risers as indicated or as required by the Engineer.

Screw taps not satisfactorily installed in the opinion of the Engineer shall be removed and replaced at the expense of the Contractor. Where the screw tap installation is unsatisfactory, it shall be removed and replaced with a solid cast iron plug. The Contractor shall relocate screw taps at locations as directed by the Engineer.

FIELD QUALITY REQUIREMENTS

The Contractor shall obtain a relative compaction of not less than 95 percent throughout each layer of all backfill constructed within 1 meter of pavement subgrade, or adjacent ground. Below the top 1 meter of backfill, the relative compaction shall not be less than 90 percent. If tests indicate work does not meet specified requirements, remove such work, replace, and retest at no additional cost to the State.

The Contractor shall furnish all equipment, accessories and incidentals for the hydrostatic tests including temporary anchoring devices.

TESTS

A. Protection from Flooding: Provide positive measures to protect exposed, installed pipe and compacted pipe bedding from flooding during testing.
B. Notice of Hydrostatic Pressure Test:

1. Give 72 hours notice of intention of hydrostatic pressure test for water main to SFWD.
2. Designate largest sections feasible for hydrostatic pressure test. Pressure test shall be performed by the Contractor; at Contractor's expense. The SFWD will perform chlorination for water main only.

C. Testing Requirements:

Perform hydrostatic tests in accordance with the requirements of the SFWD. All such tests shall be witnessed by the representative of the SFWD. The Contractor shall provide all labor and materials required for the tests and shall be responsible for making all such arrangements.
Prior to backfilling, isolate the system by use of approved valves, caps and plugs, or other acceptable methods.
Maintain such isolation throughout the performance of pressure testing.
Where valves are used for isolation, eliminate leakage through such valves if it occurs.
Maintain new work isolated from existing water mains, except for test connections, until testing and chlorination have been completed.
Provide temporary anchorage as required for the test.
Install the water source connection for testing the isolated section. The Engineer may permit the use of a tap which will be furnished and installed by SFWD for water main.
Where leakage occurs, perform necessary corrective measures.
Remove and replace defective pipes, joints, fittings, valves, and other appurtenances. Reset such items if displaced.

The Contractor shall test the line to a hydrostatic pressure of 1.55 MPa. The actual pressure test of 1.55 MPa shall be maintained for not less than two (2) hours.

If any section of the pipe under test develops a leak evidenced by a test pressure drop, the Contractor shall repair or replace the defective portion of the pipe as directed by the Engineer at no additional cost. After all repairs are made, the pipe shall be retested.

DISINFECTION

Upon completion of satisfactory hydrostatic test, SFWD will disinfect the US Navy- owned water mains. For disinfection scheduling purposes, refer to "Obstructions" of these special provisions. The SFWD will supply and install all piping, fittings, and other materials necessary to chlorinate the main, except screw taps and risers, which shall be installed by the Contractor. The Contractor shall not backfill the site of such work until the satisfactory disinfection of the main is verified by the Engineer. The Contractor shall disinfect the 100 mm Caltrans-owned maintenance water line.

REMOVAL OF SFWD -OWNED BOX AND COVER

The Contractor shall remove all existing valve boxes and valve covers, if any, that are to be abandoned in this contract or as directed by the Engineer. The Contractor shall saw cut, excavate, remove and dispose of pavement; excavate the hole to the dimensions indicated (or required); remove the box at least 45 cm below grade (removal of the plate below the box is optional) and dispose of as his/her property; place and maintain all traffic routing and public safety requirements; furnish and place sand backfill; restore pavement, sidewalk, and other roadway structures that have been removed during the progress of the work, unless otherwise specified herein, and clean the site of the work together with all other work necessary or incidental thereto.

The Contractor shall return all box covers to the SFWD Corporation Yard at 1990 Newcomb Avenue, San Francisco, or at the location indicated by the Engineer.

The Contractor shall notify the City and County of San Francisco, SFWD in writing 5 working days prior to scheduling the removal of abandoned valve boxes and valve covers for SFWD Inspector approval. The Contractor shall identify the abandoned valve boxes and covers that are to be removed by marking them in the field for the SFWD Inspector for approval. Removal work shall be completed before surrounding finish grade work.

Restoring Pavement

Vehicular travel over backfilled but unpaved and unabridged trenches and other excavations will not be permitted. The Contractor shall construct, before use of pavement by vehicular traffic, and thereafter satisfactorily maintain, a smooth, regular asphalt pavement, not less than 150 mm thick, Type A asphalt concrete, and a 345 mm thick aggregate base, Class 3, over backfilled areas for the safe passage of vehicular traffic. All excess materials shall, at the same time, be removed and the street cleaned. The asphalt surfacing shall be in accordance with the applicable requirements of the Standard Specifications.

Cleanup

Upon completion of the installation of water lines, and appurtenances, all debris and surplus materials resulting from the work shall be removed.

MEASUREMENT AND PAYMENT

200 mm water main, will be measured along the centerline of the line, including fittings and valves, and paid for per meter for various sizes in the same manner specified for welded steel pipe in Section 70-1.04, "Measurement," and Section 70-1.05, "Payment," of the Standard Specifications.

The contract price paid per meter for 200 mm water main involved shall include full compensation for furnishing all labor, materials, tools, equipment and incidentals, and for doing all the work involved in installing the different sizes and types of pipe, fittings and valves, complete in place, including excavation backfill, installing valve boxes, polyethylene encasement, shoring for all excavation by the Contractor or SFWD for connecting and disconnecting of water main, disinfection of maintenance water line and testing in as shown on the plans, and as specified in these special provisions, and as directed by the Engineer. Any related work shall be considered as incidental and no separate payment shall be made therefore.

10-1.37 THERMOPLASTIC DELINEATION (ESA)

A 200-mm thermoplastic delineation (ESA) along boundaries of the paved areas of the ESA 1a and 1b shall be furnished, installed, maintained in conformance with the details shown on the plans, as specified in these special provisions and as directed by the Engineer.

Thermoplastic delineation (ESA) shall be applied in conformance with the provisions in Section 84, "Traffic Stripes and Pavement Markings," of the Standard Specifications and these special provisions.

Thermoplastic material shall be free of lead and chromium, and shall conform to the requirements in State Specification PTH-02ALKYD.

Retroreflectivity of the thermoplastic delineation (ESA) shall conform to the requirements in ASTM Designation: D 6359-99. White thermoplastic traffic stripes and pavement markings shall have a minimum initial retroreflectivity of 250 $mcd \cdot m^{-2} \cdot lx^{-1}$.

Thermoplastic delineation (ESA) shall be applied at the minimum thickness and application rate as specified below. The minimum application rate is based on a solid stripe of 100 mm in width.

Minimum StripeThickness (mm)	Minimum Application Rate (kg/m)
2.0	0.4

MEEASUREMENT AND PAYMENT

Thermoplastic delineation (ESA) will be measured and paid for as thermoplastic traffic stripe.

Full compensation for maintaining the 200-mm ESA thermoplastic delineation (ESA) around the paved areas shall be considered as included in the contract shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no separate payment will be made therefor.

SECTION 10-3. ELECTRICAL SYSTEMS

10-3.01 DESCRIPTION

The following work shall conform to the provisions in Section 86, "Signals, Lighting and Electrical Systems," of the Standard Specifications and these special provisions:

A. Underground raceways electrical system (see E-1 to E-16 and UD-1 to UD-6) shall include, but not be limited to the following:

1. Install manholes and duct banks as shown on the plans.
2. Install all conduit including anchors, inserts, fittings, and supports as shown on the plans.
3. Install and terminate bare copper grounding conductors and copper ground bars as shown on the plans.

10-3.02 ABBREVIATIONS

The following abbreviations are added to those listed in Section 1-1.02, "Abbreviations," of the Standard Specifications:

BNC	Bayonet Nut Connector
CPU	Central Processing Unit
CSA	Canadian Standards Association
C-UL	Canadian Underwriters Laboratories
DLCI	Data Link Control Identifier
DMA	Direct Memory Access
EEMAC	Electrical Equipment Manufactures Advisory Council
EEPROM	Electrically Erasable Programmable Read-Only Memory
EMI/RFI	Electromagnetic Interference/Radio Frequency Interference
EPR	Ethylene propelyne rubber
ESO	Electrical Safety Orders of the Division of Industrial Relations, State of California
FCC	Federal Communications Commission
GFCI	Ground Fault Current Interrupter
THD	Total Harmonic Distortion
IDC	Insulation Displacement Connector
ICEA	Insulated Cable Engineering Association
IEC	International Electrotechnical Commission
I/O	Input / Output
ISDN	Integrated Services Digital Network
ISO	International Organization for Standardization
IS/OS	Individual Shield/Overall Shield
JEDEC	Joint Electron Device Engineering Council
NEC	National Electrical Code
NETA	International Electrical Testing Association Inc.
NO	Normally Open
NC	Normally Closed
NFPA	National Fire Protection Association
NTSC	National Television Systems Committee
OSHA	Occupational Safety and Health Administration
OSI	Open Systems Interconnect
PVC	Polyvinyl Chloride
REA	Rural Electrification Administration
RTD	Resistance Temperature Detector
SAS	Self-Anchored Suspension
SCADA	Supervisory Control And Data Acquisition
SCSI	Small Computer Systems Interface
SDLC	Serial Data Link Control
TELCO	Telephone company
TIA	Telecommunications Industry Association
VME	Versa Module Eurocard
XLPE	Cross Linked Polyethelene
YBI	Yerba Buena Island

10-3.03 COST BREAK-DOWN

Cost break-downs shall conform to the provisions in Section 86-1.03, "Cost Break-Down," of the Standard Specifications and these special provisions.

The Engineer shall be furnished a cost break-down for each contract lump sum item of work described in this Section 10-3.

The cost break-down shall be submitted to the Engineer for approval within 30 days after the contract has been approved. The cost break-down shall be approved, in writing, by the Engineer before any partial payment for the items of electrical work will be made.

The cost break-down shall be divided into the following categories. Within each category, each item of work shall be broken down, as a minimum, to include the following listed items in addition to those listed in the Standard Specifications:

A. Underground raceways electrical installation is shown on the plans and shall include, but not be limited to the following additional items of the cost break-down:

1. Conduits, conduit anchors, fittings and supports – list each size and type.
2. Equipment grounding system – list each size and type.
3. Manholes – list each size and type.
4. Duct bank – list each size and type.

10-3.04 NUMBERING ELECTRICAL EQUIPMENT

The placement of numbers on electrical equipment will be done by others, unless otherwise stated in these special provisions.

10-3.05 RIGID GALVANIZED STEEL CONDUIT, THREADED COUPLINGS AND ELBOWS

The rigid galvanized steel (RGS) conduit, threaded couplings, and elbows shall conform to Section 86-2.05, "Conduit," of the Standard Specifications for Type 1 where shown on the plans.

Pull ropes for use when installing cables in conduit shall consist of flat, woven, lubricated, soft-fiber polyester tape with a minimum tensile strength of 8000 N and shall have printed sequential measurement markings at least every meter.

10-3.06 UNDERGROUND RACEWAYS

DUCTBANKS

Underground conduits shall be Type 1 encased in concrete. Concrete for conduit encasement shall be 907 kg test with aggregate of 20 mm or smaller.

The concrete shall be colored red by the addition of 6 kg of red oxide powder to each cubic meter of mix. The coloring shall be thoroughly mixed into the concrete before pouring. Adequate spacers, tie-downs and bracing shall be provided to maintain conduits in place during the pouring of the concrete. Ducts shall be installed so as to drain to manholes.

All conduits entering and leaving the manholes shall be bonded together with copper bonding cable looped through the manhole. All conduit connections shall be threaded. All connections shall be made with suitable conductive thread compound. After installation all conduits shall be checked for continuity and cleaned properly. Cleaning of conduit shall be done by the use of compressed air

for sizes 41 mm and smaller, and by the use of mandrel and cleaning brushes pulled through each conduit for sizes larger than 41 mm. Prior to backfilling of the underground duct system, the Contractor shall provide a yellow (with black lettering) warning tape, 340 mm from the finished grade, stating "CAUTION-BURIED ELECTRICAL LINE".

MANHOLES

All manholes shall be installed by the Contractor as shown and specified on the plans.

MANHOLE FRAMES AND COVERS

Frame and cover shall be cast iron and shall be designated for H-20 Traffic loading, and shall comply with ASTM F1143.

Manhole cover shall be engraved with the following nameplates:

a. Caltrans High Voltage, for Manholes No. 17, 20, and 23
b. Caltrans 600 V, for Manholes No.16, 19, and 22
c. Caltrans TOS&COM, for Manholes No.18, 21, and 24

10-3.07 BONDING AND GROUNDING

Bonding and grounding shall conform to the provisions in Section 86-2.10, "Bonding and Grounding," of the Standard Specifications and these special provisions.

Bonding jumpers in standards with handholes and traffic pull box lid covers shall be attached by a UL listed lug using 4.5-mm diameter or larger brass or bronze bolts and shall run to the conduit or bonding wire in the adjacent pull box. The grounding jumper shall be visible after the standard has been installed and the mortar pad and cap have been placed on the foundation.

Standards without handholes shall have bonding accomplished by jumpers attached to UL listed ground clamps on each anchor bolt.

For slip base standards or slip base inserts, bonding shall be accomplished by jumpers attached to UL listed ground clamps on each anchor bolt, or a UL listed lug attached to the bottom slip base plate with a 4.5-mm diameter or larger brass or bronze bolt.

Equipment bonding and grounding conductors are required in conduits, except when the conduits contain combinations of loop lead-in cable, fiber optic cable, or signal interconnect cable. A No. 8 minimum, bare copper wire shall run continuously in circuits, except for series lighting circuits, where No. 6 bare copper wire shall run continuously. The bonding wire size shall be increased to match the circuit breaker size in conformance with the Code, or shall be as shown on the plans. Conduits to be installed for future conductors, may omit the copper wire.

Bonding of metallic conduits in metal pull boxes shall be by means of bonding bushings and bonding jumpers connected to the bonding wire running in the conduit system.

500 kCMIL bare copper grounding conductor and 4/0 grounding conductors shall be installed in the duct bank as shown on the plans. Route the 500 kCMIL grounding conductor through duct banks and manholes. Two 250 kCMIL bare grounding conductors are to be exothermically welded to the 500 kCMIL main grounding conductor and ran to the foundation footing of all bent and pier columns as shown on the plans. At each split in the duct bank a 4/0 bare copper grounding conductor shall be exothermically welded to the 500 kCMIL bare copper grounding conductor and ran with the separate 600 volt or TOS/COM duct bank and continued through any manholes and

back to the 15 kV duct bank. All bridge electrical components shall be grounded to this system as shown on the plans.

10-3.08 PAYMENT

The contract lump sum prices paid for underground raceways electrical shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in the listed items below, complete in place, including manuals, preparation and delivery of any and all proposals, plans, submittals, or other documents to the Engineer, warranty work or modifications, software or software changes, testing and training, as shown on the plans, as specified in the Standard Specifications and these special provisions, as directed by the Engineer, and no additional compensation will be allowed therefor.

Full compensation for furnishing and installing frames and covers for duct bank manholes shall be considered as included in the contract lump sum price paid for this contract change order 64 work involved, including all supplements, and no separate payment will be made therefor.

Standard Plans List

The Standard Plan sheets applicable to this contract include, but are not limited to those indicated below. Applicable Revised Standard Plans (RSP) and New Standard Plans (NSP) indicated below are included in the project plans as individual Standard Plan sheets.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 65	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer, provide advance planning for the bridge demolition work concerning Contract Bid Item No. 40 "Bridge Removal" necessary due to the presence of the Bent W3 through Bent W7 foundations and columns that have been added to the contract.

Estimated Cost of Extra Work at Force Account $175,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$175,000.00**

By **reason of this order the time of completion will be adjusted as follows:** 0 days

CCO DESCRIPTION: Demo Existing Bridge Adv. Planning	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	1195 Day(s)	252 %	7

THIS CHANGE ORDER PROVIDES FOR:

Advance planning pertaining to the demolition of the existing mainline bridge.

This project, the Temporary Bypass Structure (TBS), provides for the construction of a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In (ETI) to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island and the Viaduct structure between the two tie ins.

After traffic is placed onto the TBS detour, the contract calls for the removal of the abandoned section of bridge. This section is approximately 330 meters long and consist of a both double deck steel truss and concrete viaduct. Based on a December 25, 2006 Department memo, which was approved by Tony Anziano (Toll Bridge Program Manager), Richard Land (Chief Engineer) and subsequently by the Toll Bridge Program Oversight Committee (TBPOC), the advance construction of 10 foundations and columns from the future Yerba Buena Island Transition Structure (YBITS) project have been added to this contract with 3 additional columns in the process of being added. Many of these columns are being constructed directly under the existing bridge that is called for to be removed.

The advance construction of the YBITS foundations and columns will require a revised removal method for the abandoned structure than what was anticipated at the time of bid as the obstructions will require the bridge removal be performed on a more piecemeal basis. This change order provides for the advance planning of this revised bridge removal method in order to mitigate extensive delays to the project completion.

Compensation for this work shall be paid as extra work at force account at an estimated cost of $175,000.00 which shall be financed from the contract's contingency funds. A cost analysis is on file.

No adjustment of contract time is warranted as the advance planning work will not affect the controlling operation.

This change was concurred by Alec Melkonians - Asst. Project Manager.

Maintenance concurrence is not required as the work will not affect any permanent roadway features.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 65	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Estimate of Decrease in Contract Item at Contract Price:

Item No. 40: BRIDGE REMOVAL

-1 LS (-100.00%) 3,500,000.00 /LS = -$3,500,000.00 (-100.00%)

The contractor agrees that the adjustment due under Section 4-1.03B, Eliminated Items, of the Standard Specifications for the elimination of Contract Bid Item 40: Bridge Removal shall be equal to zero.

Total Cost for Decrease in Contract Item.....($3,500,000.00)

Extra Work at Lump Sum:

Compensate the contractor for all additional labor, equipment and material costs incurred to remove the existing structure from Bent 48 to Bent YB4 as originally required by Bid Item 40, as a result of changed field conditions, escalation and delays. The contractor agrees to accept the lump sum of $12,727,660 as full compensation, including all markups, surcharges and profit, for all additional costs necessary to complete this work unless otherwise delineated in this change. The aforementioned lump sum shall include compensation for:

1. All labor, equipment and material escalation costs.
2. All Silverado Contractors time-related overhead costs.
3. Loss of anticipated revenue resulting from changes in steel and concrete salvage market prices.
4. Furnishing, installing, relocating, storing and removing all temporary supports systems.

The aforementioned lump sum shall include compensation for costs involved in working around, protecting, and repairing newly constructed columns, structures and facilities constructed under contract change orders 64, 73, 75 and 77.

It is expressly understood and agreed that the following work shall be compensated as provided under various existing and/or anticipated Contract Change Orders:

1. Flagging.
2. Traffic control.
3. Storm water pollution prevention compliance.
4. Engineering associated with temporary support design and bridge removal plan.
5. Furnishing and placing additional backfill as required outside the pay limits of the W5 footings due to the removal of the YB3 footings.

If required by the Engineer, installation and removal of cable bracing system at the upper deck, and displacement monitoring of the temporary support system shall be paid for under a separate change order.

The contractor agrees to accept the compensation outlined in this change as full, complete and equitable resolution for all issues, disputes and potential claims related to the demolition of the existing structure from Bent 48 to Bent YB4. No furthe compensation shall be allowed.

Total Cost of Extra Work at Lump Sum $12,727,660.00

COST: $9,227,660.00 INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: $0.00	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Bridge Removal From Bent 48 to YB3	PROJECT DESCRIPTION: CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

compensating the contractor for all additional labor, equipment and material costs incurred to remove the existing structure from Bent 48 to Bent YB4.

This project, the Temporary Bypass Structure (TBS), was awarded in March 2004 to construct a detour that will allow for the tie in of the new east span of the San Francisco Oakland Bay Bridge to Yerba Buena Island. The TBS encompasses three main structures, the East Tie-In to the existing bridge, the West Tie-In (WTI) to Yerba Buena Island, and the Viaduct structure between the two tie ins.

Two separate Department strategy memorandums issued on December 14, 2006 entitled 'Strategy for South-South Detour Contract Completion' and December 25, 2006 entitled 'Recommendation to Construct Select Yerba Buena Island Transition Structure Foundations by Contract Change Order' were approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), which recommended the design of the ETI and WTI structures and enhancement of the Viaduct be assumed by the Department as opposed to the as-bid performance based contractor design and that a portion of the YBITS foundation work be performed under this contract by change order.

This change is necessary in order to compensate the contractor for all additional costs incurred as result of changed field conditions, delays, and escalation including:

1. All labor, equipment and material escalation costs.
2. All Silverado Contractors time-related overhead costs .
3. Loss of anticipated revenue resulting from changes in steel and concrete salvage market prices.
4. Furnishing, installing, relocating, storing and removing all temporary supports systems.

The aforementioned lump sum shall include compensation for all costs involved in working around, protecting, and repairing newly constructed columns, structures and facilities constructed under contract change orders 64, 73, 75 and 77.

The following associated work shall be compensated as provided under separate existing and/or pending contract change orders:

1. Flagging.
2. Traffic Control
3. Storm water pollution prevention compliance.
4. Engineering associated with temporary support design and bridge removal plan.
5. Furnishing and placing additional backfill as required at W5 footings.

If required by the Engineer, installation and removal of cable bracing system at the upper deck, and displacement monitoring of the temporary support system shall be paid for under a separate change order.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write

Compensation for this change shall be made as Extra Work at Agreed Lump Sum in the amount of $12,727,660.00, and by deleting Bid Item 40: Bridge Removal, for a total increase of $9,227,660.00, which can be financed through the Contingency Fund. This change constitutes full and equitable resolution for all issues, disputes and potential claims related to the demolition of the existing structure from Bent 48 to Bent YB4. Cost analyses and other cost related data are included in the associated file.

The total estimated cost of CCO 65, including all supplementals to date, is $9,402,660.00.

Adjustment of contract time is deferred pending completion of the work specified in this change as it may become the controlling operation in accordance with Section 8-1.07 "Liquidated Damages", of the Standard Specifications and Section 10-1.20 "Time Related Overhead (TRO)" of the Special Provisions.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications and Section 10-1.20 "Time Related Overhead" of the Special Provisions.

This change was concurred by Alec Melkonians - Asst. Project Manager and Hong Wong - Project Engineer. Authorization of this change provided from the TBPOC on April 2, 2009.

Maintenance concurrence is not required, as this work does not affect any permanent roadway features.

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer and in accordance with Section 10-1.18 "Photo Survey/Public Relations" of the Special Provisions, provide professional assistance, and furnish the following time-lapse photography / video equipment, and other necessary equipment:

1) 10 ea - VB-C50iR pan-tilt-zoom cameras
2) 10 ea - VFD8C10 Fusion Dome outdoor enclosure for the VB-C50iR camera
3) 8 ea - APM 3 Aluminum pole mount adpter for camera
4) 6 ea - T2428100WP 24/28 VAC power supply 100VA in weatherproof NEMA enclosure; for 120 VAC input
5) 6 ea - TR-MAX Tranzeo wireless bridge kit; maximum range; configured wireless bridge pair, flat panel; power over ethernet; 30 feet
6) 4 ea - 29db dish antennae upgrade for 3-mile link over Bay
7) 1 ea - CAT-5 KIT 1000-feet CAT5 kit: includes 50 RJ-45 connectors, 5 F/F coupler, 1000-feet ethernet cable, crimp tool TRENDnet TC-NT2 Professional Network Cable Tester
8) 1 ea - Server, Toshiba laptop for SiteProxy digital image archiving and viewing; 80+ GB, 1 G; Giga Ethernet, DVD-RW; with XP Pro; 1-year parts / service warranty.
9) 1 ea - 5-port mini ethernet switch
10) 4 ea - Wireless 3G router for Sprint 3G/EVDO service; PX-500 wireless card; external antennae; activation
11) 4 ea - Two-year wireless unlimited serice; used dynamice DNS service; renewable
12) 4 ea - Polycarbonate electronics enclosure; 15x18x10
13) 1 ea - Miscellaneous Mounting Hardware, cables, & accessories
14) 1 ea - SiteProxy 5/25 - 11 camera license;
15) 80 Hours - Configuration, on-site support, training, maintenance assistance

The work shall also include configuration, setup, and training of State personnel to operate the video equipment. Training shall be provided for the software, equipment, and start-up inspection/support by a qualified individual familiar with the above software and equipment. Training to include, at a minimum, 5 hours of initial training for administration of the SiteProxy software.

In accordance with Section 10-1.18 "Photo Survey/Public Relations" of the Special Provisions, payment for this work will be paid for as extra work as provided in Section 4-1.03D, Extra Work, of the Standard Specifications, and Section 5-1.24, Force Account Payment, of the Special Provisions, and no other compensation will be allowed therefor.

No adjustment in contract time will be made since this work is not a controlling operation.

THIS CHANGE ORDER PROVIDES FOR:

The Contractor to provide time-lapse video, still photography, video survey equipment, materials, and training to document and monitor construction activities, progress and completion of construction within the San Francisco Oakland Bay Bridge (SFOBB) eastern corridor.

The South South Detour (SSD) project will require a three-day full closure of the entire existing SFOBB bridge on Labor Day weekend 2007. The video and photography equipment and services will capture real time, and time lapse photography to document the demolition-out/ roll-in of the West Tie-In (WTI) superstructure prior to, and during the Labor Day shut down. The equipment included in this change order will monitor on-site progress of the Yerba Buena Island construction activities from the SSD command center located on Pier 7 in Oakland. The equipment will also monitor regional traffic as part of the WTI Phase 1 Labor Day shut down as an integral part of the Traffic Management Plan.

Salvage value of equipment is $0.00 at end of project. Cost analysis is available on file.

In accordance with Section 10-1.18 "Photo Survey/Public Relations" of the Special Provisions, this work will be paid for as extra work at force account, for the estimated cost of $175,000.00, which can be financed from contingency funds.

Time adjustment is not warranted, as this change does not affect the controlling operation(s) on this contract.

Maintenance concurrence is not necessary for this change.

The Resident Engineer recommends that this change order be approved. This change order was requested by the Project Manager, Alec Melkonians. This change was discussed and concurred by Ken Terpstra – Project Manager (written concurrence pending), and concurred by SFOBB Public Information Officer, Bart Ney on 06/26/07, and the Construction Traffic Manager, Raoul Maltez in March 2007.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 66	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds for professional photographic and video documentaion services per the original Contract Change Order No. 66 and as authorized by the Engineer.

No adjustment in contract time will be made since this work is not a controlling operation.

Estimated Cost of Extra Work at Force Account $200,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$200,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION:
Add Funds for TMP Video Services

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Providing additional funds to the Contractor for time-lapse video and still photography services to document and monitor construction activities, progress, and completion of construction within the San Francisco Oakland Bay Bridge (SFOBB) eastern corridor.

Two separate Department strategy memorandums, issued on December 14, 2006 and December 25, 2006, and approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), resulted in additional work being added and other work being re-sequenced on this project. This strategy led the contract to be extended through late 2010, approximately 5 years past the original completion date.

This change order is necessary to continue the time-lapse video and still photography services required to document and monitor construction activities within the San Francisco Oakland Bay Bridge (SFOBB) eastern corridor since the original funds allotted have been depleted.

In accordance with Section 10-1.18 "Photo Survey/Public Relations" of the Special Provisions, this work will be paid for as extra work at force account, for an estimated cost of 200,000.00, which can be financed from contingency funds. A cost analysis is in the project records.

The Resident Engineer recommends that this change order be approved. This change order was requested by Alec Melkonians - Project Manager, per memorandum dated 3/14/08. Maintenance concurrence is not necessary for this change.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**1195** Day(s)	**252** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Providing additional funds.

Two separate Department strategy memorandums, issued on December 14, 2006 and December 25, 2006, and approved by Tony Anziano - Toll Bridge Program Manager, Richard Land - Chief Engineer, and the Toll Bridge Program Oversight Committee (TBPOC), resulted in additional work being added and other work being re-sequenced on this project. This strategy led the contract to be extended through late 2010, approximately 5 years past the original completion date.

This change order is necessary to continue the time-lapse video especially the Roll In/Roll Out construction operation and still photography services required to document and monitor construction activities within the San Francisco Oakland Bay Bridge (SFOBB) eastern corridor. In addition, this request is to pay all oustanding bills in the holding file since the original and Supplemental funds allotted have been depleted.

In accordance with Section 10-1.18 "Photo Survey/Public Relations" of the Special Provisions, this work will be paid for as extra work at force account, for an estimated cost of 200,000.00, which can be financed from contingency funds.

The Contractor's signature is not required for additional funds request for Extra Work at Force Account change orders, therefore, this change order is being issued unilaterally.

Maintenance concurrence is not required since it does not affect any permanent roadway features on the project.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 67	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

In accordance with Section 5-1.14 "Contractor Design" of the Special Provisions, modify the Viaduct superstructure design to accommodate the East Tie-In Roll-Out/Roll-In design as per Sheets 3 through 10 of this change order. The two easterly most panels of Span 51 shall be redesigned and re-detailed. The eastern leading edge of the Viaduct needs to be modified to match the bearing and offset provided. The upper and lower deck contours should remain unchanged.

The scope of work shall include:

1. Adjust final 3-D models from CCO No. 50 to reflect the modified geometry.

2. Perform Service Load (BDS Group Load combinations 1 through 7) analysis and tabulate results for the affected components.

3. Design, draft, and independently check the modified members.

Additional work as follows:

1. Confirm the deck viaduct contours match those provided on Sheets 3 and 4 (of 10) of this Contract Change Order.

2. Modify the Truss, Floor Beam, and Stringer geometry east of Floor Beam 28 to accommodate the horizontal geometry defined by the bearing and offset from the center of the Bent 52 column (south) shown on Sheets 5 and 6 (of 10) of this Contract Change Order.

3. Develop leading edge details for the upper and lower deck to accommodate the sliding deck plate type joint schematically depicted on Sheets 7 and 9 (of 10) of this Contract Change Order.

4. Modify the upper and lower truss chords geometry between FB 27 and 29 to accommodate for the revised cantilever design.

5. Confirm truss chord sizes east of FB 27 are adequate considering the new geometry. Modify chords as necessary.

6. Re-design/Re-detail FB 29 to accommodate the leading edge of the viaduct as shown on Sheet 10 (of 10) of this Contract Change Order.

7. Evaluate the need for "X" type truss diagonals between FB 27 & 28 and FB 28 & 29. Redesign the concentric diagonal connection if it is still required.

8. Redesign and re-detail all affected truss/FB connections between FB 27 to 29.

9. Check bearing sizes if any significant difference in the DL and LL reactions are created by the change in geometry. Evaluate impacts on Bent 52 design if significant change in bearing axial load occurs.

The Contractor shall prepare and submit the following Design Submittal Changes to the Engineer for acceptance and authorization of construction:

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 67	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

1. Preliminary Design Submittal:
a. Detailed preliminary design drawings
b. Expansion joint movements at the Viaduct/ETI Interface

2. Unchecked Details
a. Unchecked Plans
b. Revised design calculations
i. Hand calculations
ii. Designer SAP model results including D/C ratios
iii. Designer SAP model electronic Copy

3. Checked details
a. Checked Plans
b. Revised design calculations
i. Final design and independent check calculations
ii. Designer/Checkers SAP model results D/C ratios
iii. Designer/Checkers SAP model electronic Copy

In accordance with the "Design Review Process", of Section 5-1.14 "Contractor Design" of the Special Provisions, when the final design submittal changes are approved by the Contractors Engineer, and authorized for construction by the Engineer, the Contractor shall revise the Construction Submittal to incorporate this change.

Estimated Cost: Increase ☑ Decrease ☐ **$800,000.00**

CCO DESCRIPTION: Viaduct / ETI Interface Modifications	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**381** Day(s)	**80** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Modifying the South-South Detour (SSD) Viaduct superstructure design to accommodate the East Tie-In Roll Out/Roll In design concept as per sheets 3 through 10 of this change. The two easterly most panels of the Viaduct span 51 shall be redesigned and re-detailed. The eastern leading edge of the Viaduct needs to be modified to match the bearing and offset provided. The upper and lower deck contours should remain unchanged.

Under the scope of the original SSD Contract the Contractor was to design and construct three defined sections of the Temporary Bypass Structure (TBS), the West Tie-In, the Viaduct, and the East Tie-In. As per the approved SSD strategy memorandum, "San Francisco-Oakland Bay Bridge Corridor Schedule Mitigation – Strategy for South-South Detour Contract Completion", dated December 14, 2006, the Department assumed responsibility for the design of the West Tie-In and East Tie-In. The modifications to the Contractor's design for the TBS Viaduct are necessary to accommodate the Department's East Tie-In Roll Out/Roll In design concept. The plan sheets of this change order will not be stamped and will be used only to assist the Contractor's Engineer in design and development of the final Viaduct design and drawings, of which these will be stamped by the Contractor's Engineer. This work which was not originally contemplated by the contract is being performed in accordance with Section 5-1.14 "Contractor Design" of the Special Provisions and the above referenced strategy memorandum.

Compensation to the Contractor for the additional design work to modify the TBS Viaduct structure to accommodate the Departments East Tie-In design concept will be compensated for as extra work at force account. Compensation to the Contractor for the additional work to fabricate and construct these modifications will compensated for under separate change order.

TBPOC provided authorization to proceed with this change order per their meeting on May 31, 2006.

This change was requested by Tom Ostrom - Office Chief, Structures Design. This change was discussed and concurred by Ken Terpstra - Project Manager, and Ken Brown - Office Chief, Structures Maintenance, and Pete Siegenthaler - SFOBB Construction Manager, and Hong Wong - Project Engineer.

This work is not covered under the contract items. Therefore, this work will be done under Extra Work at Force Account for an estimated total of $ 800,000.00, which can be financed under the current contingency fund.

No adjustment of the contract time is warranted, as this change does not affect the controlling operation.

Approval of this change order is recommended by the Resident Engineer.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 68	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer:

Provide, install, relocate, remove electrical circuits and equipment for Stage 1 electrical work at the new Viaduct / West Tie-In interface as per the attached Plans and Special Provisions.

For this work, payment will be in accordance with Section 4-1.03D, Extra Work, of the Standard Specifications, and Section 5-1.24, Force Account Payment, of the Special Provisions, and no other compensation will be allowed therefor.

No adjustment in contract time will be made since this work is not a controlling operation.

Estimated cost of Extra Work at Force Account $140,000.00

Estimated Cost: Increase ☑ Decrease ☐ **$140,000.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

Submitted by		
Signature M. U. Anigol	**Resident Engineer** MAHANTESH ANIGOL	**Date** 3/22/07
Approval Recommended by

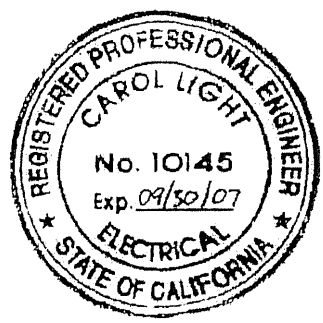
SHEET 2 OF 42

CONTRACT NO. 04-0120R4

The special provisions contained herein have been prepared by or under the direction of the following Registered Persons.

ELECTRICAL

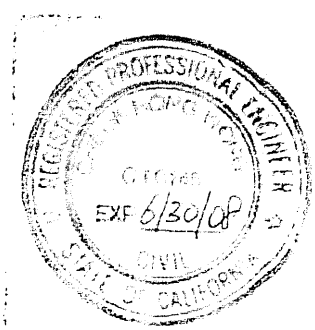
REGISTERED ELECTRICAL ENGINEER



CIVIL

2/7/07

Registered CIVIL Engineer



CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO. 68

SHEET 3 OF 42

SECTION 1. SPECIFICATIONS AND PLANS

Section 1, " Specifications and Plans,' of the Special Provisions is amended by adding the following sections:

The work embraced herein shall conform to the provisions in the Standard Specifications dated July 1999, and the Standard Plans dated July 1999, of the Department of Transportation insofar as the same may apply, the special provisions and these CCO special provisions.

In case of conflict between the Standard Specifications, the Special Provisions and these CCO special Provisions, the CCO Special Provisions shall take precedence over and shall be used in lieu of the conflicting portions.

SECTION 10. CONSTRUCTION DETAILS

SECTION 10-1. GENERAL

10-1.01 EXISTING HIGHWAY FACILITIES

The work performed in connection with various existing highway facilities shall conform to the provisions in Section 15, "Existing Highway Facilities," of the Standard Specifications and these Special Provisions.

REMOVE DRAINAGE FACILITY

Existing pipes, Utility Vaults, and drainage inlets where shown on the plans to be removed, shall be completely removed and disposed of. Resulting openings into existing structures that are to remain in place shall be plugged with commercial quality concrete. Drainage facilities shall not be removed until their use is no longer required.

Full compensation for concrete plugs, pipe removal, structure excavation, and backfill shall be considered as included in the contract lump sum price paid for drainage facilities and no additional compensation will be allowed therefor.

Existing pipes, and inlets removed shall be disposed of outside of the highway right of way in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

REMOVE GUTTER

Concrete gutter, where shown on the plans to be removed, shall be completely removed and disposed of. The pay quantities of concrete gutter to be removed will be measured by the cubic meter, measured before and during removal operations.

Concrete removed shall be disposed of outside the highway right of way in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Where no joint exists between concrete gutter to be removed and the concrete gutter to remain in place, the concrete gutter shall be cut on a neat line to a minimum depth of 50 mm. Where concrete gutter has been removed, the backfilled areas shall be graded to blend in with the surrounding terrain.

ASPHALT CONCRETE PAVEMENT AND BASE

Whenever existing asphalt concrete pavement and its underlying aggregate base is removed due to the work involved the contractor shall replace the asphalt concrete and aggregate base to match the existing condition.

Prior to removing the asphalt concrete, the outside edge of the asphalt concrete to remain in place shall be cut on a neat line to a minimum depth of 50 mm. The asphalt concrete shall be removed in such a manner that the surfacing which is to remain in place is not damaged. Asphalt concrete shall be Type A and shall conform to the provisions in Section 39, "Asphalt Concrete," of the Standard Specifications. Aggregate base shall be Class 3 and conform to the provisions in Section 26, "Aggregate Bases," of the Standard Specifications.

The asphalt concrete and aggregate base removed shall be disposed of outside of the highway right of way in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

10-1.02 ALTERNATIVE UTILITY VAULTS

Alternative Utility Vaults shall conform to the provisions in Section 62, "Alternative Utility Vaults," of the Standard Specifications.

10-1.03 DRAINAGE INLETS

Drainage inlets shall conform to the provisions in Section 75, "Miscellaneous Metal," and Section 51, "Concrete Structures," of the Standard Specifications.

10-1.04 MISCELLANEOUS CONSTRUCTION

Gutters, concrete aprons, and gutter depressions shall conform to the provisions in Section 73, "Concrete Curbs and Sidewalks," of the Standard Specifications.

10-1.05 WELDED STEEL PIPE

Welded steel pipe shall conform to the provisions in Section 70, "Miscellaneous Facilities," of the Standard Specifications.

10-1.06 ABANDON UTILITY VAULTS

Existing Utility Vaults, where shown on the plans to be abandoned, shall be abandoned in place. Resulting openings into existing structures that are to remain in place shall be plugged with commercial quality concrete containing not less than 505 pounds of cement per cubic yard.
Abandoning Utility Vault in place shall conform to the following:

A. Utility Vaults that intersect the side slopes shall be removed to a depth of not less than 1 meter measured normal to the plane of the finished side slope, before being abandoned.

B. Utility Vaults 0.3 meter in diameter and larger, shall, at the Contractor's option, be backfilled with either sand, controlled low strength material or slurry cement backfill conforming to the provisions in Section 19-3.062, "Slurry Cement Backfill," of the Standard Specifications by any method acceptable to the Engineer that completely fills the pipe. Sand backfill material shall be clean, free draining, and free from roots and other deleterious substances.

C. The ends of Utility Vaults shall be securely closed by a 0.15 meter thick tight fitting plug or wall of commercial quality concrete.

Utility Vaults shall not be abandoned until their use is no longer required. The Contractor shall notify the Engineer in advance 5 days of any intended Utility Vaults or pipeline abandonment.

Full compensation for concrete plugs, and backfill shall be considered as included in the contract unit price paid for abandon utility vaults and no additional compensation will be allowed therefor.

SECTION 86: SIGNALS, LIGHTING AND ELECTRICAL SYSTEMS

The seventh paragraph of Section 86-2.03, "Foundations," of the Standard Specifications is amended to read:

• Forms shall be true to line and grade. Tops of foundations for posts and standards, except special foundations, shall be finished to curb or sidewalk grade or as directed by the Engineer. Forms shall be rigid and securely braced in place. Conduit ends and anchor bolts shall be placed in proper position and to proper height, and anchor bolts shall be held in place by means of rigid templates. Anchor bolts shall not be installed more than 1:40 from vertical.

The twelfth paragraph of Section 86-2.03, "Foundations," of the Standard Specifications is amended to read:

• Plumbing of the standards shall be accomplished by adjusting the leveling nuts before placing the mortar or before the foundation is finished to final grade. Shims, or other similar devices shall not be used for plumbing or raking of posts, standards or pedestals. After final adjustments of both top nuts and leveling nuts on anchorage assemblies have been made, firm contact shall exist between all bearing surfaces of the anchor bolt nuts, washers, and the base plate.

Section 86-8.01, "Payment," of the Standard Specifications is amended to read by adding the following paragraph after the first paragraph:

• If a portion or all of the traffic signal and lighting standards, pursuant to Standard Specification Section 86, "Signals, Lighting and Electrical Systems," are fabricated more than 480 air line kilometers from both-Sacramento and Los Angeles, additional shop inspection expenses will be sustained by the State. Whereas it is and will be impracticable and extremely difficult to ascertain and determine the actual increase in such expenses, it is agreed that payment to the Contractor for furnishing such items from each fabrication site located more than 480 air line kilometers from both Sacramento and Los Angeles will be reduced $5000; in addition, in the case where a fabrication site is located more than 4800 air line kilometers from both Sacramento and Los Angeles, payment will be reduced an additional $3000 per each fabrication site ($8000 total per site).

SECTION 10-3. ELECTRICAL WORK

10-3.01 DESCRIPTION

Traffic signals, flashing beacons, lighting, sign illumination, traffic operation system and call box system shall conform to the provisions in Section 86, "Signals, Lighting and Electrical Systems," of the Standard Specifications and these special provisions:

Call Box system shall consist of installing foundations, conduits, conductors and cables. Callbox housings and mounting bases shall be installed by Electrical Contractor.

ELECTRICAL WORK (Stage 1)

This work shall include demolition on the north side of the viaduct in preparation for installation of new viaduct foundation piles:

1. Remove and relocate existing call boxes.
2. Remove two existing light poles on north side of viaduct at onramp.
3. Relocate two existing light poles on the north side of viaduct.
4. Relocate junction box for CCTV and CCTV camera.
5. Relocate existing junction boxes on south side of viaduct at off ramp.
6. Install new flexible conduit as necessary for relocations.

7. Contractor shall determine exact conduit routing and location of conduit supports and splice boxes.
8. Before completion of all electrical work, contractor shall label all conductors and cables by type and circuit number.
9. Conduct cable continuity and insulation tests on all circuits.
10. Conduct cable continuity test and functional test on all lighting circuits to remain in use.

ELECTRICAL WORK (Stage 2)
Demolition of south side of existing viaduct and relocation of adjacent site electrical items to prepare for new viaduct installation:

1. Extend existing conduit and conductors to new pullboxes.
2. Provide new armored cable.
3. Remove existing callbox and retain for use in stage four.
4. Contractor shall determine exact conduit routing and location of conduit supports and splice boxes.

ELECTRICAL WORK (Stage 3)
Construction of new viaduct structure:

1. Install recessed soffit lighting in underside of upper viaduct level. Provide pullboxes conduit and wire for electrical connection.
2. Install temporary light poles on permanent bases on north end of viaduct with conduit routed in permanent barrier.
3. Install call boxes on viaduct.
4. Conduct cable continuity and insulation tests on all circuits.

ELECTRICAL WORK (Stage 4)
Installation of viaduct into permanent position with connection of permanent and temporary lighting poles to circuits. Connection of call boxes to call box system:

1. Install temporary poles mounted on K-rail or movable bases.
2. Connect both permanent and temporary lighting to lighting circuitry.
3. Connect call boxes to call box system.
4. Connect lighting circuits to existing bridge to the east of bent 48 and to the west of bent 38.
5. Contractor shall determine exact conduit routing and location of conduit supports and splice boxes.
6. Before completion of all electrical work, contractor shall label all conductors and cables by type and circuit number.
7. Conduct cable continuity and insulation tests on all circuits.
8. Conduct cable continuity test and functional test on all lighting circuits to remain in use.

10-3.02 COST BREAK-DOWN

Cost break-downs shall conform to the provisions in Section 86-1.03, "Cost Break-Down," of the Standard Specifications and these special provisions.
The Engineer shall be furnished a cost break-down for each contract lump sum item of work described in this Section 10-3.
The cost break-down shall be submitted to the Engineer for approval within 20 days after the contract has been approved. The cost break-down shall be approved, in writing, by the Engineer before any partial payment for the items of electrical work will be made.
The cost break-down for the Electrical Work shall be broken down, as a minimum, to include the following listed items in addition to those listed in the Standard Specifications:

Electrical Work. Electrical installation is shown on the plans and shall include, but not be limited to the following additional items of the cost break-down:

STAGES 1-4

1. Remove existing and install new pullboxes.
2. Relocate existing light poles.
3. Relocate existing call boxes and cable to them.
4. Install new conduit and wires.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO. 68

SHEET 9 OF 42

10-3.03 CODES AND STANDARDS

All work performed and material installed or furnished on this contract shall conform to Section 86-1.02 "Regulations and Code," and the following codes and standard to the modifications and additional requirements in these special provisions:

A. California administrative Code, Title 24, part 3, "Basic Electrical Regulations."
B. National Fire Protection Association Standards.
C. All local ordinances.

10-3.04 MAINTAINING EXISTING AND TEMPORARY ELECTRICAL SYSTEMS

The Contractor shall visit the site of the proposed routing of cables and base his bids from site examination and estimate. The Contractor shall study the contract documents included under this contract to determine exactly the extent of work provided under this contract, as well as to ascertain the difficulty to be encountered in the performing the work. Continuous operation of the bridge shall be required while rerouting and splicing of the existing circuits are being performed. Outages required for construction purposes shall be scheduled for the shortest practical periods of time, in coordination with the Engineer. No outages or shutdowns of service shall occur without the written authorization of the Engineer.

Before commencing the work, the Contractor shall submit in writing to the Engineer a description and detailed schedule of the intended operations relative to keeping the bridge east and west spans lighting systems in continuous operation. Such schedule shall be part of the progress schedule.

Regardless of construction procedure, methods and equipment selected, the Contractor shall have all materials and equipment on the site for the installation of the lighting system prior to commencement of work. Disconnection of existing or temporary lighting system will not be permitted until the new cables have been tested and properly installed.

The Contractor shall provide any and all necessary temporary materials as required to keep any and all electrical facilities in continuous operation. The Contractor shall be responsible for coordinating all electrical work with all other Contractors, State forces, and entities. Where damage to facilities is caused by the Contractor's operations, the Contractor shall, at the Contractor's expense, repair or replace damaged facilities promptly in accordance with the Standard Specifications. If the Contractor fails to complete the repairs, the repairs will be made by State forces at the Contractor's expense.

Full compensation for temporary facilities shall be considered as included in the contract lump sum prices paid for the various contract items of work involved and no additional compensation will be allowed therefore.

10-3.05 CONDUIT

All conduit installed shall be Type 1 unless otherwise specified.

RIGID GALVANIZED STEEL CONDUIT, THREADED COUPLINGS AND ELBOWS

The rigid galvanized steel (RGS) conduit, threaded couplings, and elbows shall conform to Section 86-2.05, "Conduit," of the Standard Specifications for Type 1 where shown on the plans.

LIQUID-TIGHT FLEXIBLE METAL CONDUIT

The liquid tight flexible metallic conduit shall conform to the following requirements:

A. The flexible metal shall be constructed of continuously interlocked strip and shall be coated with sunlight resistant PVC jacket.

B. The metal core shall be hot-dipped galvanized steel core with a heavy coating of zinc.
C. The jacket shall be resistant to weather, temperature, oil and chemical breakdown.
D. Conform to the provisions of NEC Article 351 under "Liquid-tight Flexible Metal Conduit.
E. UL listed for Safety 360.

10-3.06 PPORT HARDWARE FOR CONDUITS AND CABLES

STAINLESS STEEL POWER-STUD, ANCHOR-THREADED VERSION

All electrical items that use anchors to attach to the concrete structures shall use stainless steel power stud anchor-threaded version.

Stainless steel power-stud, anchor-threaded version shall have a one-piece anchor body with the length identification code. The anchor bodies shall be manufactured from Type 316 stainless steel and shall have an expansion mechanism, which consists of a pair interlocking independent wedges.

Anchors that have less than a 40 mm hole depth can be installed anywhere in the box. If the anchor will require a hole depth of greater than 40 mm, the Engineer will consult with the Structural Engineer of Record prior to approving the location and depth of the anchor. The f'c for the superstructure is 55 MPa. The average strength of the concrete will therefor be almost 62 MPa. As a consequence it will be difficult to drill.

Anchor Component	Component Material
Anchor Body	Type 316L Stainless Steel
Nut	Type 316L Stainless Steel
Washer	Type 316L Stainless Steel
Expansion Wedge	Type 316L Stainless Steel

ELECTRICAL HARDWARE

All electrical hardware, including but not limited to, bolts, nuts, washers, lock washers, fastening screws, expansion anchors, U-bolts and hold-down clamps shall be Type 316L stainless steel unless otherwise noted.

10-3.07 PULL BOXES

NEMA TYPE 4 SPLICE BOX SINGLE DOOR

The NEMA Type 4 single door splice box shall conform to the following:

Construction

A. Enclosure bodies are either 14-gage or 16-gage steel. All doors are 14-gage steel.
B. Seams shall be continuously welded and ground smooth, no holes or knockouts.
C. Stainless steel clamps on three sides of cover assure watertight seal.
D. Heavy gauge continuous hinge.
E. Cover removed by pulling stainless steel hinge pin.
F. Oil resistant gasket and adhesive.
G The box engraving, physical size and dimensions shall be as shown on the plans drawings.
H. Finish shall be white inside with ANSI 61 gray outside finish over phosphatized surfaces. Optional panels shall be white.

Industry Standards

A. UL 50 Type 4.
B. NEMA/EEMAC Type 4.
C. JIC standard EGP-1-1967 (14-gage only).
D. CSA Type 4.
E. IEC 529, IP-66.

15 kV SPLICE BOX

The high voltage splice box shall be NEMA Type 4, sized as required by code. The box shall conform to all applicable requirements in NEC, Article 370(D). Each cover shall be secured with at least ten stainless steel bolts. Cover makings for high voltage splice box shall read "High Voltage" and be permanently marked and readily visible. Enclosures and covers shall be steel, 14-gage minimum with seams continuously welded and ground smooth. High voltage splice box shall be installed at each high voltage cable splice location.

10-3.08 CONDUCTORS, CABLES AND WIRING

Splices shall be insulated by heat-shrink tubing of the appropriate size after thoroughly painting the spliced conductors with electrical insulating coating.

The minimum insulation thickness, at any point, for Type USE, RHH or RHW wire shall be 1.0 mm for conductor sizes No. 14 to No. 10, inclusive, and 1.3 mm for No. 8 to No. 2, inclusive. The minimum insulation thickness, at any point, for Type THW and TW wires shall be 0.69 mm for conductor sizes No. 14 to No. 10, inclusive, 1.02 mm for No. 8, and 1.37 mm for No. 6 to No. 2, inclusive.

Testing

The Contractor shall perform a high-voltage series lighting test consisting of the open circuit voltage of the connected constant current transformer between conductors and ground.

The high-voltage test shall not be performed on existing circuits or equipment. Non-testing of existing circuits and equipment shall not relieve the Contractor from the responsibility for malfunctioning of existing lighting circuits due to the Contractor making splices in or connecting to the circuits and such malfunctions shall be corrected at the Contractor's expense.

600 VOLT SINGLE CONDUCTOR CABLE

All 600-volt single conductor cable shall be the following unless otherwise noted on the plans. The cables shall be insulated with a EPR insulation rated for 600 volts. The cables shall be UL listed as Type RHH, RHW-2, or USE-2, VW-1 600 V. All cables No. 1/0 and larger shall be UL Type TC rated.

The conductor shall be soft annealed uncoated copper Class B stranded per ASTM B-8. The EPR insulation shall meet the requirements of ICEA S-68-516, NEMA WC-8, and UL Standards 44 and 854. The composite insulation thickness shall be as follows:

Conductor Size	EPR Thickness
No. 14 - No. 10	1.14 mm
No. 8	1.52 mm
No. 6 - No. 2	1.91 mm

The cable surface shall be printed in a contrasting color with the following information:

A. Manufacturers' name.
B. Plant number.
C. Conductor size.
D. Cable type.
E. Voltage rating.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO. 68

SHEET 11 OF 42

The cable shall be manufactured by The Okonite Company, BICC Cables, Pirelli, or equal. Manufacturer shall furnish a notarized certificate of compliance to demonstrate cable furnished is in compliance with ICEA S-68-516 and UL 44.

600 VOLT MULTI-CONDUCTOR CABLE

All 600 volt rated multi-conductor cables shall be the following unless otherwise noted on the plans drawings. The cables shall be insulated with ethylene propylene rubber, assembled as a multi-conductor cable with flame resistant fillers and binder tape with an overall PVC jacket. The cables shall be capable of operating continuously in both wet and dry locations at conductor temperature of 90°C for normal operation, 130°C for emergency overload rating, and 250°C short circuit rating.

The conductors shall be soft annealed uncoated copper Class B stranded in conformance to the requirements in ASTM Designation B 8. The single conductors shall be ethylene propylene rubber insulated meeting the requirements of UL 1581 and ICEA S-68-516. Color coding for sizes No. 10, 12, 14 and 16 AWG shall conform to the requirements in ICEA Method I Table K-2. Sizes No. 8 and larger shall be numerically coded using ICEA Method 4. The insulation thickness shall be as follows:

Conductor Size	EPR Thickness
No. 16	0.64 mm
No. 14 - No. 10	0.76 mm
No. 8 - No. 2	1.14 mm

The insulated conductors (and grounding conductor if required) shall be cabled together with flame resistant fillers and binder tape. The jacket shall be extruded PVC meeting the physical and dimensional requirements of ICEA S-68-516. The cable shall pass the vertical tray flame test requirements of IEEE 383 and 1202 and UL 1277. The cable shall be UL listed as Type TC.

The cable surface shall be printed in a contrasting color with the following information:

A. Manufacturers' name.
B. Plant number.
C. Number of conductors.
D. Conductor size.
E. Cable type.
F. Voltage rating.

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO. 68

SHEET 12 OF 42

The cable shall be manufactured by The Okonite Company, BICC Cables, Pirelli, or equal. The manufacturer shall furnish a notarized certificate of compliance to demonstrate cable furnished is in compliance with ICEA S-68-516 and UL 1277.

500 kcmil INSULATED GROUNDING CONDUCTOR

The 500 kcmil insulated grounding conductor shall be Class B stranded, annealed uncoated copper per UL Standard 83. The conductor shall be insulated with PVC complying with the physical and electrical requirements of UL Standard 83 for Type THW. The conductor shall bear the UL label for Type THW.

600 VOLT ARMORED MULTI-CONDUCTOR CABLE

The 600 V armored cables shall be installed for the south-south staging. The individual conductor of the armored cable shall conform to the 600 V cable requirements as specified above in the special provisions. The armor sheath shall exceed the grounding conductor requirements of Table 250-95 of the National Electrical Code and UL 1569. The cable shall have stranded copper grounding conductor, located in the outer interstices. The armor sheath shall be impervious, continuous, welded, corrugated aluminum that will provides complete protection against moisture, liquid, and gasses and has excellent mechanical strength. The armor sheath shall be covered with low temperature black polyvinyl chloride to protect cable against chemical attack. The cable shall be UL Listed as type MC cable per Article 334 of the NEC.

SHIELDED-TWISTED PAIR CABLES

All shielded twisted pair No. 18 (0.832 mm^2) multi-conductor communication cables (fifty pairs) shall be stranded annealed copper (per ASTM Designations: B 3 and ASTM B 8). The insulated single conductors shall be twisted into pairs. The insulation shall be flame-retardant cross-linked polyethylene with color code in conformance with the requirements in ICEA Method 1. The insulation shall be 0.76 mm nominal. The cable components are cabled with non-hygroscopic fillers, as necessary, and an overall binder tape. The individual pairs shall be shielded with a 0.19 mm Aluminum/polymer tape with tinned copper drain wire applied helically over the pairs. The overall shield shall be a 0.19 mm Aluminum/polymer tape with tinned copper drain wire applied helically over the cable core.
The overall jacket shall be 2.8 mm flame-retardant and sunlight resistant polyvinyl chloride (PVC). A nylon ripcord shall be applied longitudinally under the overall jacket to facilitate jacket removal.

The cable shall be suitable for cable tray use and have the following ratings and listings:

A. UL Type TC - 600 volt.
B. UL Class XL.
C. UL Subject 13 and 1277.
D. IEEE 383 & 1202.
E. ICEA S-66-524 - 600 volt.

CONTRACT NO. 04-0126R4

CONTRACT CHANGE ORDER NO. 68

SHEET 13 OF 42

The cable shall be manufactured by Belden Cable, The Okonite Company, ~~BICC Cables, Pirelli~~, or equal. The manufacturer shall furnish a notarized certificate of compliance to demonstrate cable furnished is in compliance with ICEA S-68-516 and UL 44.

Communication Cable Splices

Splices shall be done only as approved by the Engineer. Splices for shielded No. 18 multi-conductor, twisted pair cables shall be as recommended by the cable manufacturer and suitable for the environment that the splice is located. The Contractor shall submit the cable manufacturer's recommended splicing method to the Engineer for approval prior to using the method. The Engineer shall approve splice locations. The splicing kits shall be manufactured by Raychem, 3M or other approved manufacturer.

15 kV CABLE

Cable Splices

All 15 kV splices shall be enclosed on a 15 kV splice box. The splices, shall be IEEE 404, heat shrinkable cable splices in kit form, capable of properly splicing cables specified in this section. Splice kits shall contain all necessary components to reinstate primary cable insulation, metallic shielding and grounding systems and overall jacket to the equivalent of the cable itself. Splices shall be of a uniform cross-section and shall consist of heat-shrinkable radiation crosslinked insulation. The outer insulating layer shall be bonded to a conducting layer for shielding. The splice shall be rejacketed with a heavy-wall, heat-shrinkable sealant lined sleeve to provide a waterproof hot melt adhesive seal. Splices shall contain heat-shrinkable radiation cross-linked high dielectric constant linear stress relief material. Splices shall contain a high relative permittivity electric stress relief mastic for insulation shield cutback treatment and a heat-activated sealant for environmental sealing. Kits

shall allow splicing cables with different types of insulation, conductor sizes, and shielding construction. Kits shall accommodate commercially available standard connectors.

Cable End Sealing Caps

The end seal caps shall be heat-shrinkable crosslinked polymeric end sealing caps capable of sealing cables specified in this section. End caps shall be precoated with a heat activated sealant.

DC High Potential Test

Perform DC high potential test of each conductor in accordance with NEMA WC 5.

15 kV Armored Shielded Cable

The three conductor 15 kV armored shielded cables shall be 133 percent insulation rated power cable designed to operate at conductor temperatures of 90°C normal, 130°C emergency, and 250°C short circuit conditions as defined by ICEA S-93-639 (NEMA WC-78) and (UL) Standard 1072. The cable shall be suitable for installations above or below grade, indoors or outdoors, and in wet or dry locations. The qualifying cable shall be (UL) labeled as MV-90, Sunlight Resistant and for cable tray use in accordance with UL Standard 1072.

The cable shall have a continuous corrugated welded aluminum sheath encases the cable core per UL 1072 and UL listing E-38916 recognized as a grounding conductor by NEC. The cable sheath shall provide complete protection against moisture, liquid and gasses and shall have excellent mechanical strength. The

sheath shall be protected with a low temperature polyvinyl chloride jacket in accordance with UL 1072 to protect the cable against chemical attack.

Conductors

The conductors shall be compressed, Class B stranded copper and shall be in accordance with the requirements of ICEA S-93-639. The copper conductors shall consist of all bare strands or tin-coated strands in the outer layer in conformance with the requirements in ASTM Designations: B 3, B 8 and B 33. Conductors shall be unbroken for the full length of the reels specified in the Purchase Order. Reels containing splices will be rejected.

Conductor Shield

The conductor shielding shall consist of an extruded, black-colored, nonmetallic semiconducting EPR thermosetting compound material in conformance with the provisions in Section 2.7 of ICEA S-93-639. The minimum average thickness shall be 0.5 mm.

Insulation

The insulation shall be a discharge resistant, ethylene propylene (EP) based compound and be listed by Underwriters Laboratories. The minimum average thickness of the insulation shall be 5.59 mm. The manufacturer shall perform the Insulation Corona Discharge Resistance Test (3.9.3.3 of ICEA S-93-639) tested in conformance with the requirements in ASTM Designation: D 2275-89, "Standard Test Method for Voltage Endurance of Solid Electrical insulating materials Subjected to Partial Discharges (Corona) on the Surface," and submit the results to the Engineer before acceptance of the cable.

Insulation Shielding

The insulation shielding shall consist of a nonmetallic semiconducting EPR material extruded directly over the insulation and a 0.12-mm bare copper tape. The nonmetallic semi conducting layer shall be black-colored with properties and thickness conforming to the requirements of Table 4a of ICEA S-68-516-93-639 and Tables 14.2 and 14.3 of UL-1072. The layer shall be free stripping from the EP insulation. The 0.12-mm bare copper tape shall be helical applied with a 15 percent overlap, directly over the nonmetallic layer.

Metallic Shield

The metallic shield shall be coated copper tape, helically applied with a minimum overlap of 12.5 percent, directly over the nonmetallic layer.

Phase Identification

A colored tape shall be applied longitudinally under the copper shielding tape to provide phase identification.

Assembly

The three phase conductors shall be cabled together with class B stranded, uncoated copper grounding conductor and suitable fillers to make round. Length of lay shall not exceed 35 times the phase conductor diameter. The grounding conductor shall comply with the requirement of UL Standard 1072.

Cable Tape

A suitable cable tape shall be applied over the assembly to hold the core together and provide bedding for the armor.

Armor

Aluminum steel interlocked armor shall be applied over the cable core. Armor shall be in accordance with UL Standard 1072 and Part 4 of ICEA.

Jacket

An extruded covering of PVC shall be applied over the armor. The average thickness and properties of the PVC covering shall be as specified in Part 4 of ICEA. The minimum thickness at any point shall be not less than 70 percent of the required average thickness. The covering shall meet the Sunlight Resistant requirements of UL.

Identification

An ink print legend shall be applied to the surface of the PVC covering providing cable and manufacturer identification.

SHIELDED-TWISTED PAIR ARMORED CABLES

The instrumentation armored cables shall be installed for the south-south staging. The individual conductor of the armored cable shall conform to the shielded-twisted pair cable requirements as specified above in the special provisions. The armor sheath shall be impervious, continuous, welded, corrugated aluminum that will provides complete protection against moisture, liquid, and gasses and shall have excellent mechanical strength and provides equipment grounding through the sheath. The armor sheath shall be covered with low temperature black polyvinyl chloride to protect cable against chemical attack. The cable shall be UL Listed.

10-3.09 FIELD TESTING

Field testing shall be performed in the presence of the Engineer. The Contractor shall notify the Engineer five days prior to conducting tests. The Contractor shall furnish all materials, instruments, labor, and equipment necessary to conduct field tests. The Contractor shall perform all tests recommended by the manufacturer unless specifically waived by the Engineer. The Contractor shall perform acceptance tests of all installed electrical equipment in accordance with latest applicable ICEA, NETA and IEEE standards. The tests shall be limited on cable test. The Contractor shall maintain a written record of all tests performed which includes date, test performed, personnel involved, devices tested, serial number and name of test equipment, and test results. All field test report shall be signed and dated by the Contractor. The Contractor shall provide and use safety devices such as rubber gloves, protective barriers, and danger signs to protect and warn personnel in test vicinity. The Contractor shall replace cables that are damaged due to improper procedures or handling.

10-3.10 PAYMENT

The contract lump sump price paid for Electrical Work shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved, complete in place, including manuals, preparation and delivery of any and all proposals, plans, submittals, or other documents to the Engineer, warranty work or modifications, software or software changes, testing and training, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

GENERAL NOTES

1. Conduit routing is diagramatic. Pull box location shall be located as shown onplans. The contractor shall provide additional pull boxes as required. Exact locations of equipment and devices may be adjusted depending on field conditions or by the engineer.
2. Minimum size of conduit shall be 21C. Exposed conduit shall be PVC coated galvanized rigid steel, and conduits located inside girder shall be galvanized rigid steel.
3. Conduit fitting for 78 mm conduits and larger shall have a 610 minimum bending radius.
4. All equipment and devices shall be provided with wire ground.
5. All feeders and branch circuits shall be provided with ground wire.
6. Contractor shall label all conductors and cables per wiring diagrams.
7. All E-sheets are accurate for electrical work only.
8. All existing equipment shall remain in place unless otherwise noted.
9. Locations of conduits, pull boxes and other equipment shown on the plan are approximate and may be changed to suit field conditions.
10. The contractor shall call Underground Service Alert (USA) at (800) 642-2444, 48 hours prior to all excavation.
11. All exposed circuit or conductor connections shall be protected with a corrosion coating.
12. Contractor to verify in field existing live circuit prior to cutting and splicing.

PROJECT NOTES:

1. Existing 41mm conduit.
2. Existing 53mm conduit
3. Existing 41c with 3 #6 (480V, Lighting)
4. Install new 78mm conduit with 3 #8, 5-6 #16 conductor cable to match existing.
5. Existing 41c, with 6 #6 +G, (circuits #103 and #234) to (e) TB-20W located in (E) vault #2.
6. Install new 41mm conduit with new 3 #6+G (circuit #243).
7. Install new NEMA type 4 splice box below floor beam upper deck. Splice box shall have a minimum of 305(L) x 305(W) x 152(D). Fasten box on cieling with four (4) 10-24 concrete expansion anchors and hex head cap screws.
8. Install new 41 mm conduit with 3 #8,1-6 #16 conductor cable to match existing.
9. Install new 3 #8, 2-6 #16 conductor cable in existing conduit to match existing.
10. Install and provide new Terminal Block in (E)TB-01 for call boxes #238 and #348 to match existing.
11. Install new four (4) 1-6 #16 conductor cable (for call boxes) between (E) TB-01 and (E)RTU-7 (located in YBI Substation). Route cables in existing 103 mm spare conduit via (E) MH-2 and (E) duct bank.
12. Install new 53mm conduit with 3 #8, 2-6 #16 conductor cable to match existing. (For CB #138 & CB #338).
13. Install new 41mm conduit with 3 #8, 1-6 #16 conductor cable to match existing. (For CB #338)
14. Coil enough length of 1-6 #16 conductor cable and tape inside pull box for future connection to CB #138 in stage 4 construction.
15. Existing 41c with 3 #8 (480V, Lighting)
16. Existing 41c with 3 #6+G (480V, Lighting)
17. Install new 53mm conduit with 3 #8, 2-6 #16 conductor cable to match (E), for call boxes #238 & #438.
18. Install new 41c, 3 #6+G (480V, Lighting)
    41c, MT (48V, lighting).
19. Install 41C, MT (Low Voltage, Communication).
20. Install new 41C, 3 #6+G Ckt 247 (480V,Lighting)
21. Existing 41c, 3 #6+G Ckt 237 (480V,Lighting).
    3#6+g Ckt #239 (480V, Lighting)..
22. Install new 41C, 6 #6+G (480V, Lighting)
23. Install new 53mm conduit with 3 #8 and two (2) #16 conductor cables.

NORTH LOWER DECK PLAN

RS 45 Existing "Roadside electrical service box".

@ BENT 45
No scale

NOTE:

1. Reference:
   -For (E) TB-01 schedule, see sheet E-21.

SHEET NOTES:

1. Extisting TB-01 and PB-07 located on the north retaining wall near Bent #38.
2. Install relocated call box at this location on k-rail and provide splice box for reconnection. Put into operation at the end of stage 1 or as directed by engineer.
3. Intercept (E) 41c conduit (CB #138 & CB #338) and extend to new location of relocated Call Box.
4. Install relocated lighting standard on temporary k-rail barrier. See temporary light pole foundation detail on E18.
5. Install new 41mm flex conduit wih 3 #6+G (ckt 244). Run flex conduit along K-rail. Provide adequate protetion and support for maximum protection from traffic and personnel. Provide cable connectors.
6. Provide Nema 3 pull box. Install pull box on the outside face of K-rail.
7. Provide 27mm flex conduit with 3 #10 and install new splice connector in adjacent pull box.
8. Existing Pull Box embedded in existing concrete curb to remain in place.
9. Existing Junction Box on top of existing concrete railing to remain in place.
10. Install new 41mm Flex conduit with 3 #8+G. Route conduit along (E) concrete railing and stub into conduit along (E) light pole base. Provide conduit support per NEC.
11. Route new conduit along the outside face of (E) structure and terminate at (E) TB-01 Terminal cabinet.
12. Cut (E) ckt #244 that fed (E) light pole pole (244-09) after new jumper is installed between (E) light pole (244-08) and (E) light pole (244-09). See 600 V block diagram on E-16.
13. Disconnect and remove call boxes at the beginning of stage 3. Call boxex will be reused or reinstalled on stage 4 construction.
14. Install 14 M wood pole with pole guy, overhead 3 #6 (480 V) conductors, conduit riser and other equipment as required to provide temporary lighting power.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO. 68

SHEET 26 OF 42

NOTES

1. References:
   - for 480 V roadway lighting wiring diagram, see sheet E-20.
   - For terminal and pull boxes connection diagrams, see sheet E-21 thru E-25.
   - For permanent call box conductor, use 6/c, #16, 600 V, EPR insulation.

SHEET NOTES

(1) Install standard type 21 with 300W HPS with integral ballast on K-rail. Put into operation when directedby the engineer. Provide electroliers anchor bolts per detail on E-1a. Install fused splice connectors in adjacent pul box.

(2) Install Nema 3R splice box 305(L)x305(W)x152(D). Fasten box on K-rail with concrete expansion bolt and hex head cap screws.

(3) Install new armored cable with 3 #6+G for temporary lighting circuit on outside face of K-rail. Provide cable suppor and cable connector (size as required).

(4) Standard type 21 with 300W HPS and integral ballast installed and wired during stage 3 construction.

(5) Call box #138 was installed during stage 3 construction. Provide tempoary flexible conduit with 3 #8, 1-6 #16 conductor cable. Route cables down to lower deck call boxes. Put into operation when directed by the engineer until permanent call box are installed.

(6) (E) Pull box installed during stage 1 construction.

(7) 41mm conduit with 3 #6+G. (480V, Lighting) in concrete barrier installed during stage 2 (CIP box construction).

(8) Empty conduit in concrete barrier. Installed during stage 3. See E-9 for more information.

(9) Intercept (E) conduit ckt #243 and extend to (E) vault #2A. Provide new cable from (E) pull box to (E) TB-20E located in (E) MH-02 via (E) vault #2A and 2B. Route conduit below concrete tunnel floor along (E) retaining wall, see 600 V cable block diagram sheet E-16. Provide conduit support per N.E.C.

(10) Existing TB-20W is located in (E) vault #2A. Existing TB-01 is located on the north retaining wall near Bent #38.

(11) Temporary install relocated call box #238 on K-Rail. Provide tempoary flexible conduit with 3 #8, 1-6 #16 conductor cable. Route cables down to lower deck call boxes. Put into operation when directed by the engineer until permanent call box are installed.

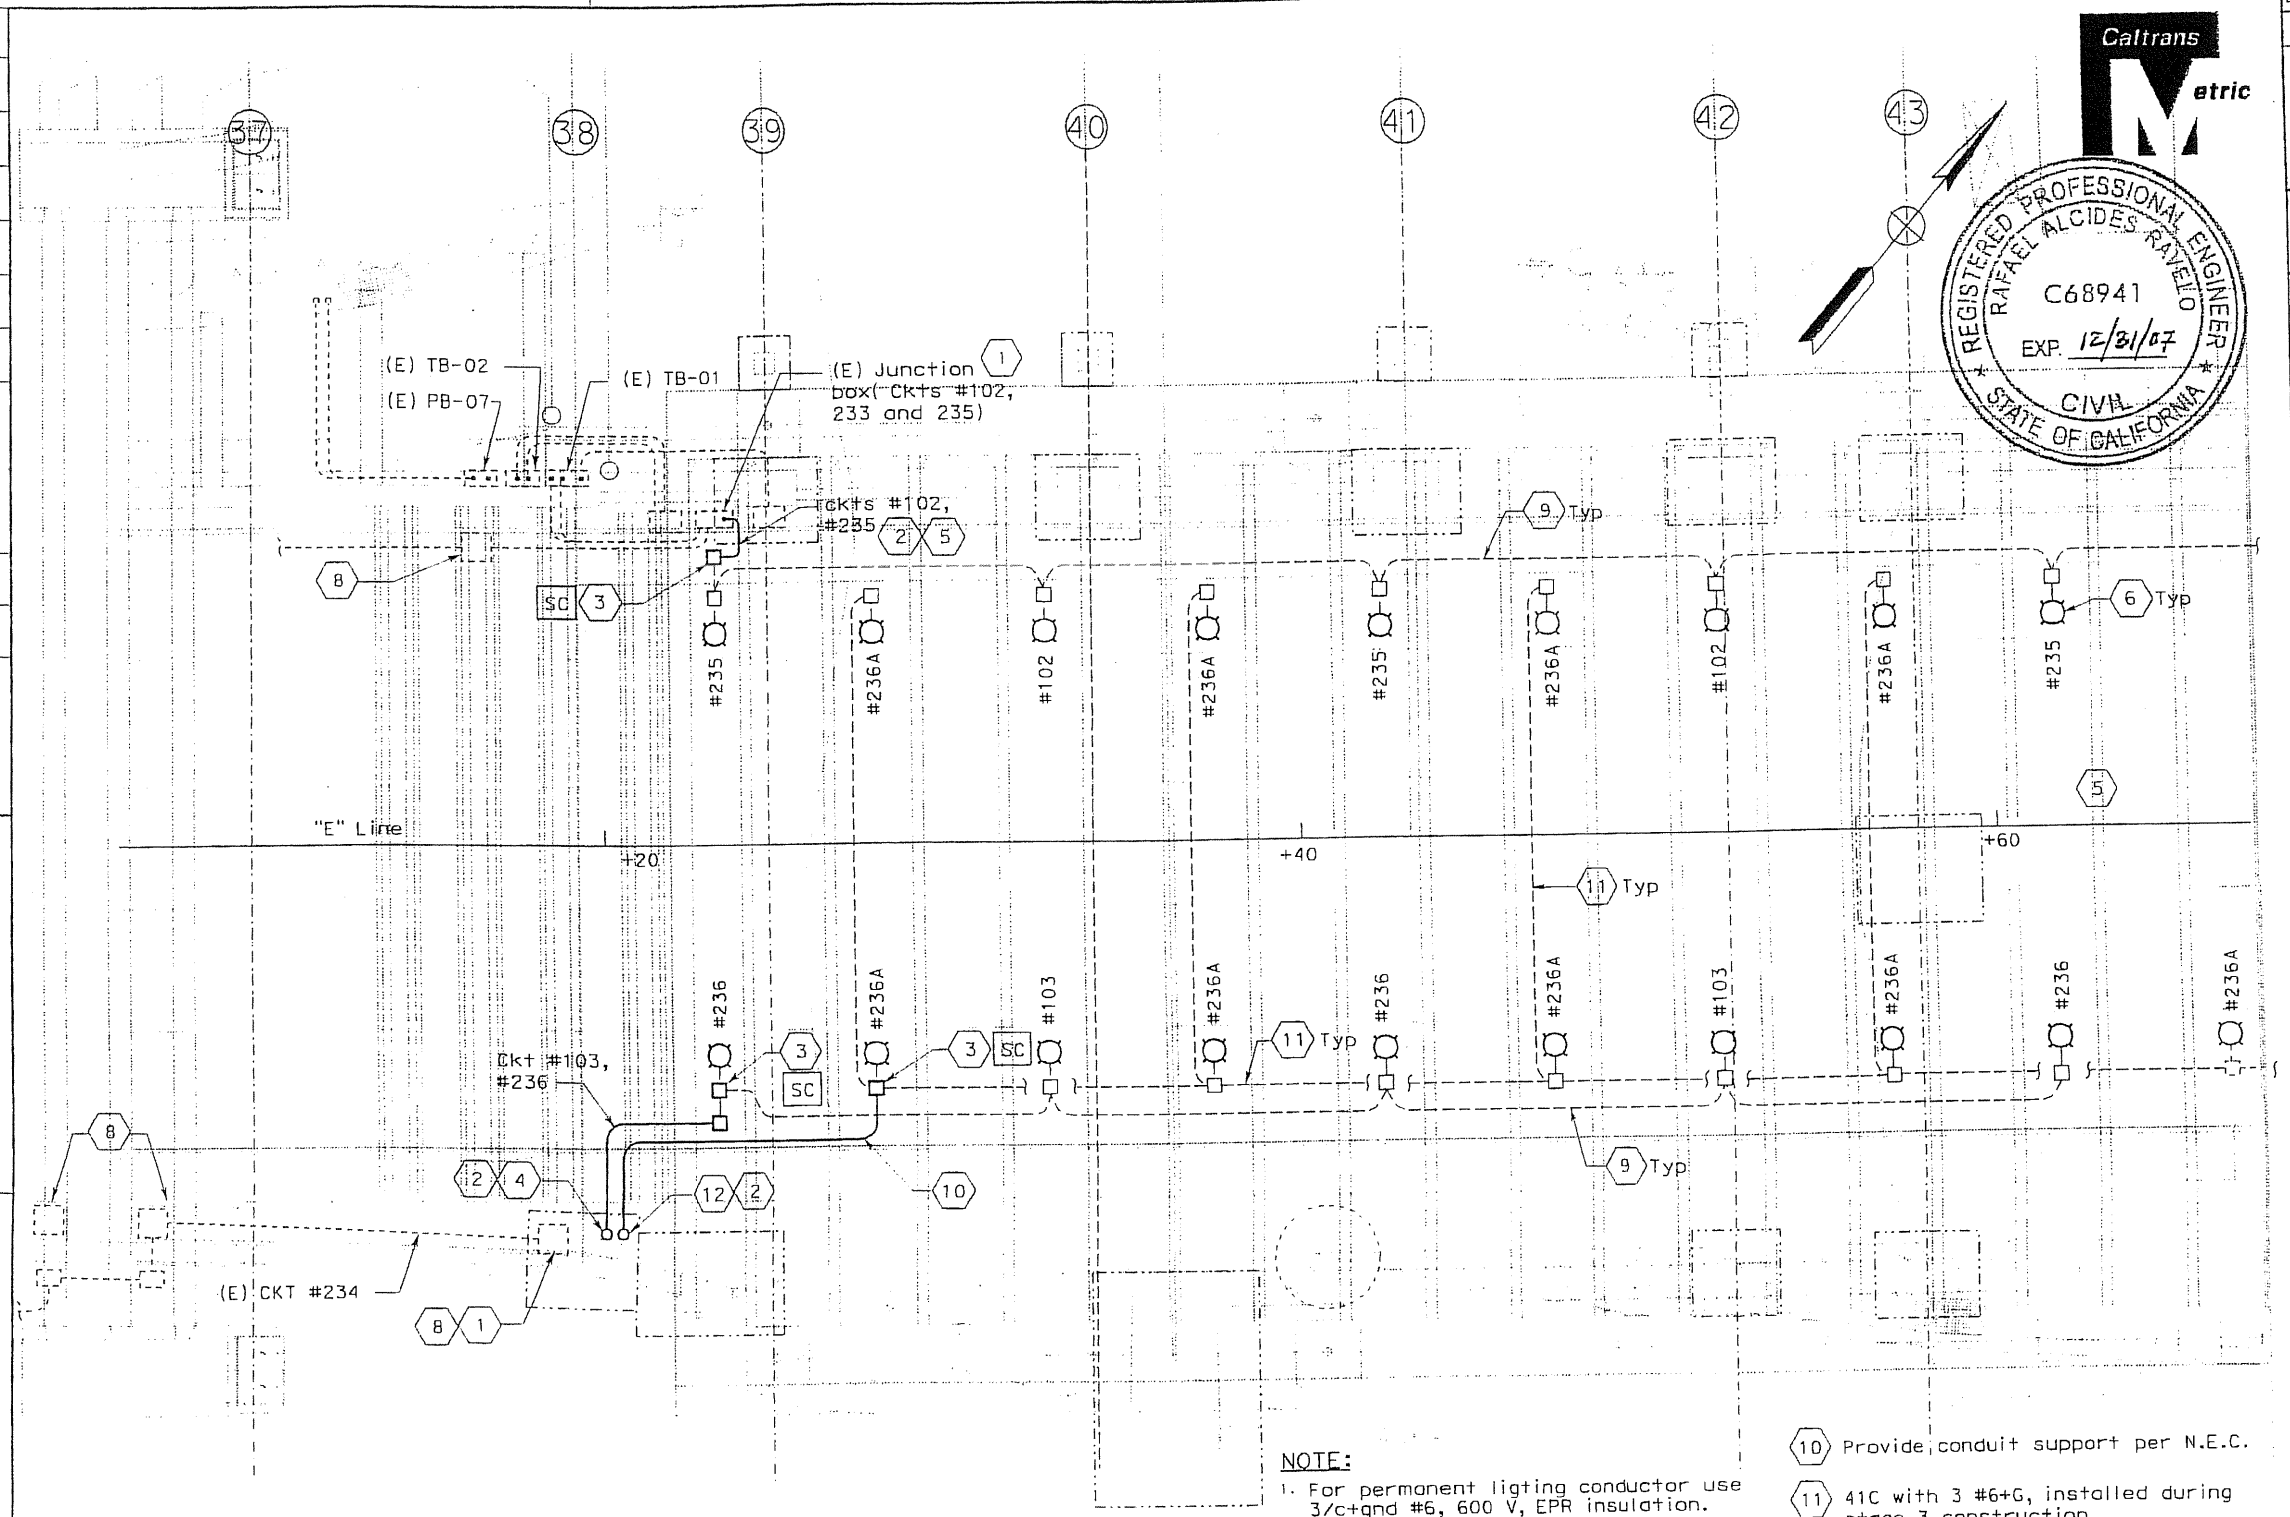
USERNAME => nwong

CU 04251 — EA 0120P1



NOTE:

1. For permanent ligting conductor use 3/c+gnd #6, 600 V, EPR insulation.

(10) Provide conduit support per N.E.C.

(11) 41C with 3 #6+G, installed during stage 3 construction.

(12) Use the same procedure as in sheet note #4 except for new Ckt #236A.

SHEET NOTES:

(1) Contractor to verify in field and locate existing splice box/junction and verify existing circuits prior to cutting and splicing.

(2) Contractor to provide necessary conduit expansion/deflection fitting in all conduit crossing the structure expansion joint. See Standard Detail ES-9B.

(3) Install new Nema type 4 extension ring below the new flush mounted splice box to accomodate splicing of new cables.

(4) Route new permanent circuit #103, and #236 from (E) MH-2 to (E) Vault #2A via (E) duct banks and (E) utility tunnel. Locate (E) Ckts #103 and #236 inside (E) TB-20E and terminate each circuits in Nema type 4 slice box, with a minimum dimensions of 305 (L) x 305 (W) x 152 (D). Install spice box in (E) Vault #2A. From each splice box, install new 41C with 6 #6+G, 600 V to new extension ring and splice new cables inside the spice box Ckts #103 and #236.

(5) From (E) juncton box, install new 41C with 6 #6+G, 600 V to new extension ring and splice new cable feeder inside the splice box Ckts #102. and #235.

(6) Install new 200 W metal halide lamp at the end of stage 4. Construction or as directed by engineer for exact quantity of lamp, see sheet E-10.

(7) Route new circuit #236A from (E) LVCC-C to (E) vault #2A vio (E) MH-2 (E) duct bank and utility tunnel. Terminate circuit in Nema type 4 splice box. Locate splice box in (E) Vault #2A.

(8) Existing wall mounted light fixture. Verify in field exact location.

(9) 41mm with 6 #6+G, installed during stage 3.

SHEET NOTES:

1. (E) PB-05 is located in (E) Vault #5.
2. Existing CKT's #103 and #236 are routed from (E) Vault #5 out to (E) splice box on inside face of girder.
3. (E) Splice box mounted on inside face of girder.
4. Install new Nema 4 extension ring on flush mounted splice box to accommodate splicing of cables.
5. Contractor to provide conduit support per N.E.C. and provide expansion/deflection fitting in all conduit crossing the structure expansion joint. See standard detail ES-9B.
6. Install new 200 watts metal hallide lamp in soffit luminaire housing. (Housing and ballast installed during stage 3.
7. 41c, with 6 #6+G, installed during phase 3.

NOTE:

1. For permanent lighting conductor use 3/c+gnd #6, 600 V, EPR insulation.

CONTRACT CHANGE ORDER MEMORANDUM

DATE: 7/12/2007 Page 1 of 2

TO: PETER SIEGENTHALER / DENNIS TURCHON	FILE: **E.A.** 04 - 0120R4
FROM: MAHANTESH ANIGOL	**CO-RTE-PM** SF-80-12.6/13.2
	FED. NO. ACBRIM-080-1(097)N
CCO#: **68** SUPPLEMENT#: **0** Category Code: **CBPC**	CONTINGENCY BALANCE (incl. this change) **$4,568,240.67**
COST: **$140,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: Electrical work phase 1 YBI Viaduct/West	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**381** Day(s)	**80** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Prepare the jobsite for demolition and constuction of the new Viaduct / West Tie-In interface by relocating, installing, removing electrical circuits and equipment for the electrical construction of Phase 1 of the West Tie-In structure in accordance with the attached plans and specifications.

This Contract originally required that a Temporary Bypass Structure (TBS) be designed and constructed to facilitate the completion of the San Francisco-Oakland Bay Bridge corridor projects by the winter of 2006. The primary goal of the corridor projects is to achieve seismic safety as soon as possible. Due to extensions in the corridor schedule, the TBS will not be required to be in service until late 2009.

On June 14, 2006, the State issued Letter Number 713 removing design responsibilities for both the East Tie-In and West Tie-In structures from the Contractor and assumed the role of the Engineer of Record for these segments. This is documented in the memorandum titled, "Strategy for South South Detour Completion," which is attached to this Change Order. As part of that memorandum, work at the West Tie-In area is broken up into two phases with the first phase currently under way. However, prior to demolition of the northside of the Viaduct structure, there are existing electrical utilities that must first be relocated.

For this work, the Contractor will be compensated at Extra Work at Force Account for an estimated cost of $140,000.00., which can be financed from the project's contingency funds.

A cost analysis, as well as other supporting documents and information relative to this change order, are on file with the project records.

This change was requested by Mike Whiteside, YBI Coordination Engineer. This change was discussed with Ken Terpstra - Project Manager and Rob Kobal - HQ Asst. Construction Coordinator. Headquarter's Issue & Approve Memorandum was granted on 7/12/07.

Maintenance concurrence is not required, as this work does not affect the maintenance of the structure.

No adjustment in contract time will be made since this work is not a controlling item.

Approval of this change order is recommended by the Resident Engineer.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 68	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer:

Provide and install electrical circuits and equipment for Stages 2, 3, and 4 electrical work at the West Tie-In (Phase 1) structure between Bents 39 to 48 as per the attached Plans and Special Provisions of Contract Change Order 68, Supplement 0 (zero).

For this work, payment will be in accordance with Section 4-1.03D, Extra Work, of the Standard Specifications, and Section 5-1.24, Force Account Payment, of the Special Provisions, and no other compensation will be allowed therefor.

No adjustment in contract time will be made since this work is not a controlling operation.

Estimated cost of Extra Work at Force Account $510,000.00

CCO DESCRIPTION: WTI Phase 1 Temp Elec. Stages 2, 3, 4	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**0** Day(s)	**381** Day(s)	**80** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

Installing electrical circuits and equipment for the electrical construction of Stages 2, 3, and 4 of the West Tie-In (Phase 1) structure in accordance with the plans and specifications attached with Contract Change Order No. 68, Supplement 0 (zero).

This Contract originally required that a Temporary Bypass Structure (TBS) be designed and constructed to facilitate the completion of the San Francisco-Oakland Bay Bridge corridor projects by the winter of 2006. The primary goal of the corridor projects is to achieve seismic safety as soon as possible. Due to extensions in the corridor schedule, the TBS will not be required to be in service until late 2009.

On June 14, 2006, the State issued Letter Number 713 removing design responsibilities for both the East Tie-In and West Tie-In structures from the Contractor and assumed the role of the Engineer of Record for these segments. This is documented in the memorandum titled, "Strategy for South South Detour Completion". As part of that memorandum, work at the West Tie-In area is broken up into Phase 1 and Phase 2, with Phase 1 - Stage 1 electrical work now completed. Phase 1 - Stages 2, 3, and 4 electrical work will complete integration between the new and existing electrical systems of the new West Tie-In (Phase 1) structure. Stage 2 work involves installing new cable for call boxes and auxillary power, Stage 3 work involves installing conduit, wiring, and light fixtures onto the new WTI structure, and Stage 4 work involves integrating the new lighting and upper & lower deck call boxes into the existing electrical system.

For this work, the Contractor will be compensated at Extra Work at Force Account for an estimated cost of $510,000.00., which can be financed from the project's contingency funds.

A cost analysis, as well as other supporting documents and information relative to this change order, are on file with the project records.

This change was requested by Mike Whiteside, YBI Coordination Engineer per Memorandum dated December 6, 2006. This change was concurred with by Alec Melkonians - Project Manager, Hong Wong - Project Engineer, and Bill Zanetich - Maintenance. Headquarter's Issue & Approve Memorandum was granted on XX/XX/07.

No adjustment in contract time will be made since this work is not a controlling item.

Approval of this change order is recommended by the Resident Engineer.

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Generate and submit shop plans in accordance with the attached plans and specifications, and upon approval, procure the pumps, motors, and control panel for the sanitary sewer lift station that must be relocated to allow for the construction of Bent 52. This work also includes all freight charges and equipment manuals.

For this work, the Contractor will be compensated $111,280.00. This sum constitutes full compensation including markups for furnishing all labor, material, tools, equipment, and incidentals for doing the work involved in this change.

All payment clauses contained within this change order's specifications are amended such that all work performed under this change order will be compensated for as extra work at agreed lump sum as part of this change order.

No adjustment in contract time will be made since this work is not a controlling operation.

Total Cost of Extra Work at Lump Sum $111,280.00

Estimated Cost: Increase ☑ Decrease ☐ **$111,280.00**

SHEET 3 OF 21

10-2. SANITARY SEWER LIFT STATION

A sanitary sewer lift station shall be furnished and installed in conformance with the details shown on the plans and these special provisions.

A sanitary sewer lift station shall consist of shaft, duplex pumps with motors, pump enclosure, foundation, pipe, fittings, valves, controls and appurtenances necessary for the satisfactory operation of the sanitary sewer lift station. Service equipment and electrical equipment shall conform to the provisions in Section 10-3 of these special provisions. Incidental material or equipment not mentioned in these special provisions or shown on the plans, which may be necessary for completion and satisfactory operation of the sanitary sewer lift station, shall be furnished and installed.

All components of the sanitary sewer lift station shall be warranted for two years from date of first operation.

MATERIALS LIST AND DRAWINGS

In conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications, the Contractor shall submit, within 15 days after approval of the contract, a list of materials which the Contractor proposes to furnish and install for the sanitary sewer lift station together with the drawings and other data as specified below:

A. The materials list shall be a complete listing of the manufacturer, catalog number, size, and capacity of the manufactured articles. There shall be a working drawing for the sanitary sewer lift station showing the pump details, piping, and equipment as planned to be furnished and installed and for other materials to be fabricated for the installation. Directions for maintenance and adjustment of the pump shall be furnished to the Engineer as well as a manufacturer's certified performance characteristics curve diagram for the pump.
B. The data submitted shall be labeled with a descriptive title, project description and contract number of the project.

At least 4 copies of the data shall be initially submitted to the Engineer for approval. The Engineer will review the submitted data and will return to the Contractor either one set for correction or 2 sets that have been approved.

After approval, 6 sets of Operation and Maintenance Manuals for the sanitary sewer lift station shall be submitted.

The State shall not be liable for materials purchased or labor performed, prior to approval of the drawings and materials list, and will not be responsible for any delay to the Contractor pending review of the drawings and information submitted after the 15-day period mentioned.

PUMP AND MOTOR

Pumps shall be heavy-duty, submersible, non-clog, centrifugal, quick disconnect pumps. The pumps shall be a Flygt Model NP3102.090 with 5 hp motor. Power supplied will be 208 volt 3 phase.

Pump Construction

A. General: The pumps shall be designed to permit ground-level removal of pumping units from the wet well for inspection or service without disconnecting or disturbing the discharge piping. The pump connection shall be metal to metal. The design shall permit

the pumps when lowered into place to be automatically connected to the discharge piping by positively locking the volute in position to prevent any axial or lateral movement. There shall be no need for personnel to enter the wet well when pump inspection or service is required.

B. Piping, fittings, and Appurtenances: Each pump shall be furnished with quick-disconnect discharge elbow, AISI Type 316 stainless steel standard pipe rails, upper guide rail bracket, intermediate guide rail bracket, rail-guided lifting assembly and AISI Type 316 stainless steel chain of sufficient strength to raise and lower pump. All miscellaneous metal within the wet well shall be stainless steel. Anchor bolts shall be stainless steel.

C. Pump Castings: Castings and other major pump components shall be of grey cast iron, ASTM A-48, Class 35B, shall be of cast iron and free from blowholes, porosity, hard spots, shrinkage defects, cracks, and other injurious defects. All metal surfaces coming into contact with the sewage, other than stainless steel or brass, shall be protected by a factory applied spray coating of acrylic dispersion zinc phosphate primer with a polyester resin paint finish on the exterior of the pump. The casings shall be designed to permit replacement of wearing parts. Joints shall be properly sealed with Nitrile or Viton rubber O-rings and shall not leak under a test pressure equal to 50 percent greater than the pump shut-off pressure. Passageways shall permit smooth flow and shall be free from sharp turns and projections.

D. Impellers: Impellers shall be of (spheroidal graphite) gray iron class 35B, cast steel, or an alloy suitable for the service required. The impellers shall be smooth and free flowing and shall have sufficient clearance to permit 75 mm objects in the sanitary waste water that enter the pump to pass into the discharge pipe. Each impeller shall be accurately fitted and keyed, splined, or threaded on the shaft, and locked in such a manner that lateral movement will be prevented and reverse rotation will not cause loosening.

E. Balance: All rotating parts of the equipment shall be in such balance, mechanically and hydraulically, as to operate without excessive end thrust, vibration or noise.

F. Shafts: Shafts shall be steel, and be provided with alignment bearings.

G. Bearings: Bearings subject to submersion shall be ball bearings manufactured from high-grade bearing alloy.

H. Mechanical Seals: Each pump shall be equipped with tungsten carbide seals.

I. The Power cable shall be sized according to the NEC and ICEA standards and shall be of sufficient length to reach the junction box without the need of any splices. The outer jacket of the cable shall be oil resistant chloroprene rubber. The motor and cable shall be capable of continuous submergence underwater without loss of watertight integrity to a depth of 65 feet. The cable entry seal design shall preclude specific torque requirements to insure a watertight and submersible seal. The cable entry shall consist of a single cylindrical elastomer grommet, flanked by washers, all having a close tolerance fit against the cable outside diameter and the entry inside diameter and compressed by the body containing a strain relief function, separate from the function of sealing the cable. The assembly shall provide ease of changing the cable when necessary using the same entry seal. The cable entry junction chamber and motor shall be separated by a stator lead sealing gland or terminal board, which shall isolate the interior from foreign material gaining access through the pump top. Epoxies, silicones, or other secondary sealing systems shall not be considered acceptable.

J. Electrical motors: Submersible, and the following requirements:

1. Air filled (not oil filled) squirrel cage induction type
2. Service factor of 1.15 or better

3. Class F insulation, Class B temperature rise
4. Rated for 6 starts per hour
5. Listed by either UL or FM for Class 1, Division 1, Groups C and D hazardous locations
6. Suitable for operating either in free air or continuously submerged in sewage
7. Bearing B10 life 18,000 hours minimum
8. Tungsten carbide seals
9. Lower bearings of either the ball or roller type
10. Provide a moisture detection system and a motor winding thermostat system, connected to the station control panel.

These systems shall be complete, including all necessary interfaces, control panels, conduits, and wires, even though these may not be shown on the Drawings.

Miscellaneous Materials: Bolts, nuts, anchors, washers, and all other types of support necessary for the installation of the pumps and drive units shall be provided and shall be of stainless steel.

Shop Painting: Pump, motor, and accessories shall be factory applied and finish painted in accordance with the manufacturer's standard.

Tools and Spare Parts: The pumps shall be furnished with a full set of manufacturer's recommended spare parts and special tools and maintenance instructions.

PIPE, VALVES, JOINTS AND FITTINGS

Valves shall be the type shown on the plans and shall be Class 125 unless otherwise shown on the plans.

Gate valves shall be iron body, wedge gate type with bronze trim and non-rising stem.

Check valves shall have cast iron body and gate, flanged ends, and bronze trim. The valves shall be the spring-loaded lever type for nonslamming under the conditions of operation and shall have stainless steel spring and shaft.

Pipes and fittings for piping 4 NPS or greater shall be ductile iron.

Ductile iron pipe shall be restrained, push-on joint pipe conforming to ANSI/AWWA C151/A21.51.

Restrained push-on joints for ductile iron pipe shall conform to ANSI/AWWA C111/A21.11. The joints shall be boltless, non-compression, non-threaded with synthetic rubber gasket seals and have a positive-locking device to keep the connection from separating. The pipe joints shall be designed for a working pressure of 2,413 Kpa and be capable of deflecting after assembly. Fittings and flanges for ductile iron pipe shall conform to ANSI/AWWA C110/A21.10, except for the manufacturer's proprietary design dimensions for restrained push-on joint pipe.

Ductile iron pipe and fittings shall have cement mortar lining and seal coating conforming to ANSI/AWWA C104/A21.4. Pipe shall have an asphaltic coating and/or polyethylene encasement outside coating conforming to ANSI/AWWA C151/A21.51, and fittings shall have an asphaltic coating and/or polyethylene encasement outside coating conforming to ANSI/AWWA C110/A21.10.

Pipe supports

All anchor bolts, nuts, pipe clamps, and other fittings shall be suitable for the type and size of the lines or casing, and shall conform to the provisions in Section 75-1.03, "Miscellaneous Bridge Metal", of the Standard Specifications.

Locate pipe supports as indicated in the plans. Unless stated otherwise, use AISI type 316 stainless steel for fabrication of pipe supports and stainless steel heavy hex head bolts with

hardened washers and heavy hex nuts for bolted connections. Pipe supports shall be fabricated and installed according to MSS SP-58 and SP-69.

Dimensions and elevations for supports are the responsibility of the contractor and should be confirmed in the field prior to fabrication and installation.

Link Type Penetration Seal

The pipe to wall penetration closures shall be a modular mechanical type consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between pipe and wall opening. Once expanded, the seal shall provide a watertight seal between pipe and wall. Pressure end plates shall be manufactured of glass reinforced plastic with a tensile strength of 186 mPa.

WET WELL

The wet well shall consist of precast wet well barrel sections as shown on the plans and in accordance with Section 70 1.02H "Precast Concrete Structures" of the Standard Specifications. The barrel sections shall conform to ASTM C-478 with single groove rubber joint gaskets. The concrete rings shall consist of Type II / Type V cement with appropriate corrosion protection against contaminated soils.

VALVE BOXES

Valve boxes shall conform to the provisions in Section 20-2.24, "Valve Boxes" of the Standard Specifications. A floor drain with deep trap shall be provided to drain the valve box to the wet well.

FOUNDATIONS

Concrete for foundations and pads shall be minor concrete and shall contain not less than 325 kg of portland cement per cubic meter. Type II / Type V cement with appropriate corrosion protection against contaminated soils shall be used for all concrete foundations and pads.

PRESSURE GAGES

Pressure gages shall be the dial type, shall be clear glycerin filled with a 65-mm minimum diameter weathertight epoxy case, and shall have accuracy within 3 percent of the full scale reading.

PUMP CONTROL

Panel

The pump control panel enclosure shall be 14 gauge 316 stainless steel. Panel shall have removable door, hinges constructed of 316 stainless steel and stainless steel hinge pins. Enclosure standards shall meet UL 508 for NEMA 4X. Enclosure shall comply with NEMA Type 4 and IEC 529, IP66. Back panel construction shall be 12 gauge steel. Swing panel shall maintain UL and NEMA ratings when installed. All operational status components shall be mounted on the swing panel. A single-phase 20 amp outlet shall be provided.

Controls

Station controls shall include the following:

A. Lockable external disconnect switch.
B. Motor starters, NEMA rated and sized for the next largest size (7.5 hp) pump motors.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 7 OF 21

C. Circuit breakers, molded case and rated for short-circuit current.
D. Control power transformer with primary and secondary circuit breakers.
E. Transfer switch with receptacle to connect portable emergency generator. The switch enclosure shall be 316 stainless steel, NEMA 4X.

1. Transfer switch shall be manually operated, 100 Amp, 240 V, 3 phase.
2. Receptacle shall be four-wire, four-pole Crouse-Hinds Catalog AR1041 model M3 or equal.

F. MultitSmart Pump Control System. In order to maintain consistency in operation, control, programming, data collection, maintenance and spare parts, the pump control system shall be a MultiSmart Pump Controller and RTU as manufactured by MultiTrode Inc._USA, (561)994-8090, www.multitrode.com. The Controller shall interface with an existing OMNEX wireless system. The following boards shall be included:

1. Pump Control/General I/O
2. CPU Board
3. DSP Board
4. Motor Protection

G. Rechargeable battery system of sufficient voltage and capacity to maintain all electronic systems for 12 hours.
H. The level indicator shall be of the conductance probe type compatible with the MultiSmart Pump Control System. The probe shall be constructed from PVC tubing with molded sensor units at regular intervals along the probe. Each sensor unit shall be PVC injected to prohibit ingress of moisture, and the sensor material shall be stainless steel. The probe shall be suspended on its own cable and connected to a stainless steel hook which shall hang from a stainless steel angle containing a polyurethane squeegee pad positioned in the opening into the wet well, so that the probe can be removed without entering the wet well. The squeegee shall have a hole and slot, enabling the probe to be pulled through and cleaned. Probe cable shall be run in a separate conduit away from any high voltage cables. Ten sensors shall be spaced along the length of the probe assembly, each individually connected to a correspondingly numbered flexible cable. The molded sensor unit shall contain two sensors mounted on opposite sides of sensor unit. The probe shall be pressure injected with an epoxy resin to encapsulate all internal components and connections to form a rigid, homogenous unit. Each sensor unit containing the two sensors shall be rotated 90 degrees to the previous sensor unit to eliminate tracking between sensors. The cable shall be encoded with number and text along the entirety of the cable and at intervals not greater than 200mm for identification. The flexible cables shall be capable of supporting the weight of the probe and cable without the need for additional support. The cable shall be secured to the top of the probe by a synthetic rubber compression fitting.

INSTALLATION

Equipment shall be installed in accordance with manufacturer's instructions. Guide rails shall be secured in place. Each pump unit shall be connected to its corresponding discharge nozzle through the rail system. Smooth, correct operation of the lifting mechanism shall be demonstrated. Connect power and control cables and verify continuity and function.

CONTRACT NO. 624-012084 CONTRACT CHANGE ORDER NO 69 SHEET 8 OF 21

Piping shall be supported as shown on the plans and in conformance with these special provisions. Pipes shall be held in place by hangers, supports, pipe rests, anchors, sway braces, guides or other special hangers. Allowances shall be made for expansion and contraction. Pipes shall have hangers or supports every 3 meters. Pipes shall be supported at each joint. Vertical pipes shall be supported with clamps or straps. Horizontal and vertical piping shall be securely supported and braced to prevent swaying, sagging or flexing of joints.

Cleaning and closing of pipe

The interior of all pipes shall be cleaned before installation. All openings shall be capped or plugged as soon as the pipe is installed to prevent the entrance of any materials. The caps or plugs shall remain in place until their removal is necessary for completion of the installation.

TESTING

Piping through the valve box shall be tested in accordance with the provisions in Section 20-5.03H(1), "Method A", of the Standard Specifications, with no leakage or pressure drop. The Contractor shall furnish pipe anchorages to resist thrust forces occurring during testing. All leaks shall be repaired, and all defective materials shall be replaced by the Contractor at the Contractors expense.

All pressure testing and necessary repairing of lines shall be completed prior to backfilling, or otherwise covering the lines.

Each end of line shall be capped prior to and after the testing

The Control System shall be initially programmed in default condition. All available signals shall be connected to the Pump Control System.

In addition to its standard programming, the unit shall be configured to alarm through the OMNEX wireless system to be installed by others.

MEASUREMENT AND PAYMENT

Quantities of sanitary sewer lift station will be measured by the unit as determined from actual count in place.

The contract unit price paid for sanitary sewer lift station shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in furnishing and installing the sanitary sewer lift station, complete in place, including foundations, pump enclosures, and excavation and backfill, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

GENERAL NOTES

1. Conduit routing is diagramatic. Pull box location shall be located as shown on plans. The contractor shall provide additional pull boxes as required. Exact locations of equipment and devices may be adjusted depending on field conditions or by the engineer.
2. Minimum size of conduit shall be 21C. Exposed conduit shall be PVC coated galvanized rigid steel.
3. Conduit fitting for 78 mm conduits and larger shall have a 610 minimum bending radius.
4. All equipment and devices shall be provided with wire ground.
5. All feeders and branch circuits shall be provided with ground wire.
6. Contractor shall label all conductors and cables per wiring diagrams.
7. All E-sheets are accurate for electrical work only.
8. All existing equipment shall remain in place unless otherwise noted.
9. Locations of conduits, pull boxes and other equipment shown on the plan are approximate and may be changed to suit field conditions.
10. The contractor shall call Underground Service Alert (USA) at (800) 642-2444, 48 hours prior to all excavation.
11. All exposed circuit or conductor connections shall be protected with a corrosion coating.
12. Contractor to verify in field existing live circuit prior to cutting and splicing.
13. Pullboxes installed on the shoulder of Roadway shall have Traffic Cover.

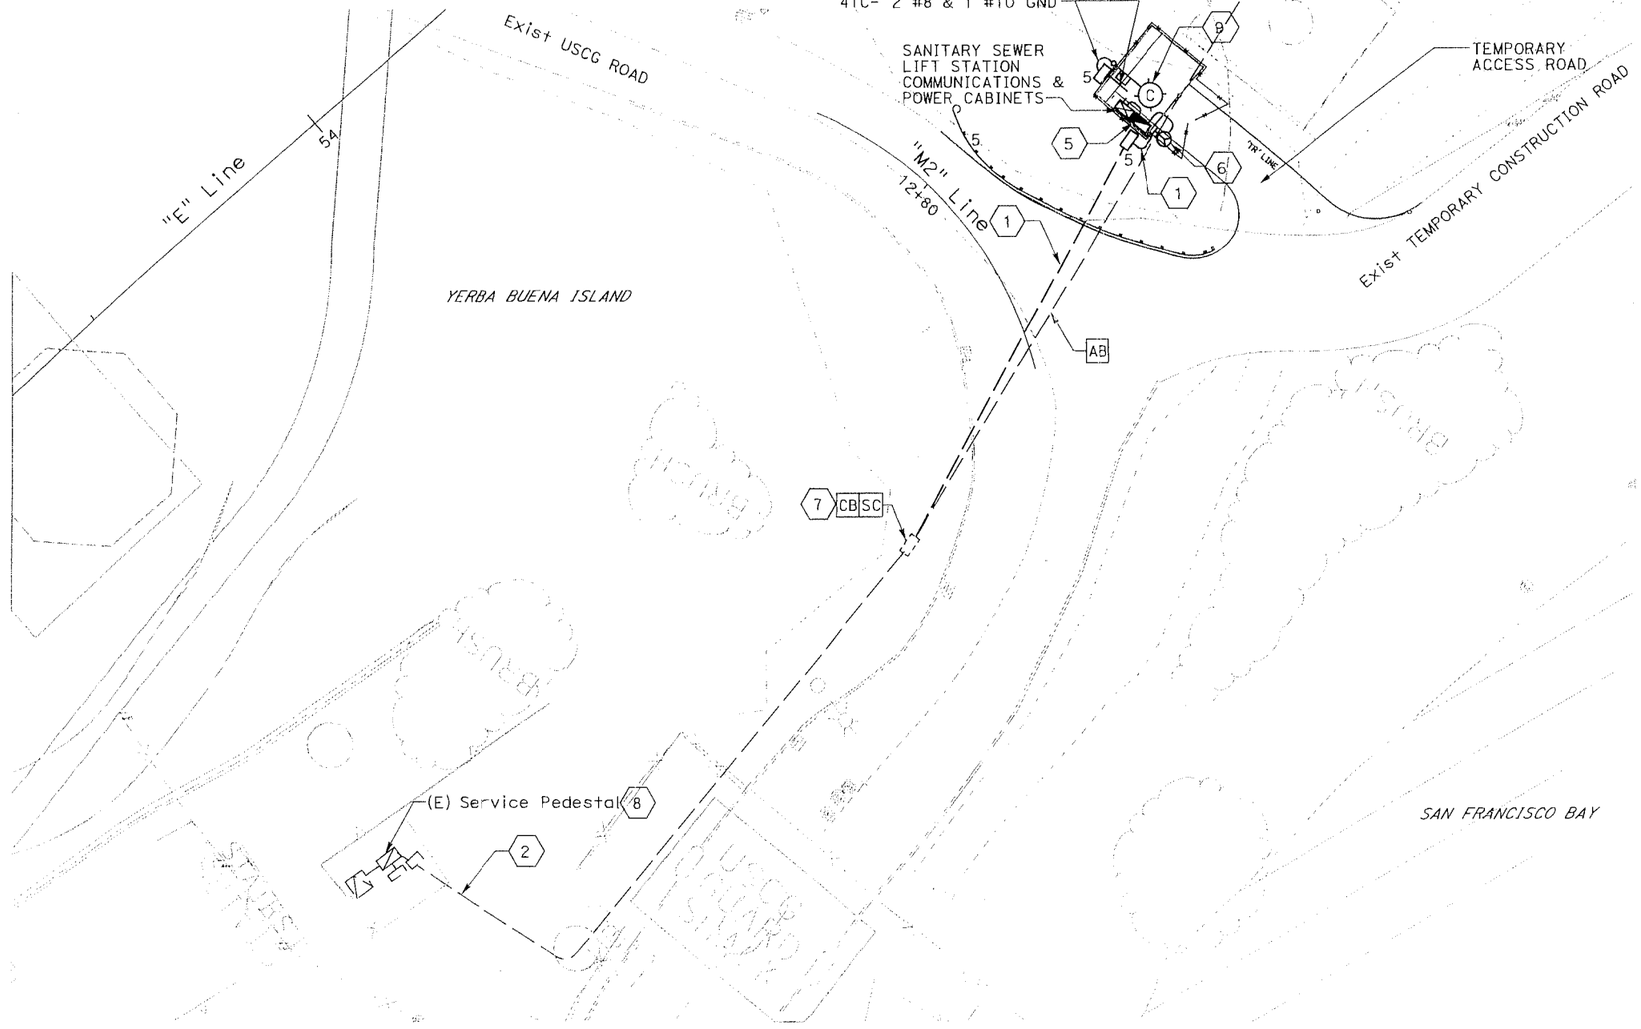
TIS-041 PUMP STATION

SCALE: 1:100



SHEET NOTES:

1. Install new 41C, 4 #1/0, 1 #6 Ground (208 V, 3-phase, Sewer Lift pump).
2. Existing 41c, with 4 #2/0 and #6 Ground.
3. Disconnect existing Sewer Lift Pump controller from existing feeder after new pump is operational. Turn over existing pump controller cabinets to SFPUC water waste division.
4. Install new free-standing pad mounted Nema 4X Lift Pump Controller Panel Enclosure. Controller Enclosure is furnished by the Vendor. Mounting detail by Supplier.
5. Install new stainless steel free-standing pad mounted Nema 4X Enclosure with non-fuseable disconnect and Monual transfer switch mounted on the interior of the enclosure.
6. Install New 100 Amp, 3-pole, 4-wire, 600 VAC, Heavy Duty Breaking Receptacle (for portable generator connection) with spring door "Crouse-Hinds catalog #AR-1041". Mount receptacle on the left side of the enclosure at +36" above finished grade.
7. Splice new conductors to existing conductors only when the new Lift Pump Station is ready to be energized. Old Lift station to remain in operational until new Pump Station is energized and functional. Contractor to field verify exact location of existing pullbox.
8. At existing service pedestal, replace existing 200 A, 3-Pole circuit breaker with 100 A, 3-pole circuit breaker. Type and interrupting capacity to match existing.Schedule replacement when new pump is ready for operation and coordinate down time with SFPUC.
9. Install Permanent City of San francisco Standard Cobra style light pole with bracket arm assemblies as shown on E-4 with 200 watts clear HPS lamp and with integral 120 V ballast. Install new fused splice connector in adjacent pullbox. Install new PEU on top of the electrolier. Locate light pole as directed by the Engineer. See Caltrans standard details ES-13A and ES13-B for more information.
10. NEMA 3X Junction Box. Coordinate with the Pump Vendor for size and location prior to installation.
11. Provide conduit(s) from Pump controller to Juction Box (for Controls). Coordinate with the Pump Vendor for size and quantity prior to installation.
12. Provide conduit(s) from Pump controller to Juction Box (for pump motor). Coordinate with the Pump Vendor for size and quantity prior to installation.

120/208 V SERVICE ENCLOSURE NO.B WIRING DIAGRAM

NO SCALE

SHEET NOTES:

1. 100 A, 3-Pole, 4-wire Main Non-Fusible Disconnect switch mounted on the interior of the Nema 4X Enclosure.
2. 100 A, 208 V, 3-pole, 4-Wire Manual Transfer Switch mounted on the interior of the Nema 4X enclosure.
3. "Crouse-Hinds Cat # AR1041" 100 Ampere, 4-pole, 4-wire Heavy Duty Circuit breaking receptacle with Spring door. Surface mount receptacle on the exterior of the panel at +36" above concrete pad.
4. Free-standing Pad Mounted Nema 4X Panel Enclosure for 200A manual transfer switch and non-fuseable 200 A , 3-pole disconnect switch.
5. Contractor to verify in field exact location of existing Pullbox.
6. See Contract Plan for Cables, Conduit Size and Quantity.
7. Replace existing 200 A-3pole circuit breaker with new 100 A-3pole Circuit Breaker.
8. Install 41C with 4 #1/0 and 1 #6 Ground.
9. Free-standing Pad Mounted Nema 4X Pump Control Panel Enclosure. See specs for more information. Control panel and wiring within the enclosure is by the Vendor except that contractor shall make connection to main circuit breaker and to the light pole. Wiring to Pump motors and to the level switches by Vendor.
10. Disconnect existing Lift pump cotroller and turn over to SFPUC Waste Water Division. Remove and scrap all related conduit and wire after new permanent Lift Pump is installed.
11. Provide two 19mm x 3 M UL listed copper-clad ground rods installed a minimum 1.8 M apart in undesturbed earth. Provide #6 bare copper connection between ground rods with connection to concrete pad structural steel at two points and a #6 pigtail connection to each enclosure.

NOTES

1. Ground Stud (Welded to Interior Surface of Shaft Opposite Door Opening). Stud shall be 6 mm x 508 mm (Continuosly Threaded) x 19 mm and shall be Furnished with A Type 316 Stainless Steel Nut and A Stainless Steel Shokeproof Washer.
2. Each Anchor Bolt-Threaded Top 200 mm.
3. The Standard, Handhole Cover, Mast Arm, and Anchor Bolts with Nuts & Washers, shall be Hot-dip Galvanized after Fabrication.
4. The Handhole Cover or Door shall have the same Radius of Curvature as the Shaft and when Installed, shall Form a Symmetrical Appearance with the Shaft.
5. The Tapering Elliptical Section shall not be more than Two-thirds the Length of the Mast Arm and shall Taper to the External Diameter of 50 mm Pipe.
6. All Exposed Welds shall be Ground Smooth and shall Conform to Contours of Adjacent Surfaces. All Welds shall have a Finished Depth of 10 mm.
7. Door or Handhole Cover shall be Securely Retained in Place with Two 6 mm x 500 mm Stainless Steel Screws.
8. For Shafts of 7.6 m or Less in Length, the Bolt Circle shall be 250 mm, unless otherwise Noted. For Shafts more than 7.6 m in Length, the Bolt Circle Diameter shall be 280 mm.
9. The Threads of All Fasteners shall be Coated with an Approved Industrial Type of Water-proof Grease Lubricant Containing a High Content of Graphite.
10. The Door or Handlehole Cover Gasket shall be Mounted to the Cover with an Approved Type of Automotive Engine Gasket Cement. The Non-cemented Surface of the Gasket shall be Coated with a Silicone Impregnated Rubber Lubricant.

Letter No. 05.03.01-001021

Subject: Sanitary Sewer Lift Station - CCO No. 69

Dear Mr. Coupe,

Per the June 13, 2007 Sanitary Sewer Lift Station meeting with C. C. Myers Inc., San Francisco Public Utilities Commission, Stoloski & Gonzalez Inc. (S&G), S&G's subcontractors, and the Department, enclosed are updated plan sheets and final Special Provisions for Contract Change Order No. 69. The Contract Change Order transmitted via Transmittal No. 05.03.02-000611, dated May 29, 2007, should read, "Page 1 of 113".

Please use these revised plan sheets and Special Provisions to submit a detailed cost breakdown per Letter No. 05.03.01-000977, dated May 28, 2007.

Please note that the procurement lump sum of $110,000.00 for CCO No. 69 should not affect these changes.

Please contact Mahantesh Anigol if you have questions at (510) 622-5183.

Sincerely,

Carla Moreno
Assistant Resident Engineer

SCOPE OF WORK (CCO No. 69)

Scope of the work for Contract Change Order No. 69 for construction consists of the following facilities:

1. Sanitary sewer lift station as shown on the plans.
2. Demolish existing sewer pump station as shown on the plans.
3. Construct Pump station access road as shown on the plans.
4. Site grading as shown on the plans.
5. Chain link fence and gates as shown on the plans.
6. Relocate sanitary sewer lines as shown on the plans.
7. Remove sanitary sewer manhole as shown on the plans.
8. Relocate water line as shown on the plans.
9. Construct AC Dike and MBGR as shown on the plans.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 7 OF 113

SECTION 5. GENERAL

SECTION 5-1. MISCELLANEOUS

5-1.01 WORKING DRAWINGS

Working drawings shall conform to the requirements in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications and these special provisions. Working drawings shall include supplements and calculations that are in addition to drawings.

Working drawings shall be submitted to the following location:

California Department of Transportation
Office of the Resident Engineer, Contract 04-0120R4
280 Beale Street
San Francisco, CA 94105

Working drawings shall conform to the following:

A. For initial review, 6 sets of the working drawings shall be submitted. After the Engineer has determined that a submittal is complete, 12 additional sets shall be submitted.

B. Drawings shall be 559 mm x 864 mm or 279 mm x 432 mm in size. Supplements and calculations shall be 216 mm x 280 mm in size.

C. For drawings, text size shall be nominally 2.8 mm high minimum. For supplement and calculations, font size shall be 12 minimum.

D. Text and details shall be legible and suitable for photocopying and reduction.

E. In addition to the paper copies of the working drawings, electronic files shall be submitted. Electronic files shall be portable document format (PDF) and shall be submitted on compact disk (CD) media. Each plan shall be a separate PDF file on the CD. The CD shall contain an index consisting of the file names and a description of the corresponding file contents. The files shall be listed in the sequence of : 1) index, 2) drawings, 3) supplement, and 4) calculations.

F. Microfilms are required for approved shop drawings and shall be only a 24x reduction. The edge of the corrected original tracing image shall be clearly visible and visually parallel with the edges of the page. A clear, legible symbol shall be provided on the upper left side of each page to show the amount of reduction, and a horizontal and vertical scale shall be provided on each reduced print to facilitate enlargement to original scale.

G. At the completion of the contract, one compiled set of all approved working drawings (in electronic form and including all corrections and revisions) shall be furnished to the Engineer. The index shall be the first file on the CD.

Working drawings shall be stamped and signed by an engineer who is registered as a Civil Engineer in the State of California. When independently checked calculations are required, these calculations shall be stamped and signed by another engineer who is registered as a Civil Engineer in the State of California.

Working drawings shall be submitted sufficiently in advance of the start of the affected work to allow time for review by the Engineer and correction by the Contractor of the drawings

without delaying the work. The time shall be proportional to the complexity of the work, but in no case shall the time be less than the review time as specified for the type of working drawings as required elsewhere in these special provisions.

The Engineer will review a working drawing submittal for completeness. Within ten working days of the receipt of the submittal by the Engineer, the Engineer will notify the Contractor in writing if the submittal is determined to be incomplete. If the submittal is determined to be incomplete, ten working days from the day of receipt shall be allowed for approval and return for correction of each submittal or resubmittal, unless otherwise specified in these special provisions.

Should the Engineer fail to review the complete working drawing submittal within the time specified, and the Contractor's controlling operation on the critical path is delayed (as determined by the Engineer) by the Engineer's failure to review within the time specified, an extension of time will be granted in conformance with the provisions in Section 8-1.07, "Liquidated Damages," of the Standard Specifications and in "Progress Schedule (Critical Path Method)," of these special provisions. Should the Engineer fail to review the complete working drawing submittal within the time specified, compensation, if any, will be made in accordance with Section 8-1.09, "Right of Way Delays," of the Standard Specifications, and "Time Related Overhead," of these special provisions.

SHEET 10 OF 113

5-1.015 LABORATORY

When a reference is made in the specifications to the "Laboratory," the reference shall mean Division of Engineering Services - Materials Engineering and Testing Services and Division of Engineering Services - Geotechnical Services of the Department of Transportation, or established laboratories of the various Districts of the Department, or other laboratories authorized by the Department to test materials and work involved in the contract. When a reference is made in the specifications to the "Transportation Laboratory," the reference shall mean Division of Engineering Services - Materials Engineering and Testing Services and Division of Engineering Services - Geotechnical Services, located at 5900 Folsom Boulevard, Sacramento, CA 95819, Telephone (916) 227-7000.

CONTRACT NO. 04-012QR4

CONTRACT CHANGE ORDER NO 69

SHEET 11 OF 113

5-1.019 COST REDUCTION INCENTIVE

Attention is directed to Section 5-1.14, "Cost Reduction Incentive," of the Standard Specifications.

Prior to preparing a written cost reduction proposal, the Contractor shall request a meeting with the Engineer to discuss the proposal in concept. Items of discussion will also include permit issues, impact on other projects, impact on the project schedule, peer reviews, overall merit of the proposal, and review times required by the Department and other agencies.

If a cost reduction proposal submitted by the Contractor, and subsequently approved by the Engineer, provides for a reduction in contract time, 50 percent of that contract time reduction shall be credited to the State by reducing the contract working days, not including plant establishment. Attention is directed to "Beginning of Work, Time of Completion and Liquidated Damages" of these special provisions regarding the working days.

If a cost reduction proposal submitted by the Contractor, and subsequently approved by the Engineer, provides for a reduction in traffic congestion or avoids traffic congestion during construction, 60 percent of the estimated net savings in construction costs attributable to the cost reduction proposal will be paid to the Contractor. In addition to the requirements in Section 5-1.14, "Cost Reduction Incentive," of the Standard Specifications, the Contractor shall provide detailed comparisons of the traffic handling between the existing contract and the proposed change, and estimates of the traffic volumes and congestion.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 12 OF 113

5-1.02 LABOR NONDISCRIMINATION

Attention is directed to the following Notice that is required by Chapter 5 of Division 4 of Title 2, California Code of Regulations.

NOTICE OF REQUIREMENT FOR NONDISCRIMINATION PROGRAM

(GOV. CODE, SECTION 12990)

Your attention is called to the "Nondiscrimination Clause", set forth in Section 7-1.01A(4), "Labor Nondiscrimination," of the Standard Specifications, which is applicable to all nonexempt State contracts and subcontracts, and to the "Standard California Nondiscrimination Construction Contract Specifications" set forth therein. The specifications are applicable to all nonexempt State construction contracts and subcontracts of $5000 or more.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 13 OF 113

5-1.03 PUBLIC SAFETY

The Contractor shall provide for the safety of traffic and the public in conformance with the provisions in Section 7-1.09, "Public Safety," of the Standard Specifications and these special provisions.

The Contractor shall install temporary railing (Type K) between a lane open to public traffic and an excavation, obstacle or storage area when the following conditions exist:

A. Excavations—The near edge of the excavation is 3.6 m or less from the edge of the lane, except:

   1. Excavations covered with sheet steel or concrete covers of adequate thickness to prevent accidental entry by traffic or the public.
   2. Excavations less than 0.3-m deep.
   3. Trenches less than 0.3-m wide for irrigation pipe or electrical conduit, or excavations less than 0.3-m in diameter.
   4. Excavations parallel to the lane for the purpose of pavement widening or reconstruction.
   5. Excavations in side slopes, where the slope is steeper than 1:4 (vertical:horizontal).
   6. Excavations protected by existing barrier or railing.

B. Temporarily Unprotected Permanent Obstacles—The work includes the installation of a fixed obstacle together with a protective system, such as a sign structure together with protective railing, and the Contractor elects to install the obstacle prior to installing the protective system; or the Contractor, for the Contractor's convenience and with permission of the Engineer, removes a portion of an existing protective railing at an obstacle and does not replace such railing complete in place during the same day.

C. Storage Areas—Material or equipment is stored within 3.6 m of the lane and the storage is not otherwise prohibited by the provisions of the Standard Specifications and these special provisions.

The approach end of temporary railing (Type K), installed in conformance with the provisions in this section "Public Safety" and in Section 7-1.09, "Public Safety," of the Standard Specifications, shall be offset a minimum of 4.6 m from the edge of the traffic lane open to public traffic. The temporary railing shall be installed on a skew toward the edge of the traffic lane of not more than 0.3-m transversely to 3 m longitudinally with respect to the edge of the traffic lane. If the 4.6-m minimum offset cannot be achieved, the temporary railing shall be installed on the 10 to 1 skew to obtain the maximum available offset between the approach end of the railing and the edge of the traffic lane, and an array of temporary crash cushion modules shall be installed at the approach end of the temporary railing.

Except for installing, maintaining and removing traffic control devices, whenever work is performed or equipment is operated in the following work areas, the Contractor shall close the adjacent traffic lane unless otherwise provided in the Standard Specifications and these special provisions:

Approach Speed of Public Traffic (Posted Limit) (Kilometers Per Hour)	Work Areas
Over 72 (45 Miles Per Hour)	Within 1.8 m of a traffic lane but not on a traffic lane
56 to 72 (35 to 45 Miles Per Hour)	Within 0.9-m of a traffic lane but not on a traffic lane

The lane closure provisions of this section shall not apply if the work area is protected by permanent or temporary railing or barrier.

When traffic cones or delineators are used to delineate a temporary edge of a traffic lane, the line of cones or delineators shall be considered to be the edge of the traffic lane, however, the Contractor shall not reduce the width of an existing lane to less than 3 m without written approval from the Engineer.

When work is not in progress on a trench or other excavation that required closure of an adjacent lane, the traffic cones or portable delineators used for the lane closure shall be placed off of and adjacent to the edge of the traveled way. The spacing of the cones or delineators shall be not more than the spacing used for the lane closure.

Suspended loads or equipment shall not be moved nor positioned over public traffic or pedestrians.

Full compensation for conforming to the provisions in this section "Public Safety," including furnishing and installing temporary railing (Type K) and temporary crash cushion modules, shall be considered as included in the contract prices paid for the various items of work involved and no additional compensation will be allowed therefor.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69

SHEET 15 OF 113

5-1.04 TESTING

Testing of materials and work shall conform to the provisions in Section 6-3, "Testing," of the Standard Specifications and these special provisions.

Whenever the provisions of Section 6-3.01, "General," of the Standard Specifications refer to tests or testing, it shall mean tests to assure the quality and to determine the acceptability of the materials and work.

The Engineer will deduct the costs for testing of materials and work found to be unacceptable, as determined by the tests performed by the Department, and the costs for testing of material sources identified by the Contractor which are not used for the work, from moneys due or to become due to the Contractor. The amount deducted will be determined by the Engineer.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69

SHEET 16 OF 113

5-1.05 REMOVAL OF ASBESTOS AND HAZARDOUS SUBSTANCES

When the presence of asbestos or hazardous substances are not shown on the plans or indicated in the specifications and the Contractor encounters materials which the Contractor reasonably believes to be asbestos or a hazardous substance as defined in Section 25914.1 of the Health and Safety Code, and the asbestos or hazardous substance has not been rendered harmless, the Contractor may continue work in unaffected areas reasonably believed to be safe. The Contractor shall immediately cease work in the affected area and report the condition to the Engineer in writing.

In conformance with Section 25914.1 of the Health and Safety Code, removal of asbestos or hazardous substances including exploratory work to identify and determine the extent of the asbestos or hazardous substance will be performed by separate contract.

If delay of work in the area delays the current controlling operation, the delay will be considered a right of way delay and the Contractor will be compensated for the delay in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

CONTRACT NO. 04-012QR4

CONTRACT CHANGE ORDER NO 69

SHEET 17 OF 113

5-1.06 PAYMENTS

Attention is directed to Sections 9-1.06, "Partial Payments," and 9-1.07, "Payment After Acceptance," of the Standard Specifications and these special provisions.

For the purpose of making partial payments pursuant to Section 9-1.06, "Partial Payments," of the Standard Specifications, the amount set forth for the contract items of work hereinafter listed shall be deemed to be the maximum value of the contract item of work which will be recognized for progress payment purposes:

A. Clearing and Grubbing $ 21,000

After acceptance of the contract pursuant to the provisions in Section 7-1.17, "Acceptance of Contract," of the Standard Specifications, the amount, if any, payable for a contract item of work in excess of the maximum value for progress payment purposes hereinabove listed for the item, will be included for payment in the first estimate made after acceptance of the contract.

No partial payment will be made for any materials on hand which are furnished but not incorporated in the work.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 18 OF 113

5-1.07 PROJECT INFORMATION

The information in this section has been compiled specifically for this project and is made available for bidders and Contractors. Other information referenced in the Standard Specifications and these special provisions do not appear in this section. The information is subject to the conditions and limitations set forth in Section 2-1.03, "Examination of Plans, Specifications, Contract, and Site of Work," and Section 6-2, "Local Materials," of the Standard Specifications. Bidders and Contractors shall be responsible for knowing the procedures for obtaining information.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 19 OF 113

Cross sections are not available for this project.

The District Office in which the work is situated is located at 111 Grand Ave, Oakland CA 94612.

Plans of the existing bridges may be requested by fax from the Office of Structure Maintenance and Investigations, 1801 30th Street, Sacramento, CA, Fax (916) 227-8357.

Plans of the existing bridges available to bidders and Contractors are reproductions of the original contract plans, with significant changes noted, and working drawings, and do not necessarily show normal construction tolerances and variances. Where dimensions of new construction required by this contract are dependent on the dimensions of the existing bridges, the Contractor shall verify the controlling field dimensions and shall be responsible for adjusting dimensions of the work to fit existing conditions.

5-1.08 AREAS FOR CONTRACTOR'S USE

Attention is directed to the requirements specified in Section 7-1.19, "Rights in Land and Improvements," of the Standard Specifications, plans and these special provisions.

The highway right of way shall be used for purposes that are necessary to perform the required work. The Contractor shall not occupy the right of way, or allow others to occupy the right of way, for purposes which are not necessary to perform the required work.

The Contractor's attention is directed to "Cooperation" of these special provisions, and the Contractor shall use only the designated areas for Contractor's use as specified in this section, as shown on the plans, and as follows:

1. **Area PR**: is available for the contractor's use for the entire contract period except limited by the areas as defined on the contract plans and these special provisions. The Contractor shall permit access by other contractors as directed by the Engineer.
2. **Area FPR**: is primarily available to Contract 04-0120R4 until May 1, 2007. After May 1, 2007, area FPR shall be considered a part of area FP.
3. **Area FP**: is available for use by the 04-0120R4 contract until November 30, 2007. The area FP shall then be made available to the contractor constructing the YBI transition structures under contract 04-0120S4 until May 1, 2009.
4. **Area EF**: is primarily available to Contract 04-0120E4 until March 31, 2008, and then to this contract after that date. Prior to March 31, 2008, the Contractor shall coordinated any planned work in area EF with the Engineer and Contract 04-0120E4 contractor.
5. **AREA CE**: is designated for use by Contract 04-0120E4 until March 31, 2008. The Contractor shall have access through area CE to the work area at Pier W2. After

CONTRACT NO. 04-0120S4
CONTRACT CHANGE ORDER NO 69
SHEET 20 OF 113

March 31, 2008, the area CE becomes a part of the area provided to the yerba Buena Island Structures contractor on Contract 04-0120S4.

The Contractor shall maintain access to the Torpedo Factory area at the east end of Yerba Buena Island at all times during the contract. Access may be via the existing Torpedo Factory Road or other routing as approved by the Engineer.

No area is available within the contract limits for the exclusive use of the Contractor. However, temporary storage of equipment and materials on State property may be arranged with the Engineer, subject to the prior demands of State maintenance forces and to other contract requirements. Use of the Contractor's work areas and other State-owned property shall be at the Contractor's own risk. The State shall not be held liable for damage to or loss of materials or equipment located within these areas.

Toll plaza parking lots shall not be used for the Contractor's employees private vehicles and the Contractor's equipment and vehicles.

The Contractor shall remove the equipment, materials, and rubbish from the work areas and other State-owned property which the Contractor occupies and shall leave the areas in presentable condition, in conformance with the provisions in Section 4-1.02, "Final Clean Up," of the Standard Specifications.

The Contractor shall secure, at the Contractor's own expense, areas required for storage of plans, equipment, and materials, or for other purposes if sufficient area is not available to the Contractor within the contract limits.

5-1.09 UTILITIES

The Contractor shall make arrangements to obtain electrical power, water or compressed air or other utilities required for the Contractor's operations and shall make and maintain the necessary service connections at the Contractor's own expense.

5-1.10 SANITARY PROVISIONS

State sanitary facilities will not be available for use by the Contractor's employees.

5-1.11 BRIDGE TOLLS

Toll-free passage on the San Francisco-Oakland Bay Bridge will be granted only for cars, trucks and special construction equipment which are clearly marked on the exterior with the Contractor's identification and which are being operated by the Contractor exclusively for the project, and which are used for the purpose of transporting materials and workers directly to and from the project site.

5-1.12 PERMITS AND LICENSES

Attention is directed to Section 7-1.04, "Permits and Licenses," of the Standard Specifications and these special provisions.

The Department has obtained the permits and licenses from the following agencies for this project:

A. California Regional Water Quality Control Board (RWQCB)

B. U.S. Army Corps of Engineers (ACOE)
C. San Francisco Bay Conservation Development Commission (BCDC)
D. United States Coast Guard (USCG)
E. California Department of Fish and Game (CDFG)

These permits have been made available to the Contractor as part of the information handout for the 04-0120R4 Contract.

For updated versions of environmental permits, the Contractor shall visit the website:

www.biomitigation.org

Full compensation for conforming to the requirements in these permits and licenses shall be considered as included in the prices paid for the various contract items of work and no additional compensation will be allowed therefor.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 21 OF 113

5-1.13 SOUND CONTROL REQUIREMENTS

Sound control shall conform to the provisions in Section 7-1.01I, "Sound Control Requirements," of the Standard Specifications and these special provisions.

The noise level from the Contractor's operations, between the hours of 7:00 p.m. and 7:00 a.m., shall not exceed 78 dBa at a distance of 15 m from the source. Impact type mechanical operations, such as pile-driving and jack-hammering, shall not be conducted between the hours of 7:00 pm to 7:00 am. This requirement shall not relieve the Contractor from responsibility for complying with local ordinances regulating noise level at all times.

The noise level requirement shall apply to the equipment on the job or related to the job, including but not limited to trucks, transit mixers or transient equipment that may or may not be owned by the Contractor. The use of loud sound signals shall be avoided in favor of light warnings except those required by safety laws for the protection of personnel.

Full compensation for conforming to the requirements of this section shall be considered as included in the prices paid for the various contract items of work involved and no additional compensation will be allowed therefor.

Noise monitoring activities will be conducted by the Department of Transportation. The Contractor shall coordinate with the Department of Transportation monitors and allow them access to noise monitoring locations.

8-1.01 SUBSTITUTION OF NON-METRIC MATERIALS AND PRODUCTS

Only materials and products conforming to the requirements of the specifications shall be incorporated in the work. When metric materials and products are not available, and when approved by the Engineer, and at no cost to the State, materials and products in the United States Standard Measures which are of equal quality and of the required properties and characteristics for the purpose intended, may be substituted for the equivalent metric materials and products, subject to the following provisions:

A. Materials and products shown on the plans or in the special provisions as being equivalent may be substituted for the metric materials and products specified or detailed on the plans.
B. Before other non-metric materials and products will be considered for use, the Contractor shall furnish, at the Contractor's expense, evidence satisfactory to the Engineer that the materials and products proposed for use are equal to or better than the materials and products specified or detailed on the plans. The burden of proof as to the quality and suitability of substitutions shall be upon the Contractor and the Contractor shall furnish necessary information as required by the Engineer. The Engineer will be the sole judge as to the quality and suitability of the substituted materials and products and the Engineer's decision will be final.
C. When the Contractor elects to substitute non-metric materials and products, including materials and products shown on the plans or in the special provisions as being equivalent, the list of sources of material specified in Section 6-1.01, "Source of Supply and Quality of Materials," of the Standard Specification shall include a list of substitutions to be made and contract items involved. In addition, for a change in design or details, the Contractor shall submit plans and working drawings in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications. The plans and working drawings shall be submitted at least 7 days before the Contractor intends to begin the work involved.

Unless otherwise specified, the following substitutions of materials and products will be allowed:

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69

SHEET 31 OF 113

SECTION 8-2. CONCRETE

8-2.01 PORTLAND CEMENT CONCRETE

Portland cement concrete shall conform to the provisions in Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

References to Section 90-2.01, "Portland Cement," of the Standard Specifications shall mean Section 90-2.01, "Cement," of the Standard Specifications.

Mineral admixture shall be combined with cement in conformance with the provisions in Section 90-4.08, "Required Use of Mineral Admixtures," of the Standard Specifications for the concrete materials specified in Section 56-2, "Roadside Signs," of the Standard Specifications.

The requirements of Section 90-4.08, "Required Use of Mineral Admixture," of the Standard Specifications shall not apply to Section 19-3.025C, "Soil Cement Bedding," of the Standard Specifications.

The Department maintains a list of sources of fine and coarse aggregate that have been approved for use with a reduced amount of mineral admixture in the total amount of cementitious material to be used. A source of aggregate will be considered for addition to the approved list if the producer of the aggregate submits to the Transportation Laboratory certified test results from a qualified testing laboratory that verify the aggregate complies with the requirements. Prior to starting the testing, the aggregate test shall be registered with the Department. A registration number can be obtained by calling (916) 227-7228. The registration number shall be used as the identification for the aggregate sample in correspondence with the Department. Upon request, a split of the tested sample shall be provided to the Department. Approval of aggregate will depend upon compliance with the specifications, based on the certified test results submitted, together with any replicate testing the Department may elect to perform. Approval will expire 3 years from the date the most recent registered and evaluated sample was collected from the aggregate source.

Qualified testing laboratories shall conform to the following requirements:

A. Laboratories performing ASTM Designation: C 1293 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Concrete Proficiency Sample Program and shall have received a score of 3 or better on all tests of the previous 2 sets of concrete samples.
B. Laboratories performing ASTM Designation: C 1260 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Pozzolan Proficiency Sample Program and shall have received a score of 3 or better on the shrinkage and soundness tests of the previous 2 sets of pozzolan samples.

Aggregates on the list shall conform to one of the following requirements:

A. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1293, the average expansion at one year shall be less than or equal to 0.040 percent; or
B. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1260, the average of the expansion at 16 days shall be less than or equal to 0.15 percent.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 33 OF 113

The amounts of cement and mineral admixture used in cementitious material shall be sufficient to satisfy the minimum cementitious material content requirements specified in Section 90-1.01, "Description," or Section 90-4.05, "Optional Use of Chemical Admixtures," of the Standard Specifications and shall conform to the following:

A. The minimum amount of cement shall not be less than 75 percent by mass of the specified minimum cementitious material content.
B. The minimum amount of mineral admixture to be combined with cement shall be determined using one of the following criteria:

    1. When the calcium oxide content of a mineral admixture is equal to or less than 2 percent by mass, the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
    2. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass, and any of the aggregates used are not listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 25 percent by mass of the total amount of cementitious material to be used in the mix.
    3. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass and the fine and coarse aggregates are listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
    4. When a mineral admixture that conforms to the provisions for silica fume in Section 90-2.04, "Admixture Materials," of the Standard Specifications is used, the amount of mineral admixture shall not be less than 10 percent by mass of the total amount of cementitious material to be used in the mix.
    5. When a mineral admixture that conforms to the provisions for silica fume in Section 90-2.04, "Admixture Materials," of the Standard Specifications is used and the fine and coarse aggregates are listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 7 percent by mass of the total amount of cementitious material to be used in the mix.

C. The total amount of mineral admixture shall not exceed 35 percent by mass of the total amount of cementitious material to be used in the mix. Where Section 90-1.01, "Description," of the Standard Specifications specifies a maximum cementitious content in kilograms per cubic meter, the total mass of cement and mineral admixture per cubic meter shall not exceed the specified maximum cementitious material content.

The Contractor will be permitted to use Type II/Type V portland cement with appropriate corrosion protection for concrete used in the manufacture of precast concrete members.

8-2.02 CORROSION CONTROL FOR PORTLAND CEMENT CONCRETE

Permanent structures with Portland cement concrete in contact with soil or rock including that utilized for sewer manhole and foundations are considered to be in corrosive environment and shall conform to the provisions in Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

Cementitious material to be used in Portland cement concrete shall conform to the provisions for cement and mineral admixtures in Section 90-2, "Materials," of the Standard Specifications, and shall be a combination of "Type II/Type V" Portland cement and mineral admixture.

Concrete in corrosive environment shall contain not less than 400 kg of cementitious material per cubic meter.

No reduction in the cementitious material content specified or ordered, in conformance with the provisions in Section 90-4.05, "Optional Use of Chemical Admixtures," of the Standard Specifications, will be allowed for concrete in a corrosive environment.

Unless otherwise specified, for concrete in a corrosive environment, the amount of cement shall be 75 percent by mass, and the amount of mineral admixture to be combined with cement shall be 25 percent by mass, of the total amount of cementitious material to be used in the concrete mix. The calcium oxide content of mineral admixtures shall not exceed 10 percent.

Mineral admixture for concrete in a corrosive environment shall conform to ASTM Designation: C618 Class F or N.

The amount of free water used in concrete in a corrosive environment shall not exceed 160 kg/m3, plus 40 kg for each 100 kg of cementitious material in excess of 400 kg/m3.

Full compensation for conforming to the above requirement shall be considered as included in the contract prices for the various items of work and no additional compensation will be allowed therefor.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 34 OF 113

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 35 OF 113

SECTION 8-3. WELDING

8-3.01 WELDING

GENERAL

Flux core welding electrodes conforming to the requirements of AWS A5.20 E6XT-4 or E7XT-4 shall not be used to perform welding for this project.

Wherever reference is made to the following AWS welding codes in the Standard Specifications, on the plans, or in these special provisions, the year of adoption for these codes shall be as listed:

AWS Code	Year of Adoption
D1.1	2002
D1.4	1998
D1.5	2002
D1.6	1999

Requirements of the AWS welding codes shall apply unless specified otherwise in the Standard Specifications, on the plans, or in these special provisions. Wherever the abbreviation AWS is used, it shall be equivalent to the abbreviations ANSI/AWS or AASHTO/AWS.

Section 6.1.1.1 of AWS D1.5 is replaced with the following:

Quality Control (QC) shall be the responsibility of the Contractor. As a minimum, the Contractor shall perform inspection and testing of each weld joint prior to welding, during welding, and after welding as specified in this section and as necessary to ensure that materials and workmanship conform to the requirements of the contract documents.

Sections 6.1.3 through 6.1.4.3 of AWS D1.1, Section 7.1.2 of AWS D1.4, and Sections 6.1.1.2 through 6.1.3.3 of AWS D1.5 are replaced with the following:

The QC Inspector shall be the duly designated person who acts for and on behalf of the Contractor for inspection, testing, and quality related matters for all welding.

Quality Assurance (QA) is the prerogative of the Engineer. The QA Inspector is the duly designated person who acts for and on behalf of the Engineer.

The QC Inspector shall be responsible for quality control acceptance or rejection of materials and workmanship, and shall be currently certified as an AWS Certified Welding Inspector (CWI) in conformance with the requirements in AWS QC1, " Standard for AWS Certification of Welding Inspectors."

The QC Inspector may be assisted by an Assistant QC Inspector provided that this individual is currently certified as an AWS Certified Associate Welding Inspector (CAWI) in conformance with the requirements in AWS QC1, "Standard for AWS Certification of Welding Inspectors." The Assistant QC Inspector may perform inspection under the direct supervision of the QC Inspector provided the Assistant is always within visible and audible range of the QC Inspector. The QC Inspector shall be responsible for signing all reports and for determining if welded materials conform to workmanship and acceptance criteria. The ratio of QC Assistants to QC Inspectors shall not exceed 5 to 1.

When the term "Inspector" is used without further qualification, it shall refer to the QC Inspector.

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 69
SHEET 36 OF 113

Section 6.14.6, "Personnel Qualification," of AWS D1.1, Section 7.8, "Personnel Qualification," of AWS D1.4, and Section 6.1.3.4, "Personnel Qualification," of AWS D1.5 are replaced with the following:

Personnel performing nondestructive testing (NDT) shall be qualified and certified in conformance with the requirements of the American Society for Nondestructive Testing (ASNT) Recommended Practice No. SNT-TC-1A and the Written Practice of the NDT firm. The Written Practice of the NDT firm shall meet or exceed the guidelines of the ASNT Recommended Practice No. SNT-TC-1A. Individuals who perform NDT, review the results, and prepare the written reports shall be either:

A. Certified NDT Level II technicians, or;
B. Level III technicians who hold a current ASNT Level III certificate in that discipline and are authorized and certified to perform the work of Level II technicians.

Section 6.5.4 of AWS D1.5 is replaced with the following:

The QC Inspector shall inspect and approve each joint preparation, assembly practice, welding technique, joint fit-up, and the performance of each welder, welding operator, and tack welder to make certain that the applicable requirements of this code and the approved Welding Procedure Specification (WPS) are met. The QC Inspector shall examine the work to make certain that it meets the requirements of Sections 3 and 6.26. The size and contour of all welds shall be measured using suitable gages. Visual inspection for cracks in welds and base metal, and for other discontinuities should be aided by strong light magnifiers, or such other devices as may be helpful. Acceptance criteria different from those specified in this code may be used when approved by the Engineer.

Section 6.6.5, "Nonspecified NDT Other than Visual," of AWS D1.1, Section 6.6.5 of AWS D1.4 and Section 6.6.5 of AWS D1.5 shall not apply.

For any welding, the Engineer may direct the Contractor to perform NDT that is in addition to the visual inspection or NDT specified in the AWS or other specified welding codes, in the Standard Specifications, or in these special provisions. Additional NDT required by the Engineer will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications. Should any welding deficiencies be discovered by this additional NDT, all costs associated with the repair of the deficient area, including NDT of the weld and of the weld repair, and any delays caused by the repair, shall be at the Contractor's expense.

Repair work to correct welding deficiencies discovered by visual inspection or NDT, or by additional NDT directed or performed by the Engineer, and any associated delays or expenses caused to the Contractor by performing these repairs, shall be at the Contractor's expense.

The Engineer shall have the authority to verify the qualifications or certifications of any welder, QC Inspector, or NDT personnel to specified levels by retests or other means approved by the Engineer.

Continuous inspection shall be provided when any welding is being performed. Continuous inspection, as a minimum, shall include having a QC Inspector within such close proximity of all welders or welding operators so that inspections by the QC Inspector of each welding operation at each welding location shall not lapse for a period exceeding 30 minutes.

Inspection and approval of all joint preparations, assembly practices, joint fit-ups, welding techniques, and the performance of each welder, welding operator, and tack welder shall be documented by the QC Inspector on a daily basis for each day welding is performed. For each

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 37 OF 113

inspection, including fit-up, Welding Procedure Specification (WPS) verification, and final weld inspection, the QC Inspector shall confirm and document compliance with the requirements of the AWS or other specified code criteria and the requirements of these special provisions on all welded joints before welding, during welding, and after the completion of each weld.

When joint weld details that are not prequalified to the details of Section 3 of AWS D1.1 or to the details of Figure 2.4 or 2.5 of AWS D1.5 are proposed for use in the work, the joint details, their intended locations, and the proposed welding parameters and essential variables, will be approved by the Engineer. The Engineer shall have 2 weeks to complete the review of the proposed joint detail locations. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications. Upon approval of the proposed joint detail locations and qualification of the proposed joint details, welders and welding operators using these details shall perform a qualification test plate using the WPS variables and the joint detail to be used in production. The test plate shall have the maximum thickness to be used in production and a minimum length of 180 mm and minimum finish welded width 460 mm. The test plate shall be mechanically and radiographically tested. Mechanical and radiographic testing and acceptance criteria shall be as specified in the applicable AWS codes.

In addition to the requirements specified in the applicable code, the period of effectiveness for a welder's or welding operator's qualification shall be a maximum of 3 years for the same weld process, welding position, and weld type. If production welding will be performed without gas shielding, then qualification shall also be without gas shielding. Excluding welding of fracture critical members, a valid qualification at the beginning of work on a contract will be acceptable for the entire period of the contract, as long as the welder's or welding operator's work remains satisfactory.

The Engineer will witness all qualification tests for WPSs that were not previously approved by the Department. An approved independent third party will witness the qualification tests for welders or welding operators. The independent third party shall be a current CWI and shall not be employed by the contractor performing the welding. The Engineer shall have 2 weeks to review the qualifications and copy of the current certification of the independent third party. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications. The Contractor shall notify the Engineer one week prior to performing any qualification tests. Witnessing of qualification tests by the Engineer shall not constitute approval of the intended joint locations, welding parameters, or essential variables.

In addition to the requirements of AWS D1.5 Section 5.12 or 5.13, welding procedures qualification, for work welded in conformance with that code, shall conform to the following requirements:

A. Unless considered prequalified, fillet welds, including reinforcing fillet welds, shall be qualified in each position. The fillet weld soundness test shall be conducted using the essential variables of the WPS as established by the Procedure Qualification Record (PQR.)

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 38 OF 113

B. For qualification of joints that do not conform to Figures 2.4 and 2.5 of AWS D1.5, two WPS qualification tests are required. The tests conforming to AWS D1.5 Section 5.13 shall be conducted using both Figure 5.1 and Figure 5.3. The test conforming to Figure 5.3 shall be conducted using the same welding electrical parameters that were established for the test conducted conforming to Figure 5.1.

C. The travel speed, current, and voltage values that are used for tests conducted per AWS D1.5 Section 5.12 or 5.13 shall be consistent for each weld joint, and shall in no case vary by more than 10 percent for travel speed, 10 percent for current, and 7 percent for voltage.

D. For a WPS qualified in conformance with AWS D1.5 Section 5.13, the values to be used for calculating ranges for current and voltage shall be based on the average of all weld passes made in the test. Heat input shall be calculated using the average of current and voltage of all weld passes made in the test for a WPS qualified in conformance with Section 5.12 or 5.13.

E. To qualify for unlimited material thickness, two qualification tests are required for WPSs utilized for welding material thicknesses greater than 38 mm. One test shall be conducted using 20-mm thick test plates, and one test shall be conducted using test plates with a thickness between 38 mm and 50 mm. Two maximum heat input tests may be conducted for unlimited thickness qualification.

F. Macroetch tests are required for WPS qualification tests, and acceptance shall be per AWS D1.5 Section 5.19.3.

G. When a weld joint is to be made using a combination of qualified WPSs, each process shall be qualified separately.

H. When a weld joint is to be made using a combination of qualified and prequalified processes, the WPS shall reflect both processes and the limitations of essential variables, including weld bead placement, for both processes.

I. Prior to preparing mechanical test specimens, the PQR welds shall be inspected by visual and radiographic tests. Backing bar shall be 75 mm in width and shall remain in place during NDT testing. Results of the visual and radiographic tests shall comply with AWS D1.5 Section 6.26.2, excluding Section 6.26.2.2. Test plates that do not comply with both tests shall not be used.

WELDING QUALITY CONTROL

Welding quality control shall conform to the requirements in the AWS or other specified welding codes, the Standard Specifications, and these special provisions.

Unless otherwise specified, welding quality control shall apply when any work is welded in conformance with the provisions in Section 49, "Piling," Section 52, "Reinforcement," Section 55, "Steel Structures," or Section 75-1.035, "Bridge Joint Restrainer Units," of the Standard Specifications.

The welding of fracture critical members (FCMs) shall conform to the provisions specified in the Fracture Control Plan (FCP) and herein.

The Contractor shall designate in writing a welding Quality Control Manager (QCM). The QCM shall be responsible directly to the Contractor for the quality of welding, including materials and workmanship, performed by the Contractor and subcontractors.

The QCM shall be the sole individual responsible to the Contractor for submitting, receiving, reviewing, and approving all correspondence, required submittals, and reports to and from the Engineer. The QCM shall be a registered professional engineer or shall be currently certified as a CWI or a CAWI.

CONTRACT NO. 4-0024 CONTRACT CHANGE ORDER NO 69
SHEET 39 OF 113

The QCM shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project. The QCM may be an employee of the Contractor.

Welding inspection personnel or NDT firms to be used in the work shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project, except for the following conditions:

A. The work is welded in conformance with AWS D1.5 and is performed at a permanent fabrication or manufacturing facility which is certified under the AISC Quality Certification Program, Category Cbr, Major Steel Bridges and Fracture Critical endorsement F.
B. The welding is performed on pipe pile material at a permanent pipe manufacturing facility authorized to apply the American Petroleum Institute (API) monogram for API 5L pipe.

For welding performed at such facilities, the inspection personnel or NDT firms may be employed or compensated by the facility performing the welding.

Prior to submitting the Welding Quality Control Plan (WQCP) required herein, a pre-welding meeting between the Engineer, the Contractor's QCM, and a representative from each entity performing welding or inspection for this project, shall be held to discuss the requirements for the WQCP.

The Contractor shall submit to the Engineer, in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications, 2 copies of a separate WQCP for each subcontractor or supplier for each item of work for which welding is to be performed.

The Contractor shall allow the Engineer 2 weeks to review the WQCP submittal after a complete plan has been received. No welding shall be performed until the WQCP is approved in writing by the Engineer. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

An amended WQCP or any addendum to the approved WQCP shall be submitted to, and approved in writing by the Engineer, for proposed revisions to the approved WQCP. An amended WQCP or addendum will be required for revisions to the WQCP, including but not limited to a revised WPS; additional welders; changes in NDT firms, QC, or NDT personnel or procedures; or updated systems for tracking and identifying welds. The Engineer shall have 1 week to complete the review of the amended WQCP or addendum. Work affected by the proposed revisions shall not be performed until the amended WQCP or addendum has been approved. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

Information regarding the contents, format, and organization of a WQCP, is available at the Transportation Laboratory or the following website:

http://www.dot.ca.gov/hq/esc/Translab/smbresources.htm

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 69
SHEET 40 OF 113

After final approval of the WQCP, amended WQCP, or addendum, the Contractor shall submit 7 copies to the Engineer of the approved documents. A copy of the Engineer approved document shall be available at each location where welding is to be performed.

A daily production log for welding shall be kept for each day that welding is performed. The log shall clearly indicate the locations of all welding. The log shall include the welders' names, amount of welding performed, any problems or deficiencies discovered, and any testing or repair work performed, at each location. The daily report from each QC Inspector shall also be included in the log.

The following items shall be included in a Welding Report that is to be submitted to the Engineer within 10 days following the performance of any welding:

A. Reports of all visual weld inspections and NDT.
B. Radiographs and radiographic reports, and other required NDT reports.
C. Documentation that the Contractor has evaluated all radiographs and other nondestructive tests and corrected all rejectable deficiencies, and all repaired welds have been reexamined by the required NDT and found acceptable.
D. Daily production log.

The following information shall be clearly written on the outside of radiographic envelopes: name of the QCM, name of the nondestructive testing firm, name of the radiographer, date, contract number, complete part description, and all included weld numbers or a report number, as detailed in the WQCP. In addition, all innerleaves shall have clearly written on them the part description and all included weld numbers, as detailed in the WQCP.

Reports regarding NDT shall be signed by both the NDT technician and the person that performed the review, and then submitted directly to the QCM for review and signature prior to submittal to the Engineer. Corresponding names shall be clearly printed or typewritten next to all signatures.

The Engineer will review the Welding Report to determine if the Contractor is in conformance with the WQCP. Unless otherwise specified, the Engineer shall be allowed 10 days to review the report and respond in writing after a complete Welding Report has been received. Prior to receiving notification from the Engineer of the Contractor's conformance with the WQCP, the Contractor may encase in concrete or cover welds for which a Welding Report has been submitted. However, should the Contractor elect to encase or cover those welds prior to receiving notification from the Engineer, it is expressly understood that the Contractor shall not be relieved of the responsibility for incorporating material in the work that conforms to the requirements of the plans and specifications. Material not conforming to these requirements will be subject to rejection. Should the Contractor elect to wait to encase or cover welds pending notification by the Engineer, and in the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

The QC Inspector shall provide reports to the QCM on a daily basis for each day that welding is performed.

Except for noncritical weld repairs, the Engineer shall be notified immediately in writing when welding problems, deficiencies, base metal repairs, or any other type of repairs not submitted in the WQCP are discovered, and also of the proposed repair procedures to correct them. The Contractor shall allow the Engineer one week to review these procedures. No remedial work shall begin until the repair procedures are approved in writing by the Engineer. In

the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

The QCM shall sign and furnish to the Engineer, a Certificate of Compliance in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications for each item of work for which welding was performed. The certificate shall state that all of the materials and workmanship incorporated in the work, and all required tests and inspections of this work, have been performed in conformance with the details shown on the plans, the Standard Specifications, and these special provisions.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 41 OF 113

PAYMENT

Full compensation for conforming to the requirements of "Welding" shall be considered as included in the contract prices paid for the various items of work involved and no additional compensation will be allowed therefor.

10-1.09 TEMPORARY RAILING

Temporary railing (Type K) shall be placed as shown on the plans, as specified in the Standard Specifications or these special provisions or where ordered by the Engineer and shall conform to the provisions in Section 12, "Construction Area Traffic Control Devices," of the Standard Specifications and these special provisions.

Reflectors on temporary railing (Type K) shall conform to the provisions in "Prequalified and Tested Signing and Delineation Materials" of these special provisions.

Temporary railing (Type K) shall conform to the details shown on Standard Plan T3. Temporary railing (Type K) fabricated prior to January 1, 1993, and conforming to 1988 Standard Plan B11-30 may be used, provided the fabrication date is printed on the required Certificate of Compliance.

Attention is directed to "Public Safety" and "Order of Work" of these special provisions.

Temporary railing (Type K) placed in conformance with the provisions in "Public Safety" of these special provisions will be neither measured nor paid for.

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO 69

SHEET 45 OF 113

10-1.10 EXISTING HIGHWAY FACILITIES

The work performed in connection with various existing highway facilities shall conform to the provisions in Section 15, "Existing Highway Facilities," of the Standard Specifications and these special provisions.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 46 OF 113

REMOVE SEWER MANHOLE

Existing manholes, at the locations shown on the plans as remove or to be demolished, shall be removed and disposed of.

Removed frames and covers shall be disposed of.

The contract unit price paid for remove sewer manhole shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all work involved in removing manhole complete in place, including concrete base, pipe risers, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the engineer.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 47 OF 113

CONTRACT NO. 01-0120R4 CONTRACT CHANGE ORDER NO 69
SHEET 48 OF 113

REMOVE CHAIN LINK FENCE

Existing chain link fence, including post footings, at the locations shown on the plans, shall be removed and disposed of.

Full compensation for removing and disposing of excess fence shall be considered as included in the contract price paid per meter for remove chain link fence and no separate payment will be made therefor.

REMOVE PIPE LINE

Existing water mains, and sewers, where shown on the plans to be removed, shall be removed and disposed of. Resulting openings into existing structures that are to remain in place shall be plugged with commercial quality concrete containing not less than 300 kg of cement per cubic meter.

Full compensation for concrete plugs, pipe removal, structure excavation, and backfill (including sand, controlled low strength material or slurry cement backfill) shall be considered as included in the contract unit price paid for remove water mains, and sewers and no additional compensation will be allowed therefor.

DEMOLISH PUMP STATION

This work shall consist of demolition and disposal of the existing pump station as shown on the plans, as specified in these special provisions, and as directed by the Engineer.

Scope of Work

The Contractor and/or subcontractors shall be properly licensed in accordance with the laws of the State of California and shall possess a Class C-21 license, CAL-OSHA permit and a Hazardous Substance Removal Certificate (HAZ) if any hazardous substances are discovered and the discovery requires removal. The Contractor shall provide all labor, equipment, supplies, permits and materials necessary to remove and demolish commercial structure, and abate all hazardous materials, according to all environmental laws and regulations. The work shall be done in accordance with all city and/or county codes/regulations. The structures are to be demolished and removed out of the State right of way.

The extent of demolition and disposal work shall consist of demolishing and removing structures, foundations, footings and other improvements including, but not limited to, the removal of siding, concrete blocks, plants, shrubs, trees, fences, walls, decks, sheds, doors and windows, concrete tanks, capping of sewer lines, slabs, stairs and landings, loading docks, steps, footings, foundations, pipe, brick, flatwork, plaster, lumber, wood splinters, trash, debris, glass, and abate all friable and non-friable asbestos and lead paint, according to all environmental laws and regulations. The Contractor shall also ensure that the proper notifications be made to the respective utility companies for the removal of meters or the disconnecting, capping or sealing, and abandoning in place of all site utilities. All demolished items shall be removed and legally disposed of outside of the State right of way, unless indicated to be salvaged or recycled by the Engineer.

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 69
SHEET 49 OF 113

Prior to the demolition work, the Contractor shall submit a schedule of pump station demolition activities to the Engineer for approval. The schedule shall indicate the following:

1. Proper Notification, time frames
2. Detailed sequence of demolition and removal work, with starting and ending dates for each.
3. Interruption of utility services.
4. Coordination for shutoff, capping, and continuation of utility services.
5. Locations of temporary protection

Backfill

The Contractor shall take all measures necessary to protect the public from basement excavations, holes, or vertical drops exposed or produced by his or her operations. The Contractor shall backfill such excavations, holes, or drops. Backfill shall be made with clean earth consisting of alluvium, decomposed granite, loam or sand. No material containing adobe or other substances, which would swell or contract with the addition of water or containing debris or large rocks will be accepted. Backfill within the limits of the State right of way shall be completed to the surface of the ground and unless otherwise specified, shall be placed in horizontal uniform layers not to exceed 20 cm in thickness before compaction.

Concrete & Debris Removal

The Contractor shall remove and dispose of all concrete, including concrete footings, 1 m below adjoining grade, flatwork , and miscellaneous rubble. Likewise, all brick, plaster, lumber, wood splinters and other debris including shrubs shall be removed from the site and disposed of by the Contractor.

Items to be Salvaged

The existing Flygt pump and Paco pump in TIS041 shall be salvaged and returned to SFPUC/WWE. The check valves shall also be salvaged and returned to SFPUC/WWE. The Engineer shall contact Kris Kilgore (415-648-6882 x1323), or Vic Zorzynski (415-274-0333) of the SFPUC/WWE once the salvaged items are removed from the existing pump station.

Payment

The contract unit price paid to demolish the pump station shall include full compensation for furnishing all labor, materials, temporary facilities, backfill, salvaging existing pumps and valves, safety measures, tools, equipment, and incidentals, and for performing all the work involved in demolition and removal of the pump station as shown on the plans, as specified in these special provisions, and as directed by the Engineer.

10-1.11 CLEARING AND GRUBBING

Clearing and grubbing shall conform to the provisions in Section 16, "Clearing and Grubbing," of the Standard Specifications and these special provisions.

Vegetation shall be cleared and grubbed only within the excavation and embankment slope lines.

At locations where there is no grading adjacent to a bridge or other structure, clearing and grubbing of vegetation shall be limited to 1.5 m outside the physical limits of the bridge or structure.

Existing vegetation outside the areas to be cleared and grubbed shall be protected from injury or damage resulting from the Contractor's operations.

Activities controlled by the Contractor, except cleanup or other required work, shall be confined within the graded areas of the roadway.

Nothing herein shall be construed as relieving the Contractor of the Contractor's responsibility for final cleanup of the highway as provided in Section 4-1.02, "Final Cleaning Up," of the Standard Specifications.

10-1.12 EARTHWORK

Earthwork shall conform to the provisions in Section 19, "Earthwork," of the Standard Specifications and these special provisions.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 50 OF 113

Surplus excavated material shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Reinforcement or metal attached to reinforced concrete rubble placed in embankments shall not protrude above the grading plane. Prior to placement within 0.6-m below the grading plane of embankments, reinforcement or metal shall be trimmed to no greater than 20 mm from the face of reinforced concrete rubble. Full compensation for trimming reinforcement or metal shall be considered as included in the contract prices paid per cubic meter for the types of excavation shown in the Engineer's estimate, or the contract prices paid for furnishing and placing imported borrow or embankment material, as the case may be, and no additional compensation will be allowed therefor.

Imported borrow shall be mineral material including rock, sand, gravel, or earth. The Contractor shall not use man-made refuse in imported borrow including:

A. Portland cement concrete,
B. Asphalt concrete,
C. Material planed from roadway surfaces,
D. Residue from grooving or grinding operations,
E. Metal,
F. Rubber,
G. Mixed debris,
H. Rubble

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 51 OF 113

10-1.13 HEALTH AND SAFETY PLAN

The Contractor shall prepare a Health and Safety Plan to prevent or minimize exposure to contaminants of concern. The Contractor's attention is directed to Title 8, California Code of Regulation, Section 5192 (b) (4)(B) Occupational Safety and Health Guidance Manual published by the National Institute of Occupational Safety and Health (NIOSH), Occupational Safety and Health Administration (OSHA), for elements of the site safety plan. The Health and Safety Plan shall contain as a minimum but not be limited to: identification of key personnel for the project, job hazard analysis for work assignments, summary of risk assessment, air monitoring plan, personal protective equipment, delineation of work zones on-site, decontamination procedures, general safe work practices, security measures, emergency response plans and worker training. The Health and Safety Plan shall be approved by the Contractor's Certified Industrial Hygienist before submission to the Engineer for review and acceptance. The plan shall be submitted to the Engineer at least 15 working days prior to beginning any work in the project area.

TRAINING

Personnel who have no prior training or are not current in their training status, including State personnel, shall complete a safety training program provided by the Contractor, which meets the requirement of Title 8, California Code of Regulations, Section 5192 (b). The Contractor shall provide a written certification of completion of safety training to the Engineer for all trained personnel prior to performing any work in areas containing contaminants of concern.

EQUIPMENT AND MEDICAL SURVEILLANCE

Personnel protective equipment, training, and medical surveillance required by the Contractor's Health and Safety Plan shall be provided to State personnel by the Contractor. The number of State personnel will be 2.

PAYMENT

The contract lump sum price paid for the Health and Safety Plan shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all work involved in preparing and implementing the Health and Safety Plan including paying the Certified Industrial Hygienist and for providing personal protective equipment, training and medical surveillance as specified in these special provisions and as directed by the Engineer.

10-1.14 AGGREGATE SUBBASE

Aggregate subbase must comply with Section 25, "Aggregate Subbases," of the Standard Specifications and these special provisions.

Aggregate subbase must be Class 4.

Do not store reclaimed asphalt concrete or aggregate subbase with reclaimed asphalt concrete within 30 m measured horizontally of any culvert, watercourse, or bridge.

Class 4 aggregate subbase must comply with:

Grading (Percentage Passing)

Sieve Sizes	Operating Range	Contract Compliance
63-mm	100	100
4.75-mm	30-65	25-70
75-µm	0-15	0-18

Quality

Test	Operating Range	Contract Compliance
Sand Equivalent	21 Min.	18 Min.
Resistance (R-value)	----	50 Min.

If tests show grading or sand equivalent does not comply with the "Operating Range" specifications but complies with the "Contract Compliance" specifications, you may place aggregate subbase for the remainder of that day. Do not start another day's work until tests or other information indicate the next day's material complies with the "Operating Range" specifications.

If tests show grading or sand equivalent does not comply with the "Contract Compliance" specifications, remove the aggregate subbase represented by the tests. If you request and the Engineer approves, that aggregate subbase may remain in place and the Department reduces payment by $3.00 per cubic meter for that aggregate subbase. If the subbase remains in place and both the grading and sand equivalent do not comply with "Contract Compliance" specifications, the Department only makes one payment reduction.

No single grading or sand equivalent test may represent more than the smaller of 400 m^3 or one day's production.

Instead of Class 4 aggregate subbase, you may place Class 1 aggregate subbase complying with the aggregate grading and quality requirements in Section 25-1.02A, "Class 1, Class 2, and Class 3 Aggregate Subbases," of the Standard Specifications. If you place Class __ aggregate subbase, do not change back to Class 4 subbase without written approval from the Engineer.

Regardless of the aggregate subbase class supplied, the Department pays for aggregate subbase as Class 4 aggregate subbase.

10-1.15 AGGREGATE BASE

Aggregate base must comply with Section 26, "Aggregate Bases," of the Standard Specifications and these special provisions.

Aggregate base must be Class 3.

Do not store reclaimed asphalt concrete or aggregate base with reclaimed asphalt concrete within 30 m measured horizontally of any culvert, watercourse, or bridge.

Class 3 aggregate base must comply with:

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 53 OF 113

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 69 SHEET 51 OF 113

Grading (Percentage Passing)

Sieve Sizes	Maximum	
	Operating Range	Contract Compliance
50-mm		
37.5-mm		
25-mm	100	100
19-mm	90-100	87-100
4.75-mm	35-60	30-65
600-µm	10-30	5-35
75-µm	2-9	0-12

Quality

Tests	Operating Range	Contract Compliance
Sand Equivalent		
Resistance (R-value)		

If tests show grading or sand equivalent does not comply with the "Operating Range" specifications but complies with the "Contract Compliance" specifications, you may place aggregate base for the remainder of that day. Do not start another day's work until tests or other information indicate the next day's material complies with the "Operating Range" specifications.

If tests show grading or sand equivalent does not comply with the "Contract Compliance" specifications, remove the aggregate base represented by the tests. If you request and the Engineer approves, that aggregate base may remain in place and the Department reduces payment by $3.25 per cubic meter for that aggregate base. If the base remains in place and both the grading and sand equivalent do not comply with "Contract Compliance" specifications, the Department only makes one payment reduction.

No single grading or sand equivalent test may represent more than the smaller of 400 m^3 or one day's production.

10-1.16 ASPHALT CONCRETE

Asphalt concrete shall be Type _A__ and shall conform to the provisions in Section 39, "Asphalt Concrete," of the Standard Specifications and these special provisions.

The grade of asphalt binder to be mixed with aggregate for Type _A__ asphalt concrete shall be Grade _PG 64-10 conforming to the provisions in Section 92, "Asphalts," of the Standard Specifications.

The amount of asphalt binder used in asphalt concrete placed in dikes, gutters, gutter flares, overside drains and aprons at the ends of drainage structures shall be increased one percent by mass of the aggregate over the amount of asphalt binder determined for use in asphalt concrete placed on the traveled way.

The asphalt content of the asphalt mixture will be determined in conformance with the requirements in California Test 379, or in conformance with the requirements in California Test 382.

Paint binder (tack coat) shall be applied to existing surfaces to be surfaced and between layers of asphalt concrete, except when eliminated by the Engineer.

Paint binder (tack coat) shall be, at the option of the Contractor, either slow-setting asphaltic emulsion, rapid-setting asphaltic emulsion or paving asphalt. Slow-setting asphaltic emulsion and rapid-setting asphaltic emulsion shall conform to the provisions in Section 39-4.02, "Prime Coat and Paint Binder (Tack Coat)," and the provisions in Section 94, "Asphaltic Emulsions," of

the Standard Specifications. When paving asphalt is used for paint binder, the grade will be determined by the Engineer. Paving asphalt shall conform to the provisions in Section 39-4.02, "Prime Coat and Paint Binder (Tack Coat)," and the provisions in Section 92, "Asphalts," of the Standard Specifications.

Paint binder (tack coat) shall be applied in the liter per square meter range limits specified for the surfaces to receive asphalt concrete in the tables below. The exact application rate within the range will be determined by the Engineer.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 55 OF 113

10-1.17 REINFORCEMENT

Reinforcement shall conform to the provisions in Section 52, "Reinforcement," of the Standard Specifications and these special provisions.

The Department's mechanical splices prequalified list can be found at the following internet site:

http://www.dot.ca.gov/hq/esc/approved_products_list/

The provisions of "Welding Quality Control" of these special provisions shall not apply to resistance butt welding.

MEASUREMENT AND PAYMENT

Measurement and payment for reinforcement in structures shall conform to the provisions in Section 52-1.10, "Measurement," and Section 52-1.11, "Payment," of the Standard Specifications and these special provisions.

10-1.18 SANITARY SEWER LIFT STATION

A sanitary sewer lift station shall be furnished and installed in conformance with the details shown on the plans and these special provisions.

A sanitary sewer lift station shall consist of shaft, duplex pumps with motors, pump enclosure, foundation, pipe, fittings, valves, controls and appurtenances necessary for the satisfactory operation of the sanitary sewer lift station. Service equipment and electrical equipment shall conform to the provisions in Section 10-3 of these special provisions. Incidental material or equipment not mentioned in these special provisions or shown on the plans, which may be necessary for completion and satisfactory operation of the sanitary sewer lift station, shall be furnished and installed.

All components of the sanitary sewer lift station shall be warranted for two years from date of first operation.

MATERIALS LIST AND DRAWINGS

In conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications, the Contractor shall submit, within 15 days after approval of the contract, a list of materials which the Contractor proposes to furnish and install for the sanitary sewer lift station together with the drawings and other data as specified below:

A. The materials list shall be a complete listing of the manufacturer, catalog number, size, and capacity of the manufactured articles. There shall be a working drawing for the sanitary sewer lift station showing the pump details, piping, and equipment as planned to be furnished and installed and for other materials to be fabricated for the installation. Directions for maintenance and adjustment of the pump shall be furnished to the Engineer as well as a manufacturer's certified performance characteristics curve diagram for the pump.
B. The data submitted shall be labeled with a descriptive title, project description and contract number of the project.

At least 4 copies of the data shall be initially submitted to the Engineer for approval. The Engineer will review the submitted data and will return to the Contractor either one set for correction or 2 sets that have been approved.

CONTRACT NO. 94-01204
CONTRACT CHANGE ORDER NO 67
SHEET 57 OF 113

After approval, 6 sets of Operation and Maintenance Manuals for the sanitary sewer lift station shall be submitted.

The State shall not be liable for materials purchased or labor performed, prior to approval of the drawings and materials list, and will not be responsible for any delay to the Contractor pending review of the drawings and information submitted after the 15-day period mentioned.

PUMP AND MOTOR

Pumps shall be heavy-duty, submersible, non-clog, centrifugal, quick disconnect pumps. The pumps shall be a Flygt Model NP3102.090 with 5 hp motor. Power supplied will be 208 volt 3 phase.

Pump Construction

A. General: The pumps shall be designed to permit ground-level removal of pumping units from the wet well for inspection or service without disconnecting or disturbing the discharge piping. The pump connection shall be metal to metal. The design shall permit the pumps when lowered into place to be automatically connected to the discharge piping by positively locking the volute in position to prevent any axial or lateral movement. There shall be no need for personnel to enter the wet well when pump inspection or service is required.

B. Piping, fittings, and Appurtenances: Each pump shall be furnished with quick-disconnect discharge elbow, AISI Type 316 stainless steel standard pipe rails, upper guide rail bracket, intermediate guide rail bracket, rail-guided lifting assembly and AISI Type 316 stainless steel chain of sufficient strength to raise and lower pump. All miscellaneous metal within the wet well shall be stainless steel. Anchor bolts shall be stainless steel.

C. Pump Castings: Castings and other major pump components shall be of grey cast iron, ASTM A-48, Class 35B, shall be of cast iron and free from blowholes, porosity, hard spots, shrinkage defects, cracks, and other injurious defects. All metal surfaces coming into contact with the sewage, other than stainless steel or brass, shall be protected by a factory applied spray coating of acrylic dispersion zinc phosphate primer with a polyester resin paint finish on the exterior of the pump. The casings shall be designed to permit replacement of wearing parts. Joints shall be properly sealed with Nitrile or Viton rubber O-rings and shall not leak under a test pressure equal to 50 percent greater than the pump shut-off pressure. Passageways shall permit smooth flow and shall be free from sharp turns and projections.

D. Impellers: Impellers shall be of (spheroidal graphite) gray iron class 35B, cast steel, or an alloy suitable for the service required. The impellers shall be smooth and free flowing and shall have sufficient clearance to permit 75 mm objects in the sanitary waste water that enter the pump to pass into the discharge pipe. Each impeller shall be accurately fitted and keyed, splined, or threaded on the shaft, and locked in such a manner that lateral movement will be prevented and reverse rotation will not cause loosening.

E. Balance: All rotating parts of the equipment shall be in such balance, mechanically and hydraulically, as to operate without excessive end thrust, vibration or noise.

F. Shafts: Shafts shall be steel, and be provided with alignment bearings.

G. Bearings: Bearings subject to submersion shall be ball bearings manufactured from high-grade bearing alloy.

H. Mechanical Seals: Each pump shall be equipped with tungsten carbide seals.

I. The Power cable shall be sized according to the NEC and ICEA standards and shall be of sufficient length to reach the junction box without the need of any splices. The outer jacket of the cable shall be oil resistant chloroprene rubber. The motor and cable shall be

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 58 OF 113

capable of continuous submergence underwater without loss of watertight integrity to a depth of 65 feet. The cable entry seal design shall preclude specific torque requirements to insure a watertight and submersible seal. The cable entry shall consist of a single cylindrical elastomer grommet, flanked by washers, all having a close tolerance fit against the cable outside diameter and the entry inside diameter and compressed by the body containing a strain relief function, separate from the function of sealing the cable. The assembly shall provide ease of changing the cable when necessary using the same entry seal. The cable entry junction chamber and motor shall be separated by a stator lead sealing gland or terminal board, which shall isolate the interior from foreign material gaining access through the pump top. Epoxies, silicones, or other secondary sealing systems shall not be considered acceptable.

J. Electrical motors: Submersible, and the following requirements:

1. Air filled (not oil filled) squirrel cage induction type
2. Service factor of 1.15 or better
3. Class F insulation, Class B temperature rise
4. Rated for 6 starts per hour
5. Listed by either UL or FM for Class 1, Division 1, Groups C and D hazardous locations
6. Suitable for operating either in free air or continuously submerged in sewage
7. Bearing B10 life 18,000 hours minimum
8. Tungsten carbide seals
9. Lower bearings of either the ball or roller type
10. Provide a moisture detection system and a motor winding thermostat system, connected to the station control panel.

These systems shall be complete, including all necessary interfaces, control panels, conduits, and wires, even though these may not be shown on the Drawings.

Miscellaneous Materials: Bolts, nuts, anchors, washers, and all other types of support necessary for the installation of the pumps and drive units shall be provided and shall be of stainless steel.

Shop Painting: Pump, motor, and accessories shall be factory applied and finish painted in accordance with the manufacturer's standard.

Tools and Spare Parts: The pumps shall be furnished with a full set of manufacturer's recommended spare parts and special tools and maintenance instructions.

PIPE, VALVES, JOINTS AND FITTINGS

Valves shall be the type shown on the plans and shall be Class 125 unless otherwise shown on the plans.

Gate valves shall be iron body, wedge gate type with bronze trim and non-rising stem.

Check valves shall have cast iron body and gate, flanged ends, and bronze trim. The valves shall be the spring-loaded lever type for nonslamming under the conditions of operation and shall have stainless steel spring and shaft.

Pipes and fittings for piping 4 NPS or greater shall be ductile iron.

Ductile iron pipe shall be restrained, push-on joint pipe conforming to ANSI/AWWA C151/A21.51.

Restrained push-on joints for ductile iron pipe shall conform to ANSI/AWWA C111/A21.11. The joints shall be boltless, non-compression, non-threaded with synthetic rubber gasket seals and have a positive-locking device to keep the connection from separating. The pipe joints shall

CONTRACT NO. 04-012049 CONTRACT CHANGE ORDER NO 69
SHEET 59 OF 113

be designed for a working pressure of 2,413 Kpa and be capable of deflecting after assembly. Fittings and flanges for ductile iron pipe shall conform to ANSI/AWWA C110/A21.10, except for the manufacturer's proprietary design dimensions for restrained push-on joint pipe.

Ductile iron pipe and fittings shall have cement mortar lining and seal coating conforming to ANSI/AWWA C104/A21.4. Pipe shall have an asphaltic coating and/or polyethylene encasement outside coating conforming to ANSI/AWWA C151/A21.51, and fittings shall have an asphaltic coating and/or polyethylene encasement outside coating conforming to ANSI/AWWA C110/A21.10.

Pipe supports

All anchor bolts, nuts, pipe clamps, and other fittings shall be suitable for the type and size of the lines or casing, and shall conform to the provisions in Section 75-1.03, "Miscellaneous Bridge Metal", of the Standard Specifications.

Locate pipe supports as indicated in the plans. Unless stated otherwise, use AISI type 316 stainless steel for fabrication of pipe supports and stainless steel heavy hex head bolts with hardened washers and heavy hex nuts for bolted connections. Pipe supports shall be fabricated and installed according to MSS SP-58 and SP-69.

Dimensions and elevations for supports are the responsibility of the contractor and should be confirmed in the field prior to fabrication and installation.

Link Type Penetration Seal

The pipe to wall penetration closures shall be a modular mechanical type consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between pipe and wall opening. Once expanded, the seal shall provide a watertight seal between pipe and wall. Pressure end plates shall be manufactured of glass reinforced plastic with a tensile strength of 186 mPa.

WET WELL

The wet well shall consist of precast wet well barrel sections as shown on the plans and in accordance with Section 70 1.02H "Precast Concrete Structures" of the Standard Specifications. The barrel sections shall conform to ASTM C-478 with single groove rubber joint gaskets. The concrete rings shall consist of Type II / Type V cement with appropriate corrosion protection against contaminated soils.

VALVE BOXES

Valve boxes shall conform to the provisions in Section 20-2.24, "Valve Boxes" of the Standard Specifications. A floor drain with deep trap shall be provided to drain the valve box to the wet well.

FOUNDATIONS

Concrete for foundations and pads shall be minor concrete and shall contain not less than 325 kg of portland cement per cubic meter. Type II / Type V cement with appropriate corrosion protection against contaminated soils shall be used for all concrete foundations and pads.

PRESSURE GAGES

Pressure gages shall be the dial type, shall be clear glycerin filled with a 65-mm minimum diameter weathertight epoxy case, and shall have accuracy within 3 percent of the full scale reading.

PUMP CONTROL

Panel

The pump control panel enclosure shall be 14 gauge 316 stainless steel. Panel shall have removable door, hinges constructed of 316 stainless steel and stainless steel hinge pins. Enclosure standards shall meet UL 508 for NEMA 4X. Enclosure shall comply with NEMA Type 4 and IEC 529, IP66. Back panel construction shall be 12 gauge steel. Swing panel shall maintain UL and NEMA ratings when installed. All operational status components shall be mounted on the swing panel. A single-phase 20 amp outlet shall be provided.

Controls

Station controls shall include the following:

A. Lockable external disconnect switch.
B. Motor starters, NEMA rated and sized for the next largest size (7.5 hp) pump motors.
C. 12 20amp-1-pole Circuit breakers, molded case and rated for short-circuit current.
D. Control power transformer with primary and secondary circuit breakers.
E. A 120V-12v dc for telemetering
F. Two circuit breakers for the pumps and two contactors
G. Transfer switch with receptacle to connect portable emergency generator. The switch enclosure shall be 316 stainless steel, NEMA 4X.

    1. Transfer switch shall be manually operated, 100 Amp, 240 V, 3 phase.
    2. Receptacle shall be four-wire, four-pole Crouse-Hinds Catalog AR1041 model M3 or equal.

H. MultitSmart Pump Control System. In order to maintain consistency in operation, control, programming, data collection, maintenance and spare parts, the pump control system shall be a MultiSmart Pump Controller and RTU as manufactured by MultiTrode Inc. USA, (561)994-8090, www.multitrode.com. The Controller shall interface with an existing OMNEX wireless system. The following boards shall be included:

    1. Pump Control/General I/O
    2. CPU Board
    3. DSP Board
    4. Motor Protection

I. Rechargeable battery system of sufficient voltage and capacity to maintain all electronic systems for 12 hours.
J. The level indicator shall be of the conductance probe type compatible with the MultiSmart Pump Control System. The probe shall be constructed from PVC tubing with molded sensor units at regular intervals along the probe. Each sensor unit shall be PVC injected to prohibit ingress of moisture, and the sensor material shall be stainless steel. The probe shall be suspended on its own cable and connected to a stainless steel hook which shall hang from a stainless steel angle containing a polyurethane squeegee pad positioned in the opening into the wet well, so that the probe can be removed without entering the wet well. The squeegee shall have a hole and slot, enabling the probe to be pulled through and cleaned. Probe cable shall be run in a separate conduit away from any high voltage cables. Ten sensors shall be spaced along the length of the probe assembly,

CONTRACT NO. 04-0120K4
CONTRACT CHANGE ORDER NO 69
SHEET 61 OF 113

each individually connected to a correspondingly numbered flexible cable. The molded sensor unit shall contain two sensors mounted on opposite sides of sensor unit. The probe shall be pressure injected with an epoxy resin to encapsulate all internal components and connections to form a rigid, homogenous unit. Each sensor unit containing the two sensors shall be rotated 90 degrees to the previous sensor unit to eliminate tracking between sensors. The cable shall be encoded with number and text along the entirety of the cable and at intervals not greater than 200mm for identification. The flexible cables shall be capable of supporting the weight of the probe and cable without the need for additional support. The cable shall be secured to the top of the probe by a synthetic rubber compression fitting.

INSTALLATION

Equipment shall be installed in accordance with manufacturer's instructions. Guide rails shall be secured in place. Each pump unit shall be connected to its corresponding discharge nozzle through the rail system. Smooth, correct operation of the lifting mechanism shall be demonstrated. Connect power and control cables and verify continuity and function.

Piping shall be supported as shown on the plans and in conformance with these special provisions. Pipes shall be held in place by hangers, supports, pipe rests, anchors, sway braces, guides or other special hangers. Allowances shall be made for expansion and contraction. Pipes shall have hangers or supports every 3 meters. Pipes shall be supported at each joint. Vertical pipes shall be supported with clamps or straps. Horizontal and vertical piping shall be securely supported and braced to prevent swaying, sagging or flexing of joints.

Cleaning and closing of pipe

The interior of all pipes shall be cleaned before installation. All openings shall be capped or plugged as soon as the pipe is installed to prevent the entrance of any materials. The caps or plugs shall remain in place until their removal is necessary for completion of the installation.

TESTING

Piping through the valve box shall be tested in accordance with the provisions in Section 20-5.03H(1), "Method A", of the Standard Specifications, with no leakage or pressure drop. The Contractor shall furnish pipe anchorages to resist thrust forces occurring during testing. All leaks shall be repaired, and all defective materials shall be replaced by the Contractor at the Contractors expense.

All pressure testing and necessary repairing of lines shall be completed prior to backfilling, or otherwise covering the lines.

Each end of line shall be capped prior to and after the testing

The Control System shall be initially programmed in default condition. All available signals shall be connected to the Pump Control System.

In addition to its standard programming, the unit shall be configured to alarm through the OMNEX wireless system to be installed by others.

MEASUREMENT AND PAYMENT

Quantities of sanitary sewer lift station will be measured by the unit as determined from actual count in place.

The contract unit price paid for sanitary sewer lift station shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in furnishing and installing the sanitary sewer lift station, complete in place, including foundations, valve vaults, sewer manhole, pump enclosures, and excavation and backfill, as

shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 62 OF 113

10-1.19 SEWER PIPE

Scope

This work shall consist of furnishing and installing Ductile Iron (DIP), Vitrified Clay (VCP), and Cast Iron (CIP) sewer pipes including excavating, lagging, backfilling and other incidental work, necessary or required for a complete, satisfactory sewer installation, in accordance with the details shown on the plans, these special provisions, and as directed by the Engineer.

Design Requirements

150 mm Ductile Iron Pipe

A. Ductile iron pipe shall be class 50 and comply with ANSI A21.51 (AWWA C151). Pipe joints shall comply with the following:

Type of Joint	Specification
Rubber Gasket Push-on Joint	ANSI A21.11 (AWWA C111)
Mechanical Joint	ANSI A21.11 (AWWA C111)
Flanged Joint	ANSI B16.1, B16.2, and A21.10 (AWWA C110)
Flanged Joint (Threaded Flanges)	ANSI B2.1

B. All rubber gasket, push-on, mechanical and flanged joint fittings for ductile iron pipe shall be manufactured in accordance with ANSI A21.10 (AWWA C110).

C. The interior surfaces of ductile iron pipe and fittings shall be lined with a uniform thickness of cement mortar then sealed with an asphaltic coating and/or polyethylene encasement outside coating in accordance with ANSI A21.51 (AWWA C151). The outside surfaces of ductile iron pipe and fittings for general use shall be coated with a asphaltic coating and/or polyethylene encasement in accordance with ANSI A21.10 or ANSI A21.51.

300 mm Vitrified Clay Pipe

A. Vitrified clay pipes (VCP) shall conform to the ASTM Designation: C700 "Standard Specifications for Extra Strength Clay Pipe," except as modified by the plans and these special provisions.

B. Joints for VCP plain-end pipe sewers 300 mm or smaller in diameter may be rubber compression couplings or composition coupling with stainless steel bands Class 316. Rubber compression couplings with Class 316 stainless steel bands shall be in accordance with the requirements of ASTM Designation C425. Composition couplings with Class 316 stainless steel bands shall be in accordance with the requirements of ASTM Designation : C425 "Tentative Specifications for Compression Couplings for Vitrified Clay Plain-End Pipe".

150 mm Cast Iron Pipe

A. Cast iron pipes (CIP) shall conform to the following standards:
   a. ANSI A21.8 (AWWA C101), "Thickness Design of Cast Iron Pipe."
   b. ANSI A21.6 (AWWA C106), "Cast Iron Pipe Centrifugally Cast in Metal Molds for Water or Other Liquids."
   c. ANSI A21.8 (AWWA C108), "Cast Iron Pipe Centrifugally Cast in Sand Lined Molds for Water or Other Liquids."
   d. ANSI A21.11 (AWWA C111), "Rubber Gasket Joints for Cast Iron Pressure Pipe and Fittings."

B. All joint fittings shall be push-on or mechanical.

C. The linings shall be double thickness of cement with bituminous seal coat.

Quality Assurance

A. The manufacturer of each shipment of pipe shall be required to supply a statement certifying that each lot or load of pipe has been manufactured and tested in accordance with these special provisions.

Execution

A. At all times when the work of installing pipe is not in progress, including worker break times, close the ends of the pipe with a tight-fitting, vermin-proof and child-proof, cap or plug. Do not permit trench water to enter the pipe. Do not place tools, clothing, or other materials in the pipe. The Contractor shall maintain the interior of the pipe in a sanitary condition free from foreign materials.

B. Where pipe sections less than the standard 3.96m or 6.10m pipe lengths are required, the pipe sections shall be installed in accordance with the manufacturer's installation guide and shall only be used with the approval of the Engineer. The minimum pipe length permitted is 1.52m when used to connect to manholes and cleanouts. The minimum pipe length permitted for stub outs shall be 900mm.

Pipe Installation

The Contractor shall furnish and install all pipe, specials, fittings, closure pieces, supports, gaskets, jointing materials, and all other appurtenances as shown and as required to provide a complete and workable installation. Pipe installation shall be as recommended in UNI-B-5 except as modified below and as shown on the plans.

A. Inspect each section of pipe prior to lowering the pipe into the trench. Thoroughly clean the ends of the pipe. Remove foreign matter and dirt from inside of the pipe and keep pipe clean during and after installation.

CONTRACT NO. 04-012084
CONTRACT CHANGE ORDER NO 69
SHEET 65 OF 113

B. Install pipe according to the manufacturer's approved order of installation to the proper lines and grades as shown on the plans.

1. Pipe shall be installed with pipe bells up-grade. Lay pipes uphill if the grade exceeds ten percent (10%).

2. Installation tolerances for the pipe shall not vary more than 50mm horizontally or 25mm vertically from the alignment and elevations shown on the plans.

3. Install the pipe such that the identification markings on each pipe section are continuously aligned for the total length of the pipeline alignment. Orient the strip marking upward to the 12 o'clock position (top) of the trench opening.

4. Avoidance of reverse slope: Any pipeline installed with reversed slope, as evidenced by ponding of water or sag, is not allowed. Any such pipeline shall be removed and replaced (at proper line and grade) to the nearest upstream and downstream sewer structure as directed by the Engineer.

C. The pipe shall have firm bearing along its full length, and bell holes shall be provided at each joint to permit visual inspection of the joint and prevent the pipe from being supported by the bell end or coupling.

A. Field cutting and milling shall be accomplished to equal the quality of shop-fabricated ends in accordance with the manufacturer's written instructions.

B. Pipe Assembly: Assemble the pipe joint using the lubricant supplied by the pipe manufacturer. Insert the spigot end into the bell or coupling to the proper insertion mark. Check that the elastomeric ring has not left the groove during assembly by passing a feeler gauge around the completed joint. Drive the spigot end into the bell in accordance with the manufacturer's recommendations. Stabbing shall not be permitted.

F. Horizontal or vertical curve alignments shall be accomplished as required, in accordance with the manufacturer's recommendations. A combination of random pipe lengths, bending, and joint deflection shall be utilized to create smooth radius curves in accordance with the manufacturer's recommendations and as directed by the Engineer.

Connection to Existing Sewer System

A. Connection to the existing sewer system at an existing manhole or dead end shall be made as shown on the plans in accordance with these special provisions.

Contractor Responsibility

It is the Contractor's responsibility to visit the site and ascertain the present site conditions for the entire reach prior to beginning work. Any discrepancies between existing drawings and field conditions shall be brought to the attention of the Engineer immediately.

Traffic Control

The Contractor shall submit a traffic control plan to the agency having jurisdiction for its approval prior to starting the work.

Manholes

Seals around manholes shall be in accordance with the manufactures recommendations.

Storm Water Pollution Prevention Plan (SWPPP) Requirements

The Contractor shall abide by the conditions of the Regional Water Quality Control Board, General Construction Activity Storm Water Permit and the project Storm Water Pollution Prevention Plan (SWPPP).

Examination of Approved Plans, Specifications and Site

The Contractor shall carefully examine the site of the proposed work, the plans, the specifications, and all other pertinent documents. Contractor shall be satisfied as to the character, quality and quantities of work to be furnished, and as to the requirements of the plans and these special provisions. The District will not be liable for any loss sustained by the Contractor as a result of any variance between conditions as shown on the plans and the actual conditions revealed during the progress of the work or otherwise.

Quality of Materials

The work shall be performed in a thorough, worker-like manner in accordance with the plans, and these special provisions. All work shall conform to the lines and grades shown on said plans.

At least one member of the Contractor's workforce who is thoroughly familiar with the specified requirements of work and who is completely trained and experienced in the construction skills necessary for satisfactory completion of the work shall be present at the site, directing the work, at all times.

Adequate number of skilled workers and sufficient and appropriate equipment shall be present at the site prior to commencing daily construction operations.

The Engineer shall inform the Contractor if any person in the employ of the Contractor fails to or refuses to comply with the requirements of these special provisions, or appears to the Engineer to be incompetent or unfit, or to act in a disorderly, improper or unsafe manner. It shall be the Contractor's responsibility to dismiss any such person from the work site or take any other action deemed appropriate by the Contractor.

All equipment, materials, and supplies to be incorporated in the work shall be new. All equipment, material and supplies shall be produced in a good and workmanlike manner.

The Contractor may offer as substitution any material, process, or article substantially equal or better in every respect to that so indicated or specified; provided, however, that if the material, process, or article offered by the Contractor is not, in the opinion of the Engineer, substantially equal or better in every respect to that specified, then the Contractor must furnish the material, process, or article specified or one that in the opinion of the Engineer is substantially equal or better in every respect.

Shop Drawing Procedures -

A. Contractor shall submit six (6) copies of all shop drawings, submittals, and manufacturer's cut sheets detailing the methods and materials intended for use on the project. Submittals shall be consecutively numbered, shall be accompanied by a transmittal letter marked with the number and title of the submittal, name of the project, name and address of the Contractor and supplier, along with contact persons for same, and shall be checked by and marked with the approval of the Contractor. In addition, any submittals that deviate from the requirements of the Contract shall be clearly noted and explained in the transmittal letter.

B. The Engineer will review the submittals so provided, and will return the submittals marked to indicate that submittals are approved or must be returned for revision. The Engineer shall be allowed a minimum of five (5) working days for the review of submittals. Submittals returned for revision must be corrected as noted and the Contractor must re-submit shop drawings as noted above until approved by the Engineer. Review and approval of shop drawings by the Engineer shall not relieve the Contractor of the responsibility for executing the work in accordance with these special provisions, using proper methods of construction, nor from furnishing materials or work required but not indicated on the submittals.

C. Construction shall not begin on relevant portions of the work until shop drawing submittals have been approved by the Engineer. Shop drawings shall be submitted in a timely manner so as not to delay construction of the work.

Materials

All materials shall be new and unused, of the quality defined in these special provisions, and approved by the Engineer. All materials to be used within a specific project and intended for equivalent uses shall be identical as to manufacturer and model number. Materials not identical as to manufacturer and model number to those approved by the Engineer, materials that are damaged, or materials that are otherwise unacceptable to the Engineer shall be rejected and immediately removed from the job site.

Pre-Construction Conference

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 69
SHEET 68 OF 113

A. The Contractor shall schedule a Pre-Construction Conference with the SFPUC's Inspection Department at least five (5) days prior to beginning any water or sewer work in the field. As a minimum, the attendees at this conference shall include:

B. The purpose of this meeting is to review the plans for the project relative to the requirements of these special provisions, and the plans. The Contractor shall be prepared to discuss, in detail, the project schedule, and shall provide the Engineer with any schedules, submittals, lists, permits, or other information required by the Engineer, by these special provisions or by the plans.

Inspection

All work and materials furnished shall be subject to inspection for compliance with these special provisions and all other appropriate specifications.

The SFPUC shall at all times have access to the work wherever it is in preparation or progress and the Contractor shall provide proper facilities for such access and for inspection. The Contractor shall provide adequate safe means by which to inspect the work.

Failure or oversight of any Inspector to condemn defective materials at the time of use, or to condemn improper work at the time it is performed, shall not diminish the Contractor's obligations to meet the requirements of the plans and these special provisions. The Contractor shall remove and replace any faulty materials and work at no additional cost to the Engineer upon discovery of the defects or upon receipt of notice from the Engineer to do so.

Defective work or material may be rejected prior to the date of acceptance of the work notwithstanding that such defective work or material may have been previously inspected. Acceptance shall not constitute approval of latent defects or waiver of maintenance requirements.

Any work covered up or otherwise rendered inaccessible without approval or consent of the Engineer must, if required by SFPUC, be uncovered for examination at the Contractor's expense. Any work done in the absence of the Engineer without written permission shall be subject to rejection.

Environmental Control

The Contractor shall abide by all applicable local, state and federal regulations, and by the conditions of the Regional Water Quality Control Board.

The Contractor shall provide effective measures where necessary to prevent operations from producing dust in an amount damaging to property or causing a nuisance as determined by the Engineer. The Contractor shall be responsible for any damage due to dust originating from its operations.
The Contractor shall anticipate and correct any erosion problem arising from its operations.

CONTRACT NO. 04-012084
CONTRACT CHANGE ORDER NO 69
SHEET 69 OF 113

Public Safety and Traffic Control

A. The Contractor shall at all times conduct operations in a manner causing the minimum obstruction and inconvenience to public traffic. The Contractor shall not interfere with the normal operation of public transit vehicles unless otherwise authorized. Trench excavations shall conform with requirements of Section 5-1.02A, "Trench Excavation Safety Plans", of the Standard Specifications. In excavations where sand and or other non-cohesive material is encountered, placing of the necessary protective systems shall commence before a depth of 1.5 meter is attained. At night, lights shall mark all open work and obstructions. The Contractor shall install and maintain all signs, lights, flares, barricades, traffic plates, railings, runways, stairs, bridges and other equipment necessary to safeguard the public. Safety instructions received from governmental authorities shall be followed, but compliance with such instructions shall not diminish the Contractor's responsibility or liability for accidents to workers or damage or injury to persons or property.

In accordance with generally accepted construction practices, the Contractor shall be solely and completely responsible for conditions of the job site, including safety of all persons and property during performance of the work, and the Contractor shall fully comply with all state, federal, and other laws, rules, regulations, and orders relating to the safety of workers and others.

The right of the Engineer to conduct construction review or observation of the Contractor's performance does not include review or observation of the adequacy of the Contractor's safety measures in, on, or near the construction site.

The Contractor shall take immediate action to correct any condition adversely affecting public safety.

B. The Contractor shall submit a traffic control plan to the Engineer and shall obtain approval prior to starting the work.

Protection of Existing Facilities

A. The Contractor's attention is directed to the provisions in Section 15, "existing Highway Facilities," of the Standard Specifications and these special provisions. Attention is directed to the possible existence of pipe and other underground improvements that may or may not be shown on the plans. Once discovered, the Contractor shall preserve and protect all such improvements whether shown on the plans or not. The Contractor shall provide and install suitable safeguards, and shall be responsible for the care and protection of all existing sewer and water pipe, telephone conduit, gas mains, culverts, or other above-ground or below-ground facilities or structures which may be encountered in or near the area of work. It shall be the responsibility of the Contractor to notify each agency of jurisdiction and utility company and to make arrangements for location of facilities prior to beginning construction. In the event of damage to existing facilities during the progress of the work, such facilities shall be replaced or restored to original condition, as determined by the Engineer, at the Contractor's expense.

B. The Contractor shall be responsible for determining in advance the location, elevation, alignment and pipe type and size of all existing pipelines to which connections are to be made. Potholing to determine location will be allowed only after providing the Engineer with three (3)

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 69
SHEET 70 OF 113

day's advance notice. The Contractor is required to contact Underground Service Alert (USA) at 1-800-227-2600 or 1-800-422-4133 for mark-out of all utilities in the area of the work.

C. If the Contractor, either before commencing work or during the course of the work, finds any discrepancy between specifications or drawings and the physical conditions at the site of the work, Contractor shall promptly notify the Engineer in writing of such discrepancy.

Protection of Workers in Tench Excavation

Whenever work involves trench excavation, the Contractor shall provide all necessary shoring, bracing, sloping, or other provisions to be made for worker protection from hazard of caving ground during the excavation. If such plan varies from the shoring system standards established by the Construction Safety Orders of the Division of Industrial Safety, a Civil Engineer or Structural Engineer registered in the State of California shall prepare the plans.

Contractor shall comply with the Safety Orders of California, Code of Regulations: Title 8, Section 1539 (Excavation, Trenches, Earthwork).

Work within Confined Spaces

The Contractor shall comply with all Federal and State regulations for confined space entry. Work inside confined spaces as defined by the applicable regulations shall not be undertaken until all the tests and safety provisions of the Code of Federal Regulations 1910.146, and the Safety Orders of the California Code of Regulations Title 8 Article 108 sections 5156 et seq. for confined space entry have been performed and the area is verified as safe to enter.

Construction Equipment

The Contractor shall furnish appropriate construction equipment to perform the work in accordance with the plans and these special provisions. Such equipment shall be in a good state of repair and shall be maintained in such state during the progress of the work. In no case shall the manufacturer's rating or capacity for any equipment be exceeded.

Storage of Materials

All materials for use in the work shall be stored by the Contractor in such manner as to prevent damage from exposure to the elements, admixture of foreign materials, or from any other cause. The Contractor shall be entirely responsible for damage or loss by weather or other causes. The Material Safety Data Sheets (MSDS) for all products to be used in the work shall be kept on-site by the Contractor, and the material manufacturer's recommendations for proper storage of its products shall be strictly followed.

Power for Construction Purposes

Contractor shall make all arrangements for electrical power required during construction.

Housekeeping During Construction and Final Cleanup

A. The Contractor shall provide suitable drainage and shall erect such temporary structures as are necessary to protect the work or materials from damage. The Contractor shall rebuild, repair, restore, and make good all injuries, losses, or damages to any portion of the work or the materials occasioned by any cause before the acceptance of the work by the Engineer and shall bear the expense thereof.

B. The Contractor shall, at all times during the course of the work, maintain work areas and all adjacent properties and public access roads free from accumulations of waste, debris, rubbish or construction materials.

C. The Contractor shall conduct cleaning and disposal operations to comply with local ordinances and anti-pollution laws.

D. Dry materials and rubbish shall be moistened to prevent blowing dust. Loads of excavated materials leaving the site or being imported to the site shall be covered or moistened to prevent blowing dust.

E. Upon completion of the work, and before making application for acceptance of the work, the Contractor shall clean all rights-of-way, roads, borrow pits, and all other grounds occupied by him in connection with the work. All rubbish, excess materials, temporary structures and equipment shall be removed. All parts of the work shall be left in a neat and presentable condition, as determined by the Engineer.

Hazardous Wastes and Unknown Physical Conditions

If conditions listed below are found during construction, or if any other conditions are found during construction that may be detrimental to the SFPUC's facilities being constructed, or to the health and safety of the public, the Contractor shall promptly notify the Engineer.

A. Material that the Contractor or Engineer believes may be hazardous waste, as defined in Section 25117 of the Health and Safety Code, and is thus required to be removed to a Class I, Class II, or Class III disposal site in accordance with the provisions of existing law. If such material is discovered, Contractor shall immediately cease work and shall not disturb the job site except as required to protect public safety.

B. Subsurface or latent physical conditions at the site differing from those indicated.

C. Unknown physical conditions at the site of any unusual nature, different materially from those ordinarily encountered and generally recognized as inherent in work of the character provided in the Contract.

The Contractor shall promptly inform the Engineer of any such conditions found during construction. The Engineer shall investigate the conditions, and if it finds that the conditions do materially differ from those shown or expected, or do involve material that may be hazardous

CONTRACT NO. 04-0120K4
CONTRACT CHANGE ORDER NO 69
SHEET 72 OF 113

waste, Contractor shall cease work in the impacted area. If material that may be hazardous waste is discovered, the Engineer shall insure that the appropriate government agencies are contacted prior to any further work being performed and that a solution is implemented.

Pipe Zone

The pipe zone includes the full width of the trench from 150mm below the bottom of the pipe to 300mm above the top of the pipe and extends into manhole or vault excavations to the point of connection to or penetration of such structure.

Trench Zone

The trench zone includes the portion of the trench from the top of the pipe zone to the bottom of the pavement zone in paved areas, or to the existing surface in unpaved areas, and extends into manhole or vault excavations above the pipe zone.

Pavement Zone

The pavement zone includes the concrete or asphalt concrete pavement and aggregate base section placed over the trench zone and extends into manhole or vault excavations above the trench zone.

Access

The Contractor shall provide continuous, unobstructed access to all driveways, water valves, hydrants, or other property or facilities within or adjacent to the work areas.

Blasting

Blasting for excavation shall not be performed without the written permission of the Engineer. Procedures and methods of blasting shall conform to all Federal, State and local laws and ordinances.

Pipe Jacking

Tunneling or jacking shall not be used unless specified or approved in writing by the Engineer.

Excess Excavated Material

The Contractor shall remove and legally dispose of all excess excavated material and demolition debris.

Materials

The Contractor shall furnish backfill material as specified below. All materials used in and above the pipe zone shall be capable of attaining the required relative density.

Imported Granular Material – Pipe Zone

Imported Granular Material shall be used within the Pipe Zone for installations of all pressure pipe and tubing.

The Imported Granular Material shall be quarry waste (decomposed granite) free from organic matter. Material shall have a sand equivalent value of not less than 30 per ASTM D 2419, a coefficient of uniformity of 3 or greater, and shall conform to the following gradation:

U.S. Standard Sieve Size	Percent Passing By Weight
25mm	100
19mm	90 – 100
4.75mm	50 – 95
600µm	25 – 45
75µm	3 – 15

Native materials may not be used in lieu of Imported Granular Material within the Pipe Zone unless such native materials meet all of the requirements specified above and specific written permission has been obtained from the Engineer.

Crushed Rock – Pipe Zone

Crushed Rock shall be used within the Pipe Zone for installations of all non-pressure pipe. Crushed rock shall be clean crushed stone free of organic matter. Crushed rock shall be certified to contain less than 1% asbestos by weight or volume and shall conform to the following gradation and requirements:

U. S. Standard Sieve Size	Percent Passing By Weight
25mm	100
19mm	90-100
12.5mm	30-60
9.5mm	0-20
4.75mm	0-5
2.36mm	----

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69

SHEET 73 OF 113

CONTRACT NO. 24-01284 CONTRACT CHANGE ORDER NO 69
SHEET 74 OF 113

ASTM C 131 Testing Grade		B
Test	Test Method	Requirement
Percentage Wear	ASTM C 131	----
100 Revolutions	----	15 Maximum
500 Revolutions	----	52 Maximum

Imported Granular Material – Trench Zone

Imported Granular Material shall be used within the Trench Zone for installations of all pressure pipe and tubing and all non-pressure pipe.

Imported Granular Material for use within the Trench Zone shall conform in all ways to Imported Granular Material specified for use within the Pipe Zone.

Native materials may not be used in lieu of Imported Granular Material within the Trench Zone unless such native materials meet all of the requirements specified for Imported Granular Material within the Pipe Zone and specific written permission has been obtained from the Engineer.

Sand-Cement Slurry

Sand-cement slurry shall consist of two sacks, 85.3kg (188 pounds) of Portland cement per cubic yard of sand and sufficient moisture for workability. District approval is required for use of sand-cement slurry as a backfill material.

Trench Plugs

Trench plugs consisting of compacted Imported Granular Material or sand-cement slurry shall be installed on piping systems that are backfilled with crushed rock.

Filter Fabric

Filter fabric shall be manufactured from polyester, nylon, or polypropylene. Material shall be of non-woven construction and shall meet the following requirements:

Grab tensile strength (ASTM D 4632): 45.4kg (100 lbs) minimum for a 25mm (1") raveled strip.
Weight (ASTM D 3776): 152.6g/m^2 (4.5 oz./yd^2)
Apparent opening size (ASTM D 4751): 0.150mm (0.006")

Dewatering

A. The Contractor shall provide and maintain at all times during construction ample means

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 69
SHEET 75 OF 113

and devices to promptly remove and dispose of all water from any source entering excavations or other parts of the work. Dewatering shall be performed by methods that will ensure a dry excavation and preservation of the final lines and grades of the bottoms of excavations. Dewatering methods may include well points, sump points, suitable rock or gravel placed as pipe bedding for drainage and pumping, temporary pipelines, or other means, all subject to the approval of the Engineer. The cost of all dewatering activities shall be borne by the Contractor.

B. Sewer systems shall not be used as drains for dewatering trenches or excavations, nor for disposal of collected or accumulated groundwater, without the approval of the agency of jurisdiction.

C. Concrete shall not be poured in water, nor shall water be allowed to rise around concrete or mortar until it has set at least four hours.

D. The Contractor is responsible for meeting all Federal, State, and local laws, rules and regulations regarding the treatment and disposal of water from dewatering operations at the construction site.

Shoring and Shielding

A. The Contractor's design and installation of shoring shall be consistent with the rules, orders, and regulations of CAL-OSHA.

B. Excavations shall be shored, sheeted, and supported such that the walls of the excavation will not slide or settle and all existing improvements of any kind, either on public or private property, will be fully protected from damage.

C. The sheeting and shoring shall be arranged so as not to place any stress on portions of the completed work until the general construction has proceeded far enough to provide ample strength.

D. Care shall be exercised in the moving or removal of trench shields, sheeting, and shoring to prevent the caving or collapse of the excavation faces being supported.

Correction of Overexcavation

Overexcavations shall be corrected by backfilling with approved imported granular material or crushed rock, compacted to 90% relative compaction, as directed by the Engineer.

Foundation Stabilization

A. When unsuitable soil materials are encountered, the unsuitable material shall be removed to the depth determined necessary in the field by the Engineer. The sub-grade shall be restored with compacted Imported Granular Material or crushed rock as recommended by the Engineer. Place the appropriate bedding or base material on this restored foundation.

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 69
SHEET 76 OF 113

B. When rock encroachment is encountered, the rock shall be removed to a point below the intended trench or excavation sub-grade as determined necessary in the field by the Engineer. The sub-grade shall be restored with compacted Imported Granular Material as recommended by the Engineer. Place the appropriate bedding or base material on this restored foundation.

C. When excessively wet, soft, spongy, or similarly unstable material is encountered at the surface upon which the bedding or base material is to be placed, the unsuitable material shall be removed to the depth determined necessary in the field by the Engineer. Restore the trench with crushed rock enclosed in filter fabric as directed by the Engineer. Larger size rocks, up to 75 mm, with appropriate gradation, may be used if recommended by the Engineer. Place the appropriate bedding or base material on this restored foundation.

Trench Excavation and Placement of Bedding

A. Excavate the trench to the lines and grades shown on the drawings with allowance for 150mm of pipe bedding material.

B. The maximum length of open trench shall be 152m except by permission of the Engineer, City or County. The distance is the collective length at any location, including open excavation and pipe laying, which has not been backfilled to the elevation of the surrounding grade.

C. Trench walls shall be sloped or shored per the requirements of CAL-OSHA.

D. The trench bottom shall be graded to provide a smooth, firm, and stable foundation that is free from rocks and other obstructions.

E. Place the specified thickness of bedding material over the full width of the trench. Grade the top of the pipe base ahead of the pipe laying to provide a firm, uniform support along the full length of pipe.

F. Excavate bell holes at each joint to permit proper assembly and inspection of the entire joint.

G. Trenches for main pipelines and all appurtenances shall be backfilled with the materials and methods as specified for the Pipe Zone, Trench Zone and Pavement Zone.

H. Trench depth shall be as required to install pipelines in accordance with the plans and these special provisions. Unless shown otherwise in the plans, the minimum cover for pipelines shall be as follows:

Pipeline Application	Minimum Cover Required
Potable Water	0.91m
Recycled Water	1.22m
Sewer	1.52m

I. Final street sub-grade shall be established prior to the excavation of pipeline trenches. Minimum cover above pipe shall be 600mm for hydrotesting.

Manhole and Vaults

A. The Contractor shall prepare an excavation large enough to accommodate the structure and permit grouting of openings and backfilling operations. The walls of the excavation shall be sloped or shored per the requirements of CAL-OSHA.

B. Manholes and vaults shall be placed at the location and elevation shown on the plans, on undisturbed soils and 150mm of compacted crushed rock base.

C. Manhole and vault excavations shall be backfilled with the materials and methods as specified for the Pipe Zone, Trench Zone and Pavement Zone.

Compaction Requirements

A. Compaction shall be accomplished by mechanical means. Consolidation by water settling methods such as jetting or flooding is prohibited.

B. If the backfill fails to meet the specified relative compaction requirements; the backfill shall be reworked until the requirements are met. All necessary excavations for density tests shall be made as directed by the Engineer.

C. Compaction tests shall be performed at random depths, and at random intervals not to exceed 45m, as directed by the Engineer.

D. Relative compaction shall be determined by the impact or field compaction test made in accordance with ASTM D 1557 Procedure C.

E. Unless otherwise shown on the drawings or otherwise described in the specifications for the particular type of pipe installed, relative compaction in pipe trenches shall be as follows:

1. Pipe zone - 90% relative compaction.
2. Trench zone - 90% relative compaction.
3. Structural section in paved areas - per agency requirements, 95% minimum.
4. Imported Granular Material for over excavation or foundation stabilization - 90% relative density.

F. All excavations are subject to compaction tests.

Trench Plugs

Trench plugs shall be installed at 60m intervals along the entire length of piping systems. Trench plugs shall be 3m in length and shall encompass the entire pipe zone. Additional trench plugs may be required as directed by the Engineer.

Pipe Zone Backfill

A. Care shall be taken in placing the imported granular backfill material simultaneously around the main pipeline and appurtenance pipes so that the pipe barrel is completely supported and that no voids or uncompacted areas are left beneath the pipe or on the sides of the pipe. Care shall be taken to place material simultaneously on both sides of the pipe to prevent lateral movement. This area shall be mechanically compacted to attain 90% relative density. Care shall be taken when compacting appurtenance laterals 50mm and smaller to prevent the crushing or denting of the copper lateral. Additional lifts of 300mm or less thickness may be required on 400mm or larger diameter pipe to attain complete support of the haunch area. Soils tests may be taken on this layer of backfill.

B. After the spring line backfill has been approved by the Engineer, backfill of the remainder of the Pipe Zone may proceed. Do not drop sharp, heavy pieces of material directly onto the pipe or the tamped material around the pipe.

C. Place and compact the imported granular material at a maximum of 300mm lifts. Compact all material placed in the Pipe Zone by mechanical methods. Sand cone tests shall be taken on this layer of backfill.

D. The use of a backhoe-mounted compaction wheel is prohibited within the pipe zone to 300mm above the top of the pipe.

E. Under no circumstances shall consolidation by water settling or water-setting methods (i.e. jetting, diking, etc.) be permitted.

Trench Zone Backfill

A. After the Pipe Zone material has been placed, compacted, approved by the Engineer, backfill in the Trench Zone may proceed.

B. Compaction using vibratory equipment, tamping rollers, pneumatic tire rollers, or other mechanical tampers shall be performed with the type and size of equipment necessary to accomplish the work. The backfill shall be placed in horizontal layers of such depths as are considered proper for the type of compacting equipment being used in relation to the backfill material being placed. Each layer shall be evenly spread, properly moistened, and compacted to the specified relative density. The Contractor shall repair or replace any pipe, fitting, manhole, or structure damaged by the installation operations as directed by the Engineer.

Pavement and Backfill Restoration

A. After the Trench Zone material has been placed, compacted, approved by the Engineer; backfill in the Pavement Zone may proceed as necessary in accordance with the requirements of the agency having jurisdiction.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 79 OF 113

B. Replace bituminous and concrete pavement, curbs, and sidewalks removed or damaged during construction in accordance with the requirements of the agency having jurisdiction.

Measurement and Payment

DIP, VCP and CIP sewer pipes will be measured by the meter along the centerline of the pipes.

The contract unit price paid per meter for DIP, VCP and CIP sewer pipes shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in installing pipe, complete in place, including structure excavation and structure backfill and connecting new pipe to existing or new facilities as shown on the plans, and as specified in these special provisions, and as directed by the Engineer.

10-1.20 SEWER MANHOLE

This work shall consist of constructing precast concrete manholes complete with cones, frames, covers, gratings, asphalt pavement around the ring, steps, excavating, lagging, backfilling, restoring pavement and other incidental work, necessary or required for a complete, satisfactory installation, in accordance with the details shown on the plans and these special provisions.

Manholes shall be constructed to conform to the improved street surface. In unimproved areas, if the ground surface is below the official grade, the manhole shall be constructed to conform to such official grade unless otherwise indicated on the plans.

Precast Concrete Manholes

This section includes materials, testing, and installation of precast concrete manholes for sewers or for access to below grade water mains and appurtenances.

Reference Standards

The publications listed below form part of this specification to the extent referenced and are referred to in the text by the basic designation only. Reference shall be made to the latest edition of said standards unless otherwise called for.

ASTM A 48	-	Gray Iron Castings
ASTM C 478	-	Precast Reinforced Concrete Manhole Sections
ASTM C 478M	-	Precast Reinforced Concrete Manhole Sections [Metric]
ASTM C 923	-	Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes and Laterals

Access Manholes for Watermains and Appertunances

A. 1500 mm diameter manholes shall be used, unless otherwise noted on the plans, to access water main appurtenances.

CONTRACT NO. 04-C12024 CONTRACT CHANGE ORDER NO 69
SHEET 80 OF 113

B. A variety of manhole diameters and configurations are utilized on various water main appurtenances and devices.

Sewer Manholes

1500 mm diameter manholes shall be used for sewer applications.

Drop Manholes

1500 mm diameter drop manholes shall be used for sewer applications and constructed only at locations shown on the plans.

Corrosion Protection

A corrosion protection lining and/or coating as described in this specification shall be applied to the interior of manholes for sewer mains 450mm or larger, and to all drop manholes regardless of sewer pipe size.

Damp-Proofing

A damp-proofing material shall be applied to the exterior portions of manholes in accordance with these special provisions and as directed by the Engineer when located at or below the water table or when moisture or seepage is indicated.

Joint Sealing

Joint sealant shall be used to form a continuous watertight seal on the concrete base and between successive precast concrete manhole or vault sections.

Vacuum Testing of Manholes

Vacuum testing of manholes is intended for testing precast concrete manhole sections to demonstrate the integrity of the installed materials and construction procedures.

Manholes

A. Precast concrete manhole components shall be in accordance with ASTM C 478.

B. Manhole components shall be designed for H-20 highway wheel loading and specific site conditions.

C. Manhole bases may be either precast or cast-in-place, as appropriate for the application, with a formed recess shaped to match the first precast shaft section. The manhole base shall extend 250mm below the bottom of the lowest pipe and 150mm above the top of the largest pipe.

D. Manhole shafts shall be fabricated only from precast shaft sections, eccentric cone sections and grade rings.

E. Pipe penetrations for sewer applications shall incorporate a watertight flexible pipe connector or ring-type seal according to the method of manhole construction. Precast manholes shall utilize either an integrally cast embedded pipe connector, or a boot-type connector installed in a circular block out opening in accordance with ASTM C 923. Connections to existing manholes shall utilize a boot-type connector per ASTM C 923 installed in a cored opening. Cast-in-place bases shall incorporate a ring-type seal on the pipe to be embedded in the concrete.

Crushed Rock Base and Backfill Materials

Crushed rock base and backfill materials shall be in conformance with the provisions in "Sewer Pipe" of these special provisions.

Manhole Frames and Covers

A. Manhole frames shall be 900mm in diameter with two concentric covers, made of cast-iron in accordance with ASTM A 48, Class 30. Locking frames and covers may be required as determined by the Engineer.

B. Frames and covers shall be designed for H-20 highway wheel loading.

C. Covers shall have the words "'AGENCY NAME' and 'WATER', 'RECYCLED WATER', or, 'SEWER'" cast into the cover as appropriate to the application. No other lettering will be permitted on the top portion of the cover.

D. Castings shall be smooth, clean, and free from blisters, blowholes, and shrinkage. Mating surfaces of the frame and cover shall be machined to prevent movement of the lid. Frames and covers shall be match marked in sets before shipping to the site.

E. All castings shall be dipped twice in a preparation of asphalt or coal tar and oil applied at a temperature of not less than 143.3 degrees C (290 degrees F) nor more than 154.4 degrees C (310 degrees F) and in such a manner as to form a firm and tenacious coating.

Concrete

Concrete used for manholes and appurtenances shall be in conformance with the provisions in these special provisions.

Joint Sealing Compound

Joint sealing compound shall be a mastic-type material in a flexible rope or rolled form with removable wrapper sized to fit into the key of manhole or vault sections.

Repair Mortar and Epoxy Bonding Agent

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 81 OF 113

Repair mortar and an epoxy bonding agent shall be used to repair minor surface damage to precast sections or cast-in-place manhole bases at the discretion of the Engineer. Repair products shall be in conformance with the provisions in these special provisions.

Mortar

Mortar for use on joints between precast sections and for setting manhole cover frames shall be in conformance with the provisions in these special provisions.

Damp-Proofing

Damp-proofing material shall be in conformance with the provisions in these special provisions.

Work within Existing Manholes

Contractor shall comply with all Federal and State regulations for confined space entry. Work inside confined spaces, as defined by the applicable regulations, shall not be undertaken until all the tests and safety provisions of the Code of Federal Regulations 1910.146, and the General Industry Safety Orders of the California Code of Regulations, Title 8, Section 5159, for confined space entry have been performed and the area is verified as safe to enter.

Earthwork

Manhole excavation, foundation stabilization (if necessary), placement of base material, backfill and compaction shall be performed in conformance with the provisions in "Sewer Pipes" of these special provisions.

Manhole Base

A. The invert of precast and cast-in-place bases shall be hand-worked to provide channels conforming in size to the inside diameter of the piping as indicated on the plans. The channels shall vary uniformly in size and shape from inlet to outlet. The concrete base shall be shaped with a wood float and shall receive a hard steel trowel finish before the concrete sets. A template shall be used to accurately form the level surface that will receive the first precast section.

B. During construction of cast-in-place bases, all sewer mains and stub piping shall be in place, including ring-type seals, before concrete placement. Pipe grade and alignment shall be verified immediately upon placement of concrete to assure that the pipelines are in proper position prior to the concrete taking an initial set. The invert elevation and flow line of piping shall be as shown on the plans. The manhole base shall extend 250mm below the bottom of the lowest pipe and 150mm above the top of the largest pipe.

C. Cast-in-place bases shall set a minimum of 24 hours before the manhole construction is continued. In certain critical situations, the setting time may be reduced upon approval of the Engineer.

Installing Manhole Sections

CONTRACT NO. 04-0120R4
CONTRACT CHANGE ORDER NO 69
SHEET 82 OF 113

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 83 OF 113

A. The concrete manhole base and successive precast sections will receive a mastic joint sealing compound prior to setting the precast sections in place. Following the vacuum testing as described in this section, the joints will be mortared and tooled to a smooth finish, free of voids. Note that sewer manholes are to be vacuum tested following assembly of the concrete sections, but prior to mortaring the joints, or backfilling.

B. Assemble the precast sections to the elevation required by the location of the manhole as follows:

1. Paved Areas: Top of cover shall be flush with the finished paving surface.

2. Traveled Way: Top of cover shall be flush with the existing surface where it is in a traveled way.

3. Shoulder Areas: Top of cover shall be 25mm above the existing surface where outside the limits of a traveled way. Vaults shall not be placed in roadside ditches without the prior approval of the Engineer.

4. Unpaved easements: Top of cover shall be 150mm above the ground surface. Guard posts around the vault may be required in this area as directed by the Engineer.

D. Secure the manhole frame to the grade ring with mortar.

E. After the frame is securely set the cover shall be installed. All necessary cleaning of foreign materials from the frames and covers shall be accomplished to ensure a satisfactory fit.

F. Where manholes are to be given a protective coating, they shall be free of seepage and surface moisture.

F. Piping installation adjacent to the manhole and connection to the base or shaft sections shall be performed as shown on the plans. Piping installation into flexible pipe connectors shall be in accordance with the manufacturer's recommendations for assembly, lubricants and limits of deflection.

H. In order to prevent accidental use of the new sewer before completion and acceptance, the new inlet to existing tie-in manhole(s) and the outlet of the first new upstream manhole(s) shall be sealed with expandable plugs. The Engineer shall approve the specific location of these plugs. Plugs shall be removed at the time of final inspection or as directed by the Engineer. Removal of all construction debris and water shall be completed prior to removal of plugs.

I. Brick or mortar bulkheads shall be installed by the Contractor at the manhole end of all unused stub channels over 900mm beyond manhole base. The bulkheads are intended to prevent ponding of sewage and debris in the unused channels until such time as the manhole stub is connected and normal sewage flow can occur.

J. New connections to existing manholes, where stubs have not been provided, shall be made by core drilling through the walls or base as directed by the Engineer. Flexible

seals shall be used for the pipe penetration. Apply a protective epoxy coating to the cored concrete and the ends of any reinforcing steel exposed in accordance with these special provisions.

K. A concrete collar shall be cast around manhole frames.

Damp-Proofing

At the discretion of the Engineer, damp-proofing material shall be applied to the exterior surfaces of manholes in accordance with the manufacturer's recommendations and these special provisions. The material shall be applied to all exterior surfaces below a point 300mm above the water table or indications of seepage or moisture as directed by the Engineer.

Vacuum Testing of Manholes

A. Vacuum testing of manholes is required and shall be performed as directed in the presence of the Engineer.

B. Vacuum testing equipment shall be as manufactured by P.A. Glazier, Inc. or equal.

C. Manholes shall be tested after assembly and prior to mortaring the joints or backfilling. In the case of manholes incorporating a PVC liner and polyurethane coating, the testing is to take place prior to mortaring the joints, welding the liner seams between sections, applying the coating, or backfilling.

D. All lift holes shall be plugged with an approved grout prior to testing.

E. All pipes entering the manhole shall be plugged, and bracing installed, to prevent the plug from being drawn into the manhole.

F. The test head shall be placed inside the top of the cone section and the seal inflated in accordance with the manufacturer's recommendations.

G. A vacuum of 254 mm of mercury shall be drawn. The time shall be measured for the vacuum to drop to 229 mm. The manhole shall pass the test if the time taken for the drop is greater than 60 seconds.

H. If the manhole fails the test, necessary repairs shall be made and the test repeated until acceptable results are obtained. The leak(s) shall be located and repaired according to their nature with material-in-kind.

Pull Testing of PVC-Lined Manholes

PVC-lined manholes shall have field-welded joints pull tested. Field welds shall withstand a pull test of at least 45.4 kg per liner cm, applied perpendicularly to the concrete surface for a period of one minute, without evidence of cracks or separations. This test shall be conducted at a temperature of 21.1 degrees C to 26.7 degrees C (70 degrees F to 80 degrees F) inclusive.

CONTRACT NO. 04-012024
CONTRACT CHANGE ORDER NO 69
SHEET 84 OF 113

Holiday Testing of PVC-Lined Manholes

PVC-Lined and Polyurethane-coated surfaces shall be holiday tested with an electrical holiday detector as manufactured by Tinker and Rasor (Model AP-W with power pack) with the instrument set at 20,000 volts and used as directed by the Engineer. All imperfections identified on the PVC lining and polyurethane coating shall be repaired with materials-in-kind and the test shall be repeated until no holidays are evident.

Sewer Leakage and Infiltration Testing

This section describes the requirements and procedures for leakage and infiltration testing of gravity sewer systems.

Requirements Prior to Testing

Trenching for all dry utilities such as electrical, telephone and cable television shall be completed prior to performing any tests on the sewer pipe.

Testing

A. Leakage Test: Each section of sewer pipe between two successive manholes, or between a manhole and its corresponding cleanout or end plug, shall be tested for leakage. The sewer laterals to the property line shall be included in the test.

B. Infiltration Test: In addition to the leakage test, an infiltration test shall be made where groundwater is encountered, or evidence exists that ground water has encroached to the elevation of the sewer, and as directed by the Engineer.

C. All tests shall be made in the presence of the Engineer.

D. Testing may be repeated, as directed by the Engineer, if the subsequent construction operations of the Contractor or others may have damaged or affected the structural integrity of the sewer pipe and/or laterals.

E. All tests must be completed before the street or trench is paved, unless otherwise allowed by the Engineer.

F. Vacuum testing of manholes shall be performed in accordance with these special provisions.

Materials

The Contractor shall furnish all equipment and materials required for testing.

Infiltration Test

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 85 OF 113

A. Prior to testing for infiltration, the ends of the sewer pipe section to be tested shall be capped or plugged to prevent the entrance of water, and pumping of groundwater shall be discontinued for at least three days.

B. Any infiltration discovered before completion and acceptance of the sewer shall be corrected. The sewer shall be examined and the source of infiltration eliminated. Following repairs or replacement as necessary, including backfill and compaction, the subject line shall be retested to assure no infiltration.

Pressure Tests for Sewer Force Mains

Pressure tests for sewer force mains shall be in accordance with these special provisions except that the allowable leakage shall be zero (0). All leak points shall be located and stopped. All defective pipe, fittings, valves and other appurtenances discovered shall be removed and replaced with sound material and tests repeated until the leakage is zero (0).

Final Acceptance

The requirements of this section shall be considered acceptable when each sewer section's air leakage rate is less than the maximum allowed, the television inspection is satisfactory, and the water infiltration rate is zero.

Measurement and Payment

Sewer manhole will be measured by each.

The contract unit price paid for sewer manhole shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in constructing sewer manhole, complete in place, including all testing, inspection, furnishing and installing manhole frame and cover, as shown on the plans, as specified in these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69

SHEET 86 OF 113

10-1.21 SLOPE PROTECTION

Slope protection shall be placed or constructed in conformance with the provisions in Section 72, "Slope Protection," of the Standard Specifications.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 89

SHEET 87 OF 113

10-1.22 MISCELLANEOUS IRON AND STEEL

Miscellaneous iron and steel shall conform to the provisions in Section 75, "Miscellaneous Metal," of the Standard Specifications .

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69

SHEET 88 OF 113

10-1.23 CHAIN LINK FENCE

Chain link fence shall be Type CL-1.8 and shall conform to the provisions in Section 80, "Fences," of the Standard Specifications.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 89 OF 113

10-1.24 METAL BEAM GUARD RAILING

Metal beam guard railing shall be constructed in conformance with the provisions in Section 83-1, "Railings," of the Standard Specifications and these special provisions.

Line posts shall be wood, steel, or plastic. Blocks shall be wood or plastic.

Metal beam guard railing elements and required backup plates, terminal sections, end caps, and return caps shall conform to the requirements of Type 2 W-Beam as shown in AASHTO Designation: M 180.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69

SHEET 90 OF 113

CONTRACT NO. 04-012024 CONTRACT CHANGE ORDER NO 69
SHEET 91 OF 113

ALTERNATIVE FLARED TERMINAL SYSTEM

Alternative flared terminal system shall be furnished and installed as shown on the plans and in conformance with these special provisions.

The allowable alternatives for a flared terminal system shall consist of one of the following or a Department approved equal.

(1) TERMINAL SYSTEM (TYPE FLEAT) - Terminal system (Type FLEAT) shall be a Flared Energy Absorbing Terminal 350 manufactured by Road Systems, Inc., located in Big Spring, Texas, and shall include items detailed for terminal system (Type FLEAT) shown on the plans. The Flared Energy Absorbing Terminal 350 can be obtained from the distributor, Universal Industrial Sales, P.O. Box 699, Pleasant Grove, UT 84062, Telephone (801) 785–0505 or from the distributor, Gregory Highway Products, 4100 13th Street, S.W., Canton, OH 44708, Telephone (330) 477–4800.

(2) TERMINAL SYSTEM (TYPE SRT) - Terminal system (Type SRT) shall be an SRT-350 Slotted Rail Terminal (8-post system) as manufactured by Trinity Industries, Inc., and shall include items detailed for terminal system (Type SRT) shown on the plans. The SRT-350 Slotted Rail Terminal (8-post system) can be obtained from the manufacturer, Trinity Industries, Inc., P.O. Box 99, 950 West 400S, Centerville, UT 84014, Telephone (800) 772–7976.

The Contractor shall provide the Engineer with a Certificate of Compliance from the manufacturer in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications. The Certificate of Compliance shall certify that the terminal systems furnished conform to the contract plans and specifications, conform to the prequalified design and material requirements, and were manufactured in conformance with the approved quality control program.

Terminal systems shall be installed in conformance with the manufacturer's installation instructions and these requirements. Each terminal system installed shall be identified by painting the type of terminal system in neat black letters and figures 60 mm high on the backside of the rail element between system posts numbers 4 and 5.

For terminal system (Type SRT), the steel foundation tubes with soil plates attached shall be, at the Contractor's option, either driven, with or without pilot holes, or placed in drilled holes. Space around the steel foundation tubes shall be backfilled with selected earth, free of rock, placed in layers approximately 100 mm thick and each layer shall be moistened and thoroughly compacted. The wood terminal posts shall be inserted into the steel foundation tubes by hand and shall not be driven. Before the wood terminal posts are inserted, the inside surfaces of the steel foundation tubes to receive the wood posts shall be coated with a grease which will not melt or run at a temperature of 65°C or less. The edges of the wood terminal posts may be slightly rounded to facilitate insertion of the post into the steel foundation tubes.

For terminal system (Type FLEAT), the soil tubes shall be, at the Contractor's option, driven with or without pilot holes, or placed in drilled holes. Space around the steel foundation tubes shall be backfilled with selected earth, free of rock, placed in layers approximately 100 mm thick and each layer shall be moistened and thoroughly compacted. Wood posts shall be inserted into the steel foundation tubes by hand. Before the wood terminal posts are inserted, the inside surfaces of the steel foundation tubes to receive the wood posts shall be coated with a grease which will not melt or run at a temperature of 65°C or less. The edges of the wood posts may be slightly rounded to facilitate insertion of the post into the steel foundation tubes.

Surplus excavated material remaining after the terminal system has been installed shall be disposed of in a uniform manner along the adjacent roadway where designated by the Engineer.

The contract unit price paid for alternative flared terminal system shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in furnishing and installing alternative flared terminal system, complete in place, including excavation, backfill and disposal of surplus material, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 92 OF 113

SECTION 10-2. (BLANK)

SECTION 10-3. SIGNALS, LIGHTING AND ELECTRICAL SYSTEMS

10-3.01 DESCRIPTION

Lighting shall conform to the provisions in Section 86, "Signals, Lighting and Electrical Systems," of the Standard Specifications and these special provisions.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 93 OF 113

10-3.02 STANDARDS, STEEL PEDESTALS, AND POSTS

Standards, steel pedestals, and posts for lighting standards shall conform to the provisions in Section 86-2.04, "Standards, Steel Pedestals and Posts," of the Standard Specifications, "Steel Structures" of these special provisions, and the following requirements.

Steel bolts not designated on the plans as high-strength (HS) or stainless steel shall be for general applications and shall conform to the requirements in ASTM Designation: A 307.

Handhole reinforcement rings for standards, steel pedestals, and posts shall be continuous around the handholes.

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO 69

SHEET 94 OF 113

10-3.03 CONDUIT

Conduit to be installed underground shall be Type 3 unless otherwise specified. Detector termination conduits shall be Type 3.

Conduit sizes shown on the plans and specified in the Standard Specifications and these special provisions are referenced to metallic type conduit. When rigid non-metallic conduit is required or allowed, the nominal equivalent industry size shall be used as shown in the following table:

Size Designation for Metallic Type Conduit	Equivalent Size for Rigid Non-metallic Conduit
21	20
27	25
41	40
53	50
63	65
78	75
103	100

When Type 3 conduit is placed in a trench (not in pavement or under portland cement concrete sidewalk), after the bedding material is placed and the conduit is installed, the trench shall be backfilled with commercial quality concrete, containing not less than 250 kg of portland cement per cubic meter, to not less than 100 mm above the conduit before additional backfill material is placed.

After conductors have been installed, the ends of conduits terminating in pull boxes, service equipment enclosures, and controller cabinets shall be sealed with an approved type of sealing compound.

.

At other locations where conduit is required to be installed under pavement and if a delay to vehicles will not exceed 5 minutes, conduit may be installed by the "Trenching in Pavement Method."

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 95 OF 113

10-3.04 CONDUCTORS AND WIRING

Splices of conductors shall be insulated with heat-shrink tubing of the appropriate size after thoroughly painting the spliced conductors with electrical insulating coating.

Heat-shrink tubing shall be heated as recommended by the manufacturer.

The minimum insulation thickness, at any point, for Type USE, RHH or RHW wire shall be 1.0 mm for conductor sizes No. 14 to No. 10, inclusive, and 1.3 mm for No. 8 to No. 2, inclusive. The minimum insulation thickness, at any point, for Type THW and TW wires shall be 0.69 mm for conductor sizes No. 14 to No. 10, inclusive, 1.02 mm for No. 8, and 1.37 mm for No. 6 to No. 2, inclusive.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 96 OF 113

10-3.05 BONDING AND GROUNDING

Bonding and grounding shall conform to the provisions in Section 86-2.10, "Bonding and Grounding," of the Standard Specifications and these special provisions.

Bonding jumpers in standards with handholes and traffic pull box lid covers shall be attached by a UL listed lug using 4.5-mm diameter or larger brass or bronze bolts and shall run to the conduit or bonding wire in the adjacent pull box. The grounding jumper shall be visible after the standard has been installed and the mortar pad and cap have been placed on the foundation.

Standards without handholes shall have bonding accomplished by jumpers attached to UL listed ground clamps on each anchor bolt.

For slip base standards or slip base inserts, bonding shall be accomplished by jumpers attached to UL listed ground clamps on each anchor bolt, or a UL listed lug attached to the bottom slip base plate with a 4.5-mm diameter or larger brass or bronze bolt.

Equipment bonding and grounding conductors are required in conduits, except when the conduits contain combinations of loop lead-in cable, fiber optic cable, or signal interconnect cable. A No. 8 minimum, bare copper wire shall run continuously in circuits, except for series lighting circuits, where No. 6 bare copper wire shall run continuously. The bonding wire size shall be increased to match the circuit breaker size in conformance with the Code, or shall be as shown on the plans. Conduits to be installed for future conductors, may omit the copper wire.

Bonding of metallic conduits in metal pull boxes shall be by means of bonding bushings and bonding jumpers connected to the bonding wire running in the conduit system.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69

SHEET 97 OF 113

10-3.06 SERVICE

Continuous welding of exterior seams in service equipment enclosures is not required.

Type III service equipment enclosures shall be the aluminum type.

Circuit breakers shall be the cable-in/cable-out type, mounted on non-energized clips. All circuit breakers shall be mounted vertically with the up position of the handle being the "ON" position.

Each service shall be provided with up to 2 main circuit breakers which shall disconnect ungrounded service entrance conductors. Where the "Main" circuit breaker consists of 2 circuit breakers as shown on the plans or required in the special provisions, each of the circuit breakers shall have a minimum interrupting capacity of 10 000 A, rms.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO _____

SHEET 98 OF 113

10-3.07 PAYMENT

The contract lump sum price or prices paid for lighting shall include highway lighting .

Other roadway lighting on the project shall be considered as included in the contract lump sum price paid for lighting .

Full compensation for hauling and stockpiling electrical materials shall be considered as included in the contract price paid for the item requiring the material to be salvaged and no additional compensation will be allowed therefor.

(R)	RELOCATED

GENERAL NOTES

1. Conduit routing is diagramatic. Pull box location shall be located as shown on plans. The contractor shall provide additional pull boxes as required. Exact locations of equipment and devices may be adjusted depending on field conditions or by the engineer.
2. Minimum size of conduit shall be 21C. Exposed conduit shall be PVC coated galvanized rigid steel.
3. Conduit fitting for 78 mm conduits and larger shall have a 610 minimum bending radius.
4. All equipment and devices shall be provided with wire ground.
5. All feeders and branch circuits shall be provided with ground wire.
6. Contractor shall label all conductors and cables per wiring diagrams.
7. All E-sheets are accurate for electrical work only.
8. All existing equipment shall remain in place unless otherwise noted.
9. Locations of conduits, pull boxes and other equipment shown on the plan are approximate and may be changed to suit field conditions.
10. The contractor shall call Underground Service Alert (USA) at (800) 642-2444, 48 hours prior to all excavation.
11. All exposed circuit or conductor connections shall be protected with a corrosion coating.
12. Contractor to verify in field existing live circuit prior to cutting and splicing.
13. Pullboxes installed on the shoulder of Roadway shall have Traffic Cover.

SHEET NOTES:

1. Install new 41C, 4 #1/0, 1 #6 Ground (208 V, 3-phase, Sewer Lift pump).
2. Existing 41c, with 4 #2/0 and #6 Ground.
3. Disconnect existing Sewer Lift Pump controller from existing feeder after new pump is operational. Turn over existing pump controller cabinets to SFPUC water waste division.
4. Install new free-standing pad mounted Nema 4X Lift Pump Controller Panel Enclosure. Controller Enclosure is furnished by the Vendor. Mounting detail by Supplier.
5. Install new stainless steel free-standing pad mounted Nema 4X Enclosure with non-fuseable disconnect and Manual transfer switch mounted on the interior of the enclosure.
6. Install New 100 Amp, 3-pole, 4-wire, 600 VAC, Heavy Duty Breaking Receptacle (for portable generator connection) with spring door "Crouse-Hinds catalog #AR-1041". Mount receptacle on the left side of the enclosure at +36" above finished grade.
7. Splice new conductors to existing conductors only when the new Lift Pump Station is ready to be energized. Old Lift station to remain in operational until new Pump Station is energized and functional. Contractor to field verify exact location of existing pullbox.
8. At existing service pedestal, replace existing 200 A, 3-Pole circuit breaker with 100 A, 3-pole circuit breaker. Type and interrupting capacity to match existing.Schedule replacement when new pump is ready for operation and coordinate down time with SFPUC.
9. Install Permanent City of San francisco Standard Cobra style light pole with bracket arm assemblies as shown on E-4 with 200 watts clear HPS lamp and with integral 120 V ballast. Install new fused splice connector in adjacent pullbox. Install new PEU on top of the electrolier. Locate light pole as directed by the Engineer. See Caltrans standard details ES-13A and ES13-B for more information.
10. NEMA 3X Junction Box. Coordinate with the Pump Vendor for size and location prior to installation.
11. Provide conduit(s) from Pump controller to Juction Box (for Controls). Coordinate with the Pump Vendor for size and quantity prior to installation.
12. Provide conduit(s) from Pump controller to Juction Box (for pump motor). Coordinate with the Pump Vendor for size and quantity prior to installation.

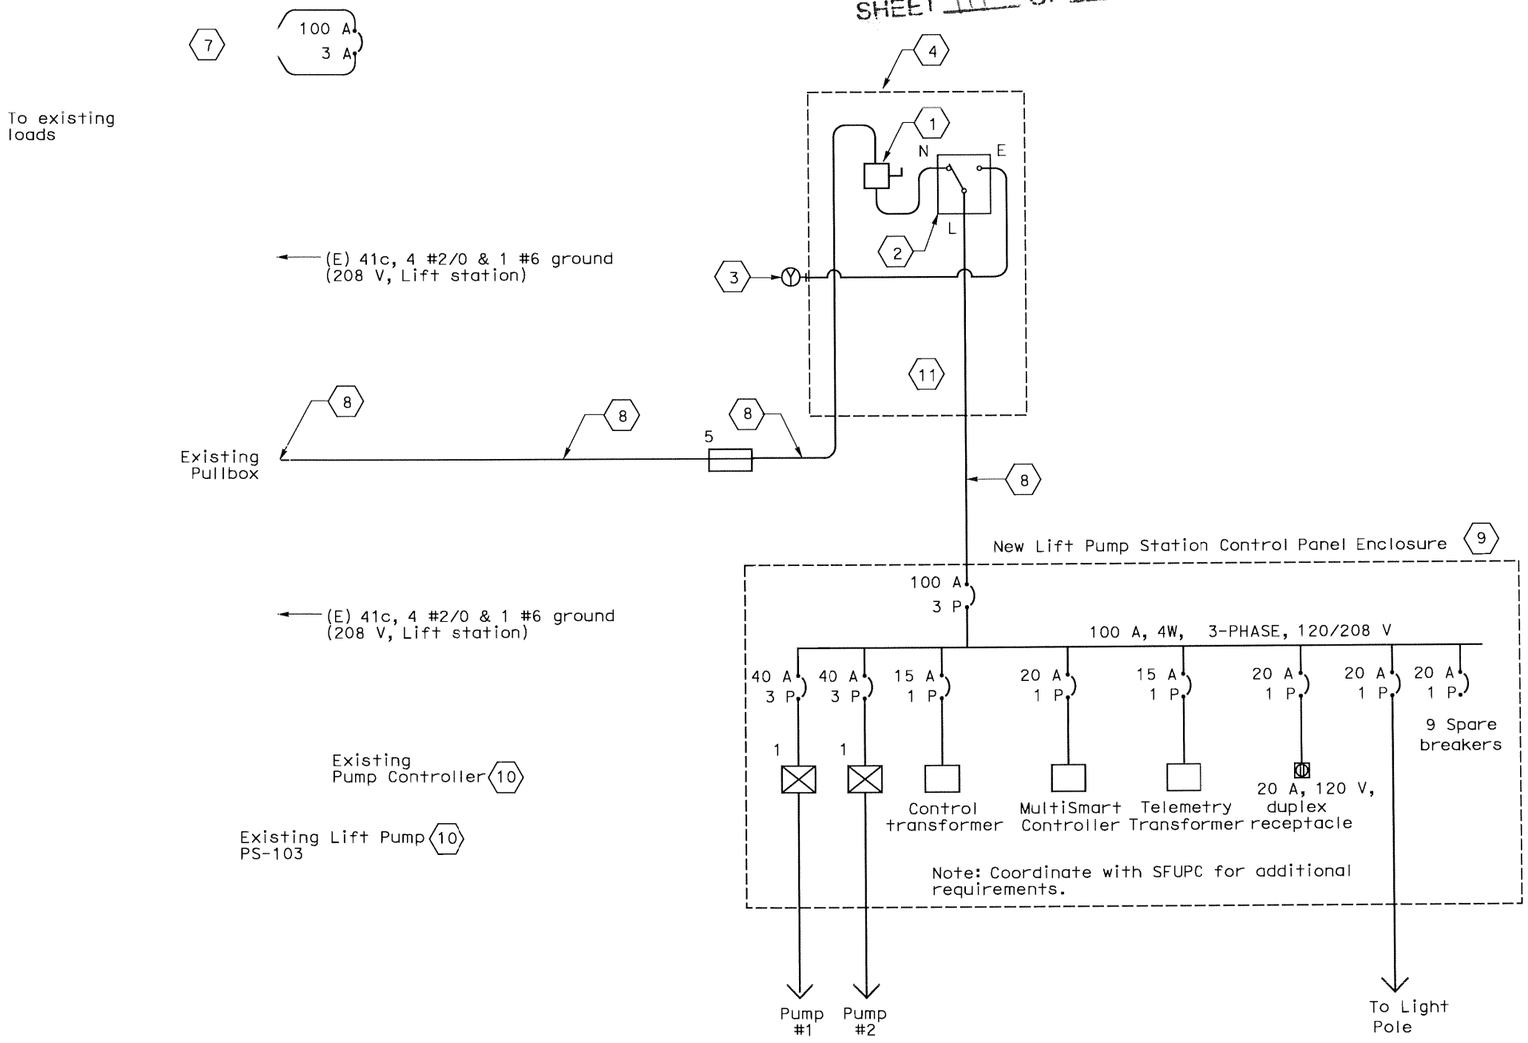
CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69

SHEET 111 OF 113



120/208 V SERVICE ENCLOSURE NO.B WIRING DIAGRAM

NO SCALE

SHEET NOTES:

1. 100 A, 3-Pole, 4-wire Main Non-Fusible Disconnect switch mounted on the interior of the Nema 4X Enclosure.
2. 100 A, 208 V, 3-pole, 4-Wire Manual Transfer Switch mounted on the interior of the Nema 4X enclosure.
3. "Crouse-Hinds Cat # AR1041" 100 Ampere, 4-pole, 4-wire Heavy Duty Circuit breaking receptacle with Spring door. Surface mount receptacle on the exterior of the panel at +36" above concrete pad.
4. Free-standing Pad Mounted Nema 4X Panel Enclosure for 200A manual transfer switch and non-fuseable 200 A , 3-pole disconnect switch.
5. Contractor to verify in field exact location of existing Pullbox.
6. See Contract Plan for Cables, Conduit Size and Quantity.
7. Replace existing 200 A-3pole circuit breaker with new 100 A-3pole Circuit Breaker.
8. Install 41C with 4 #1/0 and 1 #6 Ground.
9. Free-standing Pad Mounted Nema 4X Pump Control Panel Enclosure. See specs for more information. Control panel and wiring within the enclosure is by the Vendor except that contractor shall make connection to main circuit breaker and to the light pole. Wiring to Pump motors and to the level switches by Vendor.
10. Disconnect existing Lift pump cotroller and turn over to SFPUC Waste Water Division. Remove and scrap all related conduit and wire after new permanent Lift Pump is installed.
11. Provide two 19mm x 3 M UL listed copper-clad ground rods installed a minimum 1.8 M apart in undesturbed earth. Provide #6 bare copper connection between ground rods with connection to concrete pad structural steel at two points and a #6 pigtail connection to each enclosure.

NOTES

1. Ground Stud (Welded to Interior Surface of Shaft Opposite Door Opening). Stud shall be 6 mm x 508 mm (Continuosly Threaded) x 19 mm and shall be Furnished with A Type 316 Stainless Steel Nut and A Stainless Steel Shakeproof Washer.
2. Each Anchor Bolt-Threaded Top 200 mm.
3. The Standard, Handhole Cover, Mast Arm, and Anchor Bolts with Nuts & Washers, shall be Hot-dip Galvanized after Fabrication.
4. The Handhole Cover or Door shall have the same Radius of Curvature as the Shaft and when Installed, shall Form a Symmetrical Appearance with the Shaft.
5. The Tapering Elliptical Section shall not be more than Two-thirds the Length of the Mast Arm and shall Taper to the External Diameter of 50 mm Pipe.
6. All Exposed Welds shall be Ground Smooth and shall Conform to Contours of Adjacent Surfaces. All Welds shall have a Finished Depth of 10 mm.
7. Door or Handhole Cover shall be Securely Retained in Place with Two 6 mm x 500 mm Stainless Steel Screws.
8. For Shafts of 7.6 m or Less in Length, the Bolt Circle shall be 250 mm, unless otherwise Noted. For Shafts more than 7.6 m in Length, the Bolt Circle Diameter shall be 280 mm.
9. The Threads of All Fasteners shall be Coated with an Approved Industrial Type of Water-proof Grease Lubricant Containing a High Content of Graphite.
10. The Door or Handlehole Cover Gasket shall be Mounted to the Cover with an Approved Type of Automotive Engine Gasket Cement. The Non-cemented Surface of the Gasket shall be Coated with a Silicone Impregnated Rubber Lubricant.

THIS CHANGE ORDER PROVIDES FOR:

the procurement of the pumps, motors and control panel for the construction of a sanitary sewer lift station. This change also includes generation and submittal of shop plans, all freight charges, and equipment manuals.

Construction of the new sanitary sewer lift station will be addressed in a forthcoming supplemental to this Contract Change Order (CCO) as CCO No. 69S1.

The existing sanitary sewer lift station is in conflict with proposed footings for the new East Tie-In (ETI) design. Contract Change Order No. 35 allowed the contractor to propose an alternate design concept for the ETI segment of the Temporary Bypass Structure (TBS). This change in design required additional footings that conflict with the existing pump station. For this reason, the Department is working with San Francisco Public Utilities Commission (SFPUC) to construct a new sanitary sewer lift station, as SFPUC will be the owner and maintain the pump station. The existing sanitary sewer lift station is the property of the SFPUC and any salvagable equipment will be recovered by them.

This work is a part of the Strategy for South-South Detour Contract Completion, dated December 14, 2006, for East Tie-In work as the design has been transferred to the Department, to allow for the roll-out/roll-in method of construction.

This work will be paid as extra work at force account at an agreed lump sum of $111,280.00. No supplemental funds are available for this work, therefore this CCO will be financed from the contingency fund. A cost analysis is on file to support this amount.

No adjustment of contract time is warranted due to this change.

Approval of the change order is recommended by the Resident Engineer.

Bob Zandipour, Branch Chief Office of Toll Bridge Design requested this change on 03/19/07. Alec Melkonians, Project Manager has approved of the design, per 06/17/07 memo, and Robert Kobal, Headquarters' Assistant Construction Coordinator, concur with this change.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 69 | Suppl. No. 1 | Contract No. 04 - 0120R4 | Road SF-80-12.6/13.2 | FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Construct sanitary sewer lift station (pump station) in accordance with the plans and specifications as shown on sheets 3 through 115 of this change order. These plans and specifications replace the plans and specifications (sheets 2 through 21 of Contract change order No. 69-S0) previously issued with Contract Change Order No. 69-S0. The cost for the procurement of the pumping and associated electrical equipment have been compensated for under previously issued Contract Change Order No. 69-S0.

The third paragraph, with all five of its subparagraphs specified in Section 5-1.08 "Areas for Contractor's Use", does not apply to this change order. Additionally, Section 5-1.12 "Permits and Lincenses" also does not apply to this change order.

The control panel specified in section 10-1.18 "Sanitary Sewer Lift Station" (sheet 59 of 115 of this change order) shall be a minimum size of 1520 mm x 1219 mm (60 inch x 48 inch wide), and separate the high and low voltage vertically.

This change order price includes full compensation for stockpiling, sampling, testing, loading, transporting and offsite disposal of approximately 150 cubic meters of hazardous or Class II material excavated during the change order work, in accordance with the provisions of contract special provisions section 10-1.42 EARTHWORK.

This change order price excludes removal of existing pipes that are not in conflict with work contemplated under this contract.

Any required Storm Water Pollution Prevention Plan (SWPPP) work will be compensated for under the existing contract items and change orders issued for this work.

For this extra work, the Contractor will be compensated $499,996.00 This lump sum constitutes full compensation, including markups, for furnishing all labor, material, tools, equipment, and incidentals for doing the work involved in this change.

Total Cost of Extra Work at Lump Sum $499,996.00

All payment clauses contained within this change order's specifications are amended such that all work performed under this change order will be compensated for as extra work at agreed lump sum as part of this change order. The Contractor shall submit to the Engineer for approval, a schedule of values detailing the cost breakdown of the lump sum item for this change order. The sum of the amounts for the items and work listed in the schedule of values shall be equal to the change order lump sum price. The schedule of values will be used only to determine progress payments during the progress of the work. No payment for this change order will be made until the schedule of values is approved in writing by the Engineer.

CONTRACT CHANGE ORDER

SCOPE OF WORK (CCO No. 69S1)

Scope of the work for Contract Change Order No. 69S1 for construction consists of the following facilities:

1. Sanitary sewer lift station as shown on the plans.
2. Demolish existing sewer pump station as shown on the plans.
3. Construct Pump station access road as shown on the plans.
4. Site grading as shown on the plans.
5. Chain link fence and gates as shown on the plans.
6. Relocate sanitary sewer lines as shown on the plans.
7. Remove sanitary sewer manhole as shown on the plans.
8. Relocate water line as shown on the plans.
9. Construct AC Dike and MBGR as shown on the plans.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69S1

SHEET 8 OF 115

SECTION 5. GENERAL

SECTION 5-1. MISCELLANEOUS

5-1.01 WORKING DRAWINGS

Working drawings shall conform to the requirements in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications and these special provisions. Working drawings shall include supplements and calculations that are in addition to drawings.

Working drawings shall be submitted to the following location:

California Department of Transportation
Office of the Resident Engineer, Contract 04-0120R4
280 Beale Street
San Francisco, CA 94105

Working drawings shall conform to the following:

A. For initial review, 6 sets of the working drawings shall be submitted. After the Engineer has determined that a submittal is complete, 12 additional sets shall be submitted.

B. Drawings shall be 559 mm x 864 mm or 279 mm x 432 mm in size. Supplements and calculations shall be 216 mm x 280 mm in size.

C. For drawings, text size shall be nominally 2.8 mm high minimum. For supplement and calculations, font size shall be 12 minimum.

D. Text and details shall be legible and suitable for photocopying and reduction.

E. In addition to the paper copies of the working drawings, electronic files shall be submitted. Electronic files shall be portable document format (PDF) and shall be submitted on compact disk (CD) media. Each plan shall be a separate PDF file on the CD. The CD shall contain an index consisting of the file names and a description of the corresponding file contents. The files shall be listed in the sequence of : 1) index, 2) drawings, 3) supplement, and 4) calculations.

F. Microfilms are required for approved shop drawings and shall be only a 24x reduction. The edge of the corrected original tracing image shall be clearly visible and visually parallel with the edges of the page. A clear, legible symbol shall be provided on the upper left side of each page to show the amount of reduction, and a horizontal and vertical scale shall be provided on each reduced print to facilitate enlargement to original scale.

G. At the completion of the contract, one compiled set of all approved working drawings (in electronic form and including all corrections and revisions) shall be furnished to the Engineer. The index shall be the first file on the CD.

Working drawings shall be stamped and signed by an engineer who is registered as a Civil Engineer in the State of California. When independently checked calculations are required, these calculations shall be stamped and signed by another engineer who is registered as a Civil Engineer in the State of California.

Working drawings shall be submitted sufficiently in advance of the start of the affected work to allow time for review by the Engineer and correction by the Contractor of the drawings

without delaying the work. The time shall be proportional to the complexity of the work, but in no case shall the time be less than the review time as specified for the type of working drawings as required elsewhere in these special provisions.

The Engineer will review a working drawing submittal for completeness. Within ten working days of the receipt of the submittal by the Engineer, the Engineer will notify the Contractor in writing if the submittal is determined to be incomplete. If the submittal is determined to be incomplete, ten working days from the day of receipt shall be allowed for approval and return for correction of each submittal or resubmittal, unless otherwise specified in these special provisions.

Should the Engineer fail to review the complete working drawing submittal within the time specified, and the Contractor's controlling operation on the critical path is delayed (as determined by the Engineer) by the Engineer's failure to review within the time specified, an extension of time will be granted in conformance with the provisions in Section 8-1.07, "Liquidated Damages," of the Standard Specifications and in "Progress Schedule (Critical Path Method)," of these special provisions. Should the Engineer fail to review the complete working drawing submittal within the time specified, compensation, if any, will be made in accordance with Section 8-1.09, "Right of Way Delays," of the Standard Specifications, and "Time Related Overhead," of these special provisions.

CONTRACT NO. 04-612024

CONTRACT CHANGE ORDER NO 69151

SHEET 10 OF 115

5-1.013 LINES AND GRADES

Attention is directed to Section 5-1.07, "Lines and Grades," of the Standard Specifications.

Stakes or marks will be set by the Engineer in conformance with the requirements in Chapter 12, "Construction Surveys," of the Department's Surveys Manual.

5-1.015 LABORATORY

When a reference is made in the specifications to the "Laboratory," the reference shall mean Division of Engineering Services - Materials Engineering and Testing Services and Division of Engineering Services - Geotechnical Services of the Department of Transportation, or established laboratories of the various Districts of the Department, or other laboratories authorized by the Department to test materials and work involved in the contract. When a reference is made in the specifications to the "Transportation Laboratory," the reference shall mean Division of Engineering Services - Materials Engineering and Testing Services and Division of Engineering Services - Geotechnical Services, located at 5900 Folsom Boulevard, Sacramento, CA 95819, Telephone (916) 227-7000.

5-1.019 COST REDUCTION INCENTIVE

Attention is directed to Section 5-1.14, "Cost Reduction Incentive," of the Standard Specifications.

Prior to preparing a written cost reduction proposal, the Contractor shall request a meeting with the Engineer to discuss the proposal in concept. Items of discussion will also include permit issues, impact on other projects, impact on the project schedule, peer reviews, overall merit of the proposal, and review times required by the Department and other agencies.

If a cost reduction proposal submitted by the Contractor, and subsequently approved by the Engineer, provides for a reduction in contract time, 50 percent of that contract time reduction shall be credited to the State by reducing the contract working days, not including plant establishment. Attention is directed to "Beginning of Work, Time of Completion and Liquidated Damages" of these special provisions regarding the working days.

If a cost reduction proposal submitted by the Contractor, and subsequently approved by the Engineer, provides for a reduction in traffic congestion or avoids traffic congestion during construction, 60 percent of the estimated net savings in construction costs attributable to the cost reduction proposal will be paid to the Contractor. In addition to the requirements in Section 5-1.14, "Cost Reduction Incentive," of the Standard Specifications, the Contractor shall provide detailed comparisons of the traffic handling between the existing contract and the proposed change, and estimates of the traffic volumes and congestion.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 6957

SHEET 13 OF 115

5-1.02 LABOR NONDISCRIMINATION

Attention is directed to the following Notice that is required by Chapter 5 of Division 4 of Title 2, California Code of Regulations.

NOTICE OF REQUIREMENT FOR NONDISCRIMINATION PROGRAM

(GOV. CODE, SECTION 12990)

Your attention is called to the "Nondiscrimination Clause", set forth in Section 7-1.01A(4), "Labor Nondiscrimination," of the Standard Specifications, which is applicable to all nonexempt State contracts and subcontracts, and to the "Standard California Nondiscrimination Construction Contract Specifications" set forth therein. The specifications are applicable to all nonexempt State construction contracts and subcontracts of $5000 or more.

CONTRACT NO. 64-0120R4

CONTRACT CHANGE ORDER NO 6957

SHEET 14 OF 115

5-1.03 PUBLIC SAFETY

The Contractor shall provide for the safety of traffic and the public in conformance with the provisions in Section 7-1.09, "Public Safety," of the Standard Specifications and these special provisions.

The Contractor shall install temporary railing (Type K) between a lane open to public traffic and an excavation, obstacle or storage area when the following conditions exist:

A. Excavations—The near edge of the excavation is 3.6 m or less from the edge of the lane, except:

   1. Excavations covered with sheet steel or concrete covers of adequate thickness to prevent accidental entry by traffic or the public.
   2. Excavations less than 0.3-m deep.
   3. Trenches less than 0.3-m wide for irrigation pipe or electrical conduit, or excavations less than 0.3-m in diameter.
   4. Excavations parallel to the lane for the purpose of pavement widening or reconstruction.
   5. Excavations in side slopes, where the slope is steeper than 1:4 (vertical:horizontal).
   6. Excavations protected by existing barrier or railing.

B. Temporarily Unprotected Permanent Obstacles—The work includes the installation of a fixed obstacle together with a protective system, such as a sign structure together with protective railing, and the Contractor elects to install the obstacle prior to installing the protective system; or the Contractor, for the Contractor's convenience and with permission of the Engineer, removes a portion of an existing protective railing at an obstacle and does not replace such railing complete in place during the same day.

C. Storage Areas—Material or equipment is stored within 3.6 m of the lane and the storage is not otherwise prohibited by the provisions of the Standard Specifications and these special provisions.

The approach end of temporary railing (Type K), installed in conformance with the provisions in this section "Public Safety" and in Section 7-1.09, "Public Safety," of the Standard Specifications, shall be offset a minimum of 4.6 m from the edge of the traffic lane open to public traffic. The temporary railing shall be installed on a skew toward the edge of the traffic lane of not more than 0.3-m transversely to 3 m longitudinally with respect to the edge of the traffic lane. If the 4.6-m minimum offset cannot be achieved, the temporary railing shall be installed on the 10 to 1 skew to obtain the maximum available offset between the approach end of the railing and the edge of the traffic lane, and an array of temporary crash cushion modules shall be installed at the approach end of the temporary railing.

Except for installing, maintaining and removing traffic control devices, whenever work is performed or equipment is operated in the following work areas, the Contractor shall close the adjacent traffic lane unless otherwise provided in the Standard Specifications and these special provisions:

Approach Speed of Public Traffic (Posted Limit) (Kilometers Per Hour)	Work Areas
Over 72 (45 Miles Per Hour)	Within 1.8 m of a traffic lane but not on a traffic lane
56 to 72 (35 to 45 Miles Per Hour)	Within 0.9-m of a traffic lane but not on a traffic lane

The lane closure provisions of this section shall not apply if the work area is protected by permanent or temporary railing or barrier.

When traffic cones or delineators are used to delineate a temporary edge of a traffic lane, the line of cones or delineators shall be considered to be the edge of the traffic lane, however, the Contractor shall not reduce the width of an existing lane to less than 3 m without written approval from the Engineer.

When work is not in progress on a trench or other excavation that required closure of an adjacent lane, the traffic cones or portable delineators used for the lane closure shall be placed off of and adjacent to the edge of the traveled way. The spacing of the cones or delineators shall be not more than the spacing used for the lane closure.

Suspended loads or equipment shall not be moved nor positioned over public traffic or pedestrians.

Full compensation for conforming to the provisions in this section "Public Safety," including furnishing and installing temporary railing (Type K) and temporary crash cushion modules, shall be considered as included in the contract prices paid for the various items of work involved and no additional compensation will be allowed therefor.

5-1.04 TESTING

Testing of materials and work shall conform to the provisions in Section 6-3, "Testing," of the Standard Specifications and these special provisions.

Whenever the provisions of Section 6-3.01, "General," of the Standard Specifications refer to tests or testing, it shall mean tests to assure the quality and to determine the acceptability of the materials and work.

The Engineer will deduct the costs for testing of materials and work found to be unacceptable, as determined by the tests performed by the Department, and the costs for testing of material sources identified by the Contractor which are not used for the work, from moneys due or to become due to the Contractor. The amount deducted will be determined by the Engineer.

5-1.05 REMOVAL OF ASBESTOS AND HAZARDOUS SUBSTANCES

When the presence of asbestos or hazardous substances are not shown on the plans or indicated in the specifications and the Contractor encounters materials which the Contractor reasonably believes to be asbestos or a hazardous substance as defined in Section 25914.1 of the Health and Safety Code, and the asbestos or hazardous substance has not been rendered harmless, the Contractor may continue work in unaffected areas reasonably believed to be safe. The Contractor shall immediately cease work in the affected area and report the condition to the Engineer in writing.

In conformance with Section 25914.1 of the Health and Safety Code, removal of asbestos or hazardous substances including exploratory work to identify and determine the extent of the asbestos or hazardous substance will be performed by separate contract.

If delay of work in the area delays the current controlling operation, the delay will be considered a right of way delay and the Contractor will be compensated for the delay in conformance with the provisions in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6937

SHEET 16 OF 115

5-1.06 PAYMENTS

Attention is directed to Sections 9-1.06, "Partial Payments," and 9-1.07, "Payment After Acceptance," of the Standard Specifications and these special provisions.

For the purpose of making partial payments pursuant to Section 9-1.06, "Partial Payments," of the Standard Specifications, the amount set forth for the contract items of work hereinafter listed shall be deemed to be the maximum value of the contract item of work which will be recognized for progress payment purposes:

A. Clearing and Grubbing $ 21,000

After acceptance of the contract pursuant to the provisions in Section 7-1.17, "Acceptance of Contract," of the Standard Specifications, the amount, if any, payable for a contract item of work in excess of the maximum value for progress payment purposes hereinabove listed for the item, will be included for payment in the first estimate made after acceptance of the contract.

No partial payment will be made for any materials on hand which are furnished but not incorporated in the work.

5-1.07 PROJECT INFORMATION

The information in this section has been compiled specifically for this project and is made available for bidders and Contractors. Other information referenced in the Standard Specifications and these special provisions do not appear in this section. The information is subject to the conditions and limitations set forth in Section 2-1.03, "Examination of Plans, Specifications, Contract, and Site of Work," and Section 6-2, "Local Materials," of the Standard Specifications. Bidders and Contractors shall be responsible for knowing the procedures for obtaining information.

Cross sections are not available for this project.

The District Office in which the work is situated is located at 111 Grand Ave, Oakland CA 94612.

Plans of the existing bridges may be requested by fax from the Office of Structure Maintenance and Investigations, 1801 30th Street, Sacramento, CA, Fax (916) 227-8357.

Plans of the existing bridges available to bidders and Contractors are reproductions of the original contract plans, with significant changes noted, and working drawings, and do not necessarily show normal construction tolerances and variances. Where dimensions of new construction required by this contract are dependent on the dimensions of the existing bridges, the Contractor shall verify the controlling field dimensions and shall be responsible for adjusting dimensions of the work to fit existing conditions.

5-1.08 AREAS FOR CONTRACTOR'S USE

Attention is directed to the requirements specified in Section 7-1.19, "Rights in Land and Improvements," of the Standard Specifications, plans and these special provisions.

The highway right of way shall be used for purposes that are necessary to perform the required work. The Contractor shall not occupy the right of way, or allow others to occupy the right of way, for purposes which are not necessary to perform the required work.

The Contractor's attention is directed to "Cooperation" of these special provisions, and the Contractor shall use only the designated areas for Contractor's use as specified in this section, as shown on the plans, and as follows:

1. **Area PR**: is available for the contractor's use for the entire contract period except limited by the areas as defined on the contract plans and these special provisions. The Contractor shall permit access by other contractors as directed by the Engineer.
2. **Area FPR**: is primarily available to Contract 04-0120R4 until May 1, 2007. After May 1, 2007, area FPR shall be considered a part of area FP.
3. **Area FP**: is available for use by the 04-0120R4 contract until November 30, 2007. The area FP shall then be made available to the contractor constructing the YBI transition structures under contract 04-0120S4 until May 1, 2009.
4. **Area EF**: is primarily available to Contract 04-0120E4 until March 31, 2008, and then to this contract after that date. Prior to March 31, 2008, the Contractor shall coordinated any planned work in area EF with the Engineer and Contract 04-0120E4 contractor.
5. **AREA CE**: is designated for use by Contract 04-0120E4 until March 31, 2008. The Contractor shall have access through area CE to the work area at Pier W2. After

CONTRACT CHANGE ORDER NO 69531
SHEET 21 OF 115

March 31, 2008, the area CE becomes a part of the area provided to the yerba Buena Island Structures contractor on Contract 04-0120S4.

The Contractor shall maintain access to the Torpedo Factory area at the east end of Yerba Buena Island at all times during the contract. Access may be via the existing Torpedo Factory Road or other routing as approved by the Engineer.

No area is available within the contract limits for the exclusive use of the Contractor. However, temporary storage of equipment and materials on State property may be arranged with the Engineer, subject to the prior demands of State maintenance forces and to other contract requirements. Use of the Contractor's work areas and other State-owned property shall be at the Contractor's own risk. The State shall not be held liable for damage to or loss of materials or equipment located within these areas.

Toll plaza parking lots shall not be used for the Contractor's employees private vehicles and the Contractor's equipment and vehicles.

The Contractor shall remove the equipment, materials, and rubbish from the work areas and other State-owned property which the Contractor occupies and shall leave the areas in presentable condition, in conformance with the provisions in Section 4-1.02, "Final Clean Up," of the Standard Specifications.

The Contractor shall secure, at the Contractor's own expense, areas required for storage of plans, equipment, and materials, or for other purposes if sufficient area is not available to the Contractor within the contract limits.

5-1.09 UTILITIES

The Contractor shall make arrangements to obtain electrical power, water or compressed air or other utilities required for the Contractor's operations and shall make and maintain the necessary service connections at the Contractor's own expense.

5-1.10 SANITARY PROVISIONS

State sanitary facilities will not be available for use by the Contractor's employees.

5-1.11 BRIDGE TOLLS

Toll-free passage on the San Francisco-Oakland Bay Bridge will be granted only for cars, trucks and special construction equipment which are clearly marked on the exterior with the Contractor's identification and which are being operated by the Contractor exclusively for the project, and which are used for the purpose of transporting materials and workers directly to and from the project site.

5-1.12 PERMITS AND LICENSES

Attention is directed to Section 7-1.04, "Permits and Licenses," of the Standard Specifications and these special provisions.

The Department has obtained the permits and licenses from the following agencies for this project:

A. California Regional Water Quality Control Board (RWQCB)

B. U.S. Army Corps of Engineers (ACOE)
C. San Francisco Bay Conservation Development Commission (BCDC)
D. United States Coast Guard (USCG)
E. California Department of Fish and Game (CDFG)

These permits have been made available to the Contractor as part of the information handout for the 04-0120R4 Contract.

For updated versions of environmental permits, the Contractor shall visit the website:

www.biomitigation.org

Full compensation for conforming to the requirements in these permits and licenses shall be considered as included in the prices paid for the various contract items of work and no additional compensation will be allowed therefor.

5-1.13 SOUND CONTROL REQUIREMENTS

Sound control shall conform to the provisions in Section 7-1.011, "Sound Control Requirements," of the Standard Specifications and these special provisions.

The noise level from the Contractor's operations, between the hours of 7:00 p.m. and 7:00 a.m., shall not exceed 78 dBa at a distance of 15 m from the source. Impact type mechanical operations, such as pile-driving and jack-hammering, shall not be conducted between the hours of 7:00 pm to 7:00 am. This requirement shall not relieve the Contractor from responsibility for complying with local ordinances regulating noise level at all times.

The noise level requirement shall apply to the equipment on the job or related to the job, including but not limited to trucks, transit mixers or transient equipment that may or may not be owned by the Contractor. The use of loud sound signals shall be avoided in favor of light warnings except those required by safety laws for the protection of personnel.

Full compensation for conforming to the requirements of this section shall be considered as included in the prices paid for the various contract items of work involved and no additional compensation will be allowed therefor.

Noise monitoring activities will be conducted by the Department of Transportation. The Contractor shall coordinate with the Department of Transportation monitors and allow them access to noise monitoring locations.

SECTION 8. MATERIALS

SECTION 8-1. MISCELLANEOUS

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6951

SHEET 24 OF 115

8-1.01 SUBSTITUTION OF NON-METRIC MATERIALS AND PRODUCTS

Only materials and products conforming to the requirements of the specifications shall be incorporated in the work. When metric materials and products are not available, and when approved by the Engineer, and at no cost to the State, materials and products in the United States Standard Measures which are of equal quality and of the required properties and characteristics for the purpose intended, may be substituted for the equivalent metric materials and products, subject to the following provisions:

A. Materials and products shown on the plans or in the special provisions as being equivalent may be substituted for the metric materials and products specified or detailed on the plans.

B. Before other non-metric materials and products will be considered for use, the Contractor shall furnish, at the Contractor's expense, evidence satisfactory to the Engineer that the materials and products proposed for use are equal to or better than the materials and products specified or detailed on the plans. The burden of proof as to the quality and suitability of substitutions shall be upon the Contractor and the Contractor shall furnish necessary information as required by the Engineer. The Engineer will be the sole judge as to the quality and suitability of the substituted materials and products and the Engineer's decision will be final.

C. When the Contractor elects to substitute non-metric materials and products, including materials and products shown on the plans or in the special provisions as being equivalent, the list of sources of material specified in Section 6-1.01, "Source of Supply and Quality of Materials," of the Standard Specification shall include a list of substitutions to be made and contract items involved. In addition, for a change in design or details, the Contractor shall submit plans and working drawings in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications. The plans and working drawings shall be submitted at least 7 days before the Contractor intends to begin the work involved.

Unless otherwise specified, the following substitutions of materials and products will be allowed:

CONTRACT CHANGE ORDER NO 69151

SHEET 32 OF 115

SECTION 8-2. CONCRETE

8-2.01 PORTLAND CEMENT CONCRETE

Portland cement concrete shall conform to the provisions in Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

References to Section 90-2.01, "Portland Cement," of the Standard Specifications shall mean Section 90-2.01, "Cement," of the Standard Specifications.

Mineral admixture shall be combined with cement in conformance with the provisions in Section 90-4.08, "Required Use of Mineral Admixtures," of the Standard Specifications for the concrete materials specified in Section 56-2, "Roadside Signs," of the Standard Specifications.

The requirements of Section 90-4.08, "Required Use of Mineral Admixture," of the Standard Specifications shall not apply to Section 19-3.025C, "Soil Cement Bedding," of the Standard Specifications.

The Department maintains a list of sources of fine and coarse aggregate that have been approved for use with a reduced amount of mineral admixture in the total amount of cementitious material to be used. A source of aggregate will be considered for addition to the approved list if the producer of the aggregate submits to the Transportation Laboratory certified test results from a qualified testing laboratory that verify the aggregate complies with the requirements. Prior to starting the testing, the aggregate test shall be registered with the Department. A registration number can be obtained by calling (916) 227-7228. The registration number shall be used as the identification for the aggregate sample in correspondence with the Department. Upon request, a split of the tested sample shall be provided to the Department. Approval of aggregate will depend upon compliance with the specifications, based on the certified test results submitted, together with any replicate testing the Department may elect to perform. Approval will expire 3 years from the date the most recent registered and evaluated sample was collected from the aggregate source.

Qualified testing laboratories shall conform to the following requirements:

A. Laboratories performing ASTM Designation: C 1293 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Concrete Proficiency Sample Program and shall have received a score of 3 or better on all tests of the previous 2 sets of concrete samples.
B. Laboratories performing ASTM Designation: C 1260 shall participate in the Cement and Concrete Reference Laboratory (CCRL) Pozzolan Proficiency Sample Program and shall have received a score of 3 or better on the shrinkage and soundness tests of the previous 2 sets of pozzolan samples.

Aggregates on the list shall conform to one of the following requirements:

A. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1293, the average expansion at one year shall be less than or equal to 0.040 percent; or
B. When the aggregate is tested in conformance with the requirements in California Test 554 and ASTM Designation: C 1260, the average of the expansion at 16 days shall be less than or equal to 0.15 percent.

CONTRACT NO. 54-612824
CONTRACT CHANGE ORDER NO 6951
SHEET 34 OF 115

The amounts of cement and mineral admixture used in cementitious material shall be sufficient to satisfy the minimum cementitious material content requirements specified in Section 90-1.01, "Description," or Section 90-4.05, "Optional Use of Chemical Admixtures," of the Standard Specifications and shall conform to the following:

A. The minimum amount of cement shall not be less than 75 percent by mass of the specified minimum cementitious material content.
B. The minimum amount of mineral admixture to be combined with cement shall be determined using one of the following criteria:

    1. When the calcium oxide content of a mineral admixture is equal to or less than 2 percent by mass, the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
    2. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass, and any of the aggregates used are not listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 25 percent by mass of the total amount of cementitious material to be used in the mix.
    3. When the calcium oxide content of a mineral admixture is greater than 2 percent by mass and the fine and coarse aggregates are listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 15 percent by mass of the total amount of cementitious material to be used in the mix.
    4. When a mineral admixture that conforms to the provisions for silica fume in Section 90-2.04, "Admixture Materials," of the Standard Specifications is used, the amount of mineral admixture shall not be less than 10 percent by mass of the total amount of cementitious material to be used in the mix.
    5. When a mineral admixture that conforms to the provisions for silica fume in Section 90-2.04, "Admixture Materials," of the Standard Specifications is used and the fine and coarse aggregates are listed on the approved list as specified in these special provisions, then the amount of mineral admixture shall not be less than 7 percent by mass of the total amount of cementitious material to be used in the mix.

C. The total amount of mineral admixture shall not exceed 35 percent by mass of the total amount of cementitious material to be used in the mix. Where Section 90-1.01, "Description," of the Standard Specifications specifies a maximum cementitious content in kilograms per cubic meter, the total mass of cement and mineral admixture per cubic meter shall not exceed the specified maximum cementitious material content.

The Contractor will be permitted to use Type II/Type V portland cement with appropriate corrosion protection for concrete used in the manufacture of precast concrete members.

8-2.02 CORROSION CONTROL FOR PORTLAND CEMENT CONCRETE

Permanent structures with Portland cement concrete in contact with soil or rock including that utilized for sewer manhole and foundations are considered to be in corrosive environment and shall conform to the provisions in Section 90, "Portland Cement Concrete," of the Standard Specifications and these special provisions.

Cementitious material to be used in Portland cement concrete shall conform to the provisions for cement and mineral admixtures in Section 90-2, "Materials," of the Standard Specifications, and shall be a combination of "Type II/Type V" Portland cement and mineral admixture.

Concrete in corrosive environment shall contain not less than 400 kg of cementitious material per cubic meter.

No reduction in the cementitious material content specified or ordered, in conformance with the provisions in Section 90-4.05, "Optional Use of Chemical Admixtures," of the Standard Specifications, will be allowed for concrete in a corrosive environment.

Unless otherwise specified, for concrete in a corrosive environment, the amount of cement shall be 75 percent by mass, and the amount of mineral admixture to be combined with cement shall be 25 percent by mass, of the total amount of cementitious material to be used in the concrete mix. The calcium oxide content of mineral admixtures shall not exceed 10 percent.

Mineral admixture for concrete in a corrosive environment shall conform to ASTM Designation: C618 Class F or N.

The amount of free water used in concrete in a corrosive environment shall not exceed 160 kg/m3, plus 40 kg for each 100 kg of cementitious material in excess of 400 kg/m3.

Full compensation for conforming to the above requirement shall be considered as included in the contract prices for the various items of work and no additional compensation will be allowed therefor.

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO 69S1

SHEET 35 OF 115

SECTION 8-3. WELDING

8-3.01 WELDING

GENERAL

Flux core welding electrodes conforming to the requirements of AWS A5.20 E6XT-4 or E7XT-4 shall not be used to perform welding for this project.

Wherever reference is made to the following AWS welding codes in the Standard Specifications, on the plans, or in these special provisions, the year of adoption for these codes shall be as listed:

AWS Code	Year of Adoption
D1.1	2002
D1.4	1998
D1.5	2002
D1.6	1999

Requirements of the AWS welding codes shall apply unless specified otherwise in the Standard Specifications, on the plans, or in these special provisions. Wherever the abbreviation AWS is used, it shall be equivalent to the abbreviations ANSI/AWS or AASHTO/AWS.

Section 6.1.1.1 of AWS D1.5 is replaced with the following:

Quality Control (QC) shall be the responsibility of the Contractor. As a minimum, the Contractor shall perform inspection and testing of each weld joint prior to welding, during welding, and after welding as specified in this section and as necessary to ensure that materials and workmanship conform to the requirements of the contract documents.

Sections 6.1.3 through 6.1.4.3 of AWS D1.1, Section 7.1.2 of AWS D1.4, and Sections 6.1.1.2 through 6.1.3.3 of AWS D1.5 are replaced with the following:

The QC Inspector shall be the duly designated person who acts for and on behalf of the Contractor for inspection, testing, and quality related matters for all welding.

Quality Assurance (QA) is the prerogative of the Engineer. The QA Inspector is the duly designated person who acts for and on behalf of the Engineer.

The QC Inspector shall be responsible for quality control acceptance or rejection of materials and workmanship, and shall be currently certified as an AWS Certified Welding Inspector (CWI) in conformance with the requirements in AWS QC1, " Standard for AWS Certification of Welding Inspectors."

The QC Inspector may be assisted by an Assistant QC Inspector provided that this individual is currently certified as an AWS Certified Associate Welding Inspector (CAWI) in conformance with the requirements in AWS QC1, "Standard for AWS Certification of Welding Inspectors." The Assistant QC Inspector may perform inspection under the direct supervision of the QC Inspector provided the Assistant is always within visible and audible range of the QC Inspector. The QC Inspector shall be responsible for signing all reports and for determining if welded materials conform to workmanship and acceptance criteria. The ratio of QC Assistants to QC Inspectors shall not exceed 5 to 1.

When the term "Inspector" is used without further qualification, it shall refer to the QC Inspector.

CONTRACT CHANGE ORDER NO 6951
SHEET 37 OF 45

Section 6.14.6, "Personnel Qualification," of AWS D1.1, Section 7.8, "Personnel Qualification," of AWS D1.4, and Section 6.1.3.4, "Personnel Qualification," of AWS D1.5 are replaced with the following:

Personnel performing nondestructive testing (NDT) shall be qualified and certified in conformance with the requirements of the American Society for Nondestructive Testing (ASNT) Recommended Practice No. SNT-TC-1A and the Written Practice of the NDT firm. The Written Practice of the NDT firm shall meet or exceed the guidelines of the ASNT Recommended Practice No. SNT-TC-1A. Individuals who perform NDT, review the results, and prepare the written reports shall be either:

A. Certified NDT Level II technicians, or;
B. Level III technicians who hold a current ASNT Level III certificate in that discipline and are authorized and certified to perform the work of Level II technicians.

Section 6.5.4 of AWS D1.5 is replaced with the following:

The QC Inspector shall inspect and approve each joint preparation, assembly practice, welding technique, joint fit-up, and the performance of each welder, welding operator, and tack welder to make certain that the applicable requirements of this code and the approved Welding Procedure Specification (WPS) are met. The QC Inspector shall examine the work to make certain that it meets the requirements of Sections 3 and 6.26. The size and contour of all welds shall be measured using suitable gages. Visual inspection for cracks in welds and base metal, and for other discontinuities should be aided by strong light magnifiers, or such other devices as may be helpful. Acceptance criteria different from those specified in this code may be used when approved by the Engineer.

Section 6.6.5, "Nonspecified NDT Other than Visual," of AWS D1.1, Section 6.6.5 of AWS D1.4 and Section 6.6.5 of AWS D1.5 shall not apply.

For any welding, the Engineer may direct the Contractor to perform NDT that is in addition to the visual inspection or NDT specified in the AWS or other specified welding codes, in the Standard Specifications, or in these special provisions. Additional NDT required by the Engineer will be paid for as extra work as provided in Section 4-1.03D, "Extra Work," of the Standard Specifications. Should any welding deficiencies be discovered by this additional NDT, all costs associated with the repair of the deficient area, including NDT of the weld and of the weld repair, and any delays caused by the repair, shall be at the Contractor's expense.

Repair work to correct welding deficiencies discovered by visual inspection or NDT, or by additional NDT directed or performed by the Engineer, and any associated delays or expenses caused to the Contractor by performing these repairs, shall be at the Contractor's expense.

The Engineer shall have the authority to verify the qualifications or certifications of any welder, QC Inspector, or NDT personnel to specified levels by retests or other means approved by the Engineer.

Continuous inspection shall be provided when any welding is being performed. Continuous inspection, as a minimum, shall include having a QC Inspector within such close proximity of all welders or welding operators so that inspections by the QC Inspector of each welding operation at each welding location shall not lapse for a period exceeding 30 minutes.

Inspection and approval of all joint preparations, assembly practices, joint fit-ups, welding techniques, and the performance of each welder, welding operator, and tack welder shall be documented by the QC Inspector on a daily basis for each day welding is performed. For each

CONTRACT CHANGE ORDER NO 10851
SHEET 38 OF 115

inspection, including fit-up, Welding Procedure Specification (WPS) verification, and final weld inspection, the QC Inspector shall confirm and document compliance with the requirements of the AWS or other specified code criteria and the requirements of these special provisions on all welded joints before welding, during welding, and after the completion of each weld.

When joint weld details that are not prequalified to the details of Section 3 of AWS D1.1 or to the details of Figure 2.4 or 2.5 of AWS D1.5 are proposed for use in the work, the joint details, their intended locations, and the proposed welding parameters and essential variables, will be approved by the Engineer. The Engineer shall have 2 weeks to complete the review of the proposed joint detail locations. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications. Upon approval of the proposed joint detail locations and qualification of the proposed joint details, welders and welding operators using these details shall perform a qualification test plate using the WPS variables and the joint detail to be used in production. The test plate shall have the maximum thickness to be used in production and a minimum length of 180 mm and minimum finish welded width 460 mm. The test plate shall be mechanically and radiographically tested. Mechanical and radiographic testing and acceptance criteria shall be as specified in the applicable AWS codes.

In addition to the requirements specified in the applicable code, the period of effectiveness for a welder's or welding operator's qualification shall be a maximum of 3 years for the same weld process, welding position, and weld type. If production welding will be performed without gas shielding, then qualification shall also be without gas shielding. Excluding welding of fracture critical members, a valid qualification at the beginning of work on a contract will be acceptable for the entire period of the contract, as long as the welder's or welding operator's work remains satisfactory.

The Engineer will witness all qualification tests for WPSs that were not previously approved by the Department. An approved independent third party will witness the qualification tests for welders or welding operators. The independent third party shall be a current CWI and shall not be employed by the contractor performing the welding. The Engineer shall have 2 weeks to review the qualifications and copy of the current certification of the independent third party. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications. The Contractor shall notify the Engineer one week prior to performing any qualification tests. Witnessing of qualification tests by the Engineer shall not constitute approval of the intended joint locations, welding parameters, or essential variables.

In addition to the requirements of AWS D1.5 Section 5.12 or 5.13, welding procedures qualification, for work welded in conformance with that code, shall conform to the following requirements:

A. Unless considered prequalified, fillet welds, including reinforcing fillet welds, shall be qualified in each position. The fillet weld soundness test shall be conducted using the essential variables of the WPS as established by the Procedure Qualification Record (PQR.)

CONTRACT CHANGE ORDER NO 6951
SHEET 39 OF 115

B. For qualification of joints that do not conform to Figures 2.4 and 2.5 of AWS D1.5, two WPS qualification tests are required. The tests conforming to AWS D1.5 Section 5.13 shall be conducted using both Figure 5.1 and Figure 5.3. The test conforming to Figure 5.3 shall be conducted using the same welding electrical parameters that were established for the test conducted conforming to Figure 5.1.

C. The travel speed, current, and voltage values that are used for tests conducted per AWS D1.5 Section 5.12 or 5.13 shall be consistent for each weld joint, and shall in no case vary by more than 10 percent for travel speed, 10 percent for current, and 7 percent for voltage.

D. For a WPS qualified in conformance with AWS D1.5 Section 5.13, the values to be used for calculating ranges for current and voltage shall be based on the average of all weld passes made in the test. Heat input shall be calculated using the average of current and voltage of all weld passes made in the test for a WPS qualified in conformance with Section 5.12 or 5.13.

E. To qualify for unlimited material thickness, two qualification tests are required for WPSs utilized for welding material thicknesses greater than 38 mm. One test shall be conducted using 20-mm thick test plates, and one test shall be conducted using test plates with a thickness between 38 mm and 50 mm. Two maximum heat input tests may be conducted for unlimited thickness qualification.

F. Macroetch tests are required for WPS qualification tests, and acceptance shall be per AWS D1.5 Section 5.19.3.

G. When a weld joint is to be made using a combination of qualified WPSs, each process shall be qualified separately.

H. When a weld joint is to be made using a combination of qualified and prequalified processes, the WPS shall reflect both processes and the limitations of essential variables, including weld bead placement, for both processes.

I. Prior to preparing mechanical test specimens, the PQR welds shall be inspected by visual and radiographic tests. Backing bar shall be 75 mm in width and shall remain in place during NDT testing. Results of the visual and radiographic tests shall comply with AWS D1.5 Section 6.26.2, excluding Section 6.26.2.2. Test plates that do not comply with both tests shall not be used.

WELDING QUALITY CONTROL

Welding quality control shall conform to the requirements in the AWS or other specified welding codes, the Standard Specifications, and these special provisions.

Unless otherwise specified, welding quality control shall apply when any work is welded in conformance with the provisions in Section 49, "Piling," Section 52, "Reinforcement," Section 55, "Steel Structures," or Section 75-1.035, "Bridge Joint Restrainer Units," of the Standard Specifications.

The welding of fracture critical members (FCMs) shall conform to the provisions specified in the Fracture Control Plan (FCP) and herein.

The Contractor shall designate in writing a welding Quality Control Manager (QCM). The QCM shall be responsible directly to the Contractor for the quality of welding, including materials and workmanship, performed by the Contractor and subcontractors.

The QCM shall be the sole individual responsible to the Contractor for submitting, receiving, reviewing, and approving all correspondence, required submittals, and reports to and from the Engineer. The QCM shall be a registered professional engineer or shall be currently certified as a CWI or a CAWI.

CONTRACT NO. _____ CONTRACT CHANGE ORDER NO 69451
SHEET 40 OF 115

The QCM shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project. The QCM may be an employee of the Contractor.

Welding inspection personnel or NDT firms to be used in the work shall not be employed or compensated by any subcontractor, or by other persons or entities hired by subcontractors, who will provide other services or materials for the project, except for the following conditions:

A. The work is welded in conformance with AWS D1.5 and is performed at a permanent fabrication or manufacturing facility which is certified under the AISC Quality Certification Program, Category Cbr, Major Steel Bridges and Fracture Critical endorsement F.
B. The welding is performed on pipe pile material at a permanent pipe manufacturing facility authorized to apply the American Petroleum Institute (API) monogram for API 5L pipe.

For welding performed at such facilities, the inspection personnel or NDT firms may be employed or compensated by the facility performing the welding.

Prior to submitting the Welding Quality Control Plan (WQCP) required herein, a pre-welding meeting between the Engineer, the Contractor's QCM, and a representative from each entity performing welding or inspection for this project, shall be held to discuss the requirements for the WQCP.

The Contractor shall submit to the Engineer, in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications, 2 copies of a separate WQCP for each subcontractor or supplier for each item of work for which welding is to be performed.

The Contractor shall allow the Engineer 2 weeks to review the WQCP submittal after a complete plan has been received. No welding shall be performed until the WQCP is approved in writing by the Engineer. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

An amended WQCP or any addendum to the approved WQCP shall be submitted to, and approved in writing by the Engineer, for proposed revisions to the approved WQCP. An amended WQCP or addendum will be required for revisions to the WQCP, including but not limited to a revised WPS; additional welders; changes in NDT firms, QC, or NDT personnel or procedures; or updated systems for tracking and identifying welds. The Engineer shall have 1 week to complete the review of the amended WQCP or addendum. Work affected by the proposed revisions shall not be performed until the amended WQCP or addendum has been approved. In the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

Information regarding the contents, format, and organization of a WQCP, is available at the Transportation Laboratory or the following website:

http://www.dot.ca.gov/hq/esc/Translab/smbresources.htm

CONTRACT NO. [illegible]
CONTRACT CHANGE ORDER NO 9921
SHEET 41 OF 115

After final approval of the WQCP, amended WQCP, or addendum, the Contractor shall submit 7 copies to the Engineer of the approved documents. A copy of the Engineer approved document shall be available at each location where welding is to be performed.

A daily production log for welding shall be kept for each day that welding is performed. The log shall clearly indicate the locations of all welding. The log shall include the welders' names, amount of welding performed, any problems or deficiencies discovered, and any testing or repair work performed, at each location. The daily report from each QC Inspector shall also be included in the log.

The following items shall be included in a Welding Report that is to be submitted to the Engineer within 10 days following the performance of any welding:

A. Reports of all visual weld inspections and NDT.
B. Radiographs and radiographic reports, and other required NDT reports.
C. Documentation that the Contractor has evaluated all radiographs and other nondestructive tests and corrected all rejectable deficiencies, and all repaired welds have been reexamined by the required NDT and found acceptable.
D. Daily production log.

The following information shall be clearly written on the outside of radiographic envelopes: name of the QCM, name of the nondestructive testing firm, name of the radiographer, date, contract number, complete part description, and all included weld numbers or a report number, as detailed in the WQCP. In addition, all innerleaves shall have clearly written on them the part description and all included weld numbers, as detailed in the WQCP.

Reports regarding NDT shall be signed by both the NDT technician and the person that performed the review, and then submitted directly to the QCM for review and signature prior to submittal to the Engineer. Corresponding names shall be clearly printed or typewritten next to all signatures.

The Engineer will review the Welding Report to determine if the Contractor is in conformance with the WQCP. Unless otherwise specified, the Engineer shall be allowed 10 days to review the report and respond in writing after a complete Welding Report has been received. Prior to receiving notification from the Engineer of the Contractor's conformance with the WQCP, the Contractor may encase in concrete or cover welds for which a Welding Report has been submitted. However, should the Contractor elect to encase or cover those welds prior to receiving notification from the Engineer, it is expressly understood that the Contractor shall not be relieved of the responsibility for incorporating material in the work that conforms to the requirements of the plans and specifications. Material not conforming to these requirements will be subject to rejection. Should the Contractor elect to wait to encase or cover welds pending notification by the Engineer, and in the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

The QC Inspector shall provide reports to the QCM on a daily basis for each day that welding is performed.

Except for noncritical weld repairs, the Engineer shall be notified immediately in writing when welding problems, deficiencies, base metal repairs, or any other type of repairs not submitted in the WQCP are discovered, and also of the proposed repair procedures to correct them. The Contractor shall allow the Engineer one week to review these procedures. No remedial work shall begin until the repair procedures are approved in writing by the Engineer. In

the event the Engineer fails to complete the review within the time allowed, and if, in the opinion of the Engineer, completion of the work is delayed or interfered with by reason of the Engineer's delay in completing the review, the Contractor will be compensated for any resulting loss, and an extension of time will be granted, in the same manner as provided for in Section 8-1.09, "Right of Way Delays," of the Standard Specifications.

The QCM shall sign and furnish to the Engineer, a Certificate of Compliance in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications for each item of work for which welding was performed. The certificate shall state that all of the materials and workmanship incorporated in the work, and all required tests and inspections of this work, have been performed in conformance with the details shown on the plans, the Standard Specifications, and these special provisions.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6951

SHEET 42 OF 115

PAYMENT

Full compensation for conforming to the requirements of "Welding" shall be considered as included in the contract prices paid for the various items of work involved and no additional compensation will be allowed therefor.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6951

SECTION 10-1. GENERAL

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6951

SHEET 44 OF 115

10-1.01 ORDER OF WORK

Order of work shall conform to the provisions in Section 5-1.05, "Order of Work," of the Standard Specifications and these special provisions.

Contractor shall provide specifications and detailed shop drawings to the Engineer for the proposed sewer work, including the pipe manufacturer's names and product identification, and details for the type and location of all fittings, joints and connections to structures. The new manhole and pump shall be installed before the demolition of the existing pump station and manhole to minimize the down time of the facility.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6951

SHEET 45 OF 115

10-1.09 TEMPORARY RAILING

Temporary railing (Type K) shall be placed as shown on the plans, as specified in the Standard Specifications or these special provisions or where ordered by the Engineer and shall conform to the provisions in Section 12, "Construction Area Traffic Control Devices," of the Standard Specifications and these special provisions.

Reflectors on temporary railing (Type K) shall conform to the provisions in "Prequalified and Tested Signing and Delineation Materials" of these special provisions.

Temporary railing (Type K) shall conform to the details shown on Standard Plan T3. Temporary railing (Type K) fabricated prior to January 1, 1993, and conforming to 1988 Standard Plan B11-30 may be used, provided the fabrication date is printed on the required Certificate of Compliance.

Attention is directed to "Public Safety" and "Order of Work" of these special provisions.

Temporary railing (Type K) placed in conformance with the provisions in "Public Safety" of these special provisions will be neither measured nor paid for.

10-1.10 EXISTING HIGHWAY FACILITIES

The work performed in connection with various existing highway facilities shall conform to the provisions in Section 15, "Existing Highway Facilities," of the Standard Specifications and these special provisions.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 6951

SHEET 47 OF 115

REMOVE SEWER MANHOLE

Existing manholes, at the locations shown on the plans as remove or to be demolished, shall be removed and disposed of.

Removed frames and covers shall be disposed of.

The contract unit price paid for remove sewer manhole shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all work involved in removing manhole complete in place, including concrete base, pipe risers, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the engineer.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6957

SHEET 46 OF 115

REMOVE CHAIN LINK FENCE

Existing chain link fence, including post footings, at the locations shown on the plans, shall be removed and disposed of.

Full compensation for removing and disposing of excess fence shall be considered as included in the contract price paid per meter for remove chain link fence and no separate payment will be made therefor.

REMOVE PIPE LINE

Existing water mains, and sewers, where shown on the plans to be removed, shall be removed and disposed of. Resulting openings into existing structures that are to remain in place shall be plugged with commercial quality concrete containing not less than 300 kg of cement per cubic meter.

Full compensation for concrete plugs, pipe removal, structure excavation, and backfill (including sand, controlled low strength material or slurry cement backfill) shall be considered as included in the contract unit price paid for remove water mains, and sewers and no additional compensation will be allowed therefor.

DEMOLISH PUMP STATION

This work shall consist of demolition and disposal of the existing pump station as shown on the plans, as specified in these special provisions, and as directed by the Engineer.

Scope of Work

The Contractor and/or subcontractors shall be properly licensed in accordance with the laws of the State of California and shall possess a Class C-21 license, CAL-OSHA permit and a Hazardous Substance Removal Certificate (HAZ) if any hazardous substances are discovered and the discovery requires removal. The Contractor shall provide all labor, equipment, supplies, permits and materials necessary to remove and demolish commercial structure, and abate all hazardous materials, according to all environmental laws and regulations. The work shall be done in accordance with all city and/or county codes/regulations. The structures are to be demolished and removed out of the State right of way.

The extent of demolition and disposal work shall consist of demolishing and removing structures, foundations, footings and other improvements including, but not limited to, the removal of siding, concrete blocks, plants, shrubs, trees, fences, walls, decks, sheds, doors and windows, concrete tanks, capping of sewer lines, slabs, stairs and landings, loading docks, steps, footings, foundations, pipe, brick, flatwork, plaster, lumber, wood splinters, trash, debris, glass, and abate all friable and non-friable asbestos and lead paint, according to all environmental laws and regulations. The Contractor shall also ensure that the proper notifications be made to the respective utility companies for the removal of meters or the disconnecting, capping or sealing, and abandoning in place of all site utilities. All demolished items shall be removed and legally disposed of outside of the State right of way, unless indicated to be salvaged or recycled by the Engineer.

Prior to the demolition work, the Contractor shall submit a schedule of pump station demolition activities to the Engineer for approval. The schedule shall indicate the following:

1. Proper Notification, time frames
2. Detailed sequence of demolition and removal work, with starting and ending dates for each.
3. Interruption of utility services.
4. Coordination for shutoff, capping, and continuation of utility services.
5. Locations of temporary protection

Backfill

The Contractor shall take all measures necessary to protect the public from basement excavations, holes, or vertical drops exposed or produced by his or her operations. The Contractor shall backfill such excavations, holes, or drops. Backfill shall be made with clean earth consisting of alluvium, decomposed granite, loam or sand. No material containing adobe or other substances, which would swell or contract with the addition of water or containing debris or large rocks will be accepted. Backfill within the limits of the State right of way shall be completed to the surface of the ground and unless otherwise specified, shall be placed in horizontal uniform layers not to exceed 20 cm in thickness before compaction.

Concrete & Debris Removal

The Contractor shall remove and dispose of all concrete, including concrete footings, 1 m below adjoining grade, flatwork , and miscellaneous rubble. Likewise, all brick, plaster, lumber, wood splinters and other debris including shrubs shall be removed from the site and disposed of by the Contractor.

Items to be Salvaged

The existing Flygt pump and Paco pump in TIS041 shall be salvaged and returned to SFPUC/WWE. The check valves shall also be salvaged and returned to SFPUC/WWE. The Engineer shall contact Kris Kilgore (415-648-6882 x1323), or Vic Zorzynski (415-274-0333) of the SFPUC/WWE once the salvaged items are removed from the existing pump station.

Payment

The contract unit price paid to demolish the pump station shall include full compensation for furnishing all labor, materials, temporary facilities, backfill, salvaging existing pumps and valves, safety measures, tools, equipment, and incidentals, and for performing all the work involved in demolition and removal of the pump station as shown on the plans, as specified in these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO 6951

SHEET 50 OF 115

10-1.11 CLEARING AND GRUBBING

Clearing and grubbing shall conform to the provisions in Section 16, "Clearing and Grubbing," of the Standard Specifications and these special provisions.

Vegetation shall be cleared and grubbed only within the excavation and embankment slope lines.

At locations where there is no grading adjacent to a bridge or other structure, clearing and grubbing of vegetation shall be limited to 1.5 m outside the physical limits of the bridge or structure.

Existing vegetation outside the areas to be cleared and grubbed shall be protected from injury or damage resulting from the Contractor's operations.

Activities controlled by the Contractor, except cleanup or other required work, shall be confined within the graded areas of the roadway.

Nothing herein shall be construed as relieving the Contractor of the Contractor's responsibility for final cleanup of the highway as provided in Section 4-1.02, "Final Cleaning Up," of the Standard Specifications.

10-1.12 EARTHWORK

Earthwork shall conform to the provisions in Section 19, "Earthwork," of the Standard Specifications and these special provisions.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 6951

SHEET 51 OF 115

Surplus excavated material shall become the property of the Contractor and shall be disposed of in conformance with the provisions in Section 7-1.13, "Disposal of Material Outside the Highway Right of Way," of the Standard Specifications.

Reinforcement or metal attached to reinforced concrete rubble placed in embankments shall not protrude above the grading plane. Prior to placement within 0.6-m below the grading plane of embankments, reinforcement or metal shall be trimmed to no greater than 20 mm from the face of reinforced concrete rubble. Full compensation for trimming reinforcement or metal shall be considered as included in the contract prices paid per cubic meter for the types of excavation shown in the Engineer's estimate, or the contract prices paid for furnishing and placing imported borrow or embankment material, as the case may be, and no additional compensation will be allowed therefor.

Imported borrow shall be mineral material including rock, sand, gravel, or earth. The Contractor shall not use man-made refuse in imported borrow including:

A. Portland cement concrete,
B. Asphalt concrete,
C. Material planed from roadway surfaces,
D. Residue from grooving or grinding operations,
E. Metal,
F. Rubber,
G. Mixed debris,
H. Rubble

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6951

SHEET 52 OF 115

10-1.13 HEALTH AND SAFETY PLAN

The Contractor shall prepare a Health and Safety Plan to prevent or minimize exposure to contaminants of concern. The Contractor's attention is directed to Title 8, California Code of Regulation, Section 5192 (b) (4)(B) Occupational Safety and Health Guidance Manual published by the National Institute of Occupational Safety and Health (NIOSH), Occupational Safety and Health Administration (OSHA), for elements of the site safety plan. The Health and Safety Plan shall contain as a minimum but not be limited to: identification of key personnel for the project, job hazard analysis for work assignments, summary of risk assessment, air monitoring plan, personal protective equipment, delineation of work zones on-site, decontamination procedures, general safe work practices, security measures, emergency response plans and worker training. The Health and Safety Plan shall be approved by the Contractor's Certified Industrial Hygienist before submission to the Engineer for review and acceptance. The plan shall be submitted to the Engineer at least 15 working days prior to beginning any work in the project area.

TRAINING

Personnel who have no prior training or are not current in their training status, including State personnel, shall complete a safety training program provided by the Contractor, which meets the requirement of Title 8, California Code of Regulations, Section 5192 (b). The Contractor shall provide a written certification of completion of safety training to the Engineer for all trained personnel prior to performing any work in areas containing contaminants of concern.

EQUIPMENT AND MEDICAL SURVEILLANCE

Personnel protective equipment, training, and medical surveillance required by the Contractor's Health and Safety Plan shall be provided to State personnel by the Contractor. The number of State personnel will be 2.

PAYMENT

The contract lump sum price paid for the Health and Safety Plan shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all work involved in preparing and implementing the Health and Safety Plan including paying the Certified Industrial Hygienist and for providing personal protective equipment, training and medical surveillance as specified in these special provisions and as directed by the Engineer.

10-1.14 AGGREGATE SUBBASE

Aggregate subbase must comply with Section 25, "Aggregate Subbases," of the Standard Specifications and these special provisions.

Aggregate subbase must be Class 4.

Do not store reclaimed asphalt concrete or aggregate subbase with reclaimed asphalt concrete within 30 m measured horizontally of any culvert, watercourse, or bridge.

Class 4 aggregate subbase must comply with:

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6951

SHEET 53 OF 115

Grading (Percentage Passing)

Sieve Sizes	Operating Range	Contract Compliance
63-mm	100	100
4.75-mm	30-65	25-70
75-µm	0-15	0-18

Quality

Test	Operating Range	Contract Compliance
Sand Equivalent	21 Min.	18 Min.
Resistance (R-value)	----	50 Min.

If tests show grading or sand equivalent does not comply with the "Operating Range" specifications but complies with the "Contract Compliance" specifications, you may place aggregate subbase for the remainder of that day. Do not start another day's work until tests or other information indicate the next day's material complies with the "Operating Range" specifications.

If tests show grading or sand equivalent does not comply with the "Contract Compliance" specifications, remove the aggregate subbase represented by the tests. If you request and the Engineer approves, that aggregate subbase may remain in place and the Department reduces payment by $3.00 per cubic meter for that aggregate subbase. If the subbase remains in place and both the grading and sand equivalent do not comply with "Contract Compliance" specifications, the Department only makes one payment reduction.

No single grading or sand equivalent test may represent more than the smaller of 400 m^3 or one day's production.

Instead of Class 4 aggregate subbase, you may place Class 1 aggregate subbase complying with the aggregate grading and quality requirements in Section 25-1.02A, "Class 1, Class 2, and Class 3 Aggregate Subbases," of the Standard Specifications. If you place Class __ aggregate subbase, do not change back to Class 4 subbase without written approval from the Engineer.

Regardless of the aggregate subbase class supplied, the Department pays for aggregate subbase as Class 4 aggregate subbase.

10-1.15 AGGREGATE BASE

Aggregate base must comply with Section 26, "Aggregate Bases," of the Standard Specifications and these special provisions.

Aggregate base must be Class 3.

Do not store reclaimed asphalt concrete or aggregate base with reclaimed asphalt concrete within 30 m measured horizontally of any culvert, watercourse, or bridge.

Class 3 aggregate base must comply with:

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO 6957

SHEET 54 OF 115

CONTRACT NO. 07-212064 CONTRACT CHANGE ORDER NO 29571 SHEET 52 OF 115

Grading (Percentage Passing)

	Operating Range	Contract Compliance
50-mm		
37.5-mm		
25-mm	100	100
19-mm	90-100	87-100
4.75-mm	35-60	30-65
600-µm	10-30	5-35
75-µm	2-9	0-12

Quality

Tests	Operating Range	Contract Compliance
Sand Equivalent		
Resistance (R-value)		

If tests show grading or sand equivalent does not comply with the "Operating Range" specifications but complies with the "Contract Compliance" specifications, you may place aggregate base for the remainder of that day. Do not start another day's work until tests or other information indicate the next day's material complies with the "Operating Range" specifications.

If tests show grading or sand equivalent does not comply with the "Contract Compliance" specifications, remove the aggregate base represented by the tests. If you request and the Engineer approves, that aggregate base may remain in place and the Department reduces payment by $3.25 per cubic meter for that aggregate base. If the base remains in place and both the grading and sand equivalent do not comply with "Contract Compliance" specifications, the Department only makes one payment reduction.

No single grading or sand equivalent test may represent more than the smaller of 400 m^3 or one day's production.

10-1.16 ASPHALT CONCRETE

Asphalt concrete shall be Type _A__ and shall conform to the provisions in Section 39, "Asphalt Concrete," of the Standard Specifications and these special provisions.

The grade of asphalt binder to be mixed with aggregate for Type _A__ asphalt concrete shall be Grade _PG 64-10 conforming to the provisions in Section 92, "Asphalts," of the Standard Specifications.

The amount of asphalt binder used in asphalt concrete placed in dikes, gutters, gutter flares, overside drains and aprons at the ends of drainage structures shall be increased one percent by mass of the aggregate over the amount of asphalt binder determined for use in asphalt concrete placed on the traveled way.

The asphalt content of the asphalt mixture will be determined in conformance with the requirements in California Test 379, or in conformance with the requirements in California Test 382.

Paint binder (tack coat) shall be applied to existing surfaces to be surfaced and between layers of asphalt concrete, except when eliminated by the Engineer.

Paint binder (tack coat) shall be, at the option of the Contractor, either slow-setting asphaltic emulsion, rapid-setting asphaltic emulsion or paving asphalt. Slow-setting asphaltic emulsion and rapid-setting asphaltic emulsion shall conform to the provisions in Section 39-4.02, "Prime Coat and Paint Binder (Tack Coat)," and the provisions in Section 94, "Asphaltic Emulsions," of

the Standard Specifications. When paving asphalt is used for paint binder, the grade will be determined by the Engineer. Paving asphalt shall conform to the provisions in Section 39-4.02, "Prime Coat and Paint Binder (Tack Coat)," and the provisions in Section 92, "Asphalts," of the Standard Specifications.

Paint binder (tack coat) shall be applied in the liter per square meter range limits specified for the surfaces to receive asphalt concrete in the tables below. The exact application rate within the range will be determined by the Engineer.

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO 6951

SHEET 54 OF 115

CONTRACT NO. 04-0A2024
CONTRACT CHANGE ORDER NO 6951
SHEET 57 OF 115

10-1.17 REINFORCEMENT

Reinforcement shall conform to the provisions in Section 52, "Reinforcement," of the Standard Specifications and these special provisions.

The Department's mechanical splices prequalified list can be found at the following internet site:

http://www.dot.ca.gov/hq/esc/approved_products_list/

The provisions of "Welding Quality Control" of these special provisions shall not apply to resistance butt welding.

MEASUREMENT AND PAYMENT

Measurement and payment for reinforcement in structures shall conform to the provisions in Section 52-1.10, "Measurement," and Section 52-1.11, "Payment," of the Standard Specifications and these special provisions.

10-1.18 SANITARY SEWER LIFT STATION

A sanitary sewer lift station shall be furnished and installed in conformance with the details shown on the plans and these special provisions.

A sanitary sewer lift station shall consist of shaft, duplex pumps with motors, pump enclosure, foundation, pipe, fittings, valves, controls and appurtenances necessary for the satisfactory operation of the sanitary sewer lift station. Service equipment and electrical equipment shall conform to the provisions in Section 10-3 of these special provisions. Incidental material or equipment not mentioned in these special provisions or shown on the plans, which may be necessary for completion and satisfactory operation of the sanitary sewer lift station, shall be furnished and installed.

All components of the sanitary sewer lift station shall be warranted for two years from date of first operation.

MATERIALS LIST AND DRAWINGS

In conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications, the Contractor shall submit, within 15 days after approval of the contract, a list of materials which the Contractor proposes to furnish and install for the sanitary sewer lift station together with the drawings and other data as specified below:

A. The materials list shall be a complete listing of the manufacturer, catalog number, size, and capacity of the manufactured articles. There shall be a working drawing for the sanitary sewer lift station showing the pump details, piping, and equipment as planned to be furnished and installed and for other materials to be fabricated for the installation. Directions for maintenance and adjustment of the pump shall be furnished to the Engineer as well as a manufacturer's certified performance characteristics curve diagram for the pump.

B. The data submitted shall be labeled with a descriptive title, project description and contract number of the project.

At least 4 copies of the data shall be initially submitted to the Engineer for approval. The Engineer will review the submitted data and will return to the Contractor either one set for correction or 2 sets that have been approved.

CONTRACT NO. [illegible]
CONTRACT CHANGE ORDER NO 69572
SHEET 55 OF 115

After approval, 6 sets of Operation and Maintenance Manuals for the sanitary sewer lift station shall be submitted.

The State shall not be liable for materials purchased or labor performed, prior to approval of the drawings and materials list, and will not be responsible for any delay to the Contractor pending review of the drawings and information submitted after the 15-day period mentioned.

PUMP AND MOTOR

Pumps shall be heavy-duty, submersible, non-clog, centrifugal, quick disconnect pumps. The pumps shall be a Flygt Model NP3102.090 with 5 hp motor. Power supplied will be 208 volt 3 phase.

Pump Construction

A. General: The pumps shall be designed to permit ground-level removal of pumping units from the wet well for inspection or service without disconnecting or disturbing the discharge piping. The pump connection shall be metal to metal. The design shall permit the pumps when lowered into place to be automatically connected to the discharge piping by positively locking the volute in position to prevent any axial or lateral movement. There shall be no need for personnel to enter the wet well when pump inspection or service is required.

B. Piping, fittings, and Appurtenances: Each pump shall be furnished with quick-disconnect discharge elbow, AISI Type 316 stainless steel standard pipe rails, upper guide rail bracket, intermediate guide rail bracket, rail-guided lifting assembly and AISI Type 316 stainless steel chain of sufficient strength to raise and lower pump. All miscellaneous metal within the wet well shall be stainless steel. Anchor bolts shall be stainless steel.

C. Pump Castings: Castings and other major pump components shall be of grey cast iron, ASTM A-48, Class 35B, shall be of cast iron and free from blowholes, porosity, hard spots, shrinkage defects, cracks, and other injurious defects. All metal surfaces coming into contact with the sewage, other than stainless steel or brass, shall be protected by a factory applied spray coating of acrylic dispersion zinc phosphate primer with a polyester resin paint finish on the exterior of the pump. The casings shall be designed to permit replacement of wearing parts. Joints shall be properly sealed with Nitrile or Viton rubber O-rings and shall not leak under a test pressure equal to 50 percent greater than the pump shut-off pressure. Passageways shall permit smooth flow and shall be free from sharp turns and projections.

D. Impellers: Impellers shall be of (spheroidal graphite) gray iron class 35B, cast steel, or an alloy suitable for the service required. The impellers shall be smooth and free flowing and shall have sufficient clearance to permit 75 mm objects in the sanitary waste water that enter the pump to pass into the discharge pipe. Each impeller shall be accurately fitted and keyed, splined, or threaded on the shaft, and locked in such a manner that lateral movement will be prevented and reverse rotation will not cause loosening.

E. Balance: All rotating parts of the equipment shall be in such balance, mechanically and hydraulically, as to operate without excessive end thrust, vibration or noise.

F. Shafts: Shafts shall be steel, and be provided with alignment bearings.

G. Bearings: Bearings subject to submersion shall be ball bearings manufactured from high-grade bearing alloy.

H. Mechanical Seals: Each pump shall be equipped with tungsten carbide seals.

I. The Power cable shall be sized according to the NEC and ICEA standards and shall be of sufficient length to reach the junction box without the need of any splices. The outer jacket of the cable shall be oil resistant chloroprene rubber. The motor and cable shall be

CONTRACT NO. 441-CV20124
CONTRACT CHANGE ORDER NO 6951
SHEET 59 OF 115

capable of continuous submergence underwater without loss of watertight integrity to a depth of 65 feet. The cable entry seal design shall preclude specific torque requirements to insure a watertight and submersible seal. The cable entry shall consist of a single cylindrical elastomer grommet, flanked by washers, all having a close tolerance fit against the cable outside diameter and the entry inside diameter and compressed by the body containing a strain relief function, separate from the function of sealing the cable. The assembly shall provide ease of changing the cable when necessary using the same entry seal. The cable entry junction chamber and motor shall be separated by a stator lead sealing gland or terminal board, which shall isolate the interior from foreign material gaining access through the pump top. Epoxies, silicones, or other secondary sealing systems shall not be considered acceptable.

J. Electrical motors: Submersible, and the following requirements:

1. Air filled (not oil filled) squirrel cage induction type
2. Service factor of 1.15 or better
3. Class F insulation, Class B temperature rise
4. Rated for 6 starts per hour
5. Listed by either UL or FM for Class 1, Division 1, Groups C and D hazardous locations
6. Suitable for operating either in free air or continuously submerged in sewage
7. Bearing B10 life 18,000 hours minimum
8. Tungsten carbide seals
9. Lower bearings of either the ball or roller type
10. Provide a moisture detection system and a motor winding thermostat system, connected to the station control panel.

These systems shall be complete, including all necessary interfaces, control panels, conduits, and wires, even though these may not be shown on the Drawings.

Miscellaneous Materials: Bolts, nuts, anchors, washers, and all other types of support necessary for the installation of the pumps and drive units shall be provided and shall be of stainless steel.

Shop Painting: Pump, motor, and accessories shall be factory applied and finish painted in accordance with the manufacturer's standard.

Tools and Spare Parts: The pumps shall be furnished with a full set of manufacturer's recommended spare parts and special tools and maintenance instructions.

PIPE, VALVES, JOINTS AND FITTINGS

Valves shall be the type shown on the plans and shall be Class 125 unless otherwise shown on the plans.

Gate valves shall be iron body, wedge gate type with bronze trim and non-rising stem.

Check valves shall have cast iron body and gate, flanged ends, and bronze trim. The valves shall be the spring-loaded lever type for nonslamming under the conditions of operation and shall have stainless steel spring and shaft.

Pipes and fittings for piping 4 NPS or greater shall be ductile iron.

Ductile iron pipe shall be restrained, push-on joint pipe conforming to ANSI/AWWA C151/A21.51.

Restrained push-on joints for ductile iron pipe shall conform to ANSI/AWWA C111/A21.11. The joints shall be boltless, non-compression, non-threaded with synthetic rubber gasket seals and have a positive-locking device to keep the connection from separating. The pipe joints shall

CONTRACT NO. 69-0124
CONTRACT CHANGE ORDER NO. 9157
SHEET 60 OF 115

be designed for a working pressure of 2,413 Kpa and be capable of deflecting after assembly. Fittings and flanges for ductile iron pipe shall conform to ANSI/AWWA C110/A21.10, except for the manufacturer's proprietary design dimensions for restrained push-on joint pipe.

Ductile iron pipe and fittings shall have cement mortar lining and seal coating conforming to ANSI/AWWA C104/A21.4. Pipe shall have an asphaltic coating and/or polyethylene encasement outside coating conforming to ANSI/AWWA C151/A21.51, and fittings shall have an asphaltic coating and/or polyethylene encasement outside coating conforming to ANSI/AWWA C110/A21.10.

Pipe supports

All anchor bolts, nuts, pipe clamps, and other fittings shall be suitable for the type and size of the lines or casing, and shall conform to the provisions in Section 75-1.03, "Miscellaneous Bridge Metal", of the Standard Specifications.

Locate pipe supports as indicated in the plans. Unless stated otherwise, use AISI type 316 stainless steel for fabrication of pipe supports and stainless steel heavy hex head bolts with hardened washers and heavy hex nuts for bolted connections. Pipe supports shall be fabricated and installed according to MSS SP-58 and SP-69.

Dimensions and elevations for supports are the responsibility of the contractor and should be confirmed in the field prior to fabrication and installation.

Link Type Penetration Seal

The pipe to wall penetration closures shall be a modular mechanical type consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between pipe and wall opening. Once expanded, the seal shall provide a watertight seal between pipe and wall. Pressure end plates shall be manufactured of glass reinforced plastic with a tensile strength of 186 mPa.

WET WELL

The wet well shall consist of precast wet well barrel sections as shown on the plans and in accordance with Section 70 1.02H "Precast Concrete Structures" of the Standard Specifications. The barrel sections shall conform to ASTM C-478 with single groove rubber joint gaskets. The concrete rings shall consist of Type II / Type V cement with appropriate corrosion protection against contaminated soils.

VALVE BOXES

Valve boxes shall conform to the provisions in Section 20-2.24, "Valve Boxes" of the Standard Specifications. A floor drain with deep trap shall be provided to drain the valve box to the wet well.

FOUNDATIONS

Concrete for foundations and pads shall be minor concrete and shall contain not less than 325 kg of portland cement per cubic meter. Type II / Type V cement with appropriate corrosion protection against contaminated soils shall be used for all concrete foundations and pads.

PRESSURE GAGES

Pressure gages shall be the dial type, shall be clear glycerin filled with a 65-mm minimum diameter weathertight epoxy case, and shall have accuracy within 3 percent of the full scale reading.

PUMP CONTROL

Panel

The pump control panel enclosure shall be 14 gauge 316 stainless steel. Panel shall have removable door, hinges constructed of 316 stainless steel and stainless steel hinge pins. Enclosure standards shall meet UL 508 for NEMA 4X. Enclosure shall comply with NEMA Type 4 and IEC 529, IP66. Back panel construction shall be 12 gauge steel. Swing panel shall maintain UL and NEMA ratings when installed. All operational status components shall be mounted on the swing panel. A single-phase 20 amp outlet shall be provided.

Controls

Station controls shall include the following:

A. Lockable external disconnect switch.
B. Motor starters, NEMA rated and sized for the next largest size (7.5 hp) pump motors.
C. 12 20amp-1-pole Circuit breakers, molded case and rated for short-circuit current.
D. Control power transformer with primary and secondary circuit breakers.
E. A 120V-12v dc for telemetering
F. Two circuit breakers for the pumps and two contactors
G. Transfer switch with receptacle to connect portable emergency generator. The switch enclosure shall be 316 stainless steel, NEMA 4X.

    1. Transfer switch shall be manually operated, 100 Amp, 240 V, 3 phase.
    2. Receptacle shall be four-wire, four-pole Crouse-Hinds Catalog AR1041 model M3 or equal.

H. MultitSmart Pump Control System. In order to maintain consistency in operation, control, programming, data collection, maintenance and spare parts, the pump control system shall be a MultiSmart Pump Controller and RTU as manufactured by MultiTrode Inc. USA, (561)994-8090, www.multitrode.com. The Controller shall interface with an existing OMNEX wireless system. The following boards shall be included:

    1. Pump Control/General I/O
    2. CPU Board
    3. DSP Board
    4. Motor Protection

I. Rechargeable battery system of sufficient voltage and capacity to maintain all electronic systems for 12 hours.
J. The level indicator shall be of the conductance probe type compatible with the MultiSmart Pump Control System. The probe shall be constructed from PVC tubing with molded sensor units at regular intervals along the probe. Each sensor unit shall be PVC injected to prohibit ingress of moisture, and the sensor material shall be stainless steel. The probe shall be suspended on its own cable and connected to a stainless steel hook which shall hang from a stainless steel angle containing a polyurethane squeegee pad positioned in the opening into the wet well, so that the probe can be removed without entering the wet well. The squeegee shall have a hole and slot, enabling the probe to be pulled through and cleaned. Probe cable shall be run in a separate conduit away from any high voltage cables. Ten sensors shall be spaced along the length of the probe assembly,

CONTRACT NO
CONTRACT CHANGE ORDER NO 6GSZ
SHEET 62 OF 115

each individually connected to a correspondingly numbered flexible cable. The molded sensor unit shall contain two sensors mounted on opposite sides of sensor unit. The probe shall be pressure injected with an epoxy resin to encapsulate all internal components and connections to form a rigid, homogenous unit. Each sensor unit containing the two sensors shall be rotated 90 degrees to the previous sensor unit to eliminate tracking between sensors. The cable shall be encoded with number and text along the entirety of the cable and at intervals not greater than 200mm for identification. The flexible cables shall be capable of supporting the weight of the probe and cable without the need for additional support. The cable shall be secured to the top of the probe by a synthetic rubber compression fitting.

INSTALLATION

Equipment shall be installed in accordance with manufacturer's instructions. Guide rails shall be secured in place. Each pump unit shall be connected to its corresponding discharge nozzle through the rail system. Smooth, correct operation of the lifting mechanism shall be demonstrated. Connect power and control cables and verify continuity and function.

Piping shall be supported as shown on the plans and in conformance with these special provisions. Pipes shall be held in place by hangers, supports, pipe rests, anchors, sway braces, guides or other special hangers. Allowances shall be made for expansion and contraction. Pipes shall have hangers or supports every 3 meters. Pipes shall be supported at each joint. Vertical pipes shall be supported with clamps or straps. Horizontal and vertical piping shall be securely supported and braced to prevent swaying, sagging or flexing of joints.

Cleaning and closing of pipe

The interior of all pipes shall be cleaned before installation. All openings shall be capped or plugged as soon as the pipe is installed to prevent the entrance of any materials. The caps or plugs shall remain in place until their removal is necessary for completion of the installation.

TESTING

Piping through the valve box shall be tested in accordance with the provisions in Section 20-5.03H(1), "Method A", of the Standard Specifications, with no leakage or pressure drop. The Contractor shall furnish pipe anchorages to resist thrust forces occurring during testing. All leaks shall be repaired, and all defective materials shall be replaced by the Contractor at the Contractors expense.

All pressure testing and necessary repairing of lines shall be completed prior to backfilling, or otherwise covering the lines.

Each end of line shall be capped prior to and after the testing

The Control System shall be initially programmed in default condition. All available signals shall be connected to the Pump Control System.

In addition to its standard programming, the unit shall be configured to alarm through the OMNEX wireless system to be installed by others.

MEASUREMENT AND PAYMENT

Quantities of sanitary sewer lift station will be measured by the unit as determined from actual count in place.

The contract unit price paid for sanitary sewer lift station shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in furnishing and installing the sanitary sewer lift station, complete in place, including foundations, valve vaults, sewer manhole, pump enclosures, and excavation and backfill, as

shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69571

SHEET 63 OF 115

10-1.19 SEWER PIPE

Scope

This work shall consist of furnishing and installing Ductile Iron (DIP), Vitrified Clay (VCP), and Cast Iron (CIP) sewer pipes including excavating, lagging, backfilling and other incidental work, necessary or required for a complete, satisfactory sewer installation, in accordance with the details shown on the plans, these special provisions, and as directed by the Engineer.

Design Requirements

150 mm Ductile Iron Pipe

A. Ductile iron pipe shall be class 50 and comply with ANSI A21.51 (AWWA C151). Pipe joints shall comply with the following:

Type of Joint	Specification
Rubber Gasket Push-on Joint	ANSI A21.11 (AWWA C111)
Mechanical Joint	ANSI A21.11 (AWWA C111)
Flanged Joint	ANSI B16.1, B16.2, and A21.10 (AWWA C110)
Flanged Joint (Threaded Flanges)	ANSI B2.1

B. All rubber gasket, push-on, mechanical and flanged joint fittings for ductile iron pipe shall be manufactured in accordance with ANSI A21.10 (AWWA C110).

C. The interior surfaces of ductile iron pipe and fittings shall be lined with a uniform thickness of cement mortar then sealed with an asphaltic coating and/or polyethylene encasement outside coating in accordance with ANSI A21.51 (AWWA C151). The outside surfaces of ductile iron pipe and fittings for general use shall be coated with a asphaltic coating and/or polyethylene encasement in accordance with ANSI A21.10 or ANSI A21.51.

300 mm Vitrified Clay Pipe

A. Vitrified clay pipes (VCP) shall conform to the ASTM Designation: C700 "Standard Specifications for Extra Strength Clay Pipe," except as modified by the plans and these special provisions.

B. Joints for VCP plain-end pipe sewers 300 mm or smaller in diameter may be rubber compression couplings or composition coupling with stainless steel bands Class 316. Rubber compression couplings with Class 316 stainless steel bands shall be in accordance with the requirements of ASTM Designation C425. Composition couplings with Class 316 stainless steel bands shall be in accordance with the requirements of ASTM Designation : C425 "Tentative Specifications for Compression Couplings for Vitrified Clay Plain-End Pipe".

150 mm Cast Iron Pipe

A. Cast iron pipes (CIP) shall conform to the following standards:
   a. ANSI A21.8 (AWWA C101), "Thickness Design of Cast Iron Pipe."
   b. ANSI A21.6 (AWWA C106), "Cast Iron Pipe Centrifugally Cast in Metal Molds for Water or Other Liquids."
   c. ANSI A21.8 (AWWA C108), "Cast Iron Pipe Centrifugally Cast in Sand Lined Molds for Water or Other Liquids."
   d. ANSI A21.11 (AWWA C111), "Rubber Gasket Joints for Cast Iron Pressure Pipe and Fittings."

B. All joint fittings shall be push-on or mechanical.

C. The linings shall be double thickness of cement with bituminous seal coat.

Quality Assurance

A. The manufacturer of each shipment of pipe shall be required to supply a statement certifying that each lot or load of pipe has been manufactured and tested in accordance with these special provisions.

Execution

A. At all times when the work of installing pipe is not in progress, including worker break times, close the ends of the pipe with a tight-fitting, vermin-proof and child-proof, cap or plug. Do not permit trench water to enter the pipe. Do not place tools, clothing, or other materials in the pipe. The Contractor shall maintain the interior of the pipe in a sanitary condition free from foreign materials.

B. Where pipe sections less than the standard 3.96m or 6.10m pipe lengths are required, the pipe sections shall be installed in accordance with the manufacturer's installation guide and shall only be used with the approval of the Engineer. The minimum pipe length permitted is 1.52m when used to connect to manholes and cleanouts. The minimum pipe length permitted for stub outs shall be 900mm.

Pipe Installation

The Contractor shall furnish and install all pipe, specials, fittings, closure pieces, supports, gaskets, jointing materials, and all other appurtenances as shown and as required to provide a complete and workable installation. Pipe installation shall be as recommended in UNI-B-5 except as modified below and as shown on the plans.

A. Inspect each section of pipe prior to lowering the pipe into the trench. Thoroughly clean the ends of the pipe. Remove foreign matter and dirt from inside of the pipe and keep pipe clean during and after installation.

CONTRACT NO. ... CONTRACT CHANGE ORDER NO 1951
SHEET 66 OF 115

B. Install pipe according to the manufacturer's approved order of installation to the proper lines and grades as shown on the plans.

1. Pipe shall be installed with pipe bells up-grade. Lay pipes uphill if the grade exceeds ten percent (10%).

2. Installation tolerances for the pipe shall not vary more than 50mm horizontally or 25mm vertically from the alignment and elevations shown on the plans.

3. Install the pipe such that the identification markings on each pipe section are continuously aligned for the total length of the pipeline alignment. Orient the strip marking upward to the 12 o'clock position (top) of the trench opening.

4. Avoidance of reverse slope: Any pipeline installed with reversed slope, as evidenced by ponding of water or sag, is not allowed. Any such pipeline shall be removed and replaced (at proper line and grade) to the nearest upstream and downstream sewer structure as directed by the Engineer.

C. The pipe shall have firm bearing along its full length, and bell holes shall be provided at each joint to permit visual inspection of the joint and prevent the pipe from being supported by the bell end or coupling.

A. Field cutting and milling shall be accomplished to equal the quality of shop-fabricated ends in accordance with the manufacturer's written instructions.

B. Pipe Assembly: Assemble the pipe joint using the lubricant supplied by the pipe manufacturer. Insert the spigot end into the bell or coupling to the proper insertion mark. Check that the elastomeric ring has not left the groove during assembly by passing a feeler gauge around the completed joint. Drive the spigot end into the bell in accordance with the manufacturer's recommendations. Stabbing shall not be permitted.

F. Horizontal or vertical curve alignments shall be accomplished as required, in accordance with the manufacturer's recommendations. A combination of random pipe lengths, bending, and joint deflection shall be utilized to create smooth radius curves in accordance with the manufacturer's recommendations and as directed by the Engineer.

Connection to Existing Sewer System

A. Connection to the existing sewer system at an existing manhole or dead end shall be made as shown on the plans in accordance with these special provisions.

Contractor Responsibility

It is the Contractor's responsibility to visit the site and ascertain the present site conditions for the entire reach prior to beginning work. Any discrepancies between existing drawings and field conditions shall be brought to the attention of the Engineer immediately.

Traffic Control

The Contractor shall submit a traffic control plan to the agency having jurisdiction for its approval prior to starting the work.

Manholes

Seals around manholes shall be in accordance with the manufactures recommendations.

Storm Water Pollution Prevention Plan (SWPPP) Requirements

The Contractor shall abide by the conditions of the Regional Water Quality Control Board, General Construction Activity Storm Water Permit and the project Storm Water Pollution Prevention Plan (SWPPP).

Examination of Approved Plans, Specifications and Site

The Contractor shall carefully examine the site of the proposed work, the plans, the specifications, and all other pertinent documents. Contractor shall be satisfied as to the character, quality and quantities of work to be furnished, and as to the requirements of the plans and these special provisions. The District will not be liable for any loss sustained by the Contractor as a result of any variance between conditions as shown on the plans and the actual conditions revealed during the progress of the work or otherwise.

Quality of Materials

The work shall be performed in a thorough, worker-like manner in accordance with the plans, and these special provisions. All work shall conform to the lines and grades shown on said plans.

At least one member of the Contractor's workforce who is thoroughly familiar with the specified requirements of work and who is completely trained and experienced in the construction skills necessary for satisfactory completion of the work shall be present at the site, directing the work, at all times.

Adequate number of skilled workers and sufficient and appropriate equipment shall be present at the site prior to commencing daily construction operations.

The Engineer shall inform the Contractor if any person in the employ of the Contractor fails to or refuses to comply with the requirements of these special provisions, or appears to the Engineer to be incompetent or unfit, or to act in a disorderly, improper or unsafe manner. It shall be the Contractor's responsibility to dismiss any such person from the work site or take any other action deemed appropriate by the Contractor.

All equipment, materials, and supplies to be incorporated in the work shall be new. All equipment, material and supplies shall be produced in a good and workmanlike manner.

The Contractor may offer as substitution any material, process, or article substantially equal or better in every respect to that so indicated or specified; provided, however, that if the material, process, or article offered by the Contractor is not, in the opinion of the Engineer, substantially equal or better in every respect to that specified, then the Contractor must furnish the material, process, or article specified or one that in the opinion of the Engineer is substantially equal or better in every respect.

Shop Drawing Procedures -

A. Contractor shall submit six (6) copies of all shop drawings, submittals, and manufacturer's cut sheets detailing the methods and materials intended for use on the project. Submittals shall be consecutively numbered, shall be accompanied by a transmittal letter marked with the number and title of the submittal, name of the project, name and address of the Contractor and supplier, along with contact persons for same, and shall be checked by and marked with the approval of the Contractor. In addition, any submittals that deviate from the requirements of the Contract shall be clearly noted and explained in the transmittal letter.

B. The Engineer will review the submittals so provided, and will return the submittals marked to indicate that submittals are approved or must be returned for revision. The Engineer shall be allowed a minimum of five (5) working days for the review of submittals. Submittals returned for revision must be corrected as noted and the Contractor must re-submit shop drawings as noted above until approved by the Engineer. Review and approval of shop drawings by the Engineer shall not relieve the Contractor of the responsibility for executing the work in accordance with these special provisions, using proper methods of construction, nor from furnishing materials or work required but not indicated on the submittals.

C. Construction shall not begin on relevant portions of the work until shop drawing submittals have been approved by the Engineer. Shop drawings shall be submitted in a timely manner so as not to delay construction of the work.

Materials

All materials shall be new and unused, of the quality defined in these special provisions, and approved by the Engineer. All materials to be used within a specific project and intended for equivalent uses shall be identical as to manufacturer and model number. Materials not identical as to manufacturer and model number to those approved by the Engineer, materials that are damaged, or materials that are otherwise unacceptable to the Engineer shall be rejected and immediately removed from the job site.

A. The Contractor shall schedule a Pre-Construction Conference with the SFPUC's Inspection Department at least five (5) days prior to beginning any water or sewer work in the field. As a minimum, the attendees at this conference shall include:

B. The purpose of this meeting is to review the plans for the project relative to the requirements of these special provisions, and the plans. The Contractor shall be prepared to discuss, in detail, the project schedule, and shall provide the Engineer with any schedules, submittals, lists, permits, or other information required by the Engineer, by these special provisions or by the plans.

Inspection

All work and materials furnished shall be subject to inspection for compliance with these special provisions and all other appropriate specifications.

The SFPUC shall at all times have access to the work wherever it is in preparation or progress and the Contractor shall provide proper facilities for such access and for inspection. The Contractor shall provide adequate safe means by which to inspect the work.

Failure or oversight of any Inspector to condemn defective materials at the time of use, or to condemn improper work at the time it is performed, shall not diminish the Contractor's obligations to meet the requirements of the plans and these special provisions. The Contractor shall remove and replace any faulty materials and work at no additional cost to the Engineer upon discovery of the defects or upon receipt of notice from the Engineer to do so.

Defective work or material may be rejected prior to the date of acceptance of the work notwithstanding that such defective work or material may have been previously inspected. Acceptance shall not constitute approval of latent defects or waiver of maintenance requirements.

Any work covered up or otherwise rendered inaccessible without approval or consent of the Engineer must, if required by SFPUC, be uncovered for examination at the Contractor's expense. Any work done in the absence of the Engineer without written permission shall be subject to rejection.

Environmental Control

The Contractor shall abide by all applicable local, state and federal regulations, and by the conditions of the Regional Water Quality Control Board.

The Contractor shall provide effective measures where necessary to prevent operations from producing dust in an amount damaging to property or causing a nuisance as determined by the Engineer. The Contractor shall be responsible for any damage due to dust originating from its operations.
The Contractor shall anticipate and correct any erosion problem arising from its operations.

CONTRACT NO. CONTRACT CHANGE ORDER NO 69827
SHEET 70 OF 115

Public Safety and Traffic Control

A. The Contractor shall at all times conduct operations in a manner causing the minimum obstruction and inconvenience to public traffic. The Contractor shall not interfere with the normal operation of public transit vehicles unless otherwise authorized. Trench excavations shall conform with requirements of Section 5-1.02A, "Trench Excavation Safety Plans", of the Standard Specifications. In excavations where sand and or other non-cohesive material is encountered, placing of the necessary protective systems shall commence before a depth of 1.5 meter is attained. At night, lights shall mark all open work and obstructions. The Contractor shall install and maintain all signs, lights, flares, barricades, traffic plates, railings, runways, stairs, bridges and other equipment necessary to safeguard the public. Safety instructions received from governmental authorities shall be followed, but compliance with such instructions shall not diminish the Contractor's responsibility or liability for accidents to workers or damage or injury to persons or property.

In accordance with generally accepted construction practices, the Contractor shall be solely and completely responsible for conditions of the job site, including safety of all persons and property during performance of the work, and the Contractor shall fully comply with all state, federal, and other laws, rules, regulations, and orders relating to the safety of workers and others.

The right of the Engineer to conduct construction review or observation of the Contractor's performance does not include review or observation of the adequacy of the Contractor's safety measures in, on, or near the construction site.

The Contractor shall take immediate action to correct any condition adversely affecting public safety.

B. The Contractor shall submit a traffic control plan to the Engineer and shall obtain approval prior to starting the work.

Protection of Existing Facilities

A. The Contractor's attention is directed to the provisions in Section 15, "existing Highway Facilities," of the Standard Specifications and these special provisions. Attention is directed to the possible existence of pipe and other underground improvements that may or may not be shown on the plans. Once discovered, the Contractor shall preserve and protect all such improvements whether shown on the plans or not. The Contractor shall provide and install suitable safeguards, and shall be responsible for the care and protection of all existing sewer and water pipe, telephone conduit, gas mains, culverts, or other above-ground or below-ground facilities or structures which may be encountered in or near the area of work. It shall be the responsibility of the Contractor to notify each agency of jurisdiction and utility company and to make arrangements for location of facilities prior to beginning construction. In the event of damage to existing facilities during the progress of the work, such facilities shall be replaced or restored to original condition, as determined by the Engineer, at the Contractor's expense.

B. The Contractor shall be responsible for determining in advance the location, elevation, alignment and pipe type and size of all existing pipelines to which connections are to be made. Potholing to determine location will be allowed only after providing the Engineer with three (3)

CONTRACT CHANGE ORDER NO 16457
SHEET 71 OF 115

day's advance notice. The Contractor is required to contact Underground Service Alert (USA) at 1-800-227-2600 or 1-800-422-4133 for mark-out of all utilities in the area of the work.

C. If the Contractor, either before commencing work or during the course of the work, finds any discrepancy between specifications or drawings and the physical conditions at the site of the work, Contractor shall promptly notify the Engineer in writing of such discrepancy.

Protection of Workers in Tench Excavation

Whenever work involves trench excavation, the Contractor shall provide all necessary shoring, bracing, sloping, or other provisions to be made for worker protection from hazard of caving ground during the excavation. If such plan varies from the shoring system standards established by the Construction Safety Orders of the Division of Industrial Safety, a Civil Engineer or Structural Engineer registered in the State of California shall prepare the plans.

Contractor shall comply with the Safety Orders of California, Code of Regulations: Title 8, Section 1539 (Excavation, Trenches, Earthwork).

Work within Confined Spaces

The Contractor shall comply with all Federal and State regulations for confined space entry. Work inside confined spaces as defined by the applicable regulations shall not be undertaken until all the tests and safety provisions of the Code of Federal Regulations 1910.146, and the Safety Orders of the California Code of Regulations Title 8 Article 108 sections 5156 et seq. for confined space entry have been performed and the area is verified as safe to enter.

Construction Equipment

The Contractor shall furnish appropriate construction equipment to perform the work in accordance with the plans and these special provisions. Such equipment shall be in a good state of repair and shall be maintained in such state during the progress of the work. In no case shall the manufacturer's rating or capacity for any equipment be exceeded.

Storage of Materials

All materials for use in the work shall be stored by the Contractor in such manner as to prevent damage from exposure to the elements, admixture of foreign materials, or from any other cause. The Contractor shall be entirely responsible for damage or loss by weather or other causes. The Material Safety Data Sheets (MSDS) for all products to be used in the work shall be kept on-site by the Contractor, and the material manufacturer's recommendations for proper storage of its products shall be strictly followed.

Power for Construction Purposes

Contractor shall make all arrangements for electrical power required during construction.

Housekeeping During Construction and Final Cleanup

A. The Contractor shall provide suitable drainage and shall erect such temporary structures as are necessary to protect the work or materials from damage. The Contractor shall rebuild, repair, restore, and make good all injuries, losses, or damages to any portion of the work or the materials occasioned by any cause before the acceptance of the work by the Engineer and shall bear the expense thereof.

B. The Contractor shall, at all times during the course of the work, maintain work areas and all adjacent properties and public access roads free from accumulations of waste, debris, rubbish or construction materials.

C. The Contractor shall conduct cleaning and disposal operations to comply with local ordinances and anti-pollution laws.

D. Dry materials and rubbish shall be moistened to prevent blowing dust. Loads of excavated materials leaving the site or being imported to the site shall be covered or moistened to prevent blowing dust.

E. Upon completion of the work, and before making application for acceptance of the work, the Contractor shall clean all rights-of-way, roads, borrow pits, and all other grounds occupied by him in connection with the work. All rubbish, excess materials, temporary structures and equipment shall be removed. All parts of the work shall be left in a neat and presentable condition, as determined by the Engineer.

Hazardous Wastes and Unknown Physical Conditions

If conditions listed below are found during construction, or if any other conditions are found during construction that may be detrimental to the SFPUC's facilities being constructed, or to the health and safety of the public, the Contractor shall promptly notify the Engineer.

A. Material that the Contractor or Engineer believes may be hazardous waste, as defined in Section 25117 of the Health and Safety Code, and is thus required to be removed to a Class I, Class II, or Class III disposal site in accordance with the provisions of existing law. If such material is discovered, Contractor shall immediately cease work and shall not disturb the job site except as required to protect public safety.

B. Subsurface or latent physical conditions at the site differing from those indicated.

C. Unknown physical conditions at the site of any unusual nature, different materially from those ordinarily encountered and generally recognized as inherent in work of the character provided in the Contract.

The Contractor shall promptly inform the Engineer of any such conditions found during construction. The Engineer shall investigate the conditions, and if it finds that the conditions do materially differ from those shown or expected, or do involve material that may be hazardous

CONTRACT NO. 6987
CONTRACT CHANGE ORDER NO
SHEET 23 OF 45

waste, Contractor shall cease work in the impacted area. If material that may be hazardous waste is discovered, the Engineer shall insure that the appropriate government agencies are contacted prior to any further work being performed and that a solution is implemented.

Pipe Zone

The pipe zone includes the full width of the trench from 150mm below the bottom of the pipe to 300mm above the top of the pipe and extends into manhole or vault excavations to the point of connection to or penetration of such structure.

Trench Zone

The trench zone includes the portion of the trench from the top of the pipe zone to the bottom of the pavement zone in paved areas, or to the existing surface in unpaved areas, and extends into manhole or vault excavations above the pipe zone.

Pavement Zone

The pavement zone includes the concrete or asphalt concrete pavement and aggregate base section placed over the trench zone and extends into manhole or vault excavations above the trench zone.

Access

The Contractor shall provide continuous, unobstructed access to all driveways, water valves, hydrants, or other property or facilities within or adjacent to the work areas.

Blasting

Blasting for excavation shall not be performed without the written permission of the Engineer. Procedures and methods of blasting shall conform to all Federal, State and local laws and ordinances.

Pipe Jacking

Tunneling or jacking shall not be used unless specified or approved in writing by the Engineer.

Excess Excavated Material

The Contractor shall remove and legally dispose of all excess excavated material and demolition debris.

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO 6957

SHEET 74 OF 115

Materials

The Contractor shall furnish backfill material as specified below. All materials used in and above the pipe zone shall be capable of attaining the required relative density.

Imported Granular Material – Pipe Zone

Imported Granular Material shall be used within the Pipe Zone for installations of all pressure pipe and tubing.

The Imported Granular Material shall be quarry waste (decomposed granite) free from organic matter. Material shall have a sand equivalent value of not less than 30 per ASTM D 2419, a coefficient of uniformity of 3 or greater, and shall conform to the following gradation:

U.S. Standard Sieve Size	Percent Passing By Weight
25mm	100
19mm	90 – 100
4.75mm	50 – 95
600µm	25 – 45
75µm	3 – 15

Native materials may not be used in lieu of Imported Granular Material within the Pipe Zone unless such native materials meet all of the requirements specified above and specific written permission has been obtained from the Engineer.

Crushed Rock – Pipe Zone

Crushed Rock shall be used within the Pipe Zone for installations of all non-pressure pipe. Crushed rock shall be clean crushed stone free of organic matter. Crushed rock shall be certified to contain less than 1% asbestos by weight or volume and shall conform to the following gradation and requirements:

U. S. Standard Sieve Size	Percent Passing By Weight
25mm	100
19mm	90-100
12.5mm	30-60
9.5mm	0-20
4.75mm	0-5
2.36mm	----

CONTRACT CHANGE ORDER NO 6951
CONTRACT NO 04-0L6201
SHEET 73 OF 115

ASTM C 131 Testing Grade		B
Test	Test Method	Requirement
Percentage Wear	ASTM C 131	----
100 Revolutions	----	15 Maximum
500 Revolutions	----	52 Maximum

Imported Granular Material – Trench Zone

Imported Granular Material shall be used within the Trench Zone for installations of all pressure pipe and tubing and all non-pressure pipe.

Imported Granular Material for use within the Trench Zone shall conform in all ways to Imported Granular Material specified for use within the Pipe Zone.

Native materials may not be used in lieu of Imported Granular Material within the Trench Zone unless such native materials meet all of the requirements specified for Imported Granular Material within the Pipe Zone and specific written permission has been obtained from the Engineer.

Sand-Cement Slurry

Sand-cement slurry shall consist of two sacks, 85.3kg (188 pounds) of Portland cement per cubic yard of sand and sufficient moisture for workability. District approval is required for use of sand-cement slurry as a backfill material.

Trench Plugs

Trench plugs consisting of compacted Imported Granular Material or sand-cement slurry shall be installed on piping systems that are backfilled with crushed rock.

Filter Fabric

Filter fabric shall be manufactured from polyester, nylon, or polypropylene. Material shall be of non-woven construction and shall meet the following requirements:

Grab tensile strength (ASTM D 4632): 45.4kg (100 lbs) minimum for a 25mm (1") raveled strip.
Weight (ASTM D 3776): 152.6g/m^2 (4.5 oz./yd^2)
Apparent opening size (ASTM D 4751): 0.150mm (0.006")

Dewatering

A. The Contractor shall provide and maintain at all times during construction ample means

CONTRACT NO. 1471-CI26 WSI
CONTRACT CHANGE ORDER NO 6951
SHEET 76 OF 115

and devices to promptly remove and dispose of all water from any source entering excavations or other parts of the work. Dewatering shall be performed by methods that will ensure a dry excavation and preservation of the final lines and grades of the bottoms of excavations. Dewatering methods may include well points, sump points, suitable rock or gravel placed as pipe bedding for drainage and pumping, temporary pipelines, or other means, all subject to the approval of the Engineer. The cost of all dewatering activities shall be borne by the Contractor.

B. Sewer systems shall not be used as drains for dewatering trenches or excavations, nor for disposal of collected or accumulated groundwater, without the approval of the agency of jurisdiction.

C. Concrete shall not be poured in water, nor shall water be allowed to rise around concrete or mortar until it has set at least four hours.

D. The Contractor is responsible for meeting all Federal, State, and local laws, rules and regulations regarding the treatment and disposal of water from dewatering operations at the construction site.

Shoring and Shielding

A. The Contractor's design and installation of shoring shall be consistent with the rules, orders, and regulations of CAL-OSHA.

B. Excavations shall be shored, sheeted, and supported such that the walls of the excavation will not slide or settle and all existing improvements of any kind, either on public or private property, will be fully protected from damage.

C. The sheeting and shoring shall be arranged so as not to place any stress on portions of the completed work until the general construction has proceeded far enough to provide ample strength.

D. Care shall be exercised in the moving or removal of trench shields, sheeting, and shoring to prevent the caving or collapse of the excavation faces being supported.

Correction of Overexcavation

Overexcavations shall be corrected by backfilling with approved imported granular material or crushed rock, compacted to 90% relative compaction, as directed by the Engineer.

Foundation Stabilization

A. When unsuitable soil materials are encountered, the unsuitable material shall be removed to the depth determined necessary in the field by the Engineer. The sub-grade shall be restored with compacted Imported Granular Material or crushed rock as recommended by the Engineer. Place the appropriate bedding or base material on this restored foundation.

CONTRACT CHANGE ORDER NO 6457
SHEET 77 OF 115

B. When rock encroachment is encountered, the rock shall be removed to a point below the intended trench or excavation sub-grade as determined necessary in the field by the Engineer. The sub-grade shall be restored with compacted Imported Granular Material as recommended by the Engineer. Place the appropriate bedding or base material on this restored foundation.

C. When excessively wet, soft, spongy, or similarly unstable material is encountered at the surface upon which the bedding or base material is to be placed, the unsuitable material shall be removed to the depth determined necessary in the field by the Engineer. Restore the trench with crushed rock enclosed in filter fabric as directed by the Engineer. Larger size rocks, up to 75 mm, with appropriate gradation, may be used if recommended by the Engineer. Place the appropriate bedding or base material on this restored foundation.

Trench Excavation and Placement of Bedding

A. Excavate the trench to the lines and grades shown on the drawings with allowance for 150mm of pipe bedding material.

B. The maximum length of open trench shall be 152m except by permission of the Engineer, City or County. The distance is the collective length at any location, including open excavation and pipe laying, which has not been backfilled to the elevation of the surrounding grade.

C. Trench walls shall be sloped or shored per the requirements of CAL-OSHA.

D. The trench bottom shall be graded to provide a smooth, firm, and stable foundation that is free from rocks and other obstructions.

E. Place the specified thickness of bedding material over the full width of the trench. Grade the top of the pipe base ahead of the pipe laying to provide a firm, uniform support along the full length of pipe.

F. Excavate bell holes at each joint to permit proper assembly and inspection of the entire joint.

G. Trenches for main pipelines and all appurtenances shall be backfilled with the materials and methods as specified for the Pipe Zone, Trench Zone and Pavement Zone.

H. Trench depth shall be as required to install pipelines in accordance with the plans and these special provisions. Unless shown otherwise in the plans, the minimum cover for pipelines shall be as follows:

Pipeline Application	Minimum Cover Required
Potable Water	0.91m
Recycled Water	1.22m
Sewer	1.52m

I. Final street sub-grade shall be established prior to the excavation of pipeline trenches. Minimum cover above pipe shall be 600mm for hydrotesting.

Manhole and Vaults

A. The Contractor shall prepare an excavation large enough to accommodate the structure and permit grouting of openings and backfilling operations. The walls of the excavation shall be sloped or shored per the requirements of CAL-OSHA.

B. Manholes and vaults shall be placed at the location and elevation shown on the plans, on undisturbed soils and 150mm of compacted crushed rock base.

C. Manhole and vault excavations shall be backfilled with the materials and methods as specified for the Pipe Zone, Trench Zone and Pavement Zone.

Compaction Requirements

A. Compaction shall be accomplished by mechanical means. Consolidation by water settling methods such as jetting or flooding is prohibited.

B. If the backfill fails to meet the specified relative compaction requirements; the backfill shall be reworked until the requirements are met. All necessary excavations for density tests shall be made as directed by the Engineer.

C. Compaction tests shall be performed at random depths, and at random intervals not to exceed 45m, as directed by the Engineer.

D. Relative compaction shall be determined by the impact or field compaction test made in accordance with ASTM D 1557 Procedure C.

E. Unless otherwise shown on the drawings or otherwise described in the specifications for the particular type of pipe installed, relative compaction in pipe trenches shall be as follows:

1. Pipe zone - 90% relative compaction.
2. Trench zone - 90% relative compaction.
3. Structural section in paved areas - per agency requirements, 95% minimum.
4. Imported Granular Material for over excavation or foundation stabilization - 90% relative density.

F. All excavations are subject to compaction tests.

Trench Plugs

Trench plugs shall be installed at 60m intervals along the entire length of piping systems. Trench plugs shall be 3m in length and shall encompass the entire pipe zone. Additional trench plugs may be required as directed by the Engineer.

Pipe Zone Backfill

A. Care shall be taken in placing the imported granular backfill material simultaneously around the main pipeline and appurtenance pipes so that the pipe barrel is completely supported and that no voids or uncompacted areas are left beneath the pipe or on the sides of the pipe. Care shall be taken to place material simultaneously on both sides of the pipe to prevent lateral movement. This area shall be mechanically compacted to attain 90% relative density. Care shall be taken when compacting appurtenance laterals 50mm and smaller to prevent the crushing or denting of the copper lateral. Additional lifts of 300mm or less thickness may be required on 400mm or larger diameter pipe to attain complete support of the haunch area. Soils tests may be taken on this layer of backfill.

B. After the spring line backfill has been approved by the Engineer, backfill of the remainder of the Pipe Zone may proceed. Do not drop sharp, heavy pieces of material directly onto the pipe or the tamped material around the pipe.

C. Place and compact the imported granular material at a maximum of 300mm lifts. Compact all material placed in the Pipe Zone by mechanical methods. Sand cone tests shall be taken on this layer of backfill.

D. The use of a backhoe-mounted compaction wheel is prohibited within the pipe zone to 300mm above the top of the pipe.

E. Under no circumstances shall consolidation by water settling or water-setting methods (i.e. jetting, diking, etc.) be permitted.

Trench Zone Backfill

A. After the Pipe Zone material has been placed, compacted, approved by the Engineer, backfill in the Trench Zone may proceed.

B. Compaction using vibratory equipment, tamping rollers, pneumatic tire rollers, or other mechanical tampers shall be performed with the type and size of equipment necessary to accomplish the work. The backfill shall be placed in horizontal layers of such depths as are considered proper for the type of compacting equipment being used in relation to the backfill material being placed. Each layer shall be evenly spread, properly moistened, and compacted to the specified relative density. The Contractor shall repair or replace any pipe, fitting, manhole, or structure damaged by the installation operations as directed by the Engineer.

Pavement and Backfill Restoration

A. After the Trench Zone material has been placed, compacted, approved by the Engineer; backfill in the Pavement Zone may proceed as necessary in accordance with the requirements of the agency having jurisdiction.

CONTRACT CHANGE ORDER NO 10257
SHEET 80 OF 115

B. Replace bituminous and concrete pavement, curbs, and sidewalks removed or damaged during construction in accordance with the requirements of the agency having jurisdiction.

Measurement and Payment

DIP, VCP and CIP sewer pipes will be measured by the meter along the centerline of the pipes.

The contract unit price paid per meter for DIP, VCP and CIP sewer pipes shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in installing pipe, complete in place, including structure excavation and structure backfill and connecting new pipe to existing or new facilities as shown on the plans, and as specified in these special provisions, and as directed by the Engineer.

10-1.20 SEWER MANHOLE

This work shall consist of constructing precast concrete manholes complete with cones, frames, covers, gratings, asphalt pavement around the ring, steps, excavating, lagging, backfilling, restoring pavement and other incidental work, necessary or required for a complete, satisfactory installation, in accordance with the details shown on the plans and these special provisions.

Manholes shall be constructed to conform to the improved street surface. In unimproved areas, if the ground surface is below the official grade, the manhole shall be constructed to conform to such official grade unless otherwise indicated on the plans.

Precast Concrete Manholes

This section includes materials, testing, and installation of precast concrete manholes for sewers or for access to below grade water mains and appurtenances.

Reference Standards

The publications listed below form part of this specification to the extent referenced and are referred to in the text by the basic designation only. Reference shall be made to the latest edition of said standards unless otherwise called for.

ASTM A 48	-	Gray Iron Castings
ASTM C 478	-	Precast Reinforced Concrete Manhole Sections
ASTM C 478M	-	Precast Reinforced Concrete Manhole Sections [Metric]
ASTM C 923	-	Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes and Laterals

Access Manholes for Watermains and Appertunances

A. 1500 mm diameter manholes shall be used, unless otherwise noted on the plans, to access water main appurtenances.

B. A variety of manhole diameters and configurations are utilized on various water main appurtenances and devices.

Sewer Manholes

1500 mm diameter manholes shall be used for sewer applications.

Drop Manholes

1500 mm diameter drop manholes shall be used for sewer applications and constructed only at locations shown on the plans.

Corrosion Protection

A corrosion protection lining and/or coating as described in this specification shall be applied to the interior of manholes for sewer mains 450mm or larger, and to all drop manholes regardless of sewer pipe size.

Damp-Proofing

A damp-proofing material shall be applied to the exterior portions of manholes in accordance with these special provisions and as directed by the Engineer when located at or below the water table or when moisture or seepage is indicated.

Joint Sealing

Joint sealant shall be used to form a continuous watertight seal on the concrete base and between successive precast concrete manhole or vault sections.

Vacuum Testing of Manholes

Vacuum testing of manholes is intended for testing precast concrete manhole sections to demonstrate the integrity of the installed materials and construction procedures.

Manholes

A. Precast concrete manhole components shall be in accordance with ASTM C 478.

B. Manhole components shall be designed for H-20 highway wheel loading and specific site conditions.

C. Manhole bases may be either precast or cast-in-place, as appropriate for the application, with a formed recess shaped to match the first precast shaft section. The manhole base shall extend 250mm below the bottom of the lowest pipe and 150mm above the top of the largest pipe.

D. Manhole shafts shall be fabricated only from precast shaft sections, eccentric cone sections and grade rings.

E. Pipe penetrations for sewer applications shall incorporate a watertight flexible pipe connector or ring-type seal according to the method of manhole construction. Precast manholes shall utilize either an integrally cast embedded pipe connector, or a boot-type connector installed in a circular block out opening in accordance with ASTM C 923. Connections to existing manholes shall utilize a boot-type connector per ASTM C 923 installed in a cored opening. Cast-in-place bases shall incorporate a ring-type seal on the pipe to be embedded in the concrete.

Crushed Rock Base and Backfill Materials

Crushed rock base and backfill materials shall be in conformance with the provisions in "Sewer Pipe" of these special provisions.

Manhole Frames and Covers

A. Manhole frames shall be 900mm in diameter with two concentric covers, made of cast-iron in accordance with ASTM A 48, Class 30. Locking frames and covers may be required as determined by the Engineer.

B. Frames and covers shall be designed for H-20 highway wheel loading.

C. Covers shall have the words "'AGENCY NAME' and 'WATER', 'RECYCLED WATER', or, 'SEWER'" cast into the cover as appropriate to the application. No other lettering will be permitted on the top portion of the cover.

D. Castings shall be smooth, clean, and free from blisters, blowholes, and shrinkage. Mating surfaces of the frame and cover shall be machined to prevent movement of the lid. Frames and covers shall be match marked in sets before shipping to the site.

E. All castings shall be dipped twice in a preparation of asphalt or coal tar and oil applied at a temperature of not less than 143.3 degrees C (290 degrees F) nor more than 154.4 degrees C (310 degrees F) and in such a manner as to form a firm and tenacious coating.

Concrete

Concrete used for manholes and appurtenances shall be in conformance with the provisions in these special provisions.

Joint Sealing Compound

Joint sealing compound shall be a mastic-type material in a flexible rope or rolled form with removable wrapper sized to fit into the key of manhole or vault sections.

Repair Mortar and Epoxy Bonding Agent

CONTRACT CHANGE ORDER NO 69577
SHEET 52 OF 115

Repair mortar and an epoxy bonding agent shall be used to repair minor surface damage to precast sections or cast-in-place manhole bases at the discretion of the Engineer. Repair products shall be in conformance with the provisions in these special provisions.

Mortar

Mortar for use on joints between precast sections and for setting manhole cover frames shall be in conformance with the provisions in these special provisions.

Damp-Proofing

Damp-proofing material shall be in conformance with the provisions in these special provisions.

Work within Existing Manholes

Contractor shall comply with all Federal and State regulations for confined space entry. Work inside confined spaces, as defined by the applicable regulations, shall not be undertaken until all the tests and safety provisions of the Code of Federal Regulations 1910.146, and the General Industry Safety Orders of the California Code of Regulations, Title 8, Section 5159, for confined space entry have been performed and the area is verified as safe to enter.

Earthwork

Manhole excavation, foundation stabilization (if necessary), placement of base material, backfill and compaction shall be performed in conformance with the provisions in "Sewer Pipes" of these special provisions.

Manhole Base

A. The invert of precast and cast-in-place bases shall be hand-worked to provide channels conforming in size to the inside diameter of the piping as indicated on the plans. The channels shall vary uniformly in size and shape from inlet to outlet. The concrete base shall be shaped with a wood float and shall receive a hard steel trowel finish before the concrete sets. A template shall be used to accurately form the level surface that will receive the first precast section.

B. During construction of cast-in-place bases, all sewer mains and stub piping shall be in place, including ring-type seals, before concrete placement. Pipe grade and alignment shall be verified immediately upon placement of concrete to assure that the pipelines are in proper position prior to the concrete taking an initial set. The invert elevation and flow line of piping shall be as shown on the plans. The manhole base shall extend 250mm below the bottom of the lowest pipe and 150mm above the top of the largest pipe.

C. Cast-in-place bases shall set a minimum of 24 hours before the manhole construction is continued. In certain critical situations, the setting time may be reduced upon approval of the Engineer.

Installing Manhole Sections

CONTRACT NO. 21-21224
CONTRACT CHANGE ORDER NO 6457
SHEET 24 OF 115

A. The concrete manhole base and successive precast sections will receive a mastic joint sealing compound prior to setting the precast sections in place. Following the vacuum testing as described in this section, the joints will be mortared and tooled to a smooth finish, free of voids. Note that sewer manholes are to be vacuum tested following assembly of the concrete sections, but prior to mortaring the joints, or backfilling.

B. Assemble the precast sections to the elevation required by the location of the manhole as follows:

1. Paved Areas: Top of cover shall be flush with the finished paving surface.

2. Traveled Way: Top of cover shall be flush with the existing surface where it is in a traveled way.

3. Shoulder Areas: Top of cover shall be 25mm above the existing surface where outside the limits of a traveled way. Vaults shall not be placed in roadside ditches without the prior approval of the Engineer.

4. Unpaved easements: Top of cover shall be 150mm above the ground surface. Guard posts around the vault may be required in this area as directed by the Engineer.

D. Secure the manhole frame to the grade ring with mortar.

E. After the frame is securely set the cover shall be installed. All necessary cleaning of foreign materials from the frames and covers shall be accomplished to ensure a satisfactory fit.

F. Where manholes are to be given a protective coating, they shall be free of seepage and surface moisture.

F. Piping installation adjacent to the manhole and connection to the base or shaft sections shall be performed as shown on the plans. Piping installation into flexible pipe connectors shall be in accordance with the manufacturer's recommendations for assembly, lubricants and limits of deflection.

H. In order to prevent accidental use of the new sewer before completion and acceptance, the new inlet to existing tie-in manhole(s) and the outlet of the first new upstream manhole(s) shall be sealed with expandable plugs. The Engineer shall approve the specific location of these plugs. Plugs shall be removed at the time of final inspection or as directed by the Engineer. Removal of all construction debris and water shall be completed prior to removal of plugs.

I. Brick or mortar bulkheads shall be installed by the Contractor at the manhole end of all unused stub channels over 900mm beyond manhole base. The bulkheads are intended to prevent ponding of sewage and debris in the unused channels until such time as the manhole stub is connected and normal sewage flow can occur.

J. New connections to existing manholes, where stubs have not been provided, shall be made by core drilling through the walls or base as directed by the Engineer. Flexible

CONTRACT CHANGE ORDER NO 16457
SHEET 35 OF 115

seals shall be used for the pipe penetration. Apply a protective epoxy coating to the cored concrete and the ends of any reinforcing steel exposed in accordance with these special provisions.

K. A concrete collar shall be cast around manhole frames.

Damp-Proofing

At the discretion of the Engineer, damp-proofing material shall be applied to the exterior surfaces of manholes in accordance with the manufacturer's recommendations and these special provisions. The material shall be applied to all exterior surfaces below a point 300mm above the water table or indications of seepage or moisture as directed by the Engineer.

Vacuum Testing of Manholes

A. Vacuum testing of manholes is required and shall be performed as directed in the presence of the Engineer.

B. Vacuum testing equipment shall be as manufactured by P.A. Glazier, Inc. or equal.

C. Manholes shall be tested after assembly and prior to mortaring the joints or backfilling. In the case of manholes incorporating a PVC liner and polyurethane coating, the testing is to take place prior to mortaring the joints, welding the liner seams between sections, applying the coating, or backfilling.

D. All lift holes shall be plugged with an approved grout prior to testing.

E. All pipes entering the manhole shall be plugged, and bracing installed, to prevent the plug from being drawn into the manhole.

F. The test head shall be placed inside the top of the cone section and the seal inflated in accordance with the manufacturer's recommendations.

G. A vacuum of 254 mm of mercury shall be drawn. The time shall be measured for the vacuum to drop to 229 mm. The manhole shall pass the test if the time taken for the drop is greater than 60 seconds.

H. If the manhole fails the test, necessary repairs shall be made and the test repeated until acceptable results are obtained. The leak(s) shall be located and repaired according to their nature with material-in-kind.

Pull Testing of PVC-Lined Manholes

PVC-lined manholes shall have field-welded joints pull tested. Field welds shall withstand a pull test of at least 45.4 kg per liner cm, applied perpendicularly to the concrete surface for a period of one minute, without evidence of cracks or separations. This test shall be conducted at a temperature of 21.1 degrees C to 26.7 degrees C (70 degrees F to 80 degrees F) inclusive.

Holiday Testing of PVC-Lined Manholes

PVC-Lined and Polyurethane-coated surfaces shall be holiday tested with an electrical holiday detector as manufactured by Tinker and Rasor (Model AP-W with power pack) with the instrument set at 20,000 volts and used as directed by the Engineer. All imperfections identified on the PVC lining and polyurethane coating shall be repaired with materials-in-kind and the test shall be repeated until no holidays are evident.

Sewer Leakage and Infiltration Testing

This section describes the requirements and procedures for leakage and infiltration testing of gravity sewer systems.

Requirements Prior to Testing

Trenching for all dry utilities such as electrical, telephone and cable television shall be completed prior to performing any tests on the sewer pipe.

Testing

A. Leakage Test: Each section of sewer pipe between two successive manholes, or between a manhole and its corresponding cleanout or end plug, shall be tested for leakage. The sewer laterals to the property line shall be included in the test.

B. Infiltration Test: In addition to the leakage test, an infiltration test shall be made where groundwater is encountered, or evidence exists that ground water has encroached to the elevation of the sewer, and as directed by the Engineer.

C. All tests shall be made in the presence of the Engineer.

D. Testing may be repeated, as directed by the Engineer, if the subsequent construction operations of the Contractor or others may have damaged or affected the structural integrity of the sewer pipe and/or laterals.

E. All tests must be completed before the street or trench is paved, unless otherwise allowed by the Engineer.

F. Vacuum testing of manholes shall be performed in accordance with these special provisions.

Materials

The Contractor shall furnish all equipment and materials required for testing.

Infiltration Test

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 16951

SHEET 66 OF 115

A. Prior to testing for infiltration, the ends of the sewer pipe section to be tested shall be capped or plugged to prevent the entrance of water, and pumping of groundwater shall be discontinued for at least three days.

B. Any infiltration discovered before completion and acceptance of the sewer shall be corrected. The sewer shall be examined and the source of infiltration eliminated. Following repairs or replacement as necessary, including backfill and compaction, the subject line shall be retested to assure no infiltration.

Pressure Tests for Sewer Force Mains

Pressure tests for sewer force mains shall be in accordance with these special provisions except that the allowable leakage shall be zero (0). All leak points shall be located and stopped. All defective pipe, fittings, valves and other appurtenances discovered shall be removed and replaced with sound material and tests repeated until the leakage is zero (0).

Final Acceptance

The requirements of this section shall be considered acceptable when each sewer section's air leakage rate is less than the maximum allowed, the television inspection is satisfactory, and the water infiltration rate is zero.

Measurement and Payment

Sewer manhole will be measured by each.

The contract unit price paid for sewer manhole shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals; and for doing all the work involved in constructing sewer manhole, complete in place, including all testing, inspection, furnishing and installing manhole frame and cover, as shown on the plans, as specified in these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6957

SHEET 87 OF 115

10-1.21 SLOPE PROTECTION

Slope protection shall be placed or constructed in conformance with the provisions in Section 72, "Slope Protection," of the Standard Specifications.

CONTRACT NO. 64-012024

CONTRACT CHANGE ORDER NO 16957

SHEET 86 OF 115

10-1.22 MISCELLANEOUS IRON AND STEEL

Miscellaneous iron and steel shall conform to the provisions in Section 75, "Miscellaneous Metal," of the Standard Specifications .

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 69S1

SHEET 89 OF 115

10-1.23 CHAIN LINK FENCE

Chain link fence shall be Type CL-1.8 and shall conform to the provisions in Section 80, "Fences," of the Standard Specifications.

CONTRACT NO. 04-0120R4

CONTRACT CHANGE ORDER NO 6957

SHEET 90 OF 115

10-1.24 METAL BEAM GUARD RAILING

Metal beam guard railing shall be constructed in conformance with the provisions in Section 83-1, "Railings," of the Standard Specifications and these special provisions.

Line posts shall be wood, steel, or plastic. Blocks shall be wood or plastic.

Metal beam guard railing elements and required backup plates, terminal sections, end caps, and return caps shall conform to the requirements of Type 2 W-Beam as shown in AASHTO Designation: M 180.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6957

SHEET 91 OF 113

CONTRACT NO. 12-412254
CONTRACT CHANGE ORDER NO 16451
SHEET 92 OF 115

ALTERNATIVE FLARED TERMINAL SYSTEM

Alternative flared terminal system shall be furnished and installed as shown on the plans and in conformance with these special provisions.

The allowable alternatives for a flared terminal system shall consist of one of the following or a Department approved equal.

(1) TERMINAL SYSTEM (TYPE FLEAT) - Terminal system (Type FLEAT) shall be a Flared Energy Absorbing Terminal 350 manufactured by Road Systems, Inc., located in Big Spring, Texas, and shall include items detailed for terminal system (Type FLEAT) shown on the plans. The Flared Energy Absorbing Terminal 350 can be obtained from the distributor, Universal Industrial Sales, P.O. Box 699, Pleasant Grove, UT 84062, Telephone (801) 785–0505 or from the distributor, Gregory Highway Products, 4100 13th Street, S.W., Canton, OH 44708, Telephone (330) 477–4800.

(2) TERMINAL SYSTEM (TYPE SRT) - Terminal system (Type SRT) shall be an SRT-350 Slotted Rail Terminal (8-post system) as manufactured by Trinity Industries, Inc., and shall include items detailed for terminal system (Type SRT) shown on the plans. The SRT-350 Slotted Rail Terminal (8-post system) can be obtained from the manufacturer, Trinity Industries, Inc., P.O. Box 99, 950 West 400S, Centerville, UT 84014, Telephone (800) 772–7976.

The Contractor shall provide the Engineer with a Certificate of Compliance from the manufacturer in conformance with the provisions in Section 6-1.07, "Certificates of Compliance," of the Standard Specifications. The Certificate of Compliance shall certify that the terminal systems furnished conform to the contract plans and specifications, conform to the prequalified design and material requirements, and were manufactured in conformance with the approved quality control program.

Terminal systems shall be installed in conformance with the manufacturer's installation instructions and these requirements. Each terminal system installed shall be identified by painting the type of terminal system in neat black letters and figures 60 mm high on the backside of the rail element between system posts numbers 4 and 5.

For terminal system (Type SRT), the steel foundation tubes with soil plates attached shall be, at the Contractor's option, either driven, with or without pilot holes, or placed in drilled holes. Space around the steel foundation tubes shall be backfilled with selected earth, free of rock, placed in layers approximately 100 mm thick and each layer shall be moistened and thoroughly compacted. The wood terminal posts shall be inserted into the steel foundation tubes by hand and shall not be driven. Before the wood terminal posts are inserted, the inside surfaces of the steel foundation tubes to receive the wood posts shall be coated with a grease which will not melt or run at a temperature of 65°C or less. The edges of the wood terminal posts may be slightly rounded to facilitate insertion of the post into the steel foundation tubes.

For terminal system (Type FLEAT), the soil tubes shall be, at the Contractor's option, driven with or without pilot holes, or placed in drilled holes. Space around the steel foundation tubes shall be backfilled with selected earth, free of rock, placed in layers approximately 100 mm thick and each layer shall be moistened and thoroughly compacted. Wood posts shall be inserted into the steel foundation tubes by hand. Before the wood terminal posts are inserted, the inside surfaces of the steel foundation tubes to receive the wood posts shall be coated with a grease which will not melt or run at a temperature of 65°C or less. The edges of the wood posts may be slightly rounded to facilitate insertion of the post into the steel foundation tubes.

Surplus excavated material remaining after the terminal system has been installed shall be disposed of in a uniform manner along the adjacent roadway where designated by the Engineer.

The contract unit price paid for alternative flared terminal system shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in furnishing and installing alternative flared terminal system, complete in place, including excavation, backfill and disposal of surplus material, as shown on the plans, as specified in the Standard Specifications and these special provisions, and as directed by the Engineer.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 69572

SHEET 93 OF 115

SECTION 10-2. (BLANK)

SECTION 10-3. SIGNALS, LIGHTING AND ELECTRICAL SYSTEMS

10-3.01 DESCRIPTION

Lighting shall conform to the provisions in Section 86, "Signals, Lighting and Electrical Systems," of the Standard Specifications and these special provisions.

CONTRACT NO. 04-012084

CONTRACT CHANGE ORDER NO 6957

SHEET 94 OF 115

10-3.02 STANDARDS, STEEL PEDESTALS, AND POSTS

Standards, steel pedestals, and posts for lighting standards shall conform to the provisions in Section 86-2.04, "Standards, Steel Pedestals and Posts," of the Standard Specifications, "Steel Structures" of these special provisions, and the following requirements.

Steel bolts not designated on the plans as high-strength (HS) or stainless steel shall be for general applications and shall conform to the requirements in ASTM Designation: A 307.

Handhole reinforcement rings for standards, steel pedestals, and posts shall be continuous around the handholes.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6951

SHEET 95 OF 115

10-3.03 CONDUIT

Conduit to be installed underground shall be Type 3 unless otherwise specified. Detector termination conduits shall be Type 3.

Conduit sizes shown on the plans and specified in the Standard Specifications and these special provisions are referenced to metallic type conduit. When rigid non-metallic conduit is required or allowed, the nominal equivalent industry size shall be used as shown in the following table:

Size Designation for Metallic Type Conduit	Equivalent Size for Rigid Non-metallic Conduit
21	20
27	25
41	40
53	50
63	65
78	75
103	100

When Type 3 conduit is placed in a trench (not in pavement or under portland cement concrete sidewalk), after the bedding material is placed and the conduit is installed, the trench shall be backfilled with commercial quality concrete, containing not less than 250 kg of portland cement per cubic meter, to not less than 100 mm above the conduit before additional backfill material is placed.

After conductors have been installed, the ends of conduits terminating in pull boxes, service equipment enclosures, and controller cabinets shall be sealed with an approved type of sealing compound.

At other locations where conduit is required to be installed under pavement and if a delay to vehicles will not exceed 5 minutes, conduit may be installed by the "Trenching in Pavement Method."

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 10951

SHEET 94 OF 115

10-3.04 CONDUCTORS AND WIRING

Splices of conductors shall be insulated with heat-shrink tubing of the appropriate size after thoroughly painting the spliced conductors with electrical insulating coating.

Heat-shrink tubing shall be heated as recommended by the manufacturer.

The minimum insulation thickness, at any point, for Type USE, RHH or RHW wire shall be 1.0 mm for conductor sizes No. 14 to No. 10, inclusive, and 1.3 mm for No. 8 to No. 2, inclusive. The minimum insulation thickness, at any point, for Type THW and TW wires shall be 0.69 mm for conductor sizes No. 14 to No. 10, inclusive, 1.02 mm for No. 8, and 1.37 mm for No. 6 to No. 2, inclusive.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 16957

SHEET 97 OF 115

10-3.05 BONDING AND GROUNDING

Bonding and grounding shall conform to the provisions in Section 86-2.10, "Bonding and Grounding," of the Standard Specifications and these special provisions.

Bonding jumpers in standards with handholes and traffic pull box lid covers shall be attached by a UL listed lug using 4.5-mm diameter or larger brass or bronze bolts and shall run to the conduit or bonding wire in the adjacent pull box. The grounding jumper shall be visible after the standard has been installed and the mortar pad and cap have been placed on the foundation.

Standards without handholes shall have bonding accomplished by jumpers attached to UL listed ground clamps on each anchor bolt.

For slip base standards or slip base inserts, bonding shall be accomplished by jumpers attached to UL listed ground clamps on each anchor bolt, or a UL listed lug attached to the bottom slip base plate with a 4.5-mm diameter or larger brass or bronze bolt.

Equipment bonding and grounding conductors are required in conduits, except when the conduits contain combinations of loop lead-in cable, fiber optic cable, or signal interconnect cable. A No. 8 minimum, bare copper wire shall run continuously in circuits, except for series lighting circuits, where No. 6 bare copper wire shall run continuously. The bonding wire size shall be increased to match the circuit breaker size in conformance with the Code, or shall be as shown on the plans. Conduits to be installed for future conductors, may omit the copper wire.

Bonding of metallic conduits in metal pull boxes shall be by means of bonding bushings and bonding jumpers connected to the bonding wire running in the conduit system.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 6957

SHEET 98 OF 115

10-3.06 SERVICE

Continuous welding of exterior seams in service equipment enclosures is not required.

Type III service equipment enclosures shall be the aluminum type.

Circuit breakers shall be the cable-in/cable-out type, mounted on non-energized clips. All circuit breakers shall be mounted vertically with the up position of the handle being the "ON" position.

Each service shall be provided with up to 2 main circuit breakers which shall disconnect ungrounded service entrance conductors. Where the "Main" circuit breaker consists of 2 circuit breakers as shown on the plans or required in the special provisions, each of the circuit breakers shall have a minimum interrupting capacity of 10 000 A, rms.

CONTRACT NO. 04-012024

CONTRACT CHANGE ORDER NO 10957

SHEET 99 OF 115

10-3.07 PAYMENT

The contract lump sum price or prices paid for lighting shall include highway lighting .

Other roadway lighting on the project shall be considered as included in the contract lump sum price paid for lighting .

Full compensation for hauling and stockpiling electrical materials shall be considered as included in the contract price paid for the item requiring the material to be salvaged and no additional compensation will be allowed therefor.

NOTES

1. Ground Stud (Welded to Interior Surface of Shaft Opposite Door Opening). Stud shall be 6 mm x 508 mm (Continuosly Threaded) x 19 mm and shall be Furnished with A Type 316 Stainless Steel Nut and A Stainless Steel Shakeproof Washer.
2. Each Anchor Bolt-Threaded Top 200 mm.
3. The Standard, Handhole Cover, Mast Arm, and Anchor Bolts with Nuts & Washers, shall be Hot-dip Galvanized after Fabrication.
4. The Handhole Cover or Door shall have the same Radius of Curvature as the Shaft and when Installed, shall Form a Symmetrical Appearance with the Shaft.
5. The Tapering Elliptical Section shall not be more than Two-thirds the Length of the Mast Arm and shall Taper to the External Diameter of 50 mm Pipe.
6. All Exposed Welds shall be Ground Smooth and shall Conform to Contours of Adjacent Surfaces. All Welds shall have a Finished Depth of 10 mm.
7. Door or Handhole Cover shall be Securely Retained in Place with Two 6 mm x 500 mm Stainless Steel Screws.
8. For Shafts of 7.6 m or Less in Length, the Bolt Circle shall be 250 mm, unless otherwise Noted. For Shafts more than 7.6 m in Length, the Bolt Circle Diameter shall be 280 mm.
9. The Threads of All Fasteners shall be Coated with an Approved Industrial Type of Water-proof Grease Lubricant Containing a High Content of Graphite.
10. The Door or Handlehole Cover Gasket shall be Mounted to the Cover with an Approved Type of Automotive Engine Gasket Cement. The Non-cemented Surface of the Gasket shall be Coated with a Silicone Impregnated Rubber Lubricant.

CCO DESCRIPTION: Pump Station Construction	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

the construction of a sanitary sewer lift station in accordance with sheets 1 through 115 of this change order.

This contract provides for the construction of a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie in of the east span of the new San Francisco Oakland Bay Bridge (SFOBB) to Yerba Buena Island.

A December 14, 2006 Department strategy memorandum, approved by Tony Anziano, Toll Bridge Program Manager, and Richard Land, Chief Engineer, recommended that the Department assume the design responsibility for the East Tie-In (ETI) structure. Based on this memorandum, the design of the structure was changed from a design that incorporated the existing steel truss bridge with the new structure to a design that replaces the existing structure with a new structure (roll out / roll in). As a consequence of the change, the existing sanitary sewer lift station on Yerba Buena Island which services the USCG base, is in conflict with Bent 52A of the East Tie-In (ETI) roll-out/roll-in design. San Francisco Public Utilities Commission (SFPUC) owns and maintains the pump station.

In order to resolve this conflict, the Department has developed plans and specifications to construct a new sanitary sewer lift station, and demolish the existing one. SFPUC has reviewed and agreed to this design.

The initial costs for this work have already been compensated for in Contract Change Order No. 69-S0, including procurement of equipment and generation of shop drawings for the sanitary sewer lift station.

This contract change order provides for the completion of the remainder of the work involved in the pump station, including installation of new pump station, installation of Nema 4x pump controller panel enclosure, installation of a light pole, disconnection of the existing lift pump controller and turned over to the SFPUC Waste Water Division, grading the sewer pump station access road, installation of metal beam guard railing and chain link fencing for the new pump station access road, and removal of the existing pump station and sewer pipes as specified in the special provisions of this contract change order.

For this work the Contractor will be compensated at the agreed lump sum of $499,996.00, which will be financed from the contract's contingency funds. A cost analysis is on file.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

Maintenance concurrence is not required as the SFPUC will maintain this facility. SFPUC has concurred with procurement and construction submittals.

Bob Zandipour, Branch Chief Office of Toll Bridge Design requested this change on 03/19/07. Approval of the change order is recommended by the Resident Engineer.

Authority to proceed with this work was granted by HQ Construction on 10/03/07. However, due to numerous design revisions the contractor was never directed to proceed.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 69	Suppl. No. 2	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Compensate the Contractor for additional work performed in the construction of the Sanitary Sewer Lift Station (Pump Station) not identified in CCO No. 69 Sup. 1.

This additional work consists of field work adjustments not contemplated in the CCO plans during the sewer pump station construction. It includes installing additional pipe & fitting materials at the site.

For this work, the Contractor shall be compensated at a lump sum price of $8,953.12. This sum constitutes full and final compensation of your request for compensation as stated in your Document No. 215-STL.00370 dated April 21, 2008 and Document No. 215-STL.00448 dated February 4, 2009, including markups, for all costs associated with the work of this change.

Total Cost of Extra Work at Lump Sum $8,953.12

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$8,953.12**

By reason of this order the time of completion will be adjusted as follows: 0 days

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO: 69	Suppl. No. 3	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.:

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Adjustment of Compensation at Lump Sum:

Eliminate the following 7 items of work pertaining to the construction of the pump station that was specified under Sheet 105 of Change Order No. 69, Supplement No. 1:

1)Installation of Chain Link Fence (Type CL 1.8), and 2.4 Chain Link Fence Gate (Type CL 1.8)
2)Installation of AC Dike (Type C) and AC Dike (Type F)
3)Installation of Alternative Flared Terminal System
4)Installation of End Anchor Assembly (Type SFT)
5)Installation of Metal Beam Guard Rail (Type 11B Layout)
6)Placement of embankment and earth swale

Install Temporary Fence (Type CL 1.8) around the pump station and access road to the pump station as shown on Page No. 2 of this change order.

For these eliminated and added works, the Contractor shall credit the Department an agreed lump sum of $73,930.00 which constitutes full and final compensation, including all markups, for the net cost savings associated with this change.

The Contractor shall furnish all materials required for the construction of the chain Link Fence (Type CL 1.8), 2.4 Chain Link Fence Gate (Type CL 1.8), Alternative Flared Terminal System, End Anchor Assembly (Type SFT) and Metal Beam Guard Rail (Type 11B Layout) for the work specified under Change Order No. 69, Supplement No. 1, that were purchased prior to the elimination of these works under this change order, to the project site for future use on a subsequent contract. Compensation for furnishing this material is included in the lump sum credit being provided under this change order.

Cost of Adjustment of Compensation at Agreed Lump Sum.....($73,930.00) (Credit)

Estimated Cost: Increase ☐ **Decrease** ☑ **($73,930.00)**

CCO 70	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

As authorized by the Engineer, and in accordance with Section 5-1.01, "Working Drawings", and Section 5-1.02 "Integrated Shop Drawings" of the Special Provisions for Contract Change Order No. 64, provide integrated shop drawings (ISD) for the footings, columns, and bent caps for the YBI Transition Structures, Bridge Nos. 34-0006 L/R, at Bent W3R, Bent W4, Bent W5, Bent W6 and Bent W7 and for the YBI EB On-Ramp Structure, Bridge No. 34-0006 R Bent W7. These ISD drawings shall resolve conflicts between reinforcing, prestress ducting, utility conduits, and other embeds in the column to footing interfaces and column to bent cap interfaces.

This work shall be completed prior to the start of column reinforcing steel fabrication. The Contractor shall ensure that all reinforcement be placed in accordance with the conflict free ISD drawings.

Costs to construct the work will be compensated for under separate change order.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications.

Consideration of a time adjustment will be deferred until completion of work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07 Liquidated Damages of the Standard Specifications.

Estimated cost of Extra Work at Force Account $500,000.00

COST: **$500,000.00** INCREASE ☑ DECREASE ☐	HEADQUARTERS APPROVAL REQUIRED? ☑ YES ☐ NO
SUPPLEMENTAL FUNDS PROVIDED: **$0.00**	IS THIS REQUEST IN ACCORDANCE WITH ENVIRONMENTAL DOCUMENTS? ☑ YES ☐ NO
CCO DESCRIPTION: YBITS Advance Work	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	**DEF** Day(s)	**381** Day(s)	**80** %	**7**

THIS CHANGE ORDER PROVIDES FOR:

the Contractor to produce integrated shop drawings (ISD) for the column to footing and column to bent cap interfaces for the YBI Transition Structures, Bridge Nos. 34-0006 L/R, at Bent W3R, Bent W4, Bent W5, Bent W6 and Bent W7 and for the YBI EB On-Ramp Structure, Bridge No. 34-0006 R Bent W7.

It has been identified that the footings, columns and bent caps for the YBI Transition Structures (YBITS) are highly congested sections with bar reinforcing steel, prestress ducting, utility conduits, and other embeds. To mitigate potential conflicts and future delays during the construction of the YBITS and in order to provide the Engineer with documentation of said mitigation for review and approval, prior to actual construction, it is necessary to require the Contractor to submit ISD's for each bent for the advanced work of the YBITS.

Compensation for producing ISD's will be reimbursed as Extra Work at Force Account in accordance with Section 4-1.03D, "Extra Work," and Section 9-1.03, "Force Account Payment," of the Standard Specifications and Section 5-1.24 "Force Account Payment" of the Special Provisions. The estimated cost of $500,000 is based on a force account projection provided by the Contractor's ISD subcontractor. Payment for the completion of the ISD's can be financed from the projects contingency fund.

This change was requested by Brian Maroney - Deputy Toll Bridge Program Manager and is in concurrence with Ken Terpstra - Project Manager, Peter Siegenthaler - SFOBB Construction Manager Principal Bridge Engineer, Jason Tom - Area Construction Manager Supervising Bridge Engineer, Robert Kobal - HQ Asst. Construction Coordinator, and Tom Ostrom - Office of Structure Design. Ken Darby, HQ CCO Desk Review, provided the Issue & Approve telecopy on 4/4/07.

A cost analysis, as well as other supporting documents and information relative to this change order, are on file with the project records.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

Approval of this change order is recommended by the Resident Engineer.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 70	Suppl. No. 1	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: CC MYERS INC

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide additional funds.

Estimated Cost of Extra Work at Force Account $450,000.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$450,000.00**

By reason of this order the time of completion will be adjusted as follows: Deferred

CCO DESCRIPTION:
YBITS Advance - ISD Additional Funds

PROJECT DESCRIPTION:
CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	DEF Day(s)	1195 Day(s)	252 %	8

THIS CHANGE ORDER PROVIDES FOR:

additional funds for the Contractor to produce integrated shop drawings (ISD) for the column to footing and column to bent cap interfaces for the YBI Transition Structures, Bridge Nos. 34-0006 L/R, at Bent W3R, Bent W4, Bent W5, Bent W6 and Bent W7 and for the YBI EB On-Ramp Structure, Bridge No. 34-0006 R Bent W7.

It has been identified that the footings, columns and bent caps for the Yerba Buena Island Transition Structures (YBITS) are highly congested sections with bar reinforcing steel, prestress ducting, utility conduits, and other embeds. To mitigate potential conflicts and future delays during the construction of the YBITS and in order to provide the Engineer with documentation of said mitigation for review and approval, prior to actual construction, it is necessary to require the Contractor to submit ISDs for each bent for the advanced work of the YBITS.

There are three reasons why production of the YBI Advanced ISDs has cost more than expected: unique elements, two-end integration, and scope of superstructure work.

Unique Elements: By engineering necessity, the designs of the various footings, columns and bent caps tend to be unique and specific to each bent, rather tha being one design repeated at each bent. Foundation designs vary among CIDH piles, driven piles, and spread footings with tiedown anchors. Bent columns vary in number from one to four, with or without walls between columns. If all of the bents were of one typical design, the resolutions learned at one location would be efficiently applied at all other locations, reducing time and effort. Since each bent is unique, with unique issues to solve, each ISD is a customized effort.

Two-End Integration: Integrating column vertical bars with horizontal bars in both the footings and bent caps has been more difficult that anticipated. Adjusting the position of a column vertical bar to resolve an issue with a footing bar may cause a new issue with a bent cap, and vice versa. Adjusting the position of column vertical bars to accommodate both footing bars and bent cap bars is a meticulous and iterative process requiring more time and effort than only having to accommodate bars at one end.

Scope of Superstructure Work: The detailing effort to reconcile physical issues between bent cap horizontal bars and column vertical bars has taken more effort than intially anticipated. Bar reinforcing steel for the bent caps will be installed as future work, not installed under the current contract. The ISDs are intended to insure that placement of the column vertical bars accommodate the positions of bent cap bars to be placed during the future project. The effort expended to resolve these physical issues also contributes to the additional expected time and effort required to complete the ISDs.

Compensation for producing ISD's will be reimbursed as Extra Work at Force Account for an estimated cost of $450,000.00, which will be financed from the project's contingency funds, bringing the total amount allocated to this change order to $950,000.00. A cost analysis, as well as other supporting documents and information relative to this change order, are on file with the project records.

The Contractor's signature is not required for additional funds for Extra Work at Force Account change orders. Therefore this change order is being issued unilaterally.

ADA Notice: For individuals with sensory disabilities, this document is available in alternate formats. For information call: (916) 654-6410 or TDD (916) 654-3880 or write Records and Forms Management, 1120 N Street, MS-89, Sacramento, CA 95814.

Compensation for delays resulting from this work will be made in accordance with Section 8-1.09 "Right of Way Delays" of the Standard Specifications.

Any time adjustments relating to this work will be deferred as it may impact the controlling operation.

This change was cocurred by Alec Melkonians - Asst. Project Manager.

Approval of this change order is recommended by the Resident Engineer.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 71	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Lump Sum:

Demolish a portion of the existing facility and construct one 1.8m diameter CIDH pile.

The work includes the following:

1) Remove and dispose of the portion of bridge deck and fixed columns for the existing facility, as shown on the attached plan sheets 4R1 of 33, 5R2 of 33, 6R2 of 33, and 8R2 of 33.

2) Construct one 1.8m diameter CIDH pile, as shown on the attached plan sheet "West Tie In Phase 2, South-South Detour, CIDH Pile 46L".

For this work, the Contractor will be paid the agreed lump sum price of $384,130.00. This lump sum constitutes fulll compensation, including markups, for the work of this change.

Total Cost of Extra Work at Lump Sum $384,130.00

Estimated Cost: **Increase** ☑ **Decrease** ☐ **$384,130.00**

By reason of this order the time of completion will be adjusted as follows: 0 days

CCO DESCRIPTION: WTI Pile @ 46L / Slab Bridge Removal	**PROJECT DESCRIPTION:** CONSTRUCT ROUTE 80 TEMP BYPASS STRUCTURE

Original Contract Time:	Time Adj. This Change:	Previously Approved CCO Time Adjustments:	Percentage Time Adjusted: (including this change)	Total # of Unreconciled Deferred Time CCO(s): (including this change)
475 Day(s)	0 Day(s)	381 Day(s)	80 %	7

THIS CHANGE ORDER PROVIDES FOR:

Demolish a portion of the existing facility and construct one 1.8m diameter CIDH pile.

This contract was awarded on March 10, 2004 to construct a temporary detour for both eastbound and westbound I-80 traffic that allows for the tie-in of the east span of the new San Francisco-Oakland Bay Bridge (SFOBB) to Yerba Buena Island. The detour consists of three main structures including, the east tie-in to the bridge, the west tie-in to the island and the viaduct between the two tie-in structures.

The Department issued a December 14, 2006 memo entitled Strategy for South-South Detour Contract Completion which was approved by both Tony Anziano (Toll Bridge Program Manager) and Richard Land (Chief Engineer). This strategey memo provided for the Department to assume responsibility for the designs of the East Tie-In (ETI) and West Tie-In (WTI) portions of this contract, and incorporated seismic retrofit of the permanent Yerba Buena Island Transition Structure (YBITS).

Work on the WTI is being directed via several change orders to facilitate contract administration as plans and estimates become available. This change provides for the demolition of a portion of the existing structure and construction of one 1.8m diameter pile in preparation for the full demolition of the existing structure and roll-in of the new structure to take place on Labor Day weekend 2007. This change is in accordance with the strategey memo.

Compensation for this work shall be paid as extra work at an agreed lump sum price of $384,130.00. The cost shall be financed from the contract's contingency funds.

Supporting documents and information for this change including a cost analysis are on file with the project records.

CONTRACT CHANGE ORDER

Change Requested by: Engineer

CCO 72	Suppl. No. 0	Contract No. 04 - 0120R4	Road SF-80-12.6/13.2	FED. AID LOC.: ACBRIM-080-1(097)N

To: **CC MYERS INC**

You are directed to make the following changes from the plans and specifications or do the following described work not included in the plans and specifications for this contract. ***NOTE: This change order is not effective until approved by the Engineer.***

Description of work to be done, estimate of quantities and prices to be paid. (Segregate between additional work at contract price, agreed price and force account.) Unless otherwise stated, rates for rental of equipment cover only such time as equipment is actually used and no allowance will be made for idle time. This last percentage shown is the net accumulated increase or decrease from the original quantity in the Engineer's Estimate.

Extra Work at Force Account:

Provide temporary shuttle van service for transporting general public and passengers on Yerba Buena Island (YBI) in accordance with Section 10-1.135, Temporary Shuttle Van Service, of the Special Provisions and as authorized by the Engineer. The shuttle route and planned stops will be revised as authorized by the Engineer.

For this work, payment will be in accordance with Section 4-1.03D, Extra Work, of the Standard Specifications, and Sectior 5-1.24, Force Account Payment, of the Special Provisions, and no other compensation will be allowed therefor.

Estimated Cost of Extra Work at Force Account $500,000.00

Extra Work at Lump Sum:

Furnish additional labor, equipment, material, supplies, and other resources as required to construct the superstructure for the YBI Viaduct Replacement (Bridge No. 34-0006) in accordance with the approved CCO No. 61-S1 Package 3 plans and specifications, and the attached specifications and revised YBI Viaduct Replacement Sheets 2 through 6 of this change order.

All "Payment" clauses contained within CCO No. 61-S1 Package 3 and the attached specifications are amended such that all work performed under this change will be compensated for as extra work at agreed lump sum as part of this change order, and no other compensation will be allowed therefor.

Items of work not included as part of this change order:

1) CCO No. 61-S1 Package 3, West Tie-In Phase I YBI Viaduct Replacement: Stage II Demolition work, and work to move the YBI Viaduct Superstructure complete into place shall be compensated for under separate change order.
2) Compensation for all additional SWPPP work associated with this change shall be compensated for separately.
3) Time related costs and impacts as a result of this change shall be compensated for under separate change order.

Consideration of a time adjustment shall be deferred until completion of work specified herein. Determination of a commensurate time extension will be made in accordance with Section 8-1.07 Liquidated Damages of the Standard Specifications.

Total Cost of Extra Work at Lump Sum $10,596,900.00

REGISTERED CIVIL ENGINEER

AMENDMENTS TO JULY 1999 STANDARD SPECIFICATIONS

UPDATED NOVEMBER 18, 2005

Amendments to the Standard Specifications set forth in these special provisions shall be considered as part of the Standard Specifications for the purposes set forth in Section 5-1.04, "Coordination and Interpretation of Plans, Standard Specifications and Special Provisions," of the Standard Specifications. Whenever either the term "Standard Specifications is amended" or the term "Standard Specifications are amended" is used in the special provisions, the text or table following the term shall be considered an amendment to the Standard Specifications. In case of conflict between such amendments and the Standard Specifications, the amendments shall take precedence over and be used in lieu of the conflicting portions.

SECTION 1: DEFINITIONS AND TERMS

Issue Date: January 28, 2005

Section 1-1.265, "Manual of Traffic Controls," of the Standard Specifications is amended to read:

1-1.265 MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES

- The Manual on Uniform Traffic Control Devices for Streets and Highways, 2003 Edition (MUTCD) is administered by the Federal Highway Administration.

Section 1, "Definitions and Terms," of the Standard Specifications is amended by adding the following section:

CONTRACT NO. 04-0A20E4

CONTRACT CHANGE ORDER NO 72

SHEET 4 OF 41

5-1.01 WORKING DRAWINGS

Working drawings shall conform to the requirements in Section 5-1.02 " Plans and Working Drawings," of the Standard Specifications and these special provisions. Working drawings shall include supplements and calculations that are in addition to drawings.

Working drawings shall be submitted to the following location:

California Department of Transportation
Office of the Resident Engineer, Contract 04-0120F4
345 Burma Rd.
Oakland, CA 94607

Working drawings shall conform to the following:

A. For initial review, 6 sets of the working drawings, shall be submitted. After the Engineer has determined that a submittal is complete, 12 additional sets shall be submitted.
B. Drawings shall be 559 mm x 864 mm or 279 mm x 432 mm in size. Supplements and calculations shall be 215 mm x 280 mm in size.
C. For drawings, text size shall be nominally 2.8 mm high, minimum. For supplement and calculations, font size shall be 12, minimum.
D. Each working drawing sheet and each page of supplement or calculation, shall include the jobsite name of the structure as shown on the contract plans, District-County-Route-Kilometer Post, bridge number and contract number.
E. Text and details shall be legible and suitable for photocopying and reduction.
F. In addition to the paper copies of the working drawings, electronic files shall be submitted. Electronic files shall be portable document format (PDF) and shall be submitted on compact disk (CD) media. Each plan sheet shall be a separate PDF file on the CD. The electronic copy of the calculations and supplement shall be made into separate PDF files so that no more than 50 pages are included in a single file on the CD. The CD shall contain an index consisting of the file names and a description of the corresponding file contents. The files shall be listed in the sequence of: 1) index, 2) drawings, 3) supplement, and 4) calculations. If more than one CD is used for a given working drawing submittal, the index shall be included on each CD.
G. Microfilms are required for approved shop drawings and shall be only a 24x reduction. The edge of the corrected original tracing image shall be clearly visible and visually parallel with the edges of the page. A clear, legible symbol shall be provided on the upper left side of each page to show the amount of reduction, and a horizontal and vertical scale shall be provided on each reduced print to facilitate enlargement to original scale.
H. At the completion of the contract, one compiled set of all approved working drawings (in electronic form and including all corrections and revisions) shall be furnished to the Engineer. The index shall be the first file on the CD.
I. At the completion of the contract, one set of reduced prints on 75-g/m2 (minimum) bond paper, 279 mm x 432 mm in size, of the corrected original tracings of all approved working drawings, including all corrections and revisions shall be furnished to the Engineer. Reduced prints that are common to more than one structure shall be submitted

CONTRACT NO. 04-0120F4
CONTRACT CHANGE ORDER NO 72
SHEET 5 OF 41

for each structure. An index prepared specifically for the drawings for each structure containing sheet numbers and titles shall be included on the first reduced print in the set for each structure. Reduced prints for each structure shall be arranged in the order of drawing numbers shown in the index

Working drawings shall be stamped and signed by an engineer who is registered as a Civil Engineer in the State of California. When independently checked calculations are required, these calculations shall be stamped and signed by another engineer who is registered as a Civil Engineer in the State of California.

Working drawings shall be submitted sufficiently in advance of the start of the affected work to allow time for review by the Engineer and correction by the Contractor of the drawings without delaying the work. The time shall be proportional to the complexity of the work, but in no case shall the time be less than the review time as specified for the type of working drawings as required elsewhere in these special provisions.

The Engineer will review a working drawing submittal for completeness. Within three working days of the receipt of the submittal by the Engineer, the Engineer will notify the Contractor in writing if the submittal is determined to be incomplete. If the submittal is determined to be complete, twenty working days from the day of receipt shall be allowed for approval or return for correction of each submittal or resubmittal, unless specified otherwise in the special provisions.

Should the Engineer fail to review the complete working drawing submittal within the time specified, and the Contractor's controlling operation on the critical path is delayed (as determined by the Engineer) by the Engineer's failure to review within the time specified, an extension of time will be granted in conformance with the provisions in Section 8-1.07, "Liquidated Damages," of the Standard Specifications and in "Progress Schedule (Critical Path Method)," of these special provisions. Should the Engineer fail to review the complete working drawing submittal within the time specified, compensation, if any, will be made in accordance with Section 8-1.09, "Right of Way Delays," of the Standard Specifications, and "Time Related Overhead," of these special provisions.

5-1.__ PAYMENTS

Attention is directed to Sections 9-1.06, "Partial Payments," and 9-1.07, "Payment After Acceptance," of the Standard Specifications and these special provisions.

In determining the partial payments to be made to the Contractor, only the following listed materials will be considered for inclusion in the payment as materials furnished but not incorporated in the work:

A. Prestressing Steel (sealed containers only)
B. Bar Reinforcing Steel
C. Miscellaneous Metal
D. Bridge Deck Drainage
E. Joint Seal

5-1.__ PROJECT INFORMATION

The information in this section has been compiled specifically for this project and is made available for bidders and Contractors. Other information referenced in the Standard

CONTRACT NO. 05-1C1204
CONTRACT CHANGE ORDER NO 72
SHEET 9 OF 41

Specifications and these special provisions do not appear in this section. The information is subject to the conditions and limitations set forth in Section 2-1.03, "Examination of Plans, Specifications, Contract, and Site of Work," and Section 6-2, "Local Materials," of the Standard Specifications. Bidders and Contractors shall be responsible for knowing the procedures for obtaining information.

Plans of the existing bridges may be requested by fax from the Office of Structure Maintenance and Investigations, 1801 30th Street, Sacramento, CA, Fax (916) 227-8357.

Plans of the existing bridges available to bidders and Contractors are reproductions of the original contract plans, with significant changes noted, and working drawings, and do not necessarily show normal construction tolerances and variances. Where dimensions of new construction required by this contract are dependent on the dimensions of the existing bridges, the Contractor shall verify the controlling field dimensions and shall be responsible for adjusting dimensions of the work to fit existing conditions.

SECTION 8. MATERIALS

8-1.01 SUBSTITUTION OF NON-METRIC MATERIALS AND PRODUCTS

Only materials and products conforming to the requirements of the specifications shall be incorporated in the work. When metric materials and products are not available, and when approved by the Engineer, and at no cost to the State, materials and products in the United States Standard Measures which are of equal quality and of the required properties and characteristics for the purpose intended, may be substituted for the equivalent metric materials and products, subject to the following provisions:

A. Materials and products shown on the plans or in the special provisions as being equivalent may be substituted for the metric materials and products specified or detailed on the plans.

B. Before other non-metric materials and products will be considered for use, the Contractor shall furnish, at the Contractor's expense, evidence satisfactory to the Engineer that the materials and products proposed for use are equal to or better than the materials and products specified or detailed on the plans. The burden of proof as to the quality and suitability of substitutions shall be upon the Contractor and the Contractor shall furnish necessary information as required by the Engineer. The Engineer will be the sole judge as to the quality and suitability of the substituted materials and products and the Engineer's decision will be final.

C. When the Contractor elects to substitute non-metric materials and products, including materials and products shown on the plans or in the special provisions as being equivalent, the list of sources of material specified in Section 6-1.01, "Source of Supply and Quality of Materials," of the Standard Specification shall include a list of

CONTRACT NO. 04-012284
CONTRACT CHANGE ORDER NO 72
SHEET 7 OF 41

substitutions to be made and contract items involved. In addition, for a change in design or details, the Contractor shall submit plans and working drawings in conformance with the provisions in Section 5-1.02, "Plans and Working Drawings," of the Standard Specifications. The plans and working drawings shall be submitted at least 7 days before the Contractor intends to begin the work involved.

Unless otherwise specified, the following substitutions of materials and products will be allowed:
